1. Felling Operation. Contractor shall use removal methods that reduce potential damage to salvaged logs. All shafts shall be cut as close to the root flare as possible, and all log lengths shall be measured from this stump cut upwards. The distance from the ground surface to the first cut at stump level shall be specified for each tree or shall be not more than six (6) inches off the ground. Contractor shall either use ropes to lower salvaged logs to ground or a crane if necessary. In either case, adequate protection shall be used to brace the log fall and maintain the physical integrity of logs specified for reuse. Adequate protection shall include a series of rubber tires or similar objects on ground surface to absorb the force of log impact so as to avoid cracking and splitting and or similar damage to the salvaged log.
2. Sealant Application. Apply clear wax end-sealer Anchor-Seal or approved equal to both cut ends of salvaged logs with a pump sprayer immediately after felling.
3. Labeling and Data Tracking. Contractor will be provided with a data tracking sheet template to be filled in for each log upon felling. The template will include a tree inventory code that corresponds to markings that shall be made on the log ends. Data to be recorded shall include the following information: tree removal date, tree inventory number, species, number of sections in each tree, diameter at both cut ends, and condition prior to and after felling. Codes shall be marked on both cut ends in a manner that codes are clearly visible.
4. Move cut logs to temporary on-site storage area. Maximum safety measures must be used by the Contractor during tree removal. The Contractor shall carefully protect against damage to all existing trees, plants, curbs, sidewalks, utilities, and other features to remain. During tree removal operations, SherrillTree TRI-GUARD SYSTEM, or Engineer approved alternative such as plywood and/or tarps, must be used to protect adjacent vehicles, real property, and pedestrians. If, when removing trees, existing sidewalks or curbs are disturbed, the Contractor shall restore and/or reset disturbed sidewalks and curbs, at no additional cost, to the satisfaction of the Engineer. All repairs should take place within three (3) days of the damage occurring or as directed by the Engineer.

### **DISPOSITION OF SALVAGED LOGS**

1. Log Disposition. NYCDPR Salvaged logs shall be transported by the Contractor using a self-loading log truck to a NYCDPR facility within the five boroughs. , Contractor will document log hauler/trucking company information on manifest including company name and address, name of driver, and company contact information. Each log load will include tracking data on logs contained within as described above. Logs and manifests must be submitted to the Engineer.
2. Log Decking. An on-site log decking area with a minimum of at least 5,000 square feet for stacking logs must be designated in coordination with the Engineer. Areas should be accessible for ease of pickup by truck and should be kept secure and free from obstruction.
  - a. Contractor shall deck all logs from salvaged trees in a manner to facilitate truck

loading. Log decking and stacking shall be done so that log inventory codes are visible from one side. Logs should be organized by like species and length. Log stacks shall not exceed 14 feet in height.

3. Salvaged Log Chain of Custody For NYCDPR. The Contractor's custody of the salvaged logs ends at the time of delivery to the NYCDPR facility. At the time of delivery, NYCDPR must sign for logs and copies must be provided to the Engineer, Contractor, and NYCDPR.
4. Salvaged Log Chain of Custody For Nature Exploration. Salvaged Logs for Nature Exploration remain in the Contractor's custody until fabrication and installed on site are completed as per the specification Sections PK-ESCR 912 Nature Exploration Fabrication and PK-ESCR 913 Nature Exploration Installation. The chain of custody must be included with the Nature Exploration delivery paperwork and submitted to the Engineer.

### **PLANT PEST AND DISEASE CONTROL REQUIREMENTS**

Contractors shall comply with Federal and State Department of agriculture regulations for plant pest and disease control. New York State Department of Agriculture and New York State Department of Environmental Conservation regulations require contractors operating in infested areas to thoroughly clean all equipment units before moving equipment to non-infested areas.

**QUARANTINE AREAS and ORDERS FOR THE ESTABLISHMENT OF PROTECTIVE ZONE PROVISIONS:** The Contractor is required to abide by all existing and any new or revisions to legislation and orders regarding quarantines and protective zones while working on this contract. Full information can be obtained from Federal and State Pest and Disease Control agencies and personnel.

### **CREW CONFIGURATION**

The Tree Contractor shall furnish a list showing each employee's identification number and title (classification). The Contractor shall advise of any and all changes in the Contractor's roster of employees assigned to this contract. A Tree Removal Crew is defined for **tree removal** operations as at least five (5) crew members. One (1) aerial lift operator or climber aloft and engaged in tree cutting with a chainsaw and/or hand saw, two (2) ground workers engaged in assisting worker aloft in lowering limbs, clearing and chipping wood debris in a wood chipper attached to a truck for chip collection and two (2) worksite safety specialists exclusive of tree work operations and engaged in securing a safe work zone and directing vehicular and pedestrians around the active work zones.

### **MEASUREMENT AND PAYMENT:**

This is an incremental cost item. All trees salvaged and paid for under this section will also be paid for removal under Section **PK-ESCR 0-05 – TREE REMOVAL**.

The quantity of **TREE SELECTION, STORAGE AND PREPARATION**, for Nature Exploration shall be a unit price for **EACH** tree between 12" and 36" DBH as specified in the drawings, and shall include the cost of all labor, materials and equipment necessary for salvage of trees with log disposition – delivery to site for Nature Play Fabrication as determined by the Contractor with approval from the Engineer, and all other incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

The quantity of **REMOVE-SALVAGE TREE, ANY CLASS** shall be a unit price for **EACH** tree of the over 12" DBH size group, and shall include the cost of all labor, materials, equipment,

walkthrough and preparation necessary for salvage of trees with log disposition – delivery to NYCDPR as specified by the Engineer, and all other incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

ITEM #	CLASS SIZE	DIAMETER
PK-ESCR 968 A	2	12" to under 18"
PK-ESCR 968 B	3	18" to under 24"
PK-ESCR 968 C	4	24" to under 30"
PK-ESCR 968 D	5	over 30"

All trees marked for salvage shall be measured for their diameter at breast height (DBH), a height of four and a half (4 1/2) feet from the ground. On level surfaces, measurements shall be taken from any face of the tree. On slopes, measurements shall be taken at the highest grade elevation.

The price bid shall be a unit price per **EACH** and shall include the cost of all labor, materials, and equipment required, including transport, on site storage, limbing of trees, pruning, and all incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the engineer.

Tree Removal, Clearing and Grubbing, Nature Exploration Fabrication, and Nature Exploration Installation shall be paid for under its respective contract items .

*Payment will be made under:*

Item No.	Item	Pay Unit
PK-ESCR 916	TREE SELECTION, STORAGE AND PREPARATION	EA
PK-ESCR 968 A	REMOVE-SALVAGE TREE 12-18 CLASS 2	EA
PK-ESCR 968 B	REMOVE-SALVAGE TREE 18-24 CLASS 3	EA
PK-ESCR 968 C	REMOVE-SALVAGE TREE 24-30 CLASS 4	EA
PK-ESCR 968 D	REMOVE-SALVAGE TREE 30+ CLASS 5	EA

**END OF SECTION**

**SECTION PK-10 – BROKEN STONE – LOOSE MEASURE**

**PK-10.1.     INTENT:** This section describes Broken Stone – Loose Measure

**PK-10.2.     DESCRIPTION:** Broken Stone – Loose Measure shall include the furnishing and placement of Broken Stone in the locations where shown on the plans or as directed by the Engineer. This stone will be used for drainage applications and other miscellaneous work, as shown on the details located in Appendix A of the contract drawings(sheet #4 “Parks leaf manhole and catch basin covers”, and as directed by the Engineer.

**PK-10.3.     MATERIALS:**

(A)       BROKEN STONE — Shall consist solely of crushed ledge rock. Stone shall be No. 3 size and shall be of approved size and quality as specified in the NYCDOT Standard Highway Specifications or as directed by the Engineer.

IMPORTANT: Material substitutions will not be approved under any circumstances. All recycled materials will be rejected.

**PK-10.4.     MEASUREMENT AND PAYMENT:**

The quantity of **BROKEN STONE – LOOSE MEASURE** to be paid for under this item shall be the number of **CUBIC YARDS**, measured in trucks as delivered to the site, furnished and place in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **CUBIC YARD** and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-10</b>	<b>BROKEN STONE – LOOSE MEASURE</b>	<b>C.Y.</b>

**END OF SECTION**

## SECTION PK-77 – POLYETHYLENE CORRUGATED PIPE – 18” DIA.

**PK-77.1. WORK:** Under this item, the contractor shall furnish and lay Polyethylene Corrugated Pipe of 18” diameter in accordance with the plans, specifications, and directions of the Engineer. All work of connecting and joining to other pipes or drainage structures shall be included under this item.

**PK-77.2. MATERIALS:** Pipe and fittings shall be manufactured by Advanced Drainage systems, Inc. (ADS) Staybrook Industrial Area, Ludlow, MA. 01056, or approved equal. Sizes 4 – 36 inch (-12) shall have a full circular cross-section, with an outer corrugated pipe wall and an essentially smooth inner wall (waterway). Corrugations for these sizes may be either annular or spiral. All sizes shall conform to the AASHTO classification “Type S” (smooth waterway).

Pipe manufactured for this specification shall comply with the requirements for test methods, dimensions, and markings found in AASHTO Designations M252 and M294. Pipe and fittings shall be made from Virgin PE compounds which conform with the requirements of cell Class 324420C as defined and described in ASTM D3350.

The minimum parallel plate stiffness values when tested in accordance with ASTM D2412 shall be as follows:

<u>Diameter</u>	<u>Pipe Stiffness</u>
18” (450 mm)	40 psi (280 kPa)

The fittings shall not reduce or impair the overall integrity or function of the pipe line. Common corrugated fittings may be either molded or fabricated. Common corrugated fittings include inline joint fittings, such as couplers and reducers, and branch or complimentary assembly fittings such as tees, wyes, and end caps. These fittings may be installed by various methods, such as snap-on, screw-on, bell and spigot, and wrap around. Couplings shall provide sufficient longitudinal strength to preserve pipe alignment and prevent separation at the joints.

Only fittings supplied or recommended by the pipe manufacturers shall be used. Where designated on the plans, a neoprene or rubber gasket shall be supplied.

**PK-77.3. INSTALLATION:** All pipe should be reasonably close to conformity to line and grade and shall have a full, firm and even bearing at each joint and along the entirety length of pipe. Joint misalignment shall not result in offsets, in the interior smooth liner, greater than one-quarter (1/4”) inch. Pipe laying shall begin at the downstream end and progress upstream. Any single run of pipe, excluding end sections, shall consist wholly of the same type material unless otherwise directed by the engineer. No section of pipe used shall be less than three feet (3’) in length. Installation of the pipe shall be in accordance with ASTM Recommended Practice D2321.

### Installation Recommendation:

1. Crushed stone, gravel or compacted soil backfill material should be used as the bedding and envelope material around the culvert. The aggregate size should not exceed one-sixth (1/6) of the pipe diameter or four inch (4”) diameter, whichever is smaller.
2. The corrugated pipe should be laid on grade, on a layer of bedding material. If native soil is used as the bedding and backfill material, it should be well compacted in six inch (6”) layers under the haunches, around the sides, and above the pipe to the recommended minimum height of cover.

3. Either flexible (asphalt) or rigid (concrete) pavements may be laid as part of the minimum cover requirements.
4. Site conditions and availability of bedding materials often dictate the type of installation method used. See plans.
5. The load bearing capability of flexible conduits is dependent on the type of backfill material used and the degree compaction achieved. Crushed stone and gravel backfill materials typically reach a compaction level of ninety to ninety five percent (90-95%) AASHTO standard density without compaction. When native soils are used as backfill material, a compaction level of eighty five percent (85%) is required. This is the same minimum compaction that is recommended by all culvert pipe manufacturers and can be achieved by either hand or mechanical tamping.

Two types of installations are recommended for H-20 live loads – the heaviest legal highway loads. These are the trench and open ditch installations. The minimum height of cover recommendations are the same for both conditions.

MINIMUM DIMENSIONS TRENCH OR OPEN DITCH INSTALLATIONS			
Nominal Diameter	Min. Thickness of Bedding	Minimum Cover	Minimum Trench Width
18"	6"	12"	39"

Coupling of the pipes shall be performed using standard ADC (Advanced Drainage Systems) N-12 split coupler PRO LINK ST, or PRO LINK 10.8, or PRO LINK 5, or approved equal.

**PK-77.4. MEASUREMENT AND PAYMENT:**

The quantity of **POLYETHYLENE CORRUGATED PIPE** to be paid for under this item shall be the number of linear feet (laying length), including fittings, measured in its final position, furnished, and placed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length Polyethylene Corrugated Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer. Excavation and broken stone shall be paid for under their respective Items.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-77</b>	<b>POLYETHYLENE CORRUGATED PIPE – 18" DIA.</b>	<b>L.F.</b>

**END OF SECTION**

## SECTION PK-78 – POLYETHYLENE CORRUGATED PIPE – 24” DIA.

**PK-78.1. WORK:** Under this item, the contractor shall furnish and lay Polyethylene Corrugated Pipe of 24” diameter in accordance with the plans, specifications, and directions of the Engineer. All work of connecting and joining to other pipes or drainage structures shall be included under this item.

**PK-78.2. MATERIALS:** Pipe and fittings shall be manufactured by Advanced Drainage systems, Inc. (ADS) Staybrook Industrial Area, Ludlow, MA. 01056, or approved equal. Sizes 4 – 36 inch (-12) shall have a full circular cross-section, with an outer corrugated pipe wall and an essentially smooth inner wall (waterway). Corrugations for these sizes may be either annular or spiral. All sizes shall conform to the AASHTO classification “Type S” (smooth waterway).

Pipe manufactured for this specification shall comply with the requirements for test methods, dimensions, and markings found in AASHTO Designations M252 and M294. Pipe and fittings shall be made from Virgin PE compounds which conform with the requirements of cell Class 324420C as defined and described in ASTM D3350.

The minimum parallel plate stiffness values when tested in accordance with ASTM D2412 shall be as follows:

<u>Diameter</u>	<u>Pipe Stiffness</u>
24” (600 mm)	34 psi (235 kPa)

The fittings shall not reduce or impair the overall integrity or function of the pipe line. Common corrugated fittings may be either molded or fabricated. Common corrugated fittings include inline joint fittings, such as couplers and reducers, and branch or complimentary assembly fittings such as tees, wyes, and end caps. These fittings may be installed by various methods, such as snap-on, screw-on, bell and spigot, and wrap around. Couplings shall provide sufficient longitudinal strength to preserve pipe alignment and prevent separation at the joints.

Only fittings supplied or recommended by the pipe manufacturers shall be used. Where designated on the plans, a neoprene or rubber gasket shall be supplied.

**PK-78.3. INSTALLATION:** All pipe should be reasonably close to conformity to line and grade and shall have a full, firm and even bearing at each joint and along the entirety length of pipe. Joint misalignment shall not result in offsets, in the interior smooth liner, greater than one-quarter (1/4”) inch. Pipe laying shall begin at the downstream end and progress upstream. Any single run of pipe, excluding end sections, shall consist wholly of the same type material unless otherwise directed by the engineer. No section of pipe used shall be less than three feet (3’) in length. Installation of the pipe shall be in accordance with ASTM Recommended Practice D2321.

### Installation Recommendation:

1. Crushed stone, gravel or compacted soil backfill material should be used as the bedding and envelope material around the culvert. The aggregate size should not exceed one-sixth (1/6) of the pipe diameter or four inch (4”) diameter, whichever is smaller.
2. The corrugated pipe should be laid on grade, on a layer of bedding material. If native soil is used as the bedding and backfill material, it should be well compacted in six inch (6”) layers under the haunches, around the sides, and above the pipe to the recommended minimum height of cover.

**END OF SECTION**

## SECTION PK-667 – TEMPORARY SHEETING

**PK-667.1. WORK:** Under the Item TEMPORARY SHEETING, the Contractor shall provide temporary sheeting and bracing in all trenches or excavations for structures, where necessary for the proper protection of persons or property. Where the depth of excavation exceeds five feet (5'), sheeting and necessary bracing must be installed for the entire depth below the existing ground surface and will be paid for under this item.

All shoring work shall meet or exceed the requirements of the New York State Department of Labor, Industrial Code Rule 2 and Title 29 Code of Federal Regulations Part 1926, Safety and Health Regulations for Construction (OSHA).

The type of sheeting and bracing shall be satisfactory to the Engineer and subject to the Engineer's approval, but the approval by the Engineer of a method to be used does not relieve the Contractor of the Contractor's responsibility for protection and safety.

When sheeting is used in trenches or excavations for structures of less than five (5) feet in depth, the cost of such sheeting and bracing, unless ordered left in place, shall be included in the price bid for Unclassified Excavation, and payment will be made for such excavation to the maximum payment lines shown on the Plans.

**PK-667.2. MEASUREMENT AND PAYMENT:** The quantity of Temporary Sheeting to be paid for under this item shall be the number of **SQUARE FEET** of sheeting, measured on exposed surfaces after installation in accordance with the plans, specifications and the directions of the Engineer.

The price bid shall be a price per **SQUARE FOOT** and shall include the cost of all labor, material, equipment, and incidental expenses necessary including complete removal prior to backfilling, as necessary, to complete work in accordance with plans and specifications to the satisfaction of the Engineer.

Item No.	Item	Pay Unit
PK-667	TEMPORARY SHEETING	S.F.

END OF SECTION

**SECTION PK-668 – PARKS LEAF MANHOLE COVER & FRAME**

**PK-668.1. WORK:** Under this item, the Contractor shall furnish and install Manhole Covers along with frames, including locking bolts and keys, as directed by the Engineer.

**PK-668.2. MATERIALS:** Manhole Covers shall be of gray iron per ASTM A48, latest revision, Class 30 or better. Covers shall be manufactured by Campbell Foundry Co., Harrison, NJ, EJ USA, Inc., East Jordan, MI or approved equal. All covers shall be suitable for highway traffic, meeting the requirements for heavy duty H-20 loading, per AASHTO M306-10.

**Bolt & Key:** Each cover shall be furnished with two (2) locking bolts, similar to the *Intimidator Man-Lock*, as manufactured by McGard, Inc., Orchard Park, N.Y., or approved equal. Two (2) keys shall be furnished per site. For security reasons, keys shall be sent directly from the manufacturer to a location directed by the Engineer.

**PK-668.3. INSTALLATION:** The Covers shall be installed on frames as shown on the Standard Detail Sheet. Immediately prior to the final inspection the Contractor shall clean cover surfaces that show evidence of loose mill scale, non-adherent rust, peeling paint and other deleterious matter in accordance with SP-2, Hand Tool Cleaning, a method generally confined to wire brushing, sandpaper, hand scrapers or hand impact tools. Unless otherwise directed by the Engineer, covers shall be painted with two coats of black silicone alkyd paint, such as Steel Master 9500 manufactured by Sherwin Williams, Woodside, NY or approved equal.

**PK-668.4. CLEANING:** Except otherwise ordered by the Engineer, immediately prior to the final inspection the Contractor shall clean unimbedded surfaces that show evidence of loose mill scale, non-adherent rust, peeling paint and other deleterious matter in accordance with SSPC SP2, Hand Tool Cleaning, a method generally confined to wirebrushing, sandpaper, hand scrapers or hand impact tools.

**PK-668.5. SUBMITTALS:** All submittals shall conform to the requirements in the S-Pages. Foundry Certificates for each type of material certifying ductile iron grade for catch basin covers and H-20 loading test shall be submitted. Submittal shall be on the pattern holder's letterhead.

**PK-668.6. MEASUREMENT AND PAYMENT:**

The quantity of Parks Manhole Covers to be paid for under this item shall be the number of **EACH** type furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price for **EACH** Parks Leaf Manhole Cover, furnished and installed, and shall include the cost for all labor, material, equipment, and incidental expenses necessary to complete the work, including frame, locking bolts, painting, and keys, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

## SECTION PK-669 – PARKS LEAF CATCH BASIN COVER & FRAME

**PK-669.1. WORK:** Under this item, the Contractor shall furnish and install Catch Basin Covers along with frames, including locking bolts and keys, as directed by the Engineer.

**PK-669.2. MATERIALS:** Catch Basin Covers shall be ductile iron ASTM A-536, latest revision, Grade 65-48-12 or better. Covers shall be manufactured by Campbell Foundry Co., Harrison, NJ, EJ USA, INC., East Jordan, MI or approved equal. All covers shall be suitable for highway traffic, meeting the requirements for heavy duty H-20 loading, per AASHTO M306-10.

**Bolt & Key:** Each cover shall be furnished with two (2) locking bolts, similar to the *Intimidator Man-Lock*, as manufactured by McGard, Inc., Orchard Park, N.Y., or approved equal. Two (2) keys shall be furnished per site. For security reasons, keys shall be sent directly from the manufacturer to a location directed by the Engineer, and written confirmation must be provided by the manufacturer to the Engineer.

**PK-669.3. INSTALLATION:** The Covers shall be installed on frames as shown on the Standard Detail Sheet. Immediately prior to the final inspection the Contractor shall clean cover surfaces that show evidence of loose mill scale, non-adherent rust, peeling paint and other deleterious matter in accordance with SP-2, Hand Tool Cleaning, a method generally confined to wire brushing, sandpaper, hand scrapers or hand impact tools. Unless otherwise directed by the Engineer, covers shall be painted with two coats of black silicone alkyd paint, such as Steel Master 9500 manufactured by Sherwin Williams, Woodside, NY or approved equal.

**PK-669.4. CLEANING:** Except otherwise ordered by the Engineer, immediately prior to the final inspection the Contractor shall clean unimbedded surfaces that show evidence of loose mill scale, non-adherent rust, peeling paint and other deleterious matter in accordance with SSPC SP2, Hand Tool Cleaning, a method generally confined to wirebrushing, sandpaper, hand scrapers or hand impact tools.

**PK-669.5. SUBMITTALS:** All submittals shall conform to the requirements in the S-Pages. Foundry Certificates for each type of material certifying ductile iron grade for catch basin covers and H-20 loading test shall be submitted. Submittal shall be on the pattern holder's letterhead.

**PK-669.6. MEASUREMENT AND PAYMENT:**

The quantity of Parks Catch Basin Covers to be paid for under this item shall be the number of **EACH** type furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price for **EACH** Parks Leaf Catch Basin Cover, furnished and installed, and shall include the cost for all labor, material, equipment, and incidental expenses necessary to complete the work, including frame, locking bolts, painting, and keys, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

END OF SECTION

**SECTION PK-685 – DUCTILE IRON SEWER PIPE – 12” DIA.**

**PK-685.1. WORK:** Under this item, the Contractor shall furnish and lay **DUCTILE IRON SEWER PIPE** of the inside diameter sizes called for and shown on the plans or as directed by the Engineer.

**PK-685.2. MATERIALS:** Ductile Iron Sewer Pipe shall consist of bell and spigot type Ductile Iron Pipe sections with Field Lock Gasket Joints, smaller or equal to that manufactured by the U.S. Pipe & Foundry Co. of Birmingham, Alabama and shall conform to the American National Standards Institute C151 and American Water Works Association A21.51, Thickness Class 56. Pipe shall be laid true to line and grade when bells upstream.

**PK-685.3. LAYING:** If the foundation is good, firm earth the earth shall be pared or molded to give a full support to the lower third of each pipe. If the foundation is unstable, or other conditions prevent a proper bearing for the pipe, a bedding of broken stone shall be installed as shown on the details located in Appendix A of the contract drawings “Standard Detail Sheet ‘Drainage Details-No. 2”. If the excavation has been made deeper than necessary, a bedding of broken stone shall be installed at the Contractor’s expense.

When the pipe is to be installed under a roadway a concrete cradle shall be laid to provide a full, firm and even bearing as directed by the Engineer.

Trenches shall be promptly backfilled after the installation of pipe or completion of structures but no backfilling shall be done until the work has been inspected and approved by the Engineer.

Trenches shall be backfilled with clean fill, hand placed and tamped with six (6) inch layers to completely fill all spaces adjacent to the pipe.

**PK-685.4. CONNECTIONS:** The Contractor shall do all the work necessary to join the Ductile Iron Sewer Pipe to the existing sewer as shown on the plans. The cost for doing this shall be included in the unit price bid for this item.

**PK-685.5. MEASUREMENT AND PAYMENT:** The quantity of **DUCTILE IRON SEWER PIPE** to be paid for under this item shall be the number of **LINEAR FEET** (laying length) of each size pipe, including fittings, furnished, placed and measured in its final position, in accordance with the plans and specifications and the directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length of Ductile Iron Sewer Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary to complete the work, including delivering, handling and laying of pipe, connection and fittings, backfilling with clean fill, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation, Concrete and Broken Stone shall be paid separate for under their respective items.

**END OF SECTION**

**SECTION PK-687 – DUCTILE IRON SEWER PIPE – 8” DIA.**

**PK-687.1.     WORK:** Under this item, the Contractor shall furnish and lay **DUCTILE IRON SEWER PIPE** of the inside diameter sizes called for and shown on the plans or as directed by the Engineer.

**PK-687.2.     MATERIALS:** Ductile Iron Sewer Pipe shall consist of bell and spigot type Ductile Iron Pipe sections with Field Lock Gasket Joints, smaller or equal to that manufactured by the U.S. Pipe & Foundry Co. of Birmingham, Alabama and shall conform to the American National Standards Institute C151 and American Water Works Association A21.51, Thickness Class 56. Pipe shall be laid true to line and grade when bells upstream.

**PK-687.3.     LAYING:** If the foundation is good, firm earth the earth shall be pared or molded to give a full support to the lower third of each pipe. If the foundation is unstable, or other conditions prevent a proper bearing for the pipe, a bedding of broken stone shall be installed as shown on the details located in Appendix A of the contract drawings “Standard Detail Sheet ‘Drainage Details-No. 2”. If the excavation has been made deeper than necessary, a bedding of broken stone shall be installed at the Contractor’s expense.

When the pipe is to be installed under a roadway a concrete cradle shall be laid to provide a full, firm and even bearing as directed by the Engineer.

Trenches shall be promptly backfilled after the installation of pipe or completion of structures but no backfilling shall be done until the work has been inspected and approved by the Engineer.

Trenches shall be backfilled with clean fill, hand placed and tamped with six (6) inch layers to completely fill all spaces adjacent to the pipe.

**PK-687.4.     CONNECTIONS:** The Contractor shall do all the work necessary to join the Ductile Iron Sewer Pipe to the existing sewer as shown on the plans. The cost for doing this shall be included in the unit price bid for this item.

**PK-687.5.     MEASUREMENT AND PAYMENT:** The quantity of **DUCTILE IRON SEWER PIPE** to be paid for under this item shall be the number of **LINEAR FEET** (laying length) of each size pipe, including fittings, furnished, placed and measured in its final position, in accordance with the plans and specifications and the directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length of Ductile Iron Sewer Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary to complete the work, including delivering, handling and laying of pipe, connection and fittings, backfilling with clean fill, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation, Concrete and Broken Stone shall be paid separate for under their respective items.

## SECTION PK-900 – HYDRODYNAMIC SEPARATOR

**PK-900.1. WORK:** Under this item, the Contractor shall provide and install a **HYDRODYNAMIC SEPARATOR** of the size called for on the plans, where indicated on the plans, or as ordered by the Engineer, in accordance with the plans, specifications, and directions of the Engineer.

**PK-900.2. MATERIALS:**

**HYDRODYNAMIC SEPARATOR:** The **HYDRODYNAMIC SEPARATOR** shall be one of the following:

1. 6-foot diameter, offline Downstream Defender as manufactured by Hydro International
2. 6-foot diameter, offline Aqua-Swirl Stormwater Treatment System Model No. AS-6) as manufactured by AquaShield, Inc.
3. 6-foot diameter, offline Continuous Deflective Separator (CDS) Stormwater Treatment Device (Model No. CDS-6) as manufactured by Contech Engineered Solutions, LLC
4. Or approved equal.

**MANHOLE COVER:** Manhole Covers shall be of gray iron per ASTM A48, latest revision, Class 30 or better. All covers shall be suitable for highway traffic, meeting the requirements for heavy duty H-20 loading, per AASHTO M306-10.

**VANDAL RESISTANT BOLTS:** Each cover shall be furnished with two (2) Stainless Steel Penta-Head bolts as supplied by Campbell Foundry Co., Harrison, NJ, or approved equal. Typical plastic end caps are to be supplied with hardware and installed on Penta-Head bolts.

Each cover shall be furnished with two (2) Stainless Steel Penta-Head bolts as supplied by Campbell Foundry Co., Harrison, NJ, or approved equal. Typical plastic end caps are to be supplied with hardware and installed on Penta-Head bolts.

Each cover shall be furnished with two (2) Stainless Steel Penta-Head bolts as supplied by Campbell Foundry Co., Harrison, NJ, or approved equal. Typical plastic end caps are to be supplied with hardware and installed on Penta-Head bolts. Each cover shall be furnished with two (2) Stainless Steel Penta-Head bolts as supplied by Campbell Foundry Co., Harrison, NJ, or approved equal. Typical plastic end caps are to be supplied with hardware and installed on Penta-Head bolts.

**PK-900.3. INSTALLATION:** The installation of the **HYDRODYNAMIC SEPARATOR** shall conform to the Excavation, Setting Frames, and Incidental Work requirements specified in the Catch Basins, Drop Inlets and Manholes standard specification. Installation shall also conform to the manufacturer's specifications, including installation of the structure on a 12-inch thick broken stone subbase.

**PK-900.4. SUBMITTALS:** All submittals shall be in accordance with the S-Pages. The Contractor shall submit the following for review and approval prior to manufacture.

**SHOP DRAWINGS:** The Contractor shall submit shop drawings showing all invert elevations for approval prior to ordering the structure.

**FOUNDRY CERTIFICATES:** The Contractor shall submit foundry certificates on certifying the

material requirements above.

**OPERATIONS AND MAINTENANCE MANUAL:**

The Contractor shall submit the Operations and Maintenance Manual for the Hydrodynamic Separator proposed for use. The manual should include in all information necessary to run, inspect, and maintain the system including recommended procedures and schedules for maintenance frequency.

**PK-900.5      MEASUREMENT AND PAYMENT:**

The quantity of **HYDRODYNAMIC SEPARATOR** to be paid for under this item shall be the number of **EACH** structure furnished and installed in accordance with the plans, specifications, manufacturer's recommendations and directions of the Engineer.

The price bid shall be a unit price for **EACH** and shall include the cost of all labor, materials and equipment, including manhole covers, in accordance with the plans, specifications and to the satisfaction of the Engineer.

Excavation and temporary sheeting shall be paid for under their respective contract items.

**FLOODWALL - PAGES**

## **SPECIAL FLOODWALL SPECIFICATIONS**

---

### **CONTRACT SANDRESM1**

The specifications in the FLOODWALL-Pages cover the procurement, fabrication, and construction of the waterfront esplanade, cut-off walls, embayments, Williamsburg Bridge security bollards, floodwalls, floodgate foundations, manhole flood proofing, construction methods and associated works.

The FLOODWALL-Pages supplement the specifications shown on the Specifications and Standards of New York City sheet at the beginning of this Volume 3, which apply to the work except as modified in these Contract Documents.

## SECTION PK-ESCR 715 – CHAIN LINK FENCE SLIDING GATE

**WORK:** Under these Items, the Contractor shall furnish and erect a motorized operated chain link fence sliding gates of the heights and sizes shown on the contract plans and in accordance with the specifications and directions of the Engineer.

### **STANDARDS:**

- A. Underwriters Laboratory Gate Operator Requirements (UL 325).
  - 1. Automated/operated vehicular gates are not to be used for pedestrian traffic. Separate pedestrian gates must always be provided if pedestrian traffic is expected.
- B. ASTM F 2200 – Standard Specification for Automated Vehicular Gate Construction.
- C. ASTM F 1184 – Standard Specification for Industrial and Commercial Horizontal Slide Gates, Type II, Class 2.
- D. American Welding Society AWS D1.2 Structural Welding Code.

**MATERIAL:** In general the sliding gate frame and fabric shall match the adjacent chain link fence size, type and material. Unless otherwise noted below, all related materials shall conform to Subsection 6.34.2, Standard Highway Specifications, NYCDOT.

Overhead Track Assembly: Manufacturer's standard track, with overhead framework supports, bracing, and accessories, engineered to support size, weight, width, operation, and design of gate and roller assemblies.

Diagonal Bracing. Diagonal "X" bracing of 3/16" or 1/4" diameter stainless or galvanized steel cable shall be installed throughout the entire gate frame. Optional pipe / tube bracing may also be used in lieu of cables.

Bottom Track: The bottom track shall be a minimum of 2" x 2" x 1.12#/ foot (6063-T6) aluminum extrusions. For openings greater than 25', the bottom track shall be a minimum of 2" x 5" x 3.12# / foot.

All welds on the gate frame shall conform to Welding Procedure Specification and Procedure Qualification Record to insure conformance to the AWS D1.2 Structural Welding Code. All individual welders shall be certified to AWS D1.2 welding code.

Steel Barbed Wire: ASTMA 121, two-strand barbed wire, 12.5 ga., 4 point round barbs spaced not more than 4" o.c. Zinc coated, type Z, class 3. Clips and or tie wire fasteners shall be stainless steel.

Gate Mounting Structure:

1. The gate frame shall be supported from the track by two (2) swivel type, self-aligning, 4-wheeled, sealed lubricant, ball-bearing truck assemblies.
2. The bottom of each support post shall have a bracket equipped with a pair of 3" (76mm) UHMW guide wheels. Wheel cover protectors shall be included with bottom guides to comply with UL325.
3. Gap protectors shall be provided and installed, compliant with ASTM F 2200-05.

Posts: A single set of support posts shall be a minimum of 4" O.D. round SS40 or 4" x 4" x 3/16" wall square steel tubing, grade 500 or as designed by the manufacture based on the gate size.

Gate posts shall be galvanized and supported in concrete footings as specified by the manufacturer based on the gates size.

#### Electric Gate Operator

Operator shall have a half or 1 HP continuous-duty PSC motor, 115 or 230 VAC single phase compatible based on the requirements of the gate weight and length. Operators shall also have the following features:

- Durable, weather resistant, black UV Stabilized polyethylene cover
- Reliable chain drive; 1/2 HP #41 chain, 1 HP #40 chain
- Heavy-duty, zinc plated, steel chassis
- Pad mountable
- Exterior reset button
- UL325/UL991 compliant APeX controller
- Easy-to-operate emergency manual disconnect handle
- Fully integrated radio receiver and system shall be compatible with current users transmitters (clickers).

Electrical features shall include the following:

- Integral entrapment sensing system with digital set point for quick accurate adjustment and enhanced safety
- Continuous-tone entrapment alarm with reset button
- Integrated programmable warning beeper during gate movement
- LED diagnostic display for ease of setup and troubleshooting
- Selectable pre-start alarm with provision for ADA compliant visual pre-start and run alarm
- Regulated 24 Volt DC power available for access control accessories
- Integrated maximum run and auto close timer (0-9 minutes)
- Built-in networked dual gate capability using 3-wire shielded cable

Electrical: Conduit, wiring, junction boxes, weather tight GFI outlet, etc. shall be sized to meet the requirements of the gate operator system and conform to NYCDOT Street Lighting specifications.

#### **INSTALLATION:**

##### Gate Installation:

Final grades and installation conditions shall be examined. Coordinate installation start and end dates with the Engineer. Installation shall not begin until all unsatisfactory conditions are corrected.

Equipment in this section shall be installed in strict accordance with the manufacturer's printed instructions unless otherwise shown on the contract drawings.

The gate and installation shall conform to ASTM F 1184 standards for aluminum cantilever slide gates, Type II, Class 2. If the gate system is to be automated, the gate and installation shall also comply with ASTM F 2200 and UL 325.

#### Gate Operator Installation:

Contractor shall extend the power source from the current gate location to the proposed location as shown on the contract plans or as directed by the Engineer. New electrical system shall conform to the latest electrical code requirements and gate operator system requirements.

Construct concrete pad as shown on the contract plan and per manufacturer's instruction. Coordinate installation of electric conduit within the concrete pad.

Set operator on pad per manufacturer's specifications and to provide proper chain operation.

Signage: Install signage provided by the manufacturer. Install signage as required by the Engineer. Signage may require being removed from existing gate location to the new location. Contractor shall provide new hardware as required to mount signs as directed by the Engineer.

Install barbed wire on extended post above the gate frame as detailed on the contract drawings. Assure that the installation does not interfere with the operation of the gate.

#### **SYSTEM VALIDATION:**

- A. The complete system shall be adjusted to assure it is performing properly to the satisfaction of the Engineer.
- B. The contractor shall test that the existing user transmitters will communicate with the new gate operator system.
- C. The system shall be operated for a sufficient period of time (minimum 30 days or as approved by the Engineer) to determine that the system is in proper working order. Contractor shall lubricate, adjust and or replace fence, track and system components as needed.
- D. Operated gate systems - test and explain safety features:
  1. Each system feature and device is a separate component of the gate system.
  2. Read and follow all manufacturer's instructions for each component.
  3. Ensure that all instructions for mechanical components, safety devices and the gate operator are available for everyone who will be using the gate system. Provide 2 copies of manufacturer's instruction / manuals including parts list.
  4. Ensure the parking lot owner is clear with regard to the safety points concerning the basic operational guidelines of the safety features of the gate operator system. These safety points are listed in the gate operator manual and must be read prior to system use.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Certification:** The Contractor shall submit, at his own expense, a certification from the supplier for the following:

1. All castings are made from malleable iron.

2. All hot-dipped galvanized items have met the ASTM serial designations as indicated in this specification.
3. Gate manufacturer shall certify gate is manufactured in compliance with ASTM F 2200, Standard Specification for Automated Vehicular Gate Construction.
4. Radio control has code compatible universal receiver that is compatible with existing user transmitters.
5. Manufacturer's warranty for sliding gate and operator controller.

Shop Drawings: Before the work in the shop is started, the Contractor shall submit shop drawings for approval. Include complete details of fence and gate construction, fence height, post spacing, gate locking device, dimensions and unit weights of framework and concrete footing detail. Provide details and wiring diagram for power, signal, ground and control wiring.

Product data: For each type of product include construction details, material descriptions, dimensions of individual components and profiles, and finishes for the following:

1. Fence and gate posts, rails, fittings and hardware.
2. Chain-link fabric, reinforcements, and attachments.
3. Barbed wire
4. Gate operators, including operating instructions and motor characteristics.

**MEASUREMENT AND PAYMENT:** The quantity of chain link fence sliding gate shall be the number of gates actually installed by the contractor at the locations shown on the contract plans to the satisfaction of the Engineer.

The unit price bid for each chain link fence sliding gate shall cover the cost of all labor, materials, plant, equipment, insurance and necessary incidentals required to furnish, install and test new posts, chain link fence gate, sliding gate system, operator control system, and electrical system, complete in place, including excavation, backfilling, signage, barbed wire and concrete footings and pad where necessary; furnish samples for testing, as may be required and completing the work; all in accordance with the contract plans, specifications and the direction of the Engineer.

The cost to restore paved areas disturbed by the new gate installation and removal of existing gates shall be paid for separately under their respective contract Items. Removal of the existing sliding gates and associated operator systems and components shall be paid for under item 6.34 X per linear feet of existing opening.

**END OF SECTION**

## SECTION ESCR-2 – JET GROUTING

### 2.01 INTENT.

This section describes the performance of the jet grouting that will be used in the flood protection system as a seepage barrier, gate foundation, floodwall, and ground improvement. The Contractor shall be responsible for selecting jet grouting parameters, equipment, and construction methods to meet the specified requirements of the Engineer. Design, consisting of area replacement ratio and depth of the elements or structures created by jet grouting is to be by the Engineer. Detailing to construct the required elements or structures is by the Contractor.

### 2.02 DESCRIPTION.

Jet grouting consists of creating soil-cement in situ by jet grouting to increase the compressive strength of the subsurface soils over the depths and limits shown on the Contract Drawings.

The work shall consist of all labor, equipment, materials, testing, and supplies necessary to design and install the jet grouting to meet the specified performance requirements.

The Contractor shall use the jet grouting method to install soil-cement in areas indicated on the Contract Drawings to form complete and continuous soil-cement elements.

### 2.03 MATERIALS.

The grout slurry may consist of a homogeneous mixture of any of the following materials:

- (A) Cement, Portland, Type II, ASTM C-150 or AASHTO M85
- (B) Ground granulated blast furnace slag, ASTM C989 (Standard Specification for Ground Granulated Blast-Furnace Slag for Use in Concrete and Mortars)
- (C) Fly ash Class C or F, ASTM C618 or AASHTO M295.  
Fly ash class to be utilized depends upon the required end product. Calcium content and loss-on-ignition properties to be considered for the fly ash that is being proposed.
- (D) Potable Water or approved other source shall be free of deleterious materials that may adversely affect the grout. If water is from sources other than recognized potable water suppliers, the water shall be analyzed, e.g., in accordance with AASHTO T26, to ensure that it will have no adverse effect on the setting, hardening or durability of the mix and, where applicable, will not promote corrosion of the reinforcement.
- (E) Bentonite, if required, powdered bentonite per API Standard 13A.
- (F) The ratios of the material components, by weight, shall be proposed by the Contractor, confirmed during the preconstruction test program, and reviewed by the Engineer. Once accepted, grout slurry composition shall not be changed unless requested in writing by the Contractor and accepted in writing by the Engineer.

### 2.04 EQUIPMENT.

- (A) All equipment used for drilling boreholes; lowering, raising and rotating jet monitors; mixing grout; supplying pressurized grout and air-water to jet monitors; and jet monitors shall have proven performance records for use in jet grouting work, as demonstrated by the information to be submitted.

(B) Drilling Equipment

Use drilling equipment of a type and capacity suitable for drilling required hole diameters and depths, and lowering, raising, and rotating jet grout monitors to the depths and at the rates required to perform the work as shown on the Contract Drawings and as specified herein. The drill rig shall be equipped with automated controls to regulate and maintain consistent rod lift rate and rod RPM, and shall have pressure gauges and flow meters for all fluids injected.

The drilling equipment shall have specialty drilling bits capable of advancing through the site subsurface conditions including, but not limited to, concrete, brick, stones, timber piles, seawalls, cobbles, and boulders.

(C) Grout Mixing and Injection Equipment

Use grout mixers and holding tanks, water tanks, air compressors, and pumps of sufficient capacity to ensure adequate supply of grout, air, and water at required pressure to the jet grouting monitors during a full work shift to produce grout elements of the quality and dimensions necessary.

Grout mixers must be high shear type and equipped with load cells to accurately weigh and proportion each component of the grout mix. Paddle type mixers must be utilized.

For high grout volume demand, batch mixing may not produce sufficient supply and alternate mixing methods must be considered with evidence that quality is not compromised.

(D) Jet-Grouting Pump

Shall be capable, with the nozzles proposed, of providing the required pressure and flow rate adequate for the execution of the work.

(E) Compressor (for Double and Triple Fluid Jet-grouting)

Shall be capable of producing the pressure and flow rate values proposed by the Contractor depending on the parameters chosen.

Double fluid jet grouting refers to the jet grouting technique where one fluid, typically neat cement grout, is injected at high velocity through horizontal radial nozzle(s) and is assisted by a second fluid, typically air, delivered through a coaxial nozzle(s), to directly erode and mix with the in-situ soil.

Triple fluid jet grouting refers to the jet grouting technique where one fluid, typically water, is injected at high velocity through horizontal radial nozzle(s) and is assisted by a second fluid, typically air delivered through a coaxial nozzle(s), to erode the in-situ soil, while a separate nozzle placed lower on the monitor delivers a third fluid, typically neat cement grout, at lower velocity to simultaneously fill the soil zone eroded by the cutting fluids (air and water).

(G) Filling Grout Pump (for Triple Jet-Grouting)

Shall be capable of producing the pressure and flow rate required, and proposed by the Contractor depending on the parameter chosen.

(H) Jet Grout Tools

Contractor shall use jet grouting monitors with appropriate nozzles with the capacity suitable for producing jet grout elements in the soil types identified during

Subsurface Explorations performed at the site, and of the size and depth shown on the Contract Drawings and as specified herein. The drill hole diameter shall be sufficiently large to be a clear path for continuous spoil return during all jetting operations.

(I) Equipment Instrumentation

Contractor shall provide instrumentation that allows continuous monitoring and automatic recording of data throughout the jet grouting operations. As a minimum, the following shall be provided:

- Pressure gauges/devices at the drilling rig to automatically record pressures of cement grout, water, and air during the grouting process.
- Flow meter(s) to monitor and record the rate and total volume of grouting fluids through the grouting monitor at every element.
- Devices that automatically monitor and record the rate of monitor rotation and withdrawal.

**2.05 CONTRACTOR QUALIFICATIONS**

- (A) The entity performing the jet grouting shall be experienced in jet grouting operations comparable to that described herein and have at least 5 years of experience in jet grouting methods. Jet grouting experience shall include at least 5 projects of similar magnitude and complexity to that required for the program specified herein.
- (B) The jet grouting field superintendents shall each have at least 5 years of experience in jet grouting techniques similar to that required for the Work; including at least 2 projects, one of which within the past 5 years of similar magnitude and complexity to that required for the Work.

**2.06 SUBMITTALS**

- (A) Contractor shall submit qualifications, and information regarding similar projects the Contractor has constructed, where jet grouting was utilized.
- (B) Jet Grouting Equipment  
Contractor shall provide catalog cuts, details of grout mixers, pumps, drill rigs, and a plan view of the jet grout equipment arrangement proposed for use on this project, noting any equipment that has been modified or is of unique construction.  
Examples of field data collection forms, including a sample copy of daily field report.
- (C) Grout Mix Design  
Mix design for the project indicating sources and types of grout materials, including (if available) field test data from previous projects.  
Method for verifying grout mix proportions.
- (D) Field Demonstration Test Program  
Details of proposed field demonstration test program for jet grouting. This shall include location of test columns, layout of test pattern, jet grouting parameters to be used and variables to be tested during test program, and details of proposed quality control/quality assurance testing to meet acceptance criteria specified.

Following performance of the field demonstration test program and prior to beginning production jet grouting operations, submit a summary of the test program including details regarding as-built layout of test area, drilling procedures, grout mixture, jet grouting parameters, quality control/quality assurance records and test results, and proposed jet grouting parameters for use in production grouting based on test program.

(E) Jet Grouting Procedure

General Work Procedures Plan outlining the spacing, location, depth and general sequence to achieve the specified criteria detailed in this specification. Jet Grout element locations shall be dimensionally referenced to the contract drawings and shown on layout plans of suitable scale to effectively indicate the details of the layout. If pre-drilling of jet grout holes is to be utilized, describe the methods and type of equipment to be used.

Contractor to provide a jet grout spoil return management plan outlining waste containment methods during jet grouting and treatment and removal plans for jet grout spoil return. Include estimated width of annulus for spoil return and corrective actions to be taken if spoil return is not free-flowing, interrupted or episodic.

Jet grout site specific safety plan or job hazard analysis.

(F) Quality assurance, quality control and verification procedures to be used for the field test and production work.

Details of the procedures to obtain soil-cement samples; and catalog cuts or shop fabrication drawings of the soil-cement sampling device and curing boxes.

Proposed details and formats of all required tabular and graphical data presentations that will be submitted to the Engineer during the course of the Work. This shall include submittal of a copy of the reports used for data monitoring and recording.

Details for hydraulic conductivity testing and/or water-tightness testing if specified.

Details of column diameter and overlap verification.

(G) Contingency Plan shall be established by the Contractor to remediate any condition where it is found that jet grout columns were not constructed to the required or planned dimensions, including diameter or length.

(H) Daily Reports

Within one business day after the end of a work shift, the daily reports shall be submitted to the Engineer.

## 2.07

### TEST PROGRAM.

(A) Prior to production work, a test program shall be conducted by the Contractor in accordance with the accepted work plan, at an on-site location agreed upon with the Engineer. The test program shall resemble the production jet grouting that will be constructed for the project.

The test program shall be used to optimize/verify the various parameters including type of jet-grouting (single, double or triple), necessity of pre-jetting with water, grout mix composition, fluid(s) flows and pressures, rotational speed, lift rate, spoil

return, grout, and number and size of nozzles; and confirm that resultant in situ soil-cement properties and dimensions meet required design criteria.

- (B) The test program will be observed, reviewed and verified for contract conformance by the Engineer. The test program shall be installed within the project site in areas near the planned production work at a location agreed upon between the Engineer and the Contractor and in representative soils and depths anticipated to be found during production work.
- (C) Each test section shall consist of a plan of elements suitable to demonstrate feasibility and installed to the same elevations specified for the production jet grouting work.
- (D) The test elements shall be exposed by excavation for the upper 8 ft and measured for geometric properties. Proper shoring shall be installed to ensure the safe sampling and testing of the jet grout column at no additional cost to the City.

Core samples or other testing method shall be used to demonstrate column size/geometry for the full length. Coring at the centroid of a group of three (3) elements shall be carried out, as a minimum.

Where coring is used to verify diameter for the full length, verticality shall be measured for each test column and the core holes to verify the location of the elements at the final depth.

Three acceptable/representative specimens from each column shall be sent to an independent Laboratory for the tests required to satisfy the criteria specified in the Acceptance Criteria section. The costs for the coring, sampling, and testing and all associated work must be included in the Contractor's unit prices for jet grouting.

- (E) Perform hydraulic conductivity testing when jet grouting is used as a seepage barrier. Hydraulic conductivity testing procedures shall be in accordance with ASTM D2434, or as approved by the Engineer.
- (F) The results of the test program and the recommended jet grouting parameters for the production work shall be submitted in a report to the Engineer for approval.

The Contractor, at their expense, may be required to repeat the construction of a test section if the results of the test program do not meet the project requirements. The test program shall confirm that the resultant soil-cement properties met the required design criteria prior to the Contractor proceeding with production work.

- (G) Jet grout columns for production and the testing program shall be installed using the same make and model of mixing machinery, cement grout mixing and pumping equipment, and the same materials and procedures implemented by the contractor. The production jet grout columns must follow the materials and procedures accepted in the test program.

## 2.08

### INSTALLATION OF JET GROUT

- (A) Contractor shall conduct all survey layout and utility clearance for the jet grouting operations and coordinate with all other Work on the site. Jet grouting shall be installed in a manner so as to not create obstructions or hindrances to subsequent aspects of the Work.
- (B) Contractor shall take all precautions necessary to prevent movements and damage to any existing structure, roadways and utilities, and also prevent

settlement or heaving of the ground that could occur due to jet grouting operations in the vicinity of existing structures and utilities.

- (C) Jet grouting around existing DEP sewers that are to remain in-service shall only commence after the sewer has been inspected using a CCTV system to verify and record the existing conditions of the sewer at no additional cost to the City. If the condition of the sewer is such that the jet grouting operations might cause further damage to the sewer and/or result in the leakage of jet grout into the sewer, the interior walls of the sewer shall first be lined in accordance with NYCDEP Standard Sewer and Water Main Specifications Section 50.71 Reconstruction of Existing Sewers Using DEP Approved Cured-in-Place-Pipe (CIPP) Lining Method.
- (D) Jet grout columns shall be installed using the same make and model of; mixing machinery, cement grout mixing and pumping equipment, and the same materials and procedures implemented by the Contractor and accepted in the test program.
- (E) Jet grout columns shall be installed in accordance with the patterns developed by the Contractor and accepted by the Engineer, to achieve the compressive strengths, unit weights, and required plan area coverages over the depths and limits shown on the Contract Drawings. Where the jet grouting layout consists of overlapping jet grout columns, center-to-center spacing of jet grout elements shall at any elevation not be greater than 75% of the jet grout column diameter and shall include allowance for tolerable vertical alignment deviation. The required strengths and unit weights are as follows:

Soil Type	Soilcrete Unit Weight (min) PCF	Soilcrete Unconfined Compressive Strength (min) PSI
Sand and gravel	120	750
Silty sand and silt	120	750
Clay	115	400
Organic Silt	110	250

- (F) After final jet grouting, the Contractor shall obtain samples of in-situ jet grout in accordance with the locations and frequencies specified in the Quality Assurance-Quality Control Program.
- (G) Any jet grouted element, which exhibits partial or total instability, shall be remediated at no additional cost to the City. Engineer will provide direction regarding jet grout columns that according to the records were not constructed to replicate test columns, and agreed upon production jet grouting procedure; additional measures shall be required for these jet grout columns.
- (H) Once jet grouting is started at any location, the jet grouting operation shall continue until the soil-cement element is completed. If jet-grouting is interrupted during the execution of a column, the re-start of the jetting shall be undertaken at least 1 foot below the stopping point.
- (I) Jet grout columns shall not be installed within 2 ft as measured between outside edges of soil-cement elements that are less than 48 hours old. The 48 hour delay may be shortened if the Contractor demonstrates to the satisfaction of the Engineer that the installation of any adjacent placements would not have a deleterious effect on any previously installed soil-cement elements or the ground.

- (J) The following horizontal and vertical alignment tolerances shall apply for the jet grouting:
- The maximum horizontal deviation of the as-installed center of any jet grout column at the ground surface or mudline installation level shall not exceed 3 in. from the layout center coordinate, shown on the accepted Contractor's submittal.
  - The vertical alignment of the jet grout column (ie. vertical columns) shall not deviate in any direction more than 2% from vertical.
  - At the direction of the Engineer, any jet grout column which exceeds the allowable horizontal or vertical tolerances shall be re-mixed within two days of initial placement, or supplemented with one or more adjacent overlapping columns, at no additional cost to the City.
- (K) Contractor shall follow the approved Contingency Plan for the remediation of any condition where it is found that jet grout columns were not constructed to the required or planned dimensions, including diameter or length. This could occur due to the clogging of the equipment by the generated spoils. For such conditions, it might be necessary to install additional jet grout columns, or regrout the locations and depths affected. All remediation work performed by the Contractor shall be at not additional cost to the City.

## **2.09 OBSTRUCTIONS**

- (A) Subsurface strata may contain rubble, concrete, reinforced concrete slabs, timber piles, steel, bricks, stones, seawalls, abandoned foundations, utilities and other materials that can obstruct jet grouting operations. Where unknown obstructions are encountered during the jet grouting, the Contractor shall remove the obstruction or install additional jet grout columns to encapsulate the obstruction, at the direction of the Engineer.
- (B) Each situation shall be resolved on a case-by-case basis. Payment shall be based on an agreed upon unit rate for handling obstructions. If such conditions are encountered, the Contractor shall notify the Engineer in writing, and provide all pertinent information relating to the nature, depth, plan location coordinates, expected extent of the obstruction, and proposed procedures to overcome the obstruction.
- (C) If drilling for jet grouting cannot proceed due to an obstruction, the Contractor may elect to remove the object or submit an alternate jet grouting layout pattern to avoid or encapsulate the object, subject to the acceptance of the Engineer. Alternately, the Contractor may drill through the obstruction. Removal of the obstruction, or drilling through the obstruction shall be paid at the obstruction rate, while offsetting the column location will be paid at the standard rate for jet grouting in subsurface soils.

## **2.10 CONTAINMENT, COLLECTION, AND DISPOSAL OF SPOIL RETURN.**

- (A) At all times during jet grouting operations, the site shall be maintained cleared of all debris and water. Spoil return shall be piped or channeled to tanks or other collections structures. The Contractor shall regularly dispose of all waste materials in accordance with the requirements of the DEP and all other agencies having jurisdiction.

- (B) Contractor shall be aware that subsurface contamination is expected in Reaches H through M, and shall implement all necessary measures to prevent the spread of the contaminated material. The extent and content of the contaminated materials can be found in the Contract reference documents, but the Contractor shall perform their own testing for verification and disposal purposes.
- (C) All jet grout collection, containment, and disposal methods shall be shown on the shop drawings in the Contractor's submittals to the Engineer prior to the start of jet grout operations. The Contractor shall be responsible for and incorporate all sedimentation and turbidity control measures required by applicable federal, state, and city regulations.
- (D) The Contractor shall take all necessary precautions and implement measures to prevent any spoil return, other spoil material or stockpiles materials from entering the storm drain structures, drainage courses, and other utility lines or from leaving the site via surface runoff. The Contractor shall prevent the migration of spoil return, spoil material, or stockpiled materials into any surface water body, beyond the immediate limits of jet grouting operations.

## 2.11 **QUALITY CONTROL / QUALITY ASSURANCE**

- (A) All jet grouting shall be performed in the presence of the City's QA Representative. City's QA representative shall be notified prior to initiating jet grouting. Monitoring and logging of jet grouting operations for both test areas and production work shall be performed by the jet grouting Contractor.
- (B) The Contractor's equipment shall be configured to record and continuously show all fluid flows and pressures, rotational speed, depth and rod lift rates. The rod lift rate and rod RPM shall be set by the driller then automatically controlled by the drill rig and automatically recorded on the jet grout installation log during the entire jet grouting process. The City's QA representative shall be provided the means to monitor this information in real time on request.
- (C) All the data monitored and recorded shall be made available within one working day to the Engineer in a format previously agreed on prior to the work. The Contractor shall supply the Engineer with the software used for this task. The software shall be capable of processing the recorded data and presenting the data graphically in a satisfactory manner.
- (D) Grout mix proportions shall be measured and documented by the Contractor per the submittal requirements. Appropriate records shall be kept by the Contractor and submitted to the Engineer to verify that grout mixture(s) are as accepted. Include daily quantities of materials used in Daily Reports.
- (E) Throughout the jet grouting operations, perform continuous coring to full depth on 5% of production columns to obtain drill cores of the jet grouted soil. The core will be visually evaluated by the Engineer for compliance with specific acceptance criteria defined in this specification. The Contractor shall be notified immediately if the soil-cement samples do not meet the acceptance criteria outlined herein.
- (F) Perform hydraulic conductivity testing of production elements where the jet grouting is used as a seepage barrier at the rate of 5% of the installed columns.
- (G) Perform borehole deviation measurements on a daily basis for a minimum of 5% of the columns. Selection of columns for borehole deviation measurements must be approved by the Engineer.

## 2.12 DAILY REPORTS

- (A) Within one business day of a work shift, submit summary daily reports during production jet grouting that provide the information listed below. A sample of the report form proposed for use by the Contractor shall be submitted to the Engineer for approval prior to the start of work.
- (B) Daily reports shall include the following:
- Equipment and Personnel on site
  - Work initiated and completed
  - Production interruptions
  - Grouting Records
    - Jet grout element number, size and location.
    - Time and date of beginning and completion of each grout element, including interruptions to the jetting process or material supply.
    - Grout mix data, including mix proportions and unit weight density measurements.
    - Injection pressure of all fluids used to construct each grout element.
    - Flow rates of all fluids used to construct each grout element.
    - Rotation rate and lift rate of jet rods for each grout element.
    - Total grout quantity used for each element.
    - Top and bottom elevations of the jet grout element.
    - Whether flow of spoils return was continuous.
  - Total quantities of materials used for that day.
  - Observations of any unusual, or unanticipated conditions including obstructions, stoppages, loss of circulation, etc., impacts on instrumentation or monitoring.
  - Applicable verification testing done.
- (C) Continuous recording of jet grouting parameters shall be provided for each production column to verify consistency with the test program results.

## 2.13 ACCEPTANCE CRITERIA

- (A) Installation records, daily reports, and other project documentation shall demonstrate that the selected parameters from the test program were accurately repeated for the production work.
- (B) Wet Grab Soil-Cement Samples

A minimum of one in-situ sampling round, consisting of 3 sampling depths with 4 samples from each depth, shall be performed at a frequency of once per day, at locations selected by the Engineer. The samples shall be obtained at the same element which shall consist of a non-cured soil-cement sample obtained at three depths selected by the Engineer. The contractor shall obtain up to an additional wet grab sampling test suite at the direction of the Engineer, if required.

Each retrieved soil-cement sample shall be of sufficient volume to produce a minimum of four full cylinders, 6 in. diameter by 12 in. height. Separate and retain all soil-cement retrieved from each depth.

Soil-cement samples shall be protected from freezing and extreme weather conditions which could have deleterious effect, at all times in accordance with AASHTO T 23.

Soil-cement cylinders from each sampling depth, shall be tested to determine 7 day and 28-day unconfined compressive strength in accordance with AASHTO T 208.

If the Contractor cannot obtain all of the required wet grab samples of the soil-cement, in the designated soil-cement element, the Contractor shall obtain a full suite of wet grab samples from the next soil-cement installed by that rig.

- (C) Coring / Uniformity: Recovery minimum 90%; Rock Quality Designation (RQD) minimum 50%

Full-depth core samples retrieved by the contractor shall be used to evaluate uniformity. Coring shall be with PQ-size triple core barrel with side discharge.

Core recovery (expressed as a percentage) is equal to the total length of recovered core divided by the total core run length. Length of recovered core includes lengths of treated and untreated soil.

Percent treatment is calculated as the total length of recovered core minus the sum of the lengths of unmixed soil regions or lumps that extend across the entire diameter of the core divided by the total core run length expressed as a percentage.

Uniformity is acceptable if percent treatment is at least 90% for every 5-ft core run. If the minimum percent treatment cannot be confirmed by coring in coarse sandy or gravelly soil, downhole camera/video can be used to confirm uniformity.

If the Contractor uses core runs shorter than 5 ft (e.g., 3 ft), then the recovery and percent treatment can be calculated by adding equal amounts of core run length on either side of the short core run length to make up a total 5-ft run length for calculation purposes.

- (D) Hydraulic conductivity:  $1 \times 10^{-6}$  cm/sec
- (E) Unconfined Compressive Strength of Jet Grout Soil Cement Mix
- (F) At least 90 percent of all jet grout samples tested shall have a minimum 28-day unconfined compressive strength as specified above.
- (G) Minimum overlap thickness: Where the jet grouting layout consists of overlapping jet grout columns, spacing between jet grouting columns shall be a maximum of  $0.75 \times$  jet grout diameter
- (H) Borehole deviation and horizontal tolerances:
- The center of the elements shall not be more than 3 in. from the indicated plan location.
  - Deviations shall be less than required for adequate column overlap.

Verification will be by obtaining vertical alignment profiles. Contractor must obtain vertical alignment profiles for 5% of the jet grout cement elements, but not less than one element per day. The vertical alignment profiles must be over the length of the soil-cement element and along two perpendicular axes, as directed by the Engineer.

## 2.14 MEASUREMENT.

The quantity of jet grouting to be measured for payment shall be by the cubic yard, measured to the nearest cubic yard per column, within only the "neat" plan area of the proposed jet grout shown

on the Contract Drawings or approved by the Engineer. The volume shall be determined by multiplying the “neat” area within this zone times the actual depth of the jet grout. Jet grouting installed to overcome unknown obstructions shall be included in the total measured quantity of jet grouting, as accepted by the Engineer. Additional quantities of jet grouting installed by the Contractor during remixing to achieve the performance requirements, or that are outside the limits of the jet grout shown on the Contract Drawings without the acceptance of the Engineer will not be measured for payment.

Payment for the jet grout test program will be on a lump sum basis. The test program will consist of initially installing demonstration jet grout columns. The test elements will be required to be exposed to a depth of 8 ft, and subsequently backfilled in a controlled manner to finished grade. Coring at the centroid of each three adjacent jet grout columns shall be required as part of the testing program, and laboratory testing is expected to include as a minimum, hydraulic conductivity and unconfined compressive strength. Results of the field demonstration test program are to be submitted as a report for the Engineer’s review.

## **2.15 PRICE TO COVER.**

The contract unit price for jet grouting shall cover the cost of all labor, materials, plant, equipment, insurance, samples, testing, and incidentals required to furnish and install the jet grout within the plan area coverages over the depths and limits shown on the Contract Drawings, in full compliance with the requirements of the specifications. Jet grouting that does not meet the specific performance requirements shall be satisfactorily repaired or replaced by the Contractor at no cost to the City.

The lump sum price for the test program shall cover the cost of all labor, materials, plant, equipment, insurance, samples, testing, reporting, and incidentals required to perform the jet grout test program in full compliance with the requirements of the specifications.

*Payment will be made under:*

**END OF SECTION**

**SECTION ESCR-2.27 – RIP RAP****2.27.1 INTENT.**

This section describes rip rap stone for use in the revetment in the embayments.

**2.27.2 MATERIALS.****(A) Rip rap Material Properties****1. Stone Sources**

- a) The new stone with gradation given in Table 1 and Table 2 shall be furnished from a source designated by the Contractor, subject to the conditions herein stated (see Figure 1 for the armor stone gradation curves). The Contractor will conduct a quarry investigation and evaluate the quality test data provided by the quarry to determine whether acceptable stone can be produced from the proposed source. Satisfactory service records on other work may be acceptable. In order for the stone to be acceptable on the basis of service records, stone of a similar size must have been placed in a similar thickness and exposed to weathering under similar conditions as are anticipated for this contract and must have satisfactorily withstood such weathering for a minimum of 20 years. If no such records are available, the Contractor will conduct tests to assure the acceptability of the stone. In addition to an acceptable service record, the Engineer has the option to elect to have representative samples taken and tested.
- b) Designate in writing only one source from which the Contractor proposes to furnish stone and notify the Engineer at least 60 workdays before the stone leaves the quarry. It is the Contractor's responsibility to determine that the stone source selected is capable of providing the quality, quantities and gradation needed and at the rate needed to maintain the scheduled progress of the work. Samples for acceptance testing shall be provided in accordance with Subparagraph "Stone Source Acceptance" below. If a source for the stone so designated by the Contractor is not accepted for use, the Contractor shall propose another source with no additional compensation.
- c) Both prior to and after materials are delivered to the job site, visual inspections and measurements of the stone materials may be performed.
- d) If it is found that the stone quality, gradation or weights of stone being furnished are not as specified or are questionable, re-sampling and re-testing by the Contractor shall be required. Sampling of the delivered stone for testing shall be performed at the Contractor's expense when test results indicate that the materials do not meet specified requirements.
- e) Any material rejected shall be removed or disposed of as specified and at the Contractor's expense.

**2. Stone Source Acceptance**

- a) Rip rap shall consist of stones of acceptable size and quality, placed in the embayment for shoreline protection. Size of the stone shall be as indicated

on the Contract Drawings. All rip rap stone shall meet the specified criteria below. The armor and underlayer stone shall be hard, close grained, free of cracks, seams or other imperfections which might adversely affect its durability when exposed to weathering and wave action of the inlet environment. All stones shall be roughly angular in shape, with at least dimension of any stone no less than one-thirds of its greater dimension. Flat stones will not be accepted. The inclusion of objectionable quantities of dirt, sand, clay and rock fines will not be permitted.

Table 1: Rip Rap Stone Acceptance Criteria.

Test	Reference	Armor Stone
Unit Weight	ASTM C-127	Greater than 165 pcf
Material	ASTM D-4992	Granite, Limestone, or Bluestone
Compressive Strength	ASTM D-2938	80-120 MPa
Absorption	ASTM C-127	0.5%-2.0%
Sulfate Soundness	ASTM C-88	2-10% loss
LA Abrasion	ASTM C-535	15-25% loss
Freeze and Thaw	ASTM D-5312	Less than 10%
Wetting and Drying	ASTM D-5313	Less than 1% loss
Petrography	ASTM C-295	No deleterious material

(B) Rip Rap Gradation

1. Gradation Test- Armor Stone

- a) A gradation test shall consist of weighing every stone in a representative sample to determine the amount of each stone between the various specified weights. The weights thus obtained are accumulated and expressed as a percent by weight of the total sample lighter than the various specified stone weight.
- b) Apparatus for testing of underlayer stone shall include: one Gilson Mechanical Testing Screen with sieve sizes from 6 inches to No. 10, one Ro-Tap sieve shaker with sieve sizes No. 4 to No.20, one large capacity sample splitter, one drying oven, one timer for sieve shakers, sieve brushes, scoops, etc., and scales, 100-gram sensitivity.
- c) Sample preparation, testing procedures, and computations for the armor stone gradation testing shall be performed as specified in CIRIA (C683, 2017).
- d) Drop Test: If required a drop test provides an immediate evaluation of the durability of very large stone during handling of the stone including placement into a structure. For comparability, the test stone(s) shall be dropped from an orange peel or by other means from a height of 3 m  $\pm$  0.1

m onto a rigid surface or second stone of comparable size. Dumping from a truck is not acceptable. The stone shall be examined carefully before as well as after the completion of the test. Failure criteria is the development of new cracks, opening of old cracks, and the loss of piece from the surface of the stone. Each stone shall be dropped a total of five times for evaluation purposes with examination after each drop. Contractor shall provide all necessary equipment and operating personnel to perform the testing. Costs of testing shall be borne by the Contractor.

e) The armor stone gradation shall be as specified below.

Table 2: Armor Stone Gradation

Class	EUL	NUL	NLL	ELL	AVE. W <sub>50</sub>	W <sub>50</sub> Range
Passing Requirements	>97%	>70%	<10%	<2%		
Armor (Unit: lbs)	331	220	44	18	132	110-154

The class limits are defined in accordance with CIRIA/CUR C683 Chapter 3 (2007) as follows:

- EUL (Extreme Upper Limit): The mass below which no less than 97 percent passing by mass is permitted.
- NUL (Nominal Upper Limit): The mass below which no less than 70 percent passing by mass is permitted.
- NLL (Nominal Lower Limit): The mass below which no more than 10 percent passing by is permitted.
- ELL (Extreme Lower Limit): The mass below which no more than 2 percent passing by mass is permitted.

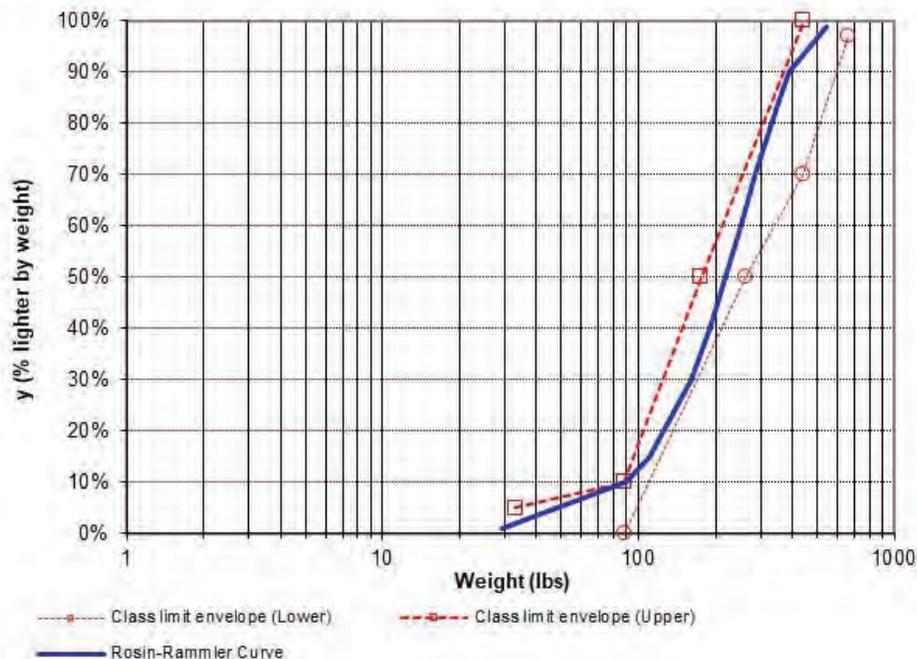

Figure 1: Armor stone gradation curve

(C) Stone Quality Testing During Construction

The Contractor shall submit on a weekly basis, for all material delivered during the week, a certification that the material meets all the requirements of the contract specifications. During the course of the work, the stone shall be tested by the Contractor. If such tests are determined necessary, the testing will be done at an approved testing laboratory.

- a) The Contractor shall be required to obtain samples of at least five (5) pieces of armor stone and deliver them at the Contractor's own expense to the Contractor's approved testing laboratory in the State of New York. All tests shall be made by the Contractor at its own expense. Tests to which the material will be subject to are as indicated in subparagraph "Stone Sources Acceptance".
- b) All stone will be subject to inspection during loading at the source and at the site of the work prior to placement.

Any stone rejected at the site of work as not meeting the requirements of these specifications for quality, condition, gradation or otherwise shall be removed from the site by and at the expense of the Contractor. Stone of suitable quality shall be furnished and placed at no additional cost to the City.

**2.27.3 MEASUREMENT AND PAYMENT.**

No separate payment will be made for complying with the requirements of this section.

**END OF SECTION**

## SECTION ESCR-3 – DECK DRAIN FOR ESPLANADE

### 3.01 INTENT.

This section describes the installation of deck drains on the raised esplanade structure.

### 3.02 DESCRIPTION.

The deck drains shall be supplied by one of the listed manufacturers herein and as shown on the Contract Drawings. The deck drain shall be installed in preparation and as sub-drainage for future work over the raised esplanade deck structure.

### 3.03 MATERIALS.

- (A) Medium/Heavy-duty two-piece Cast iron Floor/Deck drain body with drainage flange body with flat, corrosion resistant grate and integral stainless mesh screen covered grate or basket, secured in place by bolts for use in any type of planter/floor/deck construction for medium flow of liquid. Drain body shall incorporate drainage slots/weep holes and a non-puncturing flashing collar, threaded or no-hub spigot bottom outlet. The deck drain shall be furnished with a threaded or nu-hub joint cast or ductile iron tail piece. No hub shield, boot and fasteners shall be suitable for use in a marine environment. The deck drain shall be one of the listed products below, or approved equal:

Josam Company

525 W. U.S. Hwy 20, Michigan City, IN 46360, (Tel: 800-365-6726, Fax: 800-627-0008), [www.josam.com](http://www.josam.com)

Super-Flo Top Floor Drain with Nikaloy Top, Series No. 32104-1-92

Zurn Industries LLC

511 W. Freshwater Way, Milwaukee, WI 53204, 855-663-9876

Z533 [229] heavy-duty parking deck drain w/ support flange Watts

Watts

815 Chestnut Street, North Andover, MA 01845-6098 USA, 978-689-6066

FD1100A, cast iron floor drain with anchor flange, reversible clamping collar with primary and secondary weep holes, adjustable round heel proof stainless steel strainer, and no hub (standard) outlet.

### 3.04 SUBMITTALS.

- (A) Product Data  
Submit manufacturer's detailed technical data for each deck drain unit type and each related component indicating material compositions, sizes, physical properties, and fastening accessories. Include identification and data for metal weld, solvent weld, and seal materials.
- (B) Shop Drawings  
Submit for shop drawings showing complete assembly of components and relationship to adjacent deck construction. Coordinate block out requirements with manufacturer of precast concrete deck.
- (C) Samples for Verification  
Submit representative assembled unit including support elements and plate strainer.

**3.05 METHODS.****(A) Preparation and Verification of Conditions**

Verify quantities, locations, and size of the block outs in the deck surface for the drain to be installed.

Confirm top of deck structure elevation at drain unit locations before fabrication completion of drain unit lengths (depth to be installed)

Before installation of the drain units, the precast concrete deck planks/girders must be grouted into position.

**(B) Installation**

Prior to installation of the deck drain assembly, verify the length of tailpiece piping and adjust as necessary.

If block outs for installation of deck drain units have not been made in deck structure or have been incorrectly located, penetrations through the precast deck structure shall be core drilled to the diameter sizes indicated for full depth of deck structure. Core drilling shall only be performed after joints between precast planks/girders have been grouted.

Install the deck drains with the attached cast iron pipe tail piece assembly, level, plumb, and secured to concrete deck with grout prior to placement of gravel and back fill over the drains and deck. Joint between the drain body and tail piece shall extend 2 in. below the bottom of underside of deck, thus allowing the pipe assembly to be removed and replaced in the future.

Install sealant in annular space between the bottom of the pipe tail piece and deck. Install backer rod inside annular space and apply primer to cast iron pipe prior to installing sealant. Sealant should be installed 2 horizontal to 1 vertical in dimensions. Therefore, if the annular space is ½ in. wide, the sealant shall be installed ¼ in. depth. Protect unit from damage before and during topping slab placement. Top surface of grating shall be flush to deck surface.

**3.06 MEASUREMENT.**

The deck drains shall be paid for on a per unit basis, including all drain assembly components, sealants, and block outs. Grouting of the deck drain units into place shall be part of the installation of the precast elements.

**3.07 PRICE TO COVER.**

The contract price per unit of deck drain installed shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish and install the deck drain complete in place in full compliance with the requirements of the specifications, and to furnish such samples for test as may be required.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-3	DECK DRAIN FOR ESPLANADE	EACH

**END OF SECTION**

## SECTION ESCR-3.05 – CONCRETE

### 3.05.1. INTENT.

- 4 This section describes Concrete for use in the esplanade, esplanade cut-off wall, floodwall, floodgate foundations, tide gate chambers, retaining walls, retaining wall foundations, seatwall foundations, and other miscellaneous park structures.

### 3.05.2. CLASSES AND TYPES.

- (A) Concrete shall be of the classes and types shown in Table 3.05-I.

Note: Based on dry-rodded volumetric measurement of ingredient materials:

High Early Strength Concrete is approximately equal to a 1 : 1-1/4 : 2-1/4 mix.

Class A-40 Concrete is approximately equal to a 1 : 1-3/4 : 2-3/4 mix.

Class B-32 Concrete is approximately equal to a 1 : 2 : 3-1/4 mix.

**TABLE 3.05-I**

<u>Class</u>		Concrete Type	Type of Portland Cement Concrete
Designation	Nominal Mix		
Flood Protection System (ESCR-4.06 HP FL)	-	Type IA Type IIA	Normal Air-entrained Moderate Sulphate Resistant Air-entrained
Marine / Esplanade Structures (ESCR-4.06 HP ES)	-	Type IA Type IIA	Normal Air-entrained Moderate Sulphate Resistant Air-entrained
High-Early	7-1/2 Bag Mix	Type IIIA	Moderate Sulphate Strength Resistant Air-entrained
Class A-40	7-Bag Mix	Type IA Type IIA	Normal Air-entrained Moderate Sulphate Resistant Air-entrained
Class B-32	6-Bag Mix	Type IA Type IIA	Normal Air-entrained Moderate Sulphate Resistant Air-entrained

Note: The above proportions shown for non-High-Early mixes shall be modified by pozzolan substitutes as per Subsection 3.05.4.

- (B) Concrete shall be mixed by the following methods:

Method A -- Central Plant Mix

Method B -- Transit Mix

Method C -- Truck Mix

Method D -- Mixed by hand or in job mixers not exceeding one-half (1/2) cubic yard capacity when permitted by the Engineer.

Central Plant Mix Concrete is concrete produced at an approved plant, ready for use prior to discharge into a transporting vehicle.

Transit Mix Concrete is concrete whose constituent materials are proportioned at a central plant and mixed with water in transit to or at the point of deposition in a transporting vehicle.

Truck Mix Concrete is concrete whose constituent materials are proportioned at a central plant and transported to the point of deposition where water is added and mixed in a transporting vehicle.

Unless otherwise specified, concrete may be mixed by Method A, Method B or Method C.

- (C) Class, type and method of mixing concrete shall be as specified.

Type, grade, size number and corresponding nominal size of coarse aggregate shall be as specified. Concrete shall be pigmented when specified.

### **3.05.3. MATERIALS.**

Concrete shall be a homogeneous mixture consisting essentially of cement, fine aggregate, coarse aggregate, water, and admixtures and pozzolan (when used). It shall be proportion-strength concrete whose constituent materials are proportioned in accordance with specification requirements to produce a required strength. Air-entrained concrete shall be concrete which in addition to the above shall have a specified air content resulting from the use of an admixture in the concrete.

- (A) CEMENT

Cement shall be dry, free from lumps and have a temperature less than 170° Fahrenheit when used.

For concrete exposed to view, the Contractor shall not use more than one (1) brand, unless otherwise permitted.

Cement shall be measured by weight or in full bags of 94 pounds each for Portland cement.

When cement is measured by weight, it shall be weighed on a scale separate from those used for the other materials. After weighing, the entire contents of the hopper shall be completely discharged.

When the cement is measured in bags, no fractions of bags shall be used unless weighed. Bags of cement shall be taken from the place of storage and placed adjacent to the mixer, in separate piles containing the exact number of bags for each mixer charge. Each pile shall be emptied into the mixer for each charge.

- (B) AGGREGATES

Aggregates shall be measured by weight. Batch weights shall be based on saturated surface-dry materials and shall be corrected to take into account the weight of surface moisture contained in the aggregate.

When volumetric measurements are permitted, the Engineer shall require such increase in the volumes of fine and coarse aggregates as will compensate for the bulking. Only approved measuring devices shall be used.

NOTE: When aggregates are measured in the damp-loose condition (for use in Mixing Method D), they will occupy greater volume than when dry-rodded and the percentage bulking shall be determined by test. Approximate average bulking value for sand is twenty-five (25) percent and for coarse aggregate six (6) percent. Volumes may also be determined from the Contractor's approved weight formula by dividing by the damp-loose weight of aggregates per cubic foot. Average weight of damp-loose sand is 85 pounds per cubic foot and average weight of damp-loose coarse aggregate is 95 pounds per cubic foot.

(C) WATER

Water shall be measured by volume or by weight. The device for the measurement of the water shall be readily adjustable and, under all operating conditions, shall be accurate within one (1.0%) percent of its maximum capacity.

Water shall be potable and drawn from municipal water mains.

(D) PIGMENTED ADMIXTURE

When pigmented concrete is specified, the concrete shall be colored with an approved pigment conforming to the requirements of Section 2.19. The final color of the concrete shall be as approved by the Engineer. Pigments used shall not vary the air content of the concrete by more than  $\pm 0.5\%$ . The concrete mix shall be adjusted to provide that the air content of the concrete remains within the specified tolerances.

Pigmented admixture shall be measured by weight. Water present in pigment shall be taken into account in measuring the quantity of water required for each batch.

(E) POZZOLANS

Fly ash shall conform to the chemical and physical requirements for Mineral Admixture, Class F listed in AASHTO M 295 and shall meet the requirements of the NYS Department of Transportation, Standard Specifications, Section 711-10, FLY ASH, except that no alternate Class of fly ash will be acceptable. Any fly ash hardened by moisture will be rejected. Fly ash stored over the winter at the concrete producing plant will be retested for specification compliance by the Department or its agent.

Ground granulated blast-furnace slag (GGBFS) shall conform to the chemical and physical requirements for Grade 100 or 120 slag, as classified in AASHTO M 302, and shall meet the requirements of the NYS Department of Transportation, Standard Specifications, Section 711-12, GROUND GRANULATED BLAST-FURNACE SLAG. Any GGBFS hardened by moisture will be rejected. GGBFS stored over the winter at the concrete producing plant will be re-tested for specification compliance by the Department or its agent.

Microsilica (Silica fume) shall conform to the standard and optional physical and chemical requirements of AASHTO M 307 and shall meet the requirements of the NYS Department of Transportation, Standard Specifications, Section 711-11, MICROSILICA. Microsilica shall be used wherever increased early compressive strength, reduced permeability and increased abrasion resistance is required.

Maximum pozzolan limits shall be based on ACI 318-14, Exposure Class F3.

(F) ADMIXTURES

Admixtures shall comply with the requirements of Section 2.09, Admixtures.

All admixtures shall conform to ASTM C 494. They shall contain not more than 0.05% chloride ions, and shall be used in accordance with the manufacturer's recommendations. Submit dosage charts, including the effects of concrete temperatures from 50 deg F to 90 deg F, to the Engineer.

A corrosion inhibitor admixture shall be included in the mix design for the flood protection system and marine concretes. The concentration of calcium nitrite shall be 30% +/- 2% by weight of solids per gallon. Corrosion inhibitor admixture shall not accelerate the setting time of the concrete mixture. Use a retarder and/or other admixtures to ensure that acceleration of setting time does not occur, while maintaining the applicable performance criteria.

Corrosion inhibitor must be on the NYSDOT Approved List 711-1300 for Calcium Nitrite Based Corrosion Inhibitors.

**3.05.4. CONTRACTORS FORMULA**

All concrete mix designs shall be subject to approval by DDC's Quality Assurance (QA) Bureau and in accordance with their "MIX DESIGN, LABORATORY AND PLANT APPROVAL PROTOCOL". Copies of this protocol may be obtained at the pre-construction meeting or from the Engineer. Before the Contractor begins to manufacture concrete, the Contractor shall secure DDC's QA approval of the mix design the Contractor proposes to use. the Contractor shall submit for this purpose a statement, in writing, of the sources of all ingredient materials, the type and brand of the cement, pozzolans and the number of pounds of each of the materials in a saturated surface-dry condition making up one (1) cubic yard of concrete. The calculated yield of the mix shall be within + 2% of the Theoretical one (1) cubic yard. The range of water-cement (W/C) ratios within which the concrete will be manufactured and the method of mixing to be employed shall also be stated. The mix design submittal shall include gradation of aggregates, specific gravities of ingredients, unit weight, mix proportion for each batch (a minimum of 4 batches except in case of precast plants where one specific mix may be proposed), compressive strength test results for each mix at 7 days, 28 days (high early strength mixes may require 6 hrs, 24 hrs, 3 days and shrinkage test as per the requirements), and graphical representation of strength vs. W/C projected in hours/days.

With the exception of high-early strength concrete, the Contractor shall be required to substitute Portland cement with pozzolans (Fly Ash and/or GGBFS) such that the maximum amount of Portland cement per cubic yard of concrete does not exceed 400 pounds, and with the use of an approved non-corrosive, non-chloride admixture as required to obtain a minimum compressive strength of 3,000 psi in seven (7) days. For high-early strength concrete the Contractor may substitute Portland cement with pozzolans (Fly Ash and/or GGBFS), pound for pound, up to 20% (or up to 25% for tidal/sea water spray areas) of the weight of cement specified for any concrete mixture provided the Contractor can obtain a minimum compressive strength of 3,000 p.s.i. in three (3) days. The Contractor, immediately following but not later than eight weeks after the date of the Contractor's Notice to Proceed, shall file with the Engineer, Age-Strength data of the job mix the Contractor proposes to use for the various ambient temperatures anticipated during the period of concrete placement. This data shall be presented in both tabular and graphical form for those various ambient temperatures with a maximum setting period of seven (7) days for Class B-32 concrete or seventy-two (72) hours for High-Early Strength Concrete.

Also, for high-early strength concrete, at no additional cost, the Contractor may be allowed to use a water reducing admixture to achieve an additional one (1") inch slump, for a maximum slump of four (4") inches, to enhance workability and to help in surface finishing of the concrete. The admixture shall conform to the requirements of Section 2.09, Admixtures. If such an admixture is used the concrete shall have a minimum compressive strength of 3,200 psi at three (3) days as determined by the average compressive strength of one set of three (3) concrete cylinders for each day's work. The Contractor shall submit the mix design for approval by the Engineer; however, such approval by the Engineer shall not relieve the Contractor of their responsibility for meeting the minimum three (3) day strength requirements specified herein, when admixtures for slump and enhanced workability have been used.

The approved mix design shall not be changed without the written permission of the Engineer.

The approval of materials shall not preclude subsequent withdrawal of such approval in case of development of qualities objectionable to the Engineer.

On receipt of new deliveries of materials during the period of the contract, the Contractor shall inform the Engineer and the Contractor shall modify the mix design as directed by the Engineer. The order to modify the mix design shall be confirmed in writing.

The relative amounts of fine and coarse aggregates in any class of concrete may be changed within the limits given in Table 3.05-II by the Engineer at any time in order to secure maximum density and to promote workability, provided the sum of the absolute volumes of the aggregates is unchanged. Such changes shall be made when required without extra compensation, regardless of the quantity of concrete affected thereby.

#### **3.05.5. MIX DESIGN.**

- (A) Unless otherwise specified elsewhere herein, concrete shall comply with the applicable requirements of Tables 3.05-II, 3.05-III, 3.05-IV, 3.05-V, and 3.05-VI.
- (B) Concrete of Type IA, IIA and IIIA shall have an air-entrainment of 4 to 7 percent when the coarse aggregate is 1-1/2" stone and 5 to 7 percent when the coarse aggregate is 3/4" stone, with 6.5 percent desired in either case, except for the Flood Protection System and Marine / Esplanade classes of concrete, which shall meet the requirements in Paragraph (F).
- (C) When an air-entraining admixture is added to the concrete it shall comply with the requirements of ASTM Designation C260.
- (D) Maximum water-cement ratio for concrete used in the Flood Protection System and Marine / Esplanade classes of concrete shall be 0.40.
- (E) Chloride Ion Concentration by Weight of Cementitious Material (ASTM C 1152, ASTM C 1218, ASTM C 114, ACI 222R): The acid soluble chloride ions by weight of cementitious material in the concrete mix shall be less than or equal to 0.10% for reinforced concrete and 0.08% for prestressed concrete, as per ASTM C1202. The water-soluble chloride ions by weight of cementitious material in the concrete mix shall be less than or equal to 0.08% for reinforced concrete and 0.06% for prestressed concrete, as per ASTM C1218.
- (F) Air entrainment in the Flood Protection System and Marine / Esplanade classes of concrete shall meet the requirements in Table 19.3.3.1 in ACI 318-14 for Exposure Class F3, as reproduced below.

**Table 19.3.3.1—Total air content for concrete exposed to cycles of freezing and thawing**

Nominal maximum aggregate size, in.	Target air content, percent	
	F1	F2 and F3
3/8	6	7.5
1/2	5.5	7
3/4	5	6
1	4.5	6
1-1/2	4.5	5.5
2	4	5
3	3.5	4.5

- (G) The Upper Quality Limit, UQL, of concrete permeability for the Flood Protection System and Marine / Esplanade classes of concrete shall be 1,700 Coulombs when tested in accordance with ASTM C1202. Performance testing shall be performed at 28 days.

**TABLE 3.05-II – PROPORTIONS**

Class of Concrete	Nominal Size of Coarse Aggregate Used (in.)	Fine Aggregate Percentage by Weight of Total Aggregate (See Note 1)
Flood Protection System (ESCR-4.06 HP FP)	5/8 or 3/4	Note 2
Marine / Esplanade Structures (ESCR-4.06 HP ES)	5/8 or 3/4 1-1/2	Note 2
High-Early Strength	5/8 or 3/4 1-1/2	29 to 37 26 to 34
Class A-40	5/8 or 3/4 1-1/2	29 to 37 26 to 34
Class B-32	3/4	32 to 40

Note 1 – Quantity of fine aggregate may be varied within the limits indicated according to the type of coarse aggregate used, in order to obtain a smooth, dense, homogeneous and plastic mixture.

Note 2 – Fine aggregate shall conform to ASTM C33. Percentage by weight shall be selected by the Contractor to produce a workable and durable mix design.

**TABLE 3.05-III - INGREDIENT MATERIALS**

Applicable Sections							
Type of Concrete	Portland Cement	Pozzolans	Sand Fine Aggregates	Coarse Aggregate	Air-entraining Admixture	Pigment	Retarder
IA	2.10 Type I*	3.05.3.(E)	2.21 Type IA	2.02**	2.09	2.19	2.09
IIA	2.10 Type II*	3.05.3.(E)	2.21 Type IA	2.02**	2.09	2.19	2.09
IIIA	2.10 Type II* or III* Type IA	3.05.3.(E)	2.21	2.02**	2.09	2.19	2.09

\* To be used with an approved air-entraining admixture, which shall be added at the time concrete ingredients are mixed with water.

\*\* Coarse aggregate shall be Type 1, Grade A or Grade B, or Type 2, Size No. 357, Size No. 57 or Size No. 67 of ASTM Designation C 33, as specified.

**TABLE 3.05-IV**

**COMPRESSIVE STRENGTH IN LBS. PER SQ. INCH,  
MIN. AVERAGE OF NOT LESS THAN THREE  
CYLINDERS OR CORES**

Concrete – Type IA, Type IIA & Type IIIA at 28 Days	
Class of Concrete	Cylinders or Cores
Flood Protection System	5,000
Marine / Esplanade Structures	5,000
High-Early Strength	5,000***
Class A-40	4,000
Class B-32	3,200

\*\*\*Concrete shall be required to obtain a minimum of 3,200 psi compressive strength at 3 days as determined by one set (3 cylinders) of concrete cylinders for each days work.

The above date limitations concerning cores refer to the date on which the concrete represented by the cores was deposited.

No reduction in minimum compressive strength will be allowed for concrete colored with pigment or any other additives.

**TABLE 3.05-V**  
**TIME STRENGTH TABLE PORTLAND CEMENT CONCRETE**

When compressive strength tests are made after the standard 28-day period following placing of the concrete, the strength at 28 days shall be determined from the actual compressive strength in accordance with the following table:

Tested at Days	Divide by						
28	1.000	44	1.071	60	1.120	76	1.157
29	1.005	45	1.075	61	1.122	77	1.159
30	1.010	46	1.078	62	1.125	78	1.161
31	1.014	47	1.081	63	1.127	79	1.163
32	1.019	48	1.084	64	1.129	80	1.165
33	1.023	49	1.087	65	1.132	81	1.167
34	1.027	50	1.090	66	1.134	82	1.169
35	1.032	51	1.093	67	1.136	83	1.171
36	1.036	52	1.096	68	1.139	84	1.173
37	1.040	53	1.099	69	1.141	85	1.175
38	1.045	54	1.102	70	1.143	86	1.177
39	1.049	55	1.105	71	1.146	87	1.179
40	1.053	56	1.108	72	1.148	88	1.181
41	1.058	57	1.111	73	1.150	89	1.183
42	1.062	58	1.114	74	1.152	90	1.185
43	1.066	59	1.117	75	1.155	Over 90	1.185

**TABLE 3.05-VI - SLUMP VALUES**

Concrete Placement	Design Slump Range, Inches	Maximum Slump, Inches
Sidewalks	1-1/2 to 3-1/2	3-1/2
Pavement Slipform Paving Form Paving	1-1/2 to 2-1/2 1-1/2 to 2-1/2	2-1/2 3
Pavement bases	1-1/2 to 4	4
Structural Slabs	3 to 4	4
Piers, Pedestals, Rigid Frames or Arches Box Culverts throughout, Footing and Headwalls, general purpose structural.	2-1/2 to 3-1/2	4
Cast-in-Place Piles	2-1/2 to 3-1/2	5
Underwater Concrete 6 inch minimum slump	6 to 7	8
High early strength pavement slabs or structural sections	2 to 3	3
Structural placement 3 inches thick or less	2-1/2 to 3-1/2	3-1/2
Slip formed median barriers, parapet walls, curbs	1/2 to 1-1/2	1-1/2
Floodwall (not part of cutoff wall) and flood gate foundations	2-1/2 to 4	4
Esplanade and cut-off wall pile cap (Marine Structures)	6 to 8	8
Concrete Seawall Cap (Marine Structures)	6 to 8	8

*NOTE: Maximum slump for pumping applications shall be 8 inches as long as all other parameters are maintained within the values specified in this specification. Admixtures to increase slump but maintain other parameters are allowed with the approval of the Engineer. When a slump test is conducted on concrete produced by a mobile mixing unit, the slump shall be measured 3 to 5 minutes after discharge from the unit.*

The above slump requirements shall apply at the point of discharge.

The Contractor shall supply at each point of concrete delivery a slump cone and rod conforming to the requirements of ASTM Designation C143 for use by the Engineer.

### **3.05.6. CONCRETE BATCHING PLANT REQUIREMENTS.**

The batching plant shall be so designed, operated and coordinated as to produce a sufficient quantity of concrete for the construction specified.

#### **(A) ACCEPTANCE**

Each Portland cement concrete batching plant shall be subject to approval by DDC's Quality Assurance (QA) Bureau and their "MIX DESIGN, LABORATORY AND PLANT APPROVAL PROTOCOL". The minimum requirement for approval is that the proposed Portland cement concrete batching plant must be on the New York State Department of Transportation (NYSDOT) approved list for the current construction season.

The minimum requirement for approval of a pre-cast concrete plant is that the proposed plant must be on the NYSDOT approved list. A waiver for this

requirement may be granted by the DDC's Quality Assurance (QA) Director for special products that no NYSDOT approved plant is capable of producing.

Each Portland cement concrete batching plant shall also be subject to auditing and approval of the DDC's Director of Quality Assurance (QA). The Director of QA may at any time discontinue the use of any previously approved equipment if non-conformance with the specifications result during the progress of the work. When the Director of QA discontinues the use of the plant, production will not be acceptable for Department work until corrective measures satisfactory to the Director are carried out.

(B) BINS

The plant shall contain a sufficient number of aggregate storage or holding bins to produce the class of concrete specified. The bins shall have adequate separations for fine aggregate and for the various sizes of coarse aggregates.

Separate storage or holding bins shall be provided for cement of different types except that Type I or Type II may be combined in common storage. The bins shall protect the cement from rain and moisture.

Pozzolan shall be stored at the batch plant in a separate storage or holding bin and it shall be protected from rain and moisture.

(C) WEIGHT HOPPERS AND DISCHARGE CHUTES

The batching plant shall include separate weight hoppers for aggregate and cement. The cement weight hopper shall be enclosed to protect the cement against moisture and to reduce escaping dust.

All discharge chutes shall be arranged so that materials will not lodge or be lost on discharge. The chutes shall not be suspended from any part of the weighing system.

Vibrators arranged so that no significant vibrations are transmitted to the scales or other plant control equipment during the weighting process.

(D) SCALES

Each facility requires:

- Scales installed on or after January 2, 2003 for weighing materials shall be load cell type and shall indicate the load at all stages of the weighing operation from zero to full capacity.
- Scales shall meet the requirements of the National Institute of Standards and Technology, Handbook 44, with no less than 500 nor greater than 2000 scale divisions.
- Digital displays shall match the primary scale within one (1) division.
- The minimum resolution of digital displays shall be equivalent to or less than the minimum graduations on the primary scale.
- Digital displays shall be easily readable and located in direct sight from the operator's normal work station.

All plant scales shall be tested at the Contractor's expense by a competent scales technician as follows:

1. Annually, prior to use for Department work.
2. At intervals of not more than 90 calendar days.
3. Whenever a plant changes location.
4. At any time ordered by DDC's Director of Quality Assurance, or the Director's representative.

A cradle or test platform, approved by the Director of Quality Assurance or their representative, for each scale and at least 20 standard 25 pound test weights shall be provided for testing. The use of a set of tests weights for two or more plants will be permitted only when they can be made readily available within one (1) hour.

If directed by the Director of QA or their representative, provisions shall be made for locking scales against tampering.

(E) PROPORTIONING CONTROL EQUIPMENT

The materials, including admixtures, shall be proportioned by automatic proportioning devices, approved by the Director of Quality Assurance unless otherwise indicated on the plans or in the proposal.

The automatic proportioning equipment shall be installed in an area enclosed for protection against dust and inclement weather.

The requirements for these devices are specified under Subsection 3.05.7, Handling, Measuring and Batching Materials.

(F) INSPECTION FACILITIES

Each Portland cement concrete plant site supplying concrete for Department work shall have a building or room available for Department use as an office and testing facility. The facility shall be located such that the testing and inspection can be performed in a reasonable manner. The building or room shall be ventilated, lighted, and adequate heating and cooling equipment shall be provided to maintain an ambient air temperature of 70° F  $\pm 5^{\circ}$ . The facility shall contain tables, benches, shelves, running water and the necessary equipment required for testing concrete aggregates according to the Department's written instructions. A telephone or other approved means of communication shall be provided at the plant site for the Department's use. A toilet and a lavatory shall also be available at the plant site.

The following equipment is the required minimum and shall be properly installed and maintained in good operating condition:

1. A power driven coarse aggregate sieve shaker with a minimum clear sieve area of 324 Square inches and equipped with an automatic shut-off timing device. A dust cover shall be provided when the shaker is installed inside the facility. The shaker shall be anchored to a firm base.
2. A fine aggregate sieve shaker, power driven independently of the coarse aggregate shaker, for eight-inch diameter sieves and equipped with an automatic shut-off timing device.
3. An aggregate sample splitter adjustable for splitting samples ranging in maximum aggregate size from one-half inch to two inches.
4. A scale, fifty pounds minimum capacity, with maximum 0.02 pound graduations.
5. A scale, one thousand gram minimum capacity, with maximum 0.5 gram

graduations.

6. A stove or hotplate suitable for sample drying.
7. A two drawer, legal size, file cabinet with lock and two keys for the exclusive use of the inspector.
8. Necessary accessory test equipment including sieves suitable for all types of aggregates to be used and sample containers.

When the testing facility is shared with others, the Department shall be given priority during production for Department use. The suitability of the inspection facility and the condition of the equipment shall meet the approval of DDC's Director of Quality Assurance.

The plant facilities for inspection personnel are the property of the Contractor or their supplier and they shall be provided and maintained in clean condition by the Contractor or their supplier during the course of the work.

### **3.05.7. HANDLING, MEASURING, AND BATCHING.**

The batch plant site, layout and equipment shall be such as to assure a continuous supply of material to the work.

The aggregates shall be batched at the batch plant site according to these specifications. When approved by the Director of Quality Assurance, bagged cement may be incorporated into the mixture. The batch size shall be adjusted to use whole bags of cement.

#### **(A) STOCKPILES**

Stockpiles shall be formed on bases approved by the Director of Quality Assurance or their representative. The bases shall have adequate drainage and may consist of prepared aggregate bases, concrete, metal or wood surfaces, or barge floors. The stockpiles shall be built by methods which do not cause particle segregation. Aggregates from different sources and of different sizes shall be stockpiled separately in a manner such that the aggregates will not be contaminated by other sizes or aggregates from other sources. Department approved aggregates shall be stockpiled separately from the non-approved aggregates.

Aggregates shall be handled throughout the batching process in a manner such as to maintain uniform grading of the material. In case the aggregates contain a high or non-uniform moisture content, the aggregates shall be stockpiled a sufficient length of time to stabilize the moisture content.

Each plant shall be equipped with an approved moisture sensing device that will indicate on a readily visible scale or chart the moisture content of the fine aggregate as it is batched. The free moisture content of the fine aggregate at the time of batching shall not exceed 8 percent of its saturated-surface dry weight.

(B) HEATING MATERIALS FOR COLD WEATHER CONCRETING

The aggregates and/or water shall be heated prior to batching to obtain a plastic concrete temperature not less than 50°F or more than 70°F, at the time the mixture is placed in the forms. When the air temperature is 32°F or above, and when the aggregates are free of ice and frozen lumps, the desired temperature of the plastic concrete may be obtained by heating the mixing water only, unless otherwise ordered by the Engineer or the Engineer's representative. When the air temperature is below 32°F, or whenever ordered, both mixing water and aggregates shall be heated as herein specified.

For additional requirements to permit the placement of concrete base, curb and sidewalks during cold weather conditions, see Section 9.04 - Allowance for Anti-freeze Additive in Concrete.

All water used for mixing concrete shall be heated to a temperature of at least 70° Fahrenheit but not over 180° Fahrenheit. Aggregates shall be heated either by steam or by dry heat to a temperature of at least 40° Fahrenheit but not over 100° Fahrenheit. To avoid the possibility of flash set, when water is heated to a temperature in excess of 100° Fahrenheit, water and aggregate shall be mixed together in the mixer in such a way that the high temperature of the water is reduced before cement is added. The heating equipment shall be such as to heat the mass uniformly and preclude the possibility of the occurrence of hot spots which will overheat the material.

(C) BATCHING

All plants shall be equipped with an approved automatic weighing, cycling and monitoring system installed as part of the batching equipment, unless otherwise indicated in the specifications, on the plans or in the proposal. The system shall include equipment for accurately proportioning the various components of the mixture by weight, or by volume for admixtures and water, in the proper order and shall include equipment for controlling the cycle sequence. In addition, timing of the mixing operations for central mix plants shall be required. The automatic proportioning system shall be capable of consistently delivering each constituent within the tolerances indicated in Table 3.05—VII, Batching Tolerances. The system shall be designed so that the only manual operation(s) required to produce a preprogrammed batch within these specifications shall be a switch or button to initiate the batching sequence and discharge the completed batch.

There shall be auxiliary interlock cutoff circuits to interrupt and stop the automatic batching operations whenever an error exceeding the acceptable tolerance occurs in proportioning for all material components except water. DDC's Director of Quality Assurance or the Director's representative may require the locking or sealing of any automated proportioning equipment that may be manually manipulated.

When the aggregate sizes are weighed cumulatively, the tolerance for each bin draw weight shall be based on the total aggregate batch weight. If aggregate sizes are weighed separately, the percentage shall apply to each scale weight. When a pozzolan is weighed cumulatively with the cement, the pozzolan shall be last in the weighing sequence and the tolerance for each material draw weight shall be based upon the total weight of cement plus pozzolan. The electrical circuits used to check delivery tolerances may be set at any span within the full allowable tolerance for

any approved batch size. For plants not equipped to automatically adjust tolerances, the tolerance span shall be set for the minimum approved batch size wherever varying batch sizes are being produced.

The system shall be interlocked during the batching of cement and aggregates so that:

1. No inlet gate can be opened while the weigh hopper discharge gate is open.
2. No weigh hopper discharge gate can be opened:
  - (a) While the hopper is being filled.
  - (b) Until the full batch weight is within the delivery tolerance.
3. No new batch can be weighed until the hopper is entirely empty of the previous batch and the scale has returned to zero.

When manual batching is permitted, the constituents shall be batched within the indicated delivery tolerances for the automatic proportioning system.

**TABLE 3.05-VII  
BATCHING TOLERANCES**

Cement & Pozzolan Aggregate	$\pm 1\%$ (by weight)
Water (Note 1) Admixtures	$\pm 2\%$ (by weight)
	$\pm 1\%$ (by weight or volume)
	$\pm 3\%$ (by weight or volume or $\pm 1$ oz.(Note 3), whichever is greater)
Zero Return (Aggregate)(Note 2)	$\pm 2\%$
Zero Return (Cement & Pozzolan) (Note 2)	$\pm 1\%$
Zero Return (Water)(Note 1, 2)	$\pm 1\%$

- NOTES: 1: Tolerance applies to water added at central mix plants only.  
 2: Zero Tolerance is based on the minimum allowable batch size.  
 3: Based on the preprogrammed target quantity.

(D) ADMIXTURE DISPENSING SYSTEMS

Plants shall be equipped with the number of dispensing systems necessary to incorporate the required admixtures into the concrete. At least two admixture dispensing systems shall be required for plants supplying structural concrete. These systems shall be capable of accurate measurement within the tolerance limits specified in Table 3.05-VII, Batching Tolerances. The measuring devices shall be equipped with a bypass valve suitable for obtaining a calibrated sample of admixture. Admixtures shall be dispensed in a manner that shall insure uniform distribution of the material throughout the mixture within the specified mixing period. When multiple admixtures are added to the concrete, they shall not come in direct contact with each other prior to mixing. Plants equipped with automatic proportioning systems shall include an approved automatic mechanical admixture dispensing system. The dispensing system shall consist of a volumetric measuring device, interlocked with the plant automated proportioning equipment in such a manner that will positively insure that the quantity of admixture preset into the

system has been actually measured and completely discharged. The admixture system shall be interlocked with the automated system so that:

1. Aggregate and/or cement weigh hopper discharge gates cannot be opened until the preset quantity of admixture has been satisfactorily batched or discharged.
2. The recordation of the presence of admixture shall be dependent upon the completion of the admixture discharge.

All plants shall provide at the operator's normal work station readable indication of the actual quantity of admixture batched.

(E) RECORDING OF BATCHING

All concrete batching plants equipped with automatic proportion systems shall have digital recording instruments approved by DDC's Director of Quality Assurance and shall be so located as to be readily accessible and readable to the operator from their normal work station. The recording instruments shall be designed to record the quantities of each aggregate component, cement, pozzolan (when used), water (at central mix plants) and the presence of admixture for each batch of concrete produced. All records of batches shall show the batch number, the day, the month, year, and time of day to the nearest minute for each batch and they shall be imprinted on the record so that each batch may be permanently identified. The Department shall be provided with a clear and legible copy of all batch records.

Cement, pozzolan and aggregate component weights quantities shall be recorded separately. Water at central mix plants may be recorded by weight or volume.

Weights and/or volumes shall be recorded as indicated on the batching scale or meter within an accuracy of  $\pm 1$  scale or meter gradation. The minimum recorder resolution shall be equivalent to or less than the minimum gradation on the scale or meter, unless otherwise approved by the Director of QA.

When the automation system is capable of producing other than standard size batches (full, half or quarter cubic yard increments), the recordation requirements shall be in accordance with written directives from the Director of QA.

On automation systems installed on or after January 2, 1987, a clear and identifiable indication shall appear on the recordation, whenever a batch is initiated without all conditions being satisfied for fully automated production under these specifications or a system is taken out of the fully automated mode during the batching sequence.

Each plant site shall be equipped with an approved instrument capable of automatically applying a time-date stamp to each delivery ticket as the delivery vehicle departs from the plant site.

(F) FAILURE OF AUTOMATIC BATCHING, ADMIXTURE DISPENSING AND RECORDING EQUIPMENT

If at any time the automatic proportioning, admixture dispensing or recording instruments become inoperative, the plant may be allowed, with the approval of DDC's Director of Quality Assurance, or the Director's representative, to batch and mix concrete mixtures for a period not exceeding 48 hours from the time of breakdown. Written permission of the Director of Quality Assurance, will be

required to operate without these instruments for periods longer than 48 hours.

### **3.05.8. CONCRETE MIXING, TRANSPORTING AND DISCHARGING.**

#### **(A) GENERAL**

Concrete may be mixed at a central plant, in truck mixers or at the site as described in these specifications. When mixed at a central plant, the concrete shall be transported in vehicles acceptable to the NYSDOT. All concrete shall be discharged from the discharge openings directly into the forms or into approved conveyance equipment while fresh and before there is evidence of initial set. No retempering of the concrete will be permitted. Retempering is defined as the addition of water after the mix has attained its desired initial slump. Temperature of the concrete mixture upon discharge shall not exceed 90° Fahrenheit.

The Contractor shall supply concrete at a rate consistent with placement operations as determined by the Engineer. The Engineer, or its representative, may discontinue the use of any type of concrete mixing or transporting units when unsatisfactory results are obtained. The requirements of this section shall apply unless otherwise stated in the specific item.

A summary of time limitations for the various types of Portland Cement concrete mixing equipment from the beginning of batching to the completion of discharge is given to Table 3.05-X, Summary of Concrete Batching, Mixing, Hauling and Discharging.

#### **(B) CONCRETE UNIFORMITY**

Mixing shall be performed in an approved mixer capable of combining aggregates, cement, water and admixtures into a thoroughly mixed and uniform mass within the specified mixing period, and discharging the mixture without segregation. Each mixer shall display, in a clearly visible location, a manufacturer's supplied plate(s) stating the capacity of the mixer and the recommended drum speeds for each operation.

All concrete produced shall meet the uniformity requirements in Table 3.05-VIII, Concrete Uniformity. Tests shall be performed by the Department when required by the specifications or requested by the Engineer. It will not be necessary to verify that mixing equipment meets the uniformity requirement unless evidence of non-uniform concrete is found or unless the Contractor requests a reduced mixing time for central mixers. In order to obtain uniformity the Contractor may reduce the batch size below the rated mixer capacity or reduce the mixing speed tolerance limit.

#### **(C) CENTRAL MIXED CONCRETE**

Central mixed concrete is defined as concrete mixed in a stationary mixer and transported in approved agitating or non-agitating units to the point of deposition. Central mixed concrete may be used for mixing all concrete mixtures unless otherwise specified on the plans or in the proposal. Batch sizes for any mixer shall be no larger than the rated capacity of the drum indicated on the manufacturer's plate.

Mixing units shall be equipped with an acceptable timing device that will not permit a batch of concrete to be discharged until the specified mixing time has elapsed. Mixing units and control devices will be disapproved by DDC's Director of Quality

Assurance (QA), or the Director's representative if at any time they are found unfit to function properly. When the blades inside the drum have become loose, broken, bent, scalloped or worn away 20 percent in any dimension, they shall be properly repaired or replaced.

The constituents of the concrete mix shall be charged into the mixer in a manner approved by the Director of QA or the Director's representative. The minimum mixing time after all materials are in the drum shall be 90 seconds, unless it can be demonstrated through tests that uniformity of the concrete meeting the requirements of Table 3.05-VIII, Concrete Uniformity, can consistently be obtained at lesser time as approved by the Director of QA. Central mixers shall discharge the entire batch in an unrestricted manner into a hopper or directly into a delivery unit. The delivery unit shall transport the thoroughly mixed concrete to the point of use without loss of uniformity. Each delivery unit must be approved by the Director of QA or the Director's representative prior to use and subjected to frequent inspections during its use. If found unfit, it will be disapproved until the proper operating condition has been restored. Both the agitating and non-agitating delivery units shall be completely emptied, clean and free from concrete and wash water before receiving the next load of concrete.

Delivery agitating units shall rotate at a drum speed of 2 to 6 revolutions per minute unless otherwise approved by the Director of QA. Agitating units shall conform to the requirements for truck mixers under Subsection 3.05.8.(E), Truck Mixed Concrete, as they pertain to operating condition and condition of the drum. When central mixed concrete is transported in units approved for truck mixing, a minimum of 90 percent of the design water shall be added to the mix by the batch plant water system. The addition of water to obtain initial slump will be permitted at the work site in not more than two additions. After each addition, the concrete shall be mixed at least 30 revolutions in accordance to truck mix requirements before discharging.

The haul road used by non-agitating concrete delivery units shall be free from holes washboarding or any other features that would cause segregation in the mix. In addition, non-agitating concrete delivery units shall have cover, when ordered by the Engineer, to protect the concrete from adverse drying conditions and precipitation.

**TABLE 3.05-VIII  
CONCRETE UNIFORMITY**

Test	Permissible Variation concrete samples taken at two locations in the batch
1. Weight per cubic foot calculated to an Air-Free Basis	2.0 lbs. per C.F.
2. Air Content, % by volume of concrete	1.0 percent
3. Slump: Average slump 4 inches or less Average slump greater than 4 inches	1.0 inches 1.5 inches
4. Coarse aggregate content, portion by weight of each sample retained on a No. 4 sieve	6.0 percent
5. Unit weight of air-free mortars based on average for all comparative samples tested	1.6 percent
6. Average compressive strength of 7 days for each sample based on average strength of all comparative test specimens	10.0 percent

NOTE: Samples shall be taken at the point of discharge of the concrete mixer. Sampling and testing procedures shall be as approved by the DDC's Director of Quality Assurance.

The time interval between completion of mixing at the central mix plant and completion of discharge shall be as noted in Table 3.05-IX, Time Limits for Delivery of Central Mixed Concrete.

**TABLE 3.05-IX  
TIME LIMITS FOR DELIVERY OF CENTRAL MIXED CONCRETE**

Delivery Unit	Type of Placement	Maximum Time Minutes	Notes
Non-agitating including all open top units	All	30	
Agitating – rotating drum	Structural	90	1
Agitating – rotating drum	Pavement	60	1 & 2

NOTE 1. The concrete will be rejected if there is evidence of setting up in the mixer. The Engineer may reduce the total time limit in hot weather or under unusual conditions if unsatisfactory results are obtained.

NOTE 2. The Engineer may increase the allowable time to 90 minutes maximum for small or irregular sections of pavements where placing and finishing operations can be completed rapidly.

(D) TRANSIT MIXED CONCRETE

Transit mixed concrete is defined as concrete mixed completely in a truck mixer; mixing may occur at the following locations or combinations thereof: at the plant, while in transit, or at the point of deposition. Transit Mix may be used for all concrete items unless otherwise specified on the plans or in the proposal.

The truck mixer shall be the inclined axis rotating drum type equipped with a water tank(s) and water system having a measuring device to measure water (U.S. gallons) introduced into the drum within an accuracy of two percent. In addition, each truck mixer shall be equipped with a hatch in the periphery of the drum shell of such design as to permit access to the inside of the drum for inspection.

Each truck mixer used for transit mixed concrete shall be equipped with an approved electrical revolution-counting device mounted in a clearly visible position.

The device shall show on separate counters (1) the number of drum revolutions at speeds within the mixing range and (2) the total number of drum revolutions. Both counters shall be legible to one revolution and shall be designed to accept a non-standard electric plug for resetting each counter to read zero at the time of loading at the batch plant. The revolution counting device shall be tamperproof such that if tampering occurs the counters will become inoperative or the device will otherwise indicate tampering including the interruption of electric power.

The revolution counting device shall be installed to count the number of revolutions of the drum in the direction of mixing. The device shall be adjusted so that it counts the number of revolutions specified for the mixing and agitating drum speed within the tolerances indicated on the manufacturer's rating plate, but not to exceed the following requirements for truck mixers:

Mixing - 6 RPM minimum to 18 RPM maximum  
Agitating - 2 RPM minimum to 6 RPM maximum

These limits may be adjusted for individual mixing units upon approval of the DDC's Director of Quality Assurance (QA).

Each truck mixer unit shall be inspected and approved annually by the Director or QA or the Director's representative for use in Department work. During its use, additional inspections will be made by the Director of QA or the Director's representative to determine the operating condition of the equipment. Whenever improper conditions exist, the truck mixer unit shall be satisfactorily repaired or replaced. This will include blades inside the drum which have become heavily caked with mortar, loose, broken, bent, scalloped, worn 20 percent in any dimension or otherwise damaged.

Truck mixers will not be permitted to mix concrete batches having volumes greater than the maximum cubic yard capacity indicated on the manufacturer's rating plate(s). The drum shall be drained of wash water before charging with the constituents of the concrete mixture, and the drum shall be revolving during loading.

Approximately 90% of the design water shall be added to the mix in a manner approved by the Director of Quality Assurance, by either a batch plant water system or from the water supply carried on the truck.

Mixing shall begin not more than 5 minutes after cement has made contact with the aggregates. The load shall be mixed from 70 to 100 drum revolutions and then checked for consistency. If the truck is enroute to the project, the mixer speed shall be changed to agitating speed after 70 to 100 mixing revolutions. Under no circumstances shall the mixer drum be stopped.

Water may be added to the mixture in not more than two additions at the point of deposition before discharge to obtain initial slump. After each such addition the concrete shall be mixed at least 30 revolutions in the mixing speed range. The total number of revolutions in the mixing range shall not be less than 100 nor more than 160.

After completion of mixing, discharging may begin immediately, otherwise the mixer shall be revolved at agitating speed. Once discharge has commenced, the entire load shall be discharged in not more than 50 minutes.

Concrete shall be discharged through a completely opened discharge gate providing unrestricted flow. The discharge area or gate shall remain fully open throughout the discharge period and the rate of discharge shall be controlled by the speed of the drum.

The total time interval from the moment the cement makes contact with the aggregates to the completion of discharge shall not exceed 90 minutes for structural concrete placements and 60 minutes for pavement concrete placements. The Engineer may increase the allowable time for pavement placements to 90 minutes maximum for small or irregular sections where placing and finishing operations can be completed rapidly. The Assistant Commissioner, Construction or their representative may reduce the total time limit in hot weather or under unusual conditions, if unsatisfactory results are obtained.

(E) TRUCK MIXED CONCRETE

Truck mixed concrete is defined as concrete mixed completely in a truck mixer following the addition of mixing water at the point of deposition. The requirements of Subsection 3.05.8.(D), Transit Mixed Concrete, apply except as modified:

1. Each truck mixer shall have an approved revolution counter located in a position readily visible to the Engineer. The electrical revolution counting device will not be required but it may be used to count the number of revolutions of the drum in the direction of mixing.
2. The loading of the mixers shall be performed in the following manner:
  - a. Regular Truck Mix (cement in contact with moist aggregates). The drum may be rocked or revolved during the charging of coarse and/or fine aggregates with admixtures. Cement shall be charged last and the drum shall be stationary until mixing begins. Mixing shall begin no longer than 30 minutes after cement comes in contact with the aggregate.
  - b. Layered Truck Mix (cement in contact with saturated surface dry or drier coarse aggregate). Fine aggregate with admixtures, coarse aggregate and cement that have been separately batched shall be charged through a hatch in the side of the drum in the following sequence: fine aggregate with admixtures, coarse aggregate and then cement. The drum may be rocked after the addition of each aggregate size and shall remain stationary while charging the cement and until mixing begins. Mixing shall begin no longer

than 90 minutes after cement comes in contact with the coarse aggregate.

3. Mixing shall begin at the point of deposition after the addition of water. The water shall be introduced into the drum either from the head section or by dual injection from both the head and discharge section. The mixing shall continue for a minimum of 100 revolutions or until uniform concrete of the required consistency is produced whichever is longer. The mixing period shall not exceed 15 minutes.
4. The entire load shall be discharged within 30 minutes after mixing has been completed.

## (F) MOBILE CONCRETE MIXING UNITS

A mobile concrete mixing unit, as approved by the Engineer, may be used in miscellaneous work defined as curb, gutter, headwalls, catch basins, manholes, drop inlets, field inlets, sign foundations, lighting structure foundations, anchor units, pullboxes, leveling footings and similar placements.

Each mobile mixing unit shall be self-contained and of the continuous mixing type, capable of carrying sufficient unmixed dry bulk cement, fine and coarse aggregate, water and admixtures to produce on site no less than six (6) cubic yards of concrete.

The mobile mixing unit shall be equipped with proportioning devices which shall deliver the materials within the following tolerances by weight:

Cement	0 to + 4%
Fine Aggregate	$\pm 2\%$
Coarse Aggregate	$\pm 2\%$
Water	$\pm 1\%$
Admixtures	$\pm 3\%$

The amount of cement being introduced into the mix shall be measured by a meter which is clearly visible and kept clean at all times. The quantity of cement shall be recorded by a ticket printer which shall, as a minimum, record the number of revolution counts of the cement feeder.

The mixers shall provide positive control of the flow of water into the mixing chamber. Water flow shall be indicated by a flow meter and be readily adjustable to provide for minor variations in aggregate moisture. The system shall be equipped with a bypass valve or hose suitable to determine batching accuracy.

The mixers shall be equipped with at least one admixture delivery system. Each system shall provide positive control of the flow of admixture into the unit's mix water system. Flowmeters shall be used to control the amount of admixture added to the mix. Admixtures shall be dispensed in a manner that shall ensure uniform distribution of the material throughout the concrete. The system shall be capable of adding admixture in the amounts necessary to achieve the required air content. The system shall be equipped with a bypass valve suitable for obtaining a calibrated sample of admixture to determine batching accuracy. The mixers shall be capable of combining aggregates, cement, water and admixture into a thoroughly mixed and uniform mass. Discharge of the mixture shall be accomplished without segregation.

When mobile mixing units are permitted, no specific mixing time will be required except that the concrete shall be properly and uniformly mixed as determined by the Engineer. All the constituents of concrete manufactured by a mobile mixing unit shall be stockpiled at the project site unless otherwise approved by the Engineer.

The Contractor shall calibrate the mobile mixing unit and shall provide a record of the calibration of the unit to the Engineer for the mix design to be used. The Engineer will furnish the mix design information and the written calibration procedure to the Contractor. The Department reserves the right to witness the calibration of the mixing unit.

Prior to actual use, the Contractor shall demonstrate, to the Engineer, that the concrete meets the specification requirements for slump, air content and

proportioning. Proportioning may be verified in accordance with written Department procedures.

If, in the opinion of the Engineer, improper conditions exist, the conditions shall be corrected as approved by the Engineer. Improper conditions shall include, but not be limited to, hydrated cement deposits and mixing blades which are loose, broken, bent, scalloped, worn 20 percent in any dimension, or heavily caked with mortar.

If the Engineer determines that the mixer unit is not performing satisfactorily, the Engineer may discontinue use of the unit. The Contractor shall provide the necessary scales, containers and personnel approved by the Engineer to perform calibration of the unit.

(G) **SMALL CONSTRUCTION MIXERS**

In work involving small quantities of concrete, the Engineer may permit a small construction mixer. The mixer shall be capable of producing concrete having the specified slump and air content. Any concrete placed under such conditions shall be mixed no less than 90 seconds after all the materials are in the mixer drum.

The use of a small construction mixer shall not be permitted for the flood protection system and marine structures.

**3.05.9. TEMPERATURE OF CONCRETE.**

The concrete at the time of pouring shall be maintained at a temperature of not less than 50° F nor more than 90° F.

When the air temperature exceeds 85° F, the concrete subsequent to initial set shall be protected for three (3) days after pouring so as to prevent it from going above 90° F.

When the air temperature is less than 38° F in the shade the Contractor may submit, to the Engineer for approval, proposed methods for placing and protecting concrete in the cold. At such temperatures concrete shall be poured only with the approval of the Engineer and shall be adequately protected.

If the air temperature falls below 50° F, an accelerator may be used. If the air temperature exceeds 85° F, a retarder may be used. Accelerators and retarders must be approved by the Engineer before use.

**3.05.10. QUALITY CONTROL PROCEDURES.**

The quality control procedures used for on-site inspection, sampling and testing of Portland cement concrete shall conform to those procedures described in the Department's Materials Method 9.2 - Field Inspection of Portland Cement Concrete.

**3.05.11. MEASUREMENT AND PAYMENT**

No separate or additional payment will be made for compliance with the requirements of this Section.

**END OF SECTION**

## SECTION ESCR-4 – MOVABLE TL4 STAINLESS STEEL JERSEY BARRIER

### 4.01.2. INTENT.

The movable barrier system shall be used to protect the floodgates (in their open position) at the floodgate crossings at the northbound and southbound FDR Drive.

### 4.01.3. DESCRIPTION.

The TL4 movable steel barrier system shall be a longitudinal barrier, as defined in the AASHTO Roadside Design Guide, Test Level 4 Steel Barriers and shall be a lightweight, stainless steel, and easily transportable road and bridge barrier system developed to provide full TL4 Minimal Deflection impact protection. A suitable wheel system shall be integrated with the barrier to permit easy removal of the barrier system from the pathway of the floodgates when they need to be deployed. The movable barrier, when anchored into the roadway, shall keep traffic from hitting the floodgate (in its open position). The movable barrier shall meet the criteria set forth for Longitudinal Barriers in the National Cooperative Highway Research Program Report MASH at Test Levels 4.

### 4.01.4. MATERIALS.

- (A) The jersey barrier base shall be stainless steel grade 316.
- (B) HARDWARE  
All steel clamp plates, supports, splice plates, and panels shall be stainless steel grade 316.
- (C) FASTENERS  
All fasteners shall be austenitic stainless steel grade 316 fasteners, A4 quality, resistance class - 80.

### 4.01.5. SUBMITTALS.

- (A) Shop drawings for the barrier system, including all inserts and anchors required on the roadway.
- (B) Certification that the barrier system provides impact protection for TL4.

### 4.01.6. DESIGN.

- (A) BARRIER  
The movable barrier system shall be meet the performance specified herein and the dimensional requirements on the Contract Drawings. The movable barrier shall meet the criteria set forth for Longitudinal Barriers in the National Cooperative Highway Research Program Report MASH at Test Levels 4 and provides full TL4 Minimal Deflection impact protection  
  
The movable barrier shall be a longitudinal barrier composed of standard segment lengths (no longer than 20 ft) with a total height of 50.5 in. (including a 12 in. high top rail attachment) and a base width of 19 in. Each barrier segment shall be designed so that it can be easily disconnected from adjacent barrier segments facilitating replacement of damaged sections of the barrier. Each barrier segment shall have the ability to be removed individually without having to remove adjacent barriers from the beginning or end of the barrier run.

In case of a vehicle impact into the barrier, the barrier shall be designed so that the impact energy will dissipate while also minimizing the forces experienced by the surface it is attached to.

The barrier profile dimensions shall be between the conventional dimensions of a New Jersey shape and F-shape barrier with a system height of 50.5 in.

The barrier system shall weigh no more than 65 lbs per foot without its wheel system and require no through deck anchoring.

The front part of the barrier segment shall be an edged steel plate with a minimum thickness of 0.10 inches. The base of the steel barrier segments shall be attached to the concrete surface by means of a minimum of 2 connecting anchors. The 2 connecting anchors shall screw into a recessed flush mounted canister that is embedded and bonded into the concrete roadway surface. The canister shall be sized for the intended loads on the barrier.

The front of the barrier shall have two horizontal corrugations to reinforce the barriers torsional rigidity strength and to provide energy absorption during impacts by allowing the corrugations to flatten.

The barrier segment shall have easy access ports to allow for anchoring the barrier to the surface as well as for connecting and disconnecting adjacent barrier segments.

Each barrier shall have two 12 in. tall pedestals attached to the top of each standard steel barrier segment. Individual pipes, approximately 236 in. in length and 3 in. in diameter, shall be screwed in place through the pedestal top into a connecting sleeve allowing for the tube to form a continuous lineal run along the top of the barrier. The tube shall function as an additional reinforcement keeping vehicles in an upright position during and collision reducing the vehicles intrusion into the opposite side of the barrier and or reduce the risk of collision with a fixed object behind the barrier.

(B) **WHEEL ASSEMBLY**

The barrier shall be equipped with a mechanical scissor lift wheel assembly allowing the barrier to be lifted using a cordless drill with attached  $\frac{3}{4}$  in. socket or a manual crank /jack handle.

The lifting mechanism shall be concealed behind the barrier. The front of the barrier shall have ports that open allowing the wheel assembly to open up and extend the scissor lift out and lift the barrier up off the ground once the pillar bolts are removed. When the barrier is lifted, the wheel assembly shall allow the barrier to be easily relocated by manually pushing or pulling the barrier.

The barrier sections shall have two scissor wheel assemblies at each end of the barrier. The wheel assembly shall be designed so that one person may be able to manually lift the barrier allowing for displacement. Maximum length of barrier section with wheel assemblies is 20 ft.

**4.01.7. METHODS.**

The barrier system shall be assembled and installed in accordance with the manufacturer's instructions.

Manufacturer of the barrier system shall provide the necessary training and instructions for the operation of the barriers to the agency responsible for the maintenance and operation of the barrier system.

Manufacturers: MDS Barriers, or approved equal.

**4.01.8. MEASUREMENT.**

The quantity of barrier to be measured for payment shall be the number of linear feet, measured to the nearest tenth (0.1) of a foot, of the actual barrier, installed to the satisfaction of the Engineer. No payment or allowance will be made for barriers placed beyond the limits specified or any hardware that may extend past the face of the barrier.

**4.01.9. PRICE TO COVER.**

The contract unit price shall cover the cost of all labor, materials, plant, equipment, insurance, samples, training, and incidentals required to furnish and install the movable barrier, complete, in full compliance with the requirements of the specifications.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-4	MOVABLE TL4 STAINLESS STEEL JERSEY BARRIER	L.F.

**END OF SECTION**

**SECTION ESCR-4.06 – CONCRETE IN STRUCTURES**

**4.06.01 INTENT.**

This section describes Concrete in Structures to be used in the esplanade, cut-off wall, floodwall, floodgate foundations, Williamsburg Bridge security bollards and wall, light pole foundations, retaining walls, retaining wall foundations, seatwall foundations, seawall cap, and other miscellaneous park walls, curbs, seatwalls and features.

**4.06.02 DESCRIPTION.**

Concrete in Structures under this section shall refer to all concrete in structures and park features excluding steel faced-curbs, sidewalks, approach slabs, and base for pavement of city roadways within the project area. Finish, color and design shall be as specified.

**4.06.03 MATERIALS.**

- (A) Concrete for deposit as a concrete structure shall comply with the requirements of Section ESCR-3.05, Concrete, and be of the class, type and method of mixing specified. Coarse aggregate shall be of the type, grade, size number and nominal size specified. Rubble aggregate shall be used when specified or shown on the Contract Drawings.

Where concrete is specified to be lightweight, the aggregate shall be in conformance with the requirements of ASTM designation C 330, Lightweight Aggregates for Structural Concrete, and the Contractor shall design the mix for a unit weight of one hundred and twenty (120) pounds per cubic foot.

- (B) The following concrete classes, as described in ESCR-3.05, Concrete shall be used unless otherwise noted on the plans and details:

Element	Concrete Class
Park features (retaining walls, park walls, curbs, and other misc. features)	A-40
Retaining wall along the FDR Drive, Seatwalls	A-40
Floodwall and flood gate column/foundations, and Williamsburg Bridge Concrete security wall	Flood protection system
Esplanade (Cut-off walls, esplanade pile caps, decking, retaining walls, planks/girders, light pole foundations, and other misc. structural elements on the esplanade)	Marine or Esplanade structures
Utility crossing and gate seepage wall closure pours	B-32

- (C) Concrete reinforcement shall comply with the requirements of the following sections:

Steel Bars--Section 2.23

Welded Steel Wire Fabric--Section 2.25

Kind of reinforcement, size and placement shall be as specified and as shown on Contract Drawings. Reinforcement shall be installed in accordance with the requirements of Section ESCR-4.14 Steel Reinforcement in Concrete.

- (D) Elastic Type Concrete Expansion Joint Sealer shall comply with the requirements of Section 2.22, type as specified.
- (E) Prefomed Expansion Joint Filler shall comply with the requirements of Section 2.15, type as specified.

#### **4.06.04 SUBMITTALS**

##### **(A) CONCRETE MIX DESIGN**

Concrete mix design with product and test data demonstrating compliance with Section ESCR-3.05, Concrete.

Concrete mix design shall indicate strength and type of concrete; materials, type, brand and amounts of material constituents, including but not limited to cement, pozzolans, admixtures and applicable reference specifications.

Re-qualifications of materials or mix proportions required as a result of changes, test failures, or failure to gain initial approval for any reason.

##### **(B) CERTIFICATES**

1. Cement – supplier’s certified mill reports for cement produced within 30 days of the project start date and every other mill report thereafter throughout the project.
2. Fly Ash – supplier’s certified mill reports for fly ash produced within 60 days of the project start date and every other mill report thereafter through the project finish date.
3. Slag – supplier’s mill reports for fly ash produced within 60 days of the project start date and every other mill report thereafter through the project finish date.
4. Admixtures – manufacturer’s letter of certification, signed by a duly authorized manufacturer’s representative, dated not less than 30 days from the project start date, and manufacturer’s product data
5. Aggregate – supplier’s test reports generated within one year of the project start date showing evaluation and compliance of product in accordance with the specification requirements of ASTM C33.
6. Water – supplier’s test reports generated within three months of the project start date showing evaluation and compliance of product in accordance with the specification requirements of ASTM 1602.
7. Certified test reports for field cured cylinders, as required for removal of forms
8. Certified test reports for cores and/or load tests
9. Manufacturers’ certification of compliance with specified materials and products
10. Mill Test Certificates for steel reinforcement
11. Certified Test Data and reports for materials and compressive strengths of mix designs

##### **(C) CONCRETE PLACEMENT PLAN**

Concrete placement plan, including procedure for bending or straightening reinforcement in the field, plan for mixing, transporting, conveying, placing, finishing, and curing concrete, procedure for placement of concrete underwater, procedure for repair of defects, and mechanical splicing procedures.

## (D) SHOP DRAWINGS

1. Shop Drawings and required structural computations for formwork for elevated beams and slabs as applicable.
2. Plans and procedures for reshoring.
3. Shop Drawings for Steel Reinforcement.
4. Shop Drawings for concrete park feature elements. Shop drawings shall include:
  - a. plans, elevations including weep hole location for entire length of wall including all radial sections, sections, details, anchoring and connecting hardware, finishes, skateboard abatement, construction joints, expansion joints and waterstops. Details shall indicate all edge corners including bullnose radii. Detail custom conditions at all radial walls.
  - b. Shop drawings to include but not limited to the following locations: Concrete Stair – 10th Street Playground, Outdoor Classroom Seating – Fire Boat House, CIP Concrete Amphitheater Stage, CIP Concrete Wall at Amphitheater, CIP Concrete Wall at Baseball Backstop, CIP Concrete Retaining Wall at Fire Boat House, CIP Concrete Retaining Wall at Maintenance Yard, CIP Concrete Retaining Wall at Maintenance Yard – Low Height, CIP Concrete Retaining Wall at 10th Street Playground, and CIP Concrete Retaining Wall at North Park Entry.
5. Locations of Construction Joints, expansion joints, and waterstops.
6. Engineer's approval of Shop Drawings shall not relieve the Contractor of the responsibility for any errors, or for furnishing materials of the proper size, quality and quantity.
7. Locations of conduit runs, pipes, and all other inserts or openings in concrete elements.
8. Record Drawings

## (F) TEST AND SAMPLING DATA

Provide all test and sampling data as per Section ESCR-3.05, Section 5.02, and specified herein.

## (G) MOCK-UP FOR CONCRETE WORK FOR PARK FEATURES:

After all samples, product data, and the shop drawings are approved, construct mock-ups for the locations listed below in a location approved by the Engineer and as described below.

Mock-up locations are as follows:

1. Concrete Stair – 10th Street Playground
2. Outdoor Classroom Seating – Fire Boat House
3. CIP Concrete Amphitheater Stage
4. CIP Concrete Wall at Amphitheater
5. CIP Concrete Wall at Baseball Backstop
6. CIP Concrete Retaining Wall at Fire Boat House
7. CIP Concrete Retaining Wall at Maintenance Yard
8. CIP Concrete Retaining Wall at Maintenance Yard – Low Height
9. CIP Concrete Retaining Wall at 10th Street Playground

## 10. CIP Concrete Retaining Wall at North Park Entry

Mock-ups shall consist of the following:

- Foundation of a size and reinforcement adequate to support the work at the designated location.
    - Scope of Mock-up:
      - One vertical construction joint in wall.
      - Include any embeds as they would be required for wall construction and cast-in elevation markings as shown on Drawings.
      - Include typical wall elevation and transition and any jointing necessary for the transition
      - Include typical step down wall
  - Reinforce as in a similar detail on the drawings and add necessary reinforcing and/or supports to maintain stability of the mockup.
  - Use approved reinforcement and accessories and assemble formwork using methods as intended for construction and to achieve the specified requirements.
  - Place concrete with methods to be used in construction, including anticipated time delays between placements. Place concrete to achieve the specified requirements.
  - Finish exposed surfaces of the walls with specified finish treatments when directed by the Engineer.
  - Use approved concrete design mixes, inclusive of specified admixtures, for the mock-ups as will be used in the construction of the formed surfaces.
- If mock-ups do not meet the specified quality and are not approved, remove and replace in full or in part at no additional cost. Mock-ups shall be located so they will remain throughout construction. Protect mock-up from damage. Remove mock-up only when directed by the Engineer.

### 4.06.05 DESIGN AND CONSTRUCTION OF FORMS.

- (A) Forms shall accurately conform to the shape, lines and dimensions of the structure for which they are required, be substantial and sufficiently tight to prevent leakage of mortar, and have, unless otherwise specified by the Engineer, moldings or chamfer strips at angles. They shall be of adequate strength and be braced or tied together with approved ties and spacers, so as to maintain position and shape, and to insure the safety of workmen and passersby, be clean and free from sawdust, chips, dirt, ice and other objectionable materials. Forms shall present smooth, true surfaces to the concrete placed against them, having temporary openings where necessary, to facilitate cleaning and inspection immediately before concrete is deposited. Forms shall be coated with non-staining oil before the reinforcement is placed, or be wetted except in freezing weather.
- (B) Except in cases of curved, special, and exposed surfaces, the lumber for concrete forms, after being planed, shall be not less than one and one-sixteenth (1-1/16") inches in actual thickness, shall be dressed on both surfaces, shall be tongued and grooved and shall be constructed so as to produce mortar tight joints. Plywood or other approved material shall be used on all exposed concrete surfaces, and lumber used in conjunction with it may be less than one and one-sixteenth (1-1/16") inches, if approved by the Engineer.

- (C) The metal used for forms shall be of such thickness that the forms shall remain true to shape. All bolt and rivet heads shall be countersunk. Clamps, pins, or other connecting devices shall be designed to hold the forms rigidly together and to allow removal without injury to the concrete. Metal forms which do not present a smooth surface or line up properly shall not be used. Special care shall be exercised to keep metal forms free from rust, grease, or foreign matter, such as will tend to discolor the concrete.
- (D) If required, the Contractor shall submit details of the forms the Contractor proposes to use to the Engineer for approval before the Contractor starts their construction.
- (E) Any metal ties or anchorages which are required within the forms to hold them to correct alignment and location shall be so constructed that the metal work can be removed to a depth of at least one (1") inch from the face surface of the concrete without injury to such surface by spalling or otherwise. Wire ties shall not be used unless permitted by the Engineer. All cavities produced by the removal of metal ties shall be filled carefully with a mortar of fine aggregate and cement in the proportion that has been employed for the particular class of concrete treated and the surface left smooth and even and uniform in color.

#### **4.06.06 EXPANSION JOINTS AND WATERSTOPS.**

Expansion and construction joints shall be provided of the shape, in the manner, and at the intervals required as shown on the Contract Drawings.

When concrete is to be placed against a joint filler, holes or joints in the filler shall be suitably filled with mastic to prevent mortar or concrete from entering the joint and restricting its movement. The face edges of all joints shall be carefully finished or formed true to line and elevation for a minimum distance of 2 in. back from all exposed surfaces.

When caulking compound is used to seal a joint containing premolded bituminous joint fillers, a layer of an approved type of pressure-sensitive release tape shall be placed between these materials due to incompatibility.

Waterstops shall be installed in the the joints of floodwalls and esplanade walls to provide for expansion and contraction movements at joints. Place waterstop at all joints exposed to view, as shown on the Contract Drawings, or as directed by the Engineer. Waterstop shall be polyvinyl chloride or other approved flexible material, or the type indicated on the Contract Drawings. The waterstop shall extend at least 3 inches into the concrete on each side of the joint, shall be joined continuous and watertight, and shall be carefully protected from damage until covered by concrete or backfill.

#### **4.06.07 CONVEYING.**

##### **(A) LOSS OF INGREDIENTS**

Concrete shall be conveyed rapidly from the job-mixer or transporting vehicles to the place of final deposit by approved methods which will prevent loss of ingredients.

##### **(B) CONVEYORS**

Concrete shall be conveyed by chutes, pipes, buckets, tremies, buggies, wheelbarrows, or other approved conveyors.

(C) CLEANING

When required, all conveyors shall be thoroughly cleaned and flushed with water which shall not fall on concrete in place.

(D) CHUTES

Chutes shall be of metal or metal-lined. They shall have a slope not flatter than one vertical to two horizontal and shall deliver concrete in a practically continuous flow. Concrete shall be discharged into hoppers when the depositing is intermittent.

(E) LONG CHUTES

The use of long chutes is prohibited (a) generally, unless permitted under circumstances and in accordance with conditions prescribed by the Engineer, and (b) specifically, when the concrete is incorporated in structures which will be subject to salt water action.

(F) PIPES

When concrete is conveyed through pipes, the pipes shall be kept full of concrete and have discharge ends kept buried in the fresh concrete, unless otherwise permitted.

(G) BOTTOM DUMP BUCKETS

When concrete is placed by means of a bottom dump bucket, the buckets shall have a capacity of not less than one-half (1/2) cubic yard. In depositing concrete from such a bucket, the bucket shall be lowered gradually and carefully until it rests upon the concrete already placed. It shall then be raised very slowly during the discharge travel.

(H) BUGGIES OR WHEELBARROWS

Buggies or wheelbarrows shall travel on runways which have smooth surfaces.

**4.06.08 DEPOSITING.**

(A) DEPOSITING ON SURFACES

Concrete shall be deposited on surfaces free from standing water, dirt, shavings, sawdust, ice or other undesirable matter. Where necessary to deposit on set concrete, the set concrete shall be roughened, cleaned, washed and freshly coated with neat cement grout. Concrete shall be deposited at points and by methods which will minimize rehandling, prevent flowing, and obviate the necessity of working along forms. In sections confined by temporary vertical bulkheads, the concrete shall be deposited in a continuous operation until the section is completed. No drop shall exceed five (5') feet. It shall be deposited by methods which will release entrapped air and produce a dense, compact mass. Concrete shall not be deposited on ground which is in a muddy or frozen condition.

(B) DEPOSITING UNDER WATER

For concrete to be deposited under water, the cement content shall be increased by ten (10) percent over that indicated for the class and type of concrete specified.

Concrete shall not be deposited in water if it is practicable to deposit in air. No concrete shall be deposited in water having a temperature below thirty-five (35<sup>o</sup>) degrees Fahrenheit, unless permitted by the Engineer.

Concrete for deposit under water shall be conveyed by means of tremies or other approved methods.

When deposited by tremie method, the tremie shall be water-tight and sufficiently large to permit free flow of concrete. The discharge end shall be kept continuously submerged in the concrete and the shaft kept full of concrete.

(C) DEPOSITING IN FORMS

Unless specifically authorized to place concrete under water, there shall be no water in the forms at any time any concrete is deposited therein, and the work of depositing shall be kept well above the level of any rising water so that there will be no danger of entrance of water into the forms until the concrete is in place.

Concrete shall be deposited in continuous horizontal layers, each of which shall be placed before the one below has set and from which laitance and excess water shall be removed in such a manner that successive layers will be thoroughly bonded together to eliminate planes of separation between layers and prevent seepage of water.

Special care shall be taken to fill each part of the forms by depositing concrete directly as near final position as possible, to work the coarser aggregates back from the face and to force the concrete under and around the reinforcement bars without displacing them. After the concrete has taken its initial set, care shall be exercised to avoid jarring the forms or placing any strain on the ends of projecting reinforcement.

(D) DEPOSITING IN FORMS FOR FLOODWALL

Concrete for the floodwall monoliths shall be placed in one continuous pour, unless shown to be staged or otherwise noted on the Contract Drawings. Vertical and horizontal construction joints shall not be permitted in the floodwall monoliths, unless approved by the Engineer. Where construction joints cannot be avoided, a waterstop shall be installed in the joint and as approved by the Engineer.

(E) COMPACTING CONCRETE

Unless otherwise permitted by the Engineer, all concrete, during and immediately after depositing, shall be compacted thoroughly by means of internal vibrators, supplemented by spades, slicing rods, forks or treading. The concrete shall be worked thoroughly around the reinforcement and around embedded fixtures and in the corners of the forms. The operation of compacting the concrete shall be conducted so as to form a compact, dense, impervious, artificial stone which shall show a smooth face on exposed surfaces. Porous, plastered or defective concrete, shall be removed and replaced as directed by the Engineer, entirely at the Contractor's expense.

Vibrators shall be of sturdy construction, adequately powered and capable of transmitting to the concrete not less than 3,000 nor more than 5,000 vibrations per minute when operating under load. The vibration shall be sufficiently intense to cause the concrete to flow or settle rapidly into place and visibly affect the

concrete over a radius of at least eighteen (18") inches when used in a concrete having a one (1") inch slump.

Either electric or mechanical internal vibrators approved by the Engineer may be used.

When vibrators are used, at least one vibrator for every ten (10) cubic yards of concrete placed per hour shall be in use at all times. In addition to these, at least one extra vibrator shall be at hand for emergency use.

The vibration shall be of sufficient duration to accomplish thorough compaction, but shall not be prolonged to a point where segregation occurs. Internal vibrators shall be applied close enough to the forms to vibrate the surface concrete effectively, but care shall be taken to avoid hitting the forms sufficiently to damage them. In the use of the vibrators care shall be taken not to cause vibration of concrete in which initial set has taken place.

#### **4.06.09 CONCRETING DURING RAINFALL.**

During periods of rainfall, concrete may be placed only if permitted by the Engineer, and under conditions where the required water-cement ratio can be maintained.

The placing of concrete during wet weather will not relieve the Contractor of any responsibilities under this contract.

#### **4.06.10 CARE OF CONCRETE DURING COLD WEATHER.**

During air temperatures below 38<sup>o</sup> F. in the shade, concrete in structures shall, where required, be maintained in an atmosphere of not less than 50<sup>o</sup> F., for at least five (5) days after placing or until the concrete has thoroughly hardened, and sufficient protective coverings, fuel and heating equipment shall be furnished, installed, operated and maintained to secure the required temperature conditions without injury to the concrete.

#### **4.06.11 SURFACE CURING AND PROTECTION.**

All surfaces of concrete shall be protected from injury and horizontal surfaces shall be cured in compliance with the requirements of Section 2.14, Curing Materials, Type 1-D, Clear.

From the moneys due to the Contractor, under this item, the sum of ten (10) dollars will be deducted for each square foot of horizontal surface which the Contractor does not cure, as herein required.

#### **4.06.12 REMOVAL OF FORMS.**

Forms shall not be removed until the concrete has hardened sufficiently, and the removal shall be carried out in such a manner as to insure the complete safety of the structure. In no event however shall forms be removed in less than three (3) days, unless approved by the Engineer. The Contractor shall be responsible for all damage or injury resulting from the removal of forms.

#### **4.06.13 SURFACE FINISH.**

##### **(A) SAMPLE SLABS**

The Contractor shall, where required, submit for approval sample concrete slabs of desired sizes, exhibiting the surface finishes required that the Contractor proposes to furnish. Exposed surfaces of structures shall be finished, as required, to present appearances equal to those of samples on file in the office of the Engineer.

**(B) VOIDS**

The work of finishing shall not be started until all voids are filled with mortar of the same ingredients and proportions as used in the concrete.

**(C) FLOAT, RUBBED AND SCRUBBED FINISHES**

Forms shall be removed as early as possible to expose concrete while it is green (set but not hardened).

Float finish surfaces shall be finished smooth and true by means of wooden or steel floats and have edges, including those of joints, rounded or chamfered.

Rubbed finished surfaces shall be thoroughly wetted, be finished smooth and true by means of carborundum or other abrasive blocks, and have lather working up on the surface removed by brushing and washing. Only water shall be used in finishing. Scrubbed finished surfaces shall have the coarse aggregate uniformly exposed by scrubbing with wire brushes and water. Muriatic acid shall, where required, be added to the water in proportion of one to five (1:5), and be entirely removed with clean water when the desired finish is obtained.

**(D) POINTED AND BUSH-HAMMERED FINISHES**

Thoroughly cured concrete surfaces shall be dressed with tools to a uniform texture of an even face. The tools ordinarily used are electric, air, or hand tools, giving various textured surfaces such as hand-tooled, rough or fine pointed, crandalled or bush-hammered as specified.

**(E) FLOODWALL FINISH**

Finish for exposed faces of the floodwall shall be as specified on the Contract Drawings.

**(F) SURFACE FINISHES FOR PARKS FEATURES**

Unless otherwise indicated on plans all concrete sidewalks shall have a light broom finish that is non-slip, directional finish perpendicular to path of travel.

Unless otherwise indicated on contract plans, curbs and walls with exposed faces and sides shall be rubbed smooth with carborundum bricks to the satisfaction of the Engineer. Mock up shall include example of this rubbed finish.

**4.06.14 REPAIRS****(A) GENERAL**

Surface defects and tie holes shall be repaired, as specified hereinafter, within 24 hours after removal of forms, unless otherwise approved by the Engineer. Ambient air temperature, and temperature of the concrete and repair mortar shall not be lower than 50 degrees F nor higher than 90 degrees F during repair and curing.

Defects determined by Engineer to exceed surface defects (e.g., defects that extend to a depth such that reinforcing steel is exposed) shall be repaired in accordance with procedures approved by Engineer. Contractor shall submit relevant defect repair procedures.

**(B) REPAIR OF DEFECTIVE AREAS**

All honeycombed and other defective concrete in surface defects shall be removed down to sound concrete. As required, edges shall be chipped perpendicular to the

surface, or slightly undercut; no feather-edges will be permitted. The area to be patched, and an area at least six inches wide surrounding it, shall be dampened to prevent absorption of water from the patching mortar. Bonding grout, consisting of one part cement to one part fine sand (passing a No. 30 sieve) mixed to a consistency of thick cream, shall be well brushed into the surface to be patched after surface water has evaporated from the area.

Patching mixture shall be made from the same materials as the concrete; mix shall be not more than one part cement to two and one-half parts sand by damp loose volume. White portland cement shall be substituted for a part of the gray portland cement on exposed surfaces to match the surrounding concrete; color match shall be determined by a trial patch. Mixing water, for patching mixture shall be no more than necessary for handling and placing. Patching mixture shall be at the stiffest consistency that will permit placing.

Patching mixture shall be applied when the bond coat begins to lose its water sheen. Mixture shall be thoroughly consolidated into place and struck off so as to leave the patch slightly higher than the surrounding surface. Patch shall be left undisturbed for at least one hour, to permit initial shrinkage, before final finishing. Patched area shall be kept damp for seven days. Metal tools shall not be used to finish a patch in a formed surface that will be exposed.

Other materials for adhesion or patching, including latex-modified portland cement mortar and epoxy mortars and compounds, shall be subject to prior approval by Engineer and shall be used in accordance with manufacturer's recommendations.

(C) TIE HOLES

Unless stainless steel, noncorrosive, or Engineer-approved coated ties are used, tie holes in surfaces not to be exposed in the finished Work shall be cleaned, thoroughly dampened, and filled solid with patching mortar. Procedures and materials for plugging tie holes in surfaces to be exposed in the finished Work shall be as approved by Engineer.

(D) REMOVAL OF STAINS AND SURFACE DEPOSITS

Stains, rust, efflorescence, and surface deposits considered objectionable by the Engineer, shall be removed as approved by the Engineer.

**4.06.15 MEASUREMENT.**

In determining the volume of concrete to be paid for, deductions will be made for the spaces occupied by pile heads, timbers and drains. Deductions will not be made for the spaces occupied by steel reinforcement, structural steel or water-proofing. Other deductions will or will not be made, as specified.

The measured volume of concrete will be adjusted for payment in accordance with the strength requirements under the NYCDOT Standard Highway Specifications Section 5.04.

**4.06.16 PRICE TO COVER.**

The contract price per cubic yard for Concrete for Structures, Class A-40, Lightweight Concrete in Structures, Class A-40, Concrete for Structures, Class A, Concrete for Floodwall and Gates, Concrete for Marine/Esplanade Structures, and Concrete for Utility Crossings and Gate Seepage Wall Closure Pours, measured in place, except such concrete as otherwise paid for, shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish and construct the concrete structure complete in full compliance with the requirements of the

specifications, exclusive of steel reinforcement, and to furnish such samples for testing and to provide such testing equipment, laboratory space and facilities as may be required. All joints, waterstops, and sealants shall be included in the contract price.

The contract price per cubic yard for concrete placed underwater shall include the cost of the additional ten (10) percent of cement used for such concrete.

The contract price per cubic yard for Concrete for Park Features, measured in place, shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish and construct the concrete for park features, stairs, stage, walls, curbs and seatwalls complete in full compliance with the requirements of the specifications, exclusive of steel reinforcement, and to furnish such samples for testing and to provide such testing equipment, laboratory space and facilities as may be required. All joints, mock ups, waterstops, and sealants shall be included in the contract price.

*Payment will be made under:*

**END OF SECTION**

## SECTION ESCR-4.11 – EXCAVATION AND FILLING

### 4.11.1 INTENT.

This section describes Excavation and Filling necessary for the construction of the floodgates, floodwall, esplanade, cut-off wall and anchoring system, Williamsburg Bridge security system, and the raising of East River Park.

### 4.11.2 DESCRIPTION.

- (A) The location, general character and essential details shall be as specified and as shown on the Contract Drawings.
- (B) Earth excavation shall include the removal and disposal of material of whatever nature encountered in the performance of the work, unless otherwise specified. Materials of whatever nature encountered shall be defined as including, but not be limited to, soil, stones, soft weathered rock that can be removed by mechanical means other than air hammer or drilling and blasting, and miscellaneous fill (excluding contaminated materials, debris and building demolition material consisting primarily of large wooden objects, plastic, asphalt shingles, metals, etc.) which is not classified as rock excavation or contaminated or hazardous wastes that materially affect the cost of removal and disposal to the Contractor.

Earth excavation shall not include the cost of excavation and disposal of boulders or parts thereof more than one-half (1/2) cubic yard in volume (to be measured by multiplying the maximum cross section area by seven tenths (7/10) of the length of that which is to be removed) in open cuts, rock as defined in Subsection 4.11.2.(C), materials which must be removed and disposed of as contaminated material or hazardous waste, manmade objects or structures not shown on the Contract Drawings or indicated in the specifications, that could not reasonably have been anticipated by the Contractor, were not anticipated by the City, and which materially affect the cost of excavation and disposal to the Contractor. Excavation and disposal of said materials will be paid for under other contract items where anticipated by the City or will be paid for as "Extra Work", under Article 26 of the Standard Construction Contract, where the City deems the Contractor could not have reasonably anticipated the existence of such materials that significantly affects the Contractor's costs of removal and disposal.

The dismantling and removal of the existing street lights, traffic signals and fire alarms will be done by the various departments having jurisdiction, except as otherwise provided. The existing foundations for these facilities shall be removed by the Contractor to a plane two (2') feet below subgrade and such removal will be measured for payment under Earth Excavation.

- (C) Rock Excavation shall include only the removal and disposal of unbroken ledge rock in its original formation which cannot be removed by ditching machines, ripper, rock plow, backhoe, or other mechanical means and which can only be removed by air hammers or by blasting, drilling or plug and feather in order to insure the prompt and proper performance of the work. It is not intended to cover softer rock formations encountered which can be removed by mechanical means other than air hammer or drilling and blasting.
- (D) Grade shall mean the plane or planes through the tops of both curb lines.

- (E) Rock subgrade for roadway area shall mean a plane two (2') feet below and parallel to grade and two (2') feet wider on each side than the roadway. Rock subgrade for sidewalk area shall mean a plane one (1') foot below and parallel to grade. Rock subgrade for structures shall be to the depths required for the cradle and foundation of the structure.
- (F) Filling shall include the furnishing, re-use, placement and compaction of approved material required. Filling shall be by Place Measurement or Vehicle Measurement, as specified.
- (G) Excavation in earth for the footings of structures shall be carefully conducted so as to approach the neat lines as closely as possible without disturbing the underlying soil and hand excavation shall be used within the last twelve (12") inches. Under no circumstances shall any backfilling material be placed upon surfaces to be used as foundation for footings. Where, in the opinion of the Engineer, the slope of existing rock surfaces requires it, rock shall be suitably benched to give full and proper bearing to concrete in accordance with the directions of the Engineer. Rock surfaces shall be cleaned and if necessary washed before concrete is poured.
- (H) All excavation and backfilling required for the installation of Sewers and Water Mains shall be done under the appropriately scheduled items in accordance with the requirements of the NYC Department of Design and Construction, Division of Infrastructure, Standard Sewer Specifications and Standard Water Specifications.

#### **4.11.3 SUBMITTALS**

##### (A) PRODUCT DATA

Materials list of items proposed to be provided under this Section, including but not limited to, the following:

General Fill; including details of all sources of imported soil, fill or other material

Select Granular Fill; and

Lightweight Fill, including manufacturer test data and certification that the lightweight fill meets the specified properties.

##### (B) CERTIFICATES

Submit certificate stating that all materials and procedures meet or exceed the specified requirements of this Section.

##### (C) REPORTS

Tests of gradations, liquid limit, and plasticity index of fill and backfill materials.

Tests of maximum dry density or maximum index density.

Settlement monitoring results.

#### **4.11.4 MATERIALS FOR FILL AND BACKFILL.**

##### (A) GENERAL

All material for fill or backfill shall have a moisture content close to the optimum moisture content as determined by the Modified Proctor Test conducted in accordance with ASTM D1557.

All material for fill or backfill shall be natural or man-made materials, free of deleterious materials, and free from frost at the time of placement.

Miscellaneous fill material removed from trenches and excavations shall not be considered as acceptable backfill material unless found to be in compliance with these specifications and approved in writing by the Engineer. The project site subsurface conditions may consist partially of variable thickness layers of unsuitable material. This material may not be considered to be acceptable backfill material as described herein, or as determined by the Engineer.

Unless otherwise approved by the Engineer, the Contractor shall import only fill material that meets one of the following environmental criteria. If there is a conflict between the Remedial Action Plan (RAP) and this Section, the more stringent criteria shall apply.

- (a) Virgin quarried material.
- (b) NYSDOT-spec Recycled concrete aggregate (RCA), contains less than 10% fines and no asphalt, from facilities permitted or registered by NYSDEC.
- (c) Material from a facility that possesses a current Beneficial Use Determination (BUD) from the NYSDEC that includes testing at a minimum frequency of one sample per 1,000 cubic yards and such results are below the lower of the Restricted Residential and Groundwater Protection SCOs set forth in NYSDEC 6 NYCRR Part 375. Any testing shall be conducted in accordance with Part 3.2.F.
- (d) Material from any other site where testing results performed by the Engineer demonstrate that the material meets the lower of the Restricted Residential and Groundwater Protection SCOs set forth in NYSDEC 6 NYCRR Part 375 in accordance with the following procedures:
  - 1) Contractor shall establish at the facility a designated stockpile of soil intended for import to the site. Designated stockpile shall remain undisturbed until tested by the Contractor and loaded and transported to the site.
  - 2) The samples will be analyzed for Target Compound List (TCL) volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, PCBs, and Target Analyte List (TAL) metals, at a frequency of one composite sample per 1,000 cubic yards. NYCDEP must approve of a lower frequency for certain sources.
  - 3) Laboratory analysis and approval of samples may require five (5) to ten (10) business days.
  - 4) Material may not be imported for use as without prior approval by the Engineer.
- (e) Material from the New York City Office of Environmental Remediation Clean Soil Bank.

## (B) FILL AND BACKFILL

Filling and Backfilling materials shall have a composition of inorganic soil, blasted or broken rock, and similar materials of natural or man-made origin, including mixtures thereof, shall be considered suitable materials provided it is free of shale or other soft, poor durability particles.

Glass from recycling facilities that meets the requirements of Subsection 4.11.4.(E) for Glass shall be considered suitable material for mixing with fill provided the Contractor maintains the gradations specified herein and as approved by the Engineer. However, glass shall not be placed in contact with synthetic liners, geogrids, geotextiles or other geosynthetics.

Glass incorporated into fill shall be thoroughly mixed with other suitable material so that glass constitutes no more than 30 percent by volume anywhere in the fill as visually determined by the Engineer.

The Fill and Backfill material shall meet the following gradation:

<u>U.S. Sieve Size</u>	<u>Percent Passing</u>
4 inch	100
2 inch	75 to 100
No. 4	22 to 66
No. 40	5 to 15
No. 200	0-2

Fill and Backfill, as specified above may be used up to 3 ft from finished grade or the bottom of the horticultural fill layer, where specified on the Contract Drawings. The upper 3 ft of fill material (below the finished grade or horticultural fill layer) shall meet the requirements of the Select Granular Fill, as defined below.

The Contractor may use, as fill, that portion of the excavated material conforming to these specifications. However, all materials used for fill shall be free from organic material and other unsuitable material. The only exception would be the allowable contamination of recycled glass.

Excavated materials not complying with the above specifications shall be considered unsuitable for fill and shall be removed from the job site to an approved disposal site.

## (C) SELECT GRANULAR FILL

Select Granular Fill shall be a natural, well graded sand and crushed stone or approved clean earth of low silt and clay content, free from bricks, blocks, excavated pavement materials and debris, stumps, roots and other organic matter, as well as ashes, oil and other perishable or foreign material. All materials furnished under this item shall meet the following gradation:

<u>U.S. Sieve Size</u>	<u>% Passing</u>
2 inch	100
1 inch	85 to 100
1/2 inch	70 to 100
No. 4	50 to 80
No. 10	25 to 55
No. 20	11 to 30
No. 40	6 to 17
No. 60	4 to 12
No. 100	3 to 8
No. 200	0-2

Select granular fill for trench backfill material shall be well graded soil meeting the above gradation requirements, but not contain particles greater than ¼ inch in maximum dimension. The finest content (material passing the No. 200 sieve) shall not be greater than 2%.

(D) PROCESSED FILL

If approved in writing by the Engineer, excavated material determined to be unsuitable for fill may be processed (i.e. screened and/or crushed) to produce select granular fill material or fill material. Such processed materials for backfill must be in compliance with the material specifications herein for either Select Granular Fill or for Fill, as required. No separate or additional payment will be made for the cost of all labor, materials, plant, equipment, samples, tests and insurance necessary or required to perform this processing work. Payment for the costs of all labor, material, equipment and insurance necessary and required to furnish and deliver, and to place, compact, sample and test these processed acceptable backfill materials shall be in accordance with Subsection 4.11.7(C). (Excavated material that is hand groomed and/or groomed with the use of excavating equipment of bricks, blocks, pavement materials, debris, stumps, roots, stones, boulders, timber, wood, etc., so as to render the excavated material acceptable for backfill, whether ordered by the Engineer or at the Contractor's own discretion, shall not be considered as processed material but shall be considered as approved excavated suitable material. No separate or additional payment will be made for the use of this groomed excavated material as backfill, the cost of all labor and material shall be deemed included in the prices bid for all contract items of work.)

(E) GLASS

Glass shall be crushed to a maximum particle size of 3/8 inch.

Glass may contain up to a maximum of five (5%) percent by volume of china, ceramics, plate glass products, paper, plastics or other deleterious materials. The material shall be subject to visual inspection by the Engineer or their representative, and may be rejected based on this inspection. In case of rejection, the inspection will be documented in writing by the Engineer who shall indicate the basis of rejection.

**(F) LIGHTWEIGHT FILL**

Lightweight fill shall be expanded shale, clay or slate produced by the rotary kiln process and meeting the requirements of ASTM C330. The lightweight fill shall have a proven record of durability, and be non-corrosive, with the following properties:

Soundness Loss: The maximum soundness loss shall be 30% when tested, with 4 cycles of Magnesium sulfate, in accordance with AASHTO T104.

Abrasion Resistance: The maximum abrasion loss shall be 40% when tested in accordance with ASTM C131.

Chloride Content: The maximum chloride content shall be 100 ppm.

pH between 6.5 and 9.0

Gradation:

<u>U.S. Sieve Size</u>	<u>Percent Passing</u>
1 inch	100
3/4 inch	90 to 100
3/8 inch	10 to 50
No. 4	0 to 15

The in-place compacted moist density shall be 75 lbs/ft<sup>3</sup>. The lightweight aggregate producer shall submit verification of a compacted density of minimum 65 pcf (960 kg/m<sup>3</sup>) when measured by the Modified Proctor test conducted in accordance with ASTM D1557, "Modified Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft<sup>3</sup> (2,700 kN-m/m<sup>3</sup>)).

The minimum angle of internal friction  $\Phi$  shall be 40 degrees. The lightweight aggregate producer shall submit verification that the angle of internal friction shall be greater than 40° when measured in a triaxial compression test on a laboratory sample with a minimum diameter of 10 inches.

**(G) REUSE OF EXCAVATED SOIL**

Material may not be reused on-site without prior approval by the Engineer. If the Contractor anticipates reuse of site material, the Contractor shall notify the Engineer of the area with a minimum two (2) weeks notice prior to reuse to allow for sampling, if necessary, and approval by the Engineer, in consultation with NYCDEP and/or NYSDEC.

**(H) DRAINAGE CRUSHED STONE**

Crushed stone used for weep holes drainage for the L-Walls shall be No. 57 stone as per ASTM D448.

**4.11.5 EARTH EXCAVATION METHODS.****(A) Excavation for streets shall:**

- (1) be made and maintained to roadway crowns, sidewalk area slopes and side slopes specified until the entire work is accepted;
- (2) be made below grade to exposed rock, when soundings indicate the existence of rock between grade and rock subgrade;

- (3) include the removal, as directed, of unsatisfactory material below grade;
  - (4) include the cutting of the side slopes in earth excavation to a slope of one and one-half (1-1/2) horizontal to one (1) vertical or such other approved slope as may be rendered necessary by local conditions, and no measurement beyond such approved limits of slope will be made or allowed for payment.
- (B) Excavation for walls and other structures shall be made to the dimensions specified and shall be done as follows.
- (1) GENERAL.

Trenches and pits shall be excavated to the depths required for cradle and foundation of structures. All trenches in earth shall be excavated with vertical sides, and shall be supported by close sheeting, properly braced. Sheeting and bracing shall extend from at least the existing surface of the ground to an adequate depth below the subgrade of the structure, except where otherwise specified on the Contract Drawings, or permitted by the Engineer in writing. Sheeting must be driven below the area of the pilot cut. Driving of sheeting above the pilot cut is subject to the directions of the Engineer.

Pilot cuts for trenches shall not exceed five (5') feet at any time. The Engineer may reduce the depth of the pilot cut should soil and subsurface conditions warrant such action.

The Engineer may direct the Contractor to use other types of equipment, and to revise the procedure during the excavation of the pilot trench and the driving of the sheeting should it be found necessary to do so.

In accordance with 29 CFR 1926.650, a trench is a narrow excavation (in relation to its length) made below the surface of the ground. In general, the depth is greater than the width, but the width of a trench (measured at the bottom) is not greater than fifteen (15') feet. If forms or other structures are installed or constructed in an excavation so as to reduce the dimension measured from the forms or structure to the side of the excavation to fifteen (15') feet or less, the excavation is also considered to be a trench. The Contractor shall provide protection from collapse and cave-in for any employee who enters a trench or other excavation in accordance with the requirements of 29 CFR 1926 Subpart P, unless the excavation is less than five (5') feet in depth and examination of the ground by the Contractor's "competent person" provides no indication of a potential cave-in. The Contractor shall include the proposed procedures to meet the excavation safety requirements in the Contractor's Project Safety and Health Plan. Trenching and excavation work shall be carried out under the supervision of the Contractor's "competent person." The Contractor shall provide ladders or ramps for access and egress within twenty-five (25') feet of an employee work area if a trench is four (4') feet or more deep. The Contractor shall keep traffic, equipment and materials at least two (2') feet away from the edge of any trench or excavation, or use retaining devices. When mobile equipment is operated near an excavation or must approach the edge of an excavation, either the operator must have a clear and direct view of the edge of the excavation; or a warning system of barricades, hand signals or mechanical signals shall be used. Workers shall not be permitted under loads that are being handled by lifting or digging equipment.

Trenches under five (5') feet in depth need not be sheeted and braced, except where one of the following conditions exist: the trenches are in close proximity to

existing structures or subsurface structures; where the Engineer, in writing, specifically prohibits the use of a non-sheeted trench; or where examination of the ground by a "competent person" provides indication of a potential cave-in, and trenches need to be sheeted and braced.

For the purposes of open excavations and trenches, the term "competent person" shall be defined as a person designated by the Contractor, in writing, who has had specific training in, and is knowledgeable about, soil analysis, the use of protective systems and the requirements of 29 CFR 1926 Subpart P, who is capable of identifying existing and predictable hazards in the surroundings, or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

Where shown, specified or permitted in writing by the Engineer, the sides of the trenches shall be sloped to elevations approved by the Engineer. Side slopes must be stable and shall be, in the dry, at least one and one half (1-1/2) vertical on one (1) horizontal.

The subgrade of trenches shall be constructed neat and to the grades as shown in the Contract Documents, and as directed by the Engineer.

Upon completion of the trenches and excavations and prior to placement of structures, the Contractor shall take in-place soil density tests of the subgrade (the number and locations of these tests shall be as directed by the Engineer), and shall compact the subgrade, as directed by the Engineer, to a minimum of ninety (90) percent of Modified Proctor Maximum Dry Density.

## (2) ADDITIONAL REQUIREMENTS FOR TRENCHES

- (a) Where structures are to be supported on piles and the Contractor deems it necessary to widen the trench beyond the maximum widths herein specified in order to permit the driving of such piles, the Contractor shall apply to the Engineer in writing for permission to widen the trench.
- (b) Any widening or enlargement of excavation permitted in writing by the Engineer upon the request of the Contractor in order to perform the work as specified in the Contract Documents and/or to expedite the Contractor's construction operations, will not be measured for any separate or additional payment, but the costs thereof shall be deemed included in the prices bid for all contract items of work.
- (c) In rock trenches the Contractor may, with the written permission of the Engineer, omit the use of side forms. No rock shall project inside the minimum width vertical rock cut lines herein specified.
- (d) Where the Contractor elects to cut the trench in rock by means that will result in overbreakage, rather than resorting to means which will insure adherence to the maximum allowable width of trench, the Contractor shall be required to fill the spaces between the edges of the external neat line of the poured-in-place structure and the sides of the rock cut with concrete, from subgrade of trench to a minimum height of two (2') feet above the top of the footing.
- (e) If the Contractor elects to carry the excavation in earth below the required subgrade of the trench, the Contractor shall backfill the trench to the required subgrade with either properly compacted Stone Ballast or with

concrete, as directed by the Engineer. If the Contractor elects to carry the excavation in rock below the required subgrade of the trench, the Contractor shall backfill the trench to the required subgrade with concrete or stone ballast as directed by the Engineer. No separate or additional payment shall be made for such backfilling where required, nor for any additional excavation and sheeting, the cost thereof shall be deemed included in the prices bid for all contract items of work.

- (f) The construction of adjacent sewers and/or water mains in the same trench shall be in accordance with the requirements of the NYCDEP Standard Sewer and Water Specifications.

(3) LENGTH OF TRENCH EXCAVATION.

The maximum length of trench excavation in roadway any time shall be as stipulated for the maintenance and protection of traffic.

Unless otherwise specified in the Contract Documents or ordered in writing by the Engineer, all trenches in rock shall be excavated to its full depth for a minimum distance of twenty (20') feet in advance of the length of structure permitted to be laid; however, the total length of trench shall not be less than fifty (50') feet. The only exception to this is at its upper end or ends, where rock shall be excavated to its full depth to a distance of not less than five (5') feet beyond the sewer to be built.

(4) EXPOSED STRUCTURES TO BE PROTECTED.

All exposed structures shall be carefully protected from the effects of blasts. Any damage done to such structures shall be promptly repaired by the Contractor at the Contractor's own expense.

(5) DISPOSAL OF WATER FROM EXCAVATIONS.

The Contractor shall at all times during the progress of the work keep the trenches and excavations free from water. The water from the trenches and excavations shall be disposed of in such a manner as will not cause injury to the public health, nor to public or private property, nor to the work completed or in progress, nor to the surface of the streets, nor cause any interference with the use of the same by the public. All sewers used for disposal of water from the trenches and excavation during construction shall be acceptably cleaned.

When in order to comply with the above, it is deemed necessary to widen the trench beyond the allowable maximum width, to permit the installation of well-points, the Contractor shall, as directed by the Engineer, provide either pipe of additional strength or concrete encasement at no additional cost to the City.

The Contractor shall, with their own equipment, provide dewatering where required at no additional cost to the City. The cost for all labor, equipment, materials, etc. required to dispose of water from the trenches shall be deemed included in the prices bid for all items of the Contract.

All dewatering and discharge pipes and hoses which cross traveled roadways shall be placed in such a manner so as to eliminate any disruption of traffic flow. If so ordered by the Engineer, the Contractor shall place the pipes and hoses in shallow trenches which will then be plated over. All header pipe shall be buried below existing roadway grade at driveways in order to maintain access to driveways.

Contaminated water shall be placed in containers and treated prior to disposal.

All plates shall be firmly secured so as to eliminate any possible shift or movement.

All pumps used in the dewatering operation shall be electric and shall be powered directly from the electric grid (Con Edison drop), unless otherwise unavailable.

Where the subgrade of the trench cannot be maintained in a dry condition, except in locations where the structures are on piles, the Contractor shall excavate the trench to an additional depth of six (6") inches below the subgrade of the sewer and backfill the trench to the subgrade of the sewer with stone ballast.

The cost for this additional excavation, sheeting, installation of stone ballast, labor, materials, plant, equipment and insurance required or necessary to complete this work shall be deemed included in the prices bid for the respective sewer or manhole items.

- (C) Approved sheeting and bracing shall be used where necessary to support sides of excavation, in order to: prevent damage to subsurface structures and adjacent buildings; safeguard persons and property; minimize inconvenience to traffic and the public; protect the structure to be installed; and, provide suitable and safe working conditions. Except as otherwise provided, deviations from the above will be permitted only where, in the judgment of the Engineer, such exception will not result in any of the hazards described above.

In cases where sheeting and bracing will not adequately protect adjacent structures from damage and settlement, the Contractor will be required to use such methods as are necessary to safely support and maintain adjacent and abutting property and structures and to maintain the work safe to life, limb and property.

All sheeting and bracing systems that the Contractor elects to use or that are ordered to use by the Engineer or the Department shall comply with the requirements of Section 40.05, "SHEETING AND BRACING," of the NYC Department of Environmental Protection, Bureau of Water and Sewer Operations, Standard Sewer and Water Main Specifications, and must receive the approvals stated therein.

Unless otherwise specified in the Contract Drawings or these Specifications or specifically permitted in writing by the Engineer, the Contractor shall be required to withdraw and remove all sheeting and bracing simultaneously with the backfilling of trenches and excavations.

- (D) When directed, soundings shall be made at intervals of about ten (10') feet to determine the existence of rock between grade and rock subgrade.
- (E) When boulders, masonry, concrete, loose fragments of rock, tree stumps or other material are removed by blasting, all blasting operations shall be conducted in strict accordance with the City ordinances and regulations relative to rock blasting and the storage and use of explosives.
- (F) No blasting shall be done within five (5') feet of water mains, sewers or other structures.
- (G) Excavation for the purpose of removing boulders, loose fragments of rock, tree stumps, roots and unsatisfactory material shall be backfilled with material complying with the specifications for Filling.

- (H) Unless otherwise permitted, all earth excavation which is suitable and needed for fill shall be used within the contract limits.

#### 4.11.6 ROCK EXCAVATION METHODS.

When rock surfaces in streets, trenches or other excavations are uncovered, the Engineer shall be notified in order that the Contractor may make necessary measurements. Rock excavated before such measurements are made will not be paid for.

- (A) Rock Excavation for Streets shall:
- (1) be made to rock subgrade, when specified;
  - (2) be made and maintained to side planes specified until the entire work is accepted;
  - (3) be made in sections not less than fifty (50') feet in length, unless otherwise permitted.

- (B) Rock Excavation for walls and other structures shall be made to the dimensions specified.

In rock trenches the Contractor may, with the written permission of the Engineer, omit the use of side forms. No rock shall project inside the minimum width vertical rock cut lines herein specified.

If the Contractor elects to carry the excavation in rock below the required subgrade of the trench, the Contractor shall backfill the trench to the required subgrade with either concrete or properly compacted stone ballast, as directed by the Engineer. No separate or additional payment shall be made for such backfilling where required, nor for any additional excavation and sheeting, the cost thereof shall be deemed included in the prices bid for all contract items of work.

In addition, the filling of voids left by the removal of ledge rock from within the limits of rock excavation payment limits shall be done in accordance with the requirements of this Subsection 4.11.7.

Any widening or enlargement of excavation permitted in writing by the Engineer upon the request of the Contractor in order to perform the work as specified in the Contract Documents and/or to expedite the Contractor's construction operations, will not be measured for any separate or additional payment, but the costs thereof shall be deemed included in the prices bid for all contract items of work.

- (C) No blasting will be permitted unless otherwise specified. The Contractor shall use line drilling or other acceptable methods to excavate rock. But if blasting is permitted, blasting operations shall be conducted in strict accordance with The City ordinances and regulations relative to rock blasting, the storage and use of explosives and prevention of silicosis. Any rock excavation within five (5') feet of a water main less than thirty-six (36") inches in diameter, and within ten (10') feet of a water main thirty-six (36") inches or more in diameter, shall be done with very light charges of explosives, or if directed, without blasting, and the utmost care shall be used to avoid breaking or disturbing the main. No blasting shall be done within five (5') feet of water mains, sewers or other structures except by written permission of the Engineer.

**4.11.7 BACKFILLING METHODS.****(A) BACKFILLING AROUND STRUCTURES**

Unless otherwise specified or directed, all trenches and excavations shall be backfilled immediately after the structures are built and inspected, and permission to backfill has been granted by the Engineer.

All backfill shall be carefully deposited and spread by approved methods.

Backfill shall proceed simultaneously with the withdrawal of sheeting. Withdrawal of sheeting below levels previously backfilled and compacted is prohibited.

The use of backhoe buckets for the compaction of backfill material in all trenches and excavations will not be permitted.

**(1) Select Granular Fill**

The Contractor shall use Select Granular Fill for backfilling trenches and excavations within any area less than two (2') feet wide in its least dimension (i.e. space between face of trench and outside face of cavities behind sheeting, filling of voids left by removal of boulders beyond the limits of sheeted trench, etc.) and within eighteen (18") inches around all underground facilities (i.e. conduit, cable, etc.).

Select granular fill shall be deposited and spread by approved methods in uniform horizontal layers not exceeding ten (10") inches in depth and each layer shall be thoroughly compacted to the satisfaction of the Engineer, before a successive layer is deposited. A minimum of 95 percent of Modified Proctor Maximum Density will be required after compaction.

The cost of providing Select Granular Fill as specified hereinabove, together with all labor, materials, plant, equipment, samples, and tests necessary and required for delivering, placing, compacting and testing of Select Granular Fill, shall be deemed included in the prices bid for all respective items of work. No separate or additional payment shall be made for this work unless otherwise specified.

(2) All excavated material from within the project limits which is considered as suitable material under the requirements of Subsection 4.11.4.(B), shall be utilized for backfill unless determined to be unsuitable as contaminated material by the Engineer.

The cost for all labor, materials, plant, equipment, samples, and tests necessary and required for the hauling, storing, placing, compacting and testing of suitable excavated fill material all in accordance with the Specifications and as directed by the Engineer, shall be deemed included in the prices bid for all respective items of work. No separate or additional payment shall be made for this work unless otherwise specified.

**(B) BACKFILLING AROUND SHEETING**

When sheeting is withdrawn all cavities remaining in or adjoining the trench shall be filled and compacted. When sheeting is left in place all cavities behind such sheeting shall be filled as directed. All materials used for such backfill and the compaction of such materials shall be as specified herein.

## (C) DEFICIENCY IN FILL MATERIAL

Unless otherwise shown on the plan, trenches shall be backfilled to the height of the surface of the ground as it existed at the commencement of the work. Should there be a deficiency of suitable material for that purpose, the Contractor shall furnish and place such additional material as may be required.

Payment for the cost of all labor, material, and equipment necessary and required to furnish and deliver these acceptable backfill materials, where a deficiency of acceptable backfill material occurs, shall be made as follows:

- (1) For providing acceptable select granular fill (whether natural or processed) to satisfy the requirements of Section 4.11.7(A)(1), payment shall be deemed included in the prices bid for all contract items of work. No separate payment will be made for this work.
- (2) For providing acceptable clean fill (whether natural or processed) to satisfy the requirements of Section 4.11.7(A)(3) to fill voids left by the removal of ledge rock, payment shall be made under the Contract Item - ROCK EXCAVATION.
- (3) For providing acceptable clean fill (whether natural or processed) ordered by the Engineer, payment shall be made under the Contract Item - FILL.

## (D) REMOVAL OF SURPLUS MATERIAL

As the trenches are backfilled, the Contractor shall remove all surplus material, and regrade and leave free, clear and in good order all roadways and sidewalks adjacent to the completed work and within fifty (50') feet of the end of the completed work. All surplus material or any part thereof shall be deposited, if required by the Engineer and at the Engineer's direction, on the streets and avenues within the limits of this Contract where they are below grade or contain depressions. Such fill shall be compacted to the required density (95% Modified Proctor Maximum Density) and in such a manner so as to leave the surfaces of the backfill even with the adjoining surfaces. The surplus material not reused on site shall be disposed of in accordance with Section 8.01.□

## (E) TEMPORARY BULKHEADS

For retaining the backfilling only temporary bulkheads will be allowed over sewers, basin connections and drains. Such bulkheads shall not be of stone, and they shall be removed as the trenches are backfilled.

## (F) SUBGRADE STRUCTURES NOT TO BE COVERED

Subgrade structures shall not be covered until the Engineer shall have inspected, measured and located the same and given permission to backfill the trenches over them.

## (G) FILL

Fill shall be deposited, satisfactorily compacted, and maintained until the entire work is accepted, between:

- (1) the subgrade of proposed pavement and the surface of proposed curbs and sidewalks and the existing ground surface;
- (2) the planes of the slopes of the embankment or the backs of retaining walls, as specified;

(3) rock subgrade and the finished surfaces of roadways and sidewalks.

Embankment slope shall be one and one-half (1-1/2) horizontal to one (1) vertical.

- (H) The Contractor shall fill or backfill with material having a moisture content suitable for the proper compaction of that material. The Contractor shall be responsible for determining the proper limits as the work is progressed. Water added shall be thoroughly incorporated into the soil, and manipulation shall be provided whenever necessary to attain uniform moisture distribution to the soil. When the moisture content of a lift, that is about to be compacted, exceeds the required amount, compaction shall be deferred until the required moisture content is achieved or a more suitable material shall be used. Fill material shall be carefully deposited and spread by approved methods in uniform horizontal layers not exceeding ten (10") inches in depth, extending across the entire width of fill prior to compaction, and each layer being thoroughly compacted to the satisfaction of the Engineer before a successive layer is deposited. A minimum of 95 percent of Modified Proctor Maximum Density will be required after compaction.

No separate or additional payment be made for any costs associated with the achievement of optimum moisture content, including any additional excavation due to the removal of any layer not meeting the specified requirements and for the replacement of any layers with suitable material. Costs shall be deemed included in the prices bid for all items of work.

When placing fill or backfill around underground facilities in shallow excavations, ten (10") inch layers shall be deposited to progressively bury the facility to equal depths on both sides and for the full depth and width of the trench excavated for the facility.

- (I) In deep trenches, in lieu of depositing and compacting the backfill from two (2') feet above the underground facility to a plane five (5') feet below final surface in accordance with the above specified procedure, the Contractor may submit to the Engineer, for approval, an alternate backfill method (i.e. puddling, jetting, deeper compaction layers, etc.). This submittal must fully describe the alternate method, including proposed equipment, backfill material, depth of compaction layer, and trench locations where it will be employed. However, approval of any alternate backfill method shall not relieve the Contractor from obtaining a minimum 95% Modified Proctor maximum density. Should the Engineer determine that the specified density is not being obtained, the area must be re-excavated and backfilled at the Contractor's own cost until the required compaction density is achieved.
- (J) Backfill immediately adjacent to conduits shall not contain particles larger than one-quarter (1/4") inch in diameter. Compaction shall be attained by the use of impact rammers, plate or small drum vibrators, or pneumatic button head compaction equipment and shall be capable of exerting a pressure equivalent to two hundred and fifty (250) to three hundred (300) pounds per inch width of compression roll, or an equivalent pressure if other than smooth wheel or pneumatic tired rollers are permitted.

Hand tamping will not be permitted except in the immediate area of the underground facility.

The backfill, within two (2') feet of such facilities, shall be wetted (except where clay is present) in ten (10") inch lifts and lightly hand tamped with as many strokes

as required to achieve maximum density.

- (K) Where sheeting has been used for the excavation, it shall be pulled when the excavation has been filled or backfilled to the maximum unsupported depth allowed by New York State Department of Labor Industrial Code Rule 23 and Title 29 Code of Federal Regulations Part 1926, Safety and Health Regulations for Construction. Where a difference exists between regulations, the more stringent requirements shall apply.
- (L) In-place soil density tests will be required to ensure that the soil compaction requirements of the specifications are met. In-place soil density tests shall be taken for each and every layer of backfill placed, at a maximum of one hundred (100') feet intervals along the length of each layer. However, the location of the tests shall vary horizontally along each successive layer, such that no two (2) tests are conducted at the same station location as any previous layers. The number and locations of in-place soil density tests shall be as directed by the Engineer.

For each one thousand (1,000) cubic yards of each type of backfill soil utilized, for which in-place soil density tests are to be performed, shall undergo a minimum of one (1) Modified Proctor analysis in order to determine the maximum dry density and optimum moisture content of the soil material to be tested. Due to varying soil conditions, additional Proctor analyses may be required by the Engineer. The number and locations of all samples to undergo Proctor analysis shall be as directed by the Engineer.

The Contractor shall retain the services of a testing laboratory, in accordance with Section 7.12 - Soil Density Testing, to make all compaction tests of backfill materials used and placed. All compaction tests shall be witnessed and verified by the Engineer. Proctor analyses and in-place soil density tests shall be performed in accordance with Section 7.12.

Unless otherwise provided for in the Contract no separate or additional payment shall be made for the depositing, compacting and sampling of backfill nor for the services of the approved testing laboratory, the costs thereof, shall be deemed included in the prices bid for all items of work.

The Contractor shall furnish the Engineer with copies of in-process compaction reports certified by a Professional Engineer as to the compliance with the requirements of the aforementioned filling and backfilling specifications. This certified compaction report shall be submitted as directed by the Department's Quality Assurance.

The cost for all labor, materials, and equipment necessary and required to place, compact, sample and test provided acceptable backfill material shall be deemed included in the prices bid for all contract items of work. No separate or additional payment will be made for this work.

- (M) LIGHTWEIGHT FILL

Lightweight fill shall be placed in uniform layers of 10 in., unless Contractor proves by testing that thickness can be increased, but in no case shall lift thicknesses be greater than 12 in. In confined areas vibratory plate compaction equipment shall be used (5 hp to 20 hp) with a minimum of two passes in 6 in. lifts for a 5 hp plate and 10 in. lifts for a 20 hp plate.

The Contractor shall take all necessary precautions when working adjacent to the lightweight fill to ensure that the material is not over compacted. Construction

equipment, other than for placement and compaction, shall not operate on the exposed lightweight fill.

(N) **MONITORING**

Contractor shall install settlement monitoring monuments at finished subgrade level at a frequency of two monuments per 100 ft of length along East River Park. One monument shall be installed adjacent to the cut-off wall along the esplanade and one monument shall be installed 50 ft inland at locations approved by the Engineer. Settlement monitoring shall be conducted weekly for a period of three months after completion of filling work, or until negligible settlement is detected, as determined by the Engineer. A weekly report shall be submitted to the Engineer for review and approval.

**4.11.8 MEASUREMENT.**

(A) **EARTH EXCAVATION FOR STRUCTURES, EXCAVATION OF RIP RAP AND MISCELLANEOUS FILL, AND EXCAVATION OF FILL ON AND BEHIND THE ESPLANADE**

Excavation within the limits of the work except for structures for which the contract prices include the cost of earth excavation, will be measured and allowed to the following limits:

Condition	Payment Limits
For streets . . . . .	Above the depth specified and between side limits specified.
For uncovering rock between grade and rock subgrade.....	Below grade and above the rock surface.
For the removal of boulders, loose fragments of rock, tree stumps, roots and unsatisfactory material.	Below the depth specified and between side limits as directed.
For dry retaining walls....	To depth specified and to vertical planes passing through the neat lines of the footings of the walls.
For masonry walls (except dry rubble), culverts and drains (except pipe drains).....	To depths specified and to vertical planes passing one (1') feet outside of the neat line of the structure.

(B) **ROCK EXCAVATION IN STREETS, TRENCHES AND STRUCTURES**

When rock surfaces in streets or trenches are uncovered, the Engineer shall be notified in order that the Engineer may make necessary measurements. Rock excavated or blasted before such measurements are made will not be paid for.

The qualities of rock to be measured for payment under each Rock Excavation item shall be the volume of ledge rock actually removed from within the following payment limits:

Condition	Payment Limits
For streets	Above rock subgrade and between side limits specified.

For walls, culverts and other lines specified	Below rock subgrade to depths and to the payment structures
---	---

(C) **ADDITIONAL INCREMENTAL COST TO EXCAVATE ROCK AT DEPTHS GREATER THAN FIVE (5') FEET IN TRENCHES AND FOR STRUCTURES**

For rock excavation within trenches and for structures, where the depth of rock excavation exceeds 5 feet below grade, that quantity of rock removed below five (5') feet of grade will be measured, under Item ESCR-4.11 BAA, for an additional incremental payment over and above that made for rock excavation under Item 4.11 AA.

(D) **FILL, PLACE MEASUREMENT**

All filling required to complete the work, between the ground surface as determined by the Engineer before the work of filling is commenced and the surfaces specified, and between rock subgrade and the surfaces specified, will be measured in place after compaction.

No payment or allowance will be made for:

- (1) sinkage, shrinkage, and settlement;
- (2) backfilling holes below grade caused by the removal of boulders, loose fragments of rock, tree stumps, roots and other unsatisfactory material;
- (3) backfilling to original ground surface for culverts, drains, basin connections, and between structures and sides of excavations;
- (4) fill which may be spread out beyond the embankment slopes specified;
- (5) spaces occupied by subsurface structures over one (1) cubic foot in volume when the placement or construction of such structures is made on newly placed fill and is started while fill operations are in progress.

The spaces occupied by curbs, crosswalks, flagging, concrete sidewalks, gutters, culverts, drains, basin connections, manholes, receiving basins, seepage basins, inlets, and gas or water pipes or any appurtenances thereof, will not be deducted from the volume of filling to be paid for when the aforesaid structures are placed or constructed after filling operations have been completed and excavation of the newly placed fill is required for such placement or construction.

(E) **FILL, VEHICLE MEASUREMENT**

All fill required to complete the work of filling on unstable ground by vehicle measurement, between the limits specified, will be measured in cars, trucks, etc., at the place of deposit. In computing the amount of fill to be paid for, one (1) cubic yard of measured material in the vehicle will be paid for as eight-tenths (0.8) of a cubic yard of fill. For carload and truckload deliveries, only water level loads will be accepted and no allowance will be made for any crown or peak of the load.

(F) **SELECT GRANULAR FILL, PLACE MEASUREMENT**

The quantity of select granular fill to be measured for payment shall be the number of cubic yards of select granular fill used outside the limits of trench excavation, as ordered in writing by the Engineer, measured in place after compaction.

No payment or allowance will be made for fill placed beyond the limits specified.

**(G) SELECT GRANULAR FILL, VEHICLE MEASUREMENT**

All select granular fill required to complete the work of filling on unstable ground by vehicle measurement, between the limits specified, will be measured in cars, trucks, etc., at the place of deposit. In computing the amount of select granular fill to be paid for, one (1) cubic yard of measured material in the vehicle will be paid for as eight-tenths (0.8) of a cubic yard of fill. For carload and truckload deliveries, only water level loads will be accepted and no allowance will be made for any crown or peak of the load.

No payment or allowance will be made for fill placed beyond the limits specified.

**(H) LIGHTWEIGHT FILL, PLACE MEASUREMENT**

The quantity of lightweight fill to be measured for payment shall be the number of cubic yards of lightweight fill used outside the limits of trench excavation, as ordered in writing by the Engineer, measured in place after compaction by the cubic yard.

No payment or allowance will be made for fill placed beyond the limits specified.

**(I) CRUSHED STONE FILL FOR L-WALL DRAINAGE, PLACE MEASUREMENT**

The quantity of crushed stone for L-Wall drainage to be measured for payment shall be the number of cubic yards of crushed stone fill along the concrete L-wall at the esplanade, as ordered in writing by the Engineer, measured in place after compaction.

No payment or allowance will be made for crushed stone placed beyond the limits specified.

**(J) SETTLEMENT MONITORING**

The settlement monitoring shall be measured on a lump sum basis for the 3 month monitoring period. Start of the monitoring period shall be coordinated with and as approved by the Engineer.

**4.11.9 PRICE TO COVER.****(A) EARTH EXCAVATION FOR STRUCTURES**

The contract price per cubic yard for earth excavation for structures shall cover the cost of all labor, materials, equipment, and insurance required to complete the work of earth excavation within the contract limits, in full compliance with the requirements of the specifications, without regard to the subsequent use of the excavated materials.

**(B) ROCK EXCAVATION IN STREETS, TRENCHES AND STRUCTURES**

The contract price bid per cubic yard for rock excavation shall cover the cost of all labor, materials, equipment, and insurance required to complete the work of rock excavation within the contract limits, in full compliance with the requirements of the specifications without regard to the subsequent use of the excavated material.

In addition, included in the unit prices bid hereunder for rock excavation shall be the cost of all labor, material, plant, and equipment required to furnish and deliver acceptable select granular fill material required to fill the voids left by the removal of ledge rock.

(C) ADDITIONAL INCREMENTAL COST TO EXCAVATE ROCK AT DEPTHS GREATER THAN FIVE (5') FEET IN TRENCHES AND FOR STRUCTURES

The contract price bid per cubic yard for the additional incremental cost to excavate rock at depths greater than five (5') feet in trenches and for structures, shall cover the cost of all additional labor, materials, equipment required to complete the work of rock removal at depths exceeding five (5') feet below grade. Payment under this item will be made in addition to that made under Item ESCR-4.11 AA.

(D) EXCAVATION OF RIP RAP AND MISCELLANEOUS FILL, EXCAVATION OF FILL ON AND BEHIND THE ESPLANADE

The contract price bid per cubic yard of Rip Rap and Miscellaneous Fill and for Excavation of Fill on and Behind the Esplanade shall cover the cost of all additional labor, materials, equipment required to complete the removal of the material to the grades shown on the Contract Drawings.

(E) FILL

The contract price per cubic yard for Fill, Place Measurement or Vehicle Measurement, shall cover the cost of all labor, materials, and equipment required to complete the work of filling within the contract limits in full compliance with the requirements of the specifications. All material excavated within the limits of the work which is used as filling will be paid for as filling.

When there is no price for Fill, the cost of furnishing and depositing any Fill required shall be covered by and included in the contract prices bid for all respective items of work.

(F) SELECT GRANULAR FILL

The contract price per cubic yard for Select Granular Fill, Place Measurement or Vehicle Measurement, shall cover the cost of all labor, materials, plant, equipment, insurance, and samples required to furnish and deliver the clean select granular fill material and to do all work incidental thereto, all in accordance with the Contract Drawings and Specifications and as directed by the Engineer.

(G) LIGHTWEIGHT FILL

The contract price per cubic yard for Lightweight Fill, Place Measurement, shall cover the cost of all labor, materials, plant, equipment, insurance, and samples required to furnish and deliver the clean lightweight fill material and to do all work incidental thereto, all in accordance with the Contract Drawings and Specifications and as directed by the Engineer.

(H) CRUSHED STONE FILL FOR L-WALL DRAINAGE

The contract price per cubic yard for Crushed Stone Fill for L-Wall Drainage shall cover the cost of all labor, materials, plant, equipment, insurance, and samples required to furnish and deliver the clean select granular fill material, including the PVC weep holes with screen, as shown on the drawings, and to do all work incidental thereto, all in accordance with the Contract Drawings and Specifications and as directed by the Engineer.

## (I) SETTLEMENT MONITORING

The contract price for the settlement monitoring shall be lump sum and cover the cost of all labor, materials, plant, equipment, insurance, and reporting required to successfully complete the monitoring over the specified period.

**END OF SECTION**

**SECTION ESCR-4.14 – STEEL REINFORCEMENT IN CONCRETE****4.14.01 INTENT.**

This section describes installation of Steel Reinforcement in Concrete.

**4.14.02 DESCRIPTION.**

Steel Reinforcement for Concrete shall be of steel bars or welded steel wire fabric used in the floodwall, floodgate foundations, esplanade, and park structures, as specified and as shown on the Contract Drawings.

**4.14.03 MATERIALS**

- (A) Steel reinforcement shall comply with the requirements of the following sections:
  - Steel Bars -- Section 2.23
  - Welded Steel Wire Fabric -- Section 2.25
- (B) Steel reinforcement shall be epoxy-coated in accordance with ASTM A775 for steel bars and ASTM A884 for welded wire fabric, unless otherwise noted. Supplier and applicator shall be on the NYSDOT approved list (<https://www.dot.ny.gov/divisions/engineering/technical-services/technical-services-repository/alme/pages/890-1.html>)
- (C) Size and placement shall be as specified and as shown on the Contract Drawings.
- (D) Dowel and anchor bars, if required, shall be of a type, size and placement as specified and as shown on the Contract Drawings. The type of filler material used for anchoring shall be as specified on the Contract Drawings.
- (E) Shop drawings of reinforcing steel showing the location and type of supports and tie wires shall be submitted to the Engineer for approval before any work covered by these drawings is undertaken.
- (F) Taper threaded terminators must be positive-locking taper threaded type anchors meeting ASTM A615 Grade 60, and ASTM A970 Class HA. Threading must be done using equipment approved by the terminator manufacturer. Terminators must be installed per the manufacturer's written requirements.

Any errors discovered in these drawings will be corrected by the Engineer, but failure to discover errors shall not relieve the Contractor of responsibility, and any incorrect work resulting therefrom shall be corrected by the Contractor at no expense to The City.

The Contractor shall obtain the Engineer's approval of the proposed reinforcement before ordering.

**4.14.04 METHODS.****(A) FABRICATION AND PROTECTION**

Steel reinforcement bars shall be delivered in bundles or fabricated mats, and shall have the manufacturer and size of steel identified by attached metal tags when one-quarter (1/4") inch or less in size and by rolled raised symbols or letters when greater than one-quarter (1/4") inch, or by other means acceptable to the Engineer. Where reinforcement bars are delivered in bundles, they shall be securely wired. Bars shall be identified with heat number marked on attached tag.

Bar mats shall have bars of the size and spacing required and be made up in sections of the length and width required. They shall be fastened together in an approved manner at each intersection.

Reinforcement bars shall be protected at all times from mechanical injuries and from the weather and, when placed in the work, shall be free from injurious dirt, defects, paint and oil, and have a workmanlike finish. Bars which will remain exposed for some time after being placed in the work shall, if directed, be immediately coated with thin grout composed of equal parts of cement and sand.

Steel wire fabric shall be protected from moisture, and, when placed in the work, shall be free from grease, injurious rust, dirt or other foreign substances.

(B) BENDING BARS

Reinforcement bars shall be bent cold to the exact shapes shown on the Contract Drawings and, if required, in conformity with approved templates. Bars having kinks or bends not shown on the plan will be rejected.

(C) SPLICES AND LAPS

Reinforcement bars under flexural stress shall be of the full lengths required, or if permitted, be spliced with approved clamps or other approved devices which will transfer the full working stress of the bar. Reinforcement bars under temperature and shrinkage stresses shall be as long as can be conveniently used. Where necessary, laps shall be as directed. Laps shall be not less than forty (40) times the nominal diameter of the bars. Splices and laps shall be staggered. The distance between splices and laps and adjacent bars, and the distance between a splice or lap and the exposed surface of concrete shall be not less than two (2") inches, or as shown on the plan.

Welded steel wire fabric shall have transverse or longitudinal end members overlapping each other by not less than a full mesh length or width respectively. Overlapping sheets shall be securely and properly fastened together.

(D) SUPPORTS

Steel reinforcement shall be supported at the specified depth in such a manner that no displacement will occur during concreting operations. It shall be supported either on approved devices or upon a layer of concrete which has been evenly struck off. The method of supporting the steel at the proper elevation shall be as approved by the Engineer. Bar supports shall be non-conductive material or plastic bar supports.

(E) PLACING

Reinforcement bars shall be placed, spaced, securely fastened together and held in their positions in an approved manner until the concrete is placed around them.

Steel wire fabric shall be laid in sheets which shall be straight and true to form and shall be securely held in position by approved methods so that they will be in their prescribed position after the concrete has been thoroughly compacted.

No concrete shall be deposited until the Engineer has inspected the placing of the reinforcing steel and has given permission to place the concrete. All concrete placed in violation of this provision will be rejected and removed at the Contractor's own expense.

**(F) EPOXY COATING REPAIRS**

Repair sheared and cut ends and damaged coating with an epoxy patching material conforming to ASTM A775 (AASHTO M284) in accordance with the patching material manufacturer's recommendations.

**(G) MECHANICAL ANCHORS**

Reinforcing bar anchorage in the form of taper-threaded terminators shall be provided for pile plugs at the locations indicated on the Contract Drawings, and as directed by the Engineer.

The terminators shall be installed on-site, prior to placement of the cast-in-place concrete pile plugs. The taper-threaded terminators shall be of the size indicated on the Contract Drawings.

**4.14.05 MEASUREMENT.**

The weight of steel reinforcement bars to be paid for will be that of all reinforcement bars incorporated in the work, as required, which shall be computed from theoretical lengths and weights of bars.

The weight of steel wire fabric to be paid for will be that of all material incorporated in the work, as required, which shall be computed from the theoretical lengths, widths and weights.

The number of epoxy-coated anchor rods to be paid for will be inclusive of all drilling, specified length of reinforcement bars, and filler material incorporated into the work as required.

**4.14.06 PRICE TO COVER.**

The contract price per pound for Epoxy-Coated Steel Reinforcement shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish and install coated reinforcement complete in place in full compliance with the requirements of the specifications, and to furnish such samples for test as may be required.

The contract price per Epoxy-Coated Anchor Rod shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish and install the anchor rod, along with any filler materials, in place and in full compliance with the requirements of the specifications.

*Payment will be made under:*

**END OF SECTION**

## SECTION ESCR-5 – GROUND IMPROVEMENT WITH STONE COLUMNS

### 5.01 INTENT.

This section describes the detailing, furnishing, installing, monitoring, and testing of Stone Column up to the lines and grades designated on the Contract Documents, and as Specified herein, for use in the flood protection system as ground improvement. This Specification addresses the following two applications: (1) reinforcement and (2) soil densification between columns.

(1) Reinforcement refers to the contribution of the columns to the overall strength and stiffness of the soil mass. This is particularly applicable for cohesive soil or soils with a high fines content (i.e., material finer than the No. 200 sieve), where there is little to no improvement between columns, but is also applicable to cohesionless soils.

(2) Soil densification between columns refers to the gain in strength and stiffness of matrix soils due to column installation. This is only applicable to cohesionless soil and can be verified by in-situ testing (i.e., SPT, CPT) between adjacent column locations. In addition to the two main applications provided above, stone columns provide a means for excess porewater pressure to dissipate during a seismic event, thus mitigating the site against liquefaction potential.

The Contractor shall be responsible for selecting stone column parameters, equipment, and construction methods to meet the specified requirements of the Engineer. Design, consisting of area replacement ratio and depth of the elements or structures created by stone column has been performed by the Engineer and shown on the Contract Drawings. Detailing to construct the required elements or structures shall be by the Contractor.

### 5.02 DESCRIPTION.

#### (A) Scope of Work

The work shall consist of installation, monitoring, and testing of the stone columns within the limits indicated on the Contract Drawings, specifically Reaches C, D, E, and F along the East River, to meet the performance criteria presented in Paragraph 5.13 of this Specification Section.

In connection with the stone column program, as shown on the Contract Drawings, the Contractor shall provide all labor, materials, and equipment to accomplish the following items of work:

- a. If required, pre-drilling of holes as necessary and disposal or stockpiling of all spoil.
- b. Construction of the stone column to the lines and grades on the Contract Documents.

It shall be the Contractor's responsibility to determine and implement the systems and criteria to ensure that the specified performance is achieved.

#### (B) References

The most recent version of the following testing methods shall be employed:

- a. ASTM C29 Standard Test Method for Bulk Density ("Unit Weight") and Voids in Aggregate
- b. ASTM C88 Standard Test Method for Soundness of Aggregate by Use of Sodium Sulfate or Magnesium Sulfate

- c. ASTM C127 Standard Test Method for Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate
- d. ASTM C131 Standard Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles machine
- e. ASTM D1241 Standard Specification for Materials for Soil-Aggregate Subbase, Base, Surface Courses
- f. ASTM D1586 Standard Test Method for Standard Penetration Test (SPT) and Split-Barrel Sampling of Soils
- g. ASTM D5778 Standard Test Method for Electronic Friction Cone and Piezocone Penetration Testing of Soils

(C) Definitions

Down-Hole Vibrators are specially-designed, high-energy depth vibrators. The horizontal vibrations are created by a motor and rotating eccentric weight located near the tip of the vibrator. Extension tubes are bolted to the vibrator to allow it to be lowered to the necessary treatment depth.

Bottom Feed Vibrators are down-hole vibrators which are equipped with a tremie pipe through which the aggregate is fed to the tip of the vibrator. This equipment is most often used in soil conditions which are too soft or cohesionless to remain open when pre-drilled.

Down-Hole Tampers are proprietary high-energy impact apparatus. The vertical tamping energy is provided by a hammer which is connected to a round, beveled tamper. The apparatus is lowered into a pre-drilled hole to the required treatment depth.

Bottom Feed Displacement Mandrel Systems are another type of proprietary high-energy impact apparatus. The hollow-shaft mandrel is used to convey aggregate below the tamper foot at the mandrel tip. Placed aggregate is displaced by the mandrel into the surrounding soil and compacted by the tamper foot during successive re-penetrations. The apparatus is driven or pushed to the required treatment depth prior to aggregate placement.

(D) Subsurface Conditions

Borings completed within the limits of the project encountered varying thicknesses of very loose to medium dense fill layer underlain by silty sand or sandy till overlying weathered rock. Clay was also encountered in some isolated cases.

Although it may not be shown on the soil profile, the contractor shall anticipate that some obstructions such as, rocks, boulders, wood, debris, gravel, or concrete may still exist below the proposed surface elevation.

### 5.03 MATERIALS.

The crushed stone for stone column backfill shall be clean, hard, unweathered stone free from organics, trash, or other deleterious materials. When subjected to the magnesium sulfate soundness test (ASTM C88), the percent weight loss shall be no more than 15%. When tested according to ASTM C131, the crushed stone shall have maximum loss of 40 percent at 500 revolutions.

- (A) Down-Hole Vibrator Method: The backfill aggregate shall consist of hard, angular to sub-angular durable rock fragments, with the majority of particles in the range

of 1/8th inch to 1-1/2 inches such as ASTM C33 Size No. 57 or shall be other graded aggregate selected by the Contractor and approved by the Engineer. The aggregate shall have been successfully used in the modulus test.

(B) Down-Hole Tamper Method:

Aggregate used for columns constructed above the water table shall be Type I, Grade B in accordance with ASTM D1241, or shall be other graded aggregate selected by the Contractor and approved by the Engineer.

For aggregate used for columns constructed below the water table, the gradation shall be the same as Type I Grade B, except that particles passing the number 40 sieve shall be eliminated. Alternately, No. 57 stone or other stone selected by the Contractor may be used and approved by the Engineer. The aggregate shall have been successfully used in the modulus test.

When Type I Grade B material is used, potable water or other suitable sources shall be used to increase the aggregate moisture content when required.

(C) Displacement Mandrel Method: The backfill aggregate shall meet the same requirements as listed in Paragraph 5.03 B for the down-hole tamper method.

#### 5.04

#### **EQUIPMENT.**

(A) Down-Hole Vibrator

Should the Contractor use a down-hole vibrator, the vibrator shall be capable of providing a minimum 70 HP rated energy and a centrifugal force of 15 tons. For soil densification, an appropriate metering device shall be provided at such a location that inspection of amperage increase may be verified during the operation of the equipment. The metering device may be an ammeter directly indicating the performance of the vibrator tip. Complete equipment specifications shall be submitted to the Engineer prior to commencement of the fieldwork.

(B) Down-Hole Tamper

Should the Contractor use a down-hole tamper, the tamper shall have a diameter that is at least 85% of the pre-drilled hole diameter, have beveled sides, and be long enough to reach the full depth of the pre-drilled hole. The tamper shall have a minimum Construction Industry Manufacturer's Association (CIMA) rating of 1,200 ft-lb and shall apply direct downward impact energy to each lift of aggregate. Complete equipment specifications shall be submitted to the Engineer prior to commencement of the fieldwork.

(C) Displacement Mandrel Systems

Should the stone column contractor use a displacement mandrel system, the specially designed mandrel shall have a bottom tamper foot diameter of at least 50% of the column design diameter and be long enough to reach the full column design depth. The tamper foot shall be capable of applying a minimum 15 ton static force augmented by dynamic vertical ramming energy to the full design depth. Complete equipment specifications shall be submitted to the Engineer prior to commencement of the fieldwork.

**5.05 INSTALLER QUALIFICATIONS.**

- (A) The stone column installation shall be performed by a Specialist Stone Column Installer (“Installer”) with at least five years of documented experience in stone columns.
- (B) The Installer shall provide experienced management, supervisory and key personnel to implement the aggregate column program.
- (C) Identify full-time stone column equipment operators who have been directly responsible for stone column installation for at least 5 projects in the last 5 years. Provide a detailed resume of the equipment operator’s experience and qualifications.
- (D) Include in the resumes for supervisor and the equipment operator a list of referenced projects, the project start and completion dates, total quantity of stone columns installed, and a detailed description of the project, site conditions, and subsurface conditions. The project description shall include details of the stone column materials, the equipment and technique used to install the stone columns, the average and maximum length of stone column installed, the client name and address, the name and telephone number of the representative of the consultant and owner for whom the work was performed.
- (E) The Installer must ensure that procedures and documentation conform to these specifications.

**5.06 SUBMITTALS.**

The following shall be submitted to the Engineer for approval prior to stone column work:

- (A) Installer qualifications per subsection 5.05 above.
- (B) At least 30 calendar days before beginning stone column installation, identify the proposed source of the stone materials and supply to the Engineer.
- (C) The following shall be submitted to the Engineer by the Contractor three weeks prior to the start of the work:
  - Resumes of the management, supervisory, and key personnel.
  - A ground improvement calculation package based on information contained in the Contract Drawings, prepared by an engineer licensed in the state of New York that demonstrates that the program achieves the specified performance criteria as specified in this Specification Section.
  - The Contractor will be required to submit representative test results and the materials will be based on certification. Contractor submitted certification and representative test results required are as follows:
    - a. Gradation in accordance with AASHTO T-27.
    - b. Specific Gravity in accordance with ASTM C127.
    - c. Density of loose select material in accordance with ASTM C29.
    - d. Density of compacted select material in accordance with ASTM C29.

- A ground improvement QA plan, as detailed in Paragraph 5.12 of this Specifications.
  - Work procedures and control criteria.
  - A shop drawing for review, indicating the spacing, location, and depth of the stone columns to achieve the criteria outlined in this specification.
  - A stone column installation plan that includes as a minimum the following information:
    - a. The configuration of the installation equipment including size, type, weight, maximum pushing force, and vibratory hammer rated energy.
    - b. Detailed description of proposed installation procedures.
    - c. Proposed methods and equipment for pre-augering or spudding, if required.
    - d. Provide a description of spoil disposal. If the use of water is used for installation, provide a detailed description for controlling and disposing of all water as well as any sediment.
    - e. Submit documentation of the successful application of the proposed stone column installation operations.
    - f. Determine the amount of stone anticipated per stone column and submit the method for determining the amount of stone installed per stone column (i.e. number of hoppers or skips).
- (D) The following shall be submitted to the Engineer by the Contractor during the work:
- Accurate daily records that include the type and size of compaction equipment and predrill auger diameter used (if required), and a shop drawing indicating the as-constructed location, bottom depth, and identification number for each aggregate column.
  - A record for each stone column that includes a log of the stone consumption and average diameter per 5-foot increment, energy used to compact the column per 5-foot increment, column identification number, bottom depth, column length, time to construct the column, and a note of any obstructions or other problems encountered during column installation.
  - Any change in the subsurface conditions observed during the work.
- (E) The following shall be submitted to the Engineer by the Contractor after the work is completed:
- Report of post-treatment verification testing to include uncorrected field SPT blow count values, calculations of the normalized SPT blow count values, and a summary of the results, prepared by an engineer licensed in the State of New York.
  - A report documenting the observations and results of the tests. This report will certify that the minimum normalized SPT blow count values and/or static settlement criteria have been achieved within the improvement zone as detailed in Paragraph 5.12.

- As-built drawings indicating the location, bottom depth, and identification number for each stone column.
- Other documents that may be required by the Engineer (i.e., a warranty covering the quality of the work).

#### **5.07 SITE INSPECTION.**

- (A) Inspect the site prior to the start of operations to verify the depth ground improvements can be constructed using the proposed equipment.
- (B) Prior to commencing work, examine the following: existing site conditions, Contract Drawings, including records of existing utilities and other existing subsurface structures, and Geotechnical Subsurface Data Reports.
- (C) Data on indicated subsurface conditions is provided solely for convenience of the Contractor..
- (D) If an adjacent building is within 25 ft of the aggregate column work area, a relevant building examination shall be performed prior to initiating Work to document preexisting cracks/damage. The building must also be monitored for movement during any work within 50 ft of the structure. The work shall be stopped, and the Engineer notified if any building settlement is observed.

#### **5.08 CONSTRUCTION REQUIREMENT.**

- (A) Construct stone columns by bottom feed method at the locations shown on the Contract Drawings, and in accordance with this Specification or as directed by the Engineer.
- (B) Construct the stone columns to the depths required, using the methods necessary to penetrate to the required depth, including but not limited to pre-augering through stiff and dense layers that may be present, as well as obstructions from existing construction.
- (C) At all times, protect structures (new or existing), underground utilities and other construction from damage caused by stone column installation. Damaged materials or structures shall be replaced or repaired to the satisfaction of the Engineer at no additional cost to the City.
- (D) Install the stone columns to the minimum required Area Replacement Ratio (ARR) with the minimum ARR indicated on the Contract Drawings. The ARR is based on the spacing between the stone columns, the shape of the layout of the stone columns (e.g. triangular or square) and diameter of the stone columns.
- (E) Verify the location of existing underground utilities before starting stone column installation operations. If utility lines are to remain in place, provide protection from damage during installation operations.
- (F) Consult with the Engineer immediately for directions as to the required procedure if uncharted or incorrectly charted piping or other utilities are encountered during execution of work. Cooperate with City and public or private utility companies in keeping their respective service and facilities in operation. Repair damaged utilities to satisfaction of utility department at no additional cost to the City.
- (G) Ensure that existing utilities serving facilities occupied by City or others are not interrupted, except when permitted in writing by the Engineer and then only after temporary utility services have been provided.

- (H) Construct a test section at the location indicated on the Contract Drawings, or within the park adjacent to the existing waterfront at agreed upon location with the Engineer. The test section shall be used to verify the Stone Column Installer's equipment and procedures achieve the requirements contained in the Contract Drawings. Vibration monitoring must also be performed during the construction of the test section. At the completion of the test section, a report including all the information specified in Paragraphs 5.06 D and 5.06 E of this Specification shall be submitted to the Engineer for evaluation. Based on the results of the test section the Engineer will determine whether the Stone Column Installer's proposed procedure meets the requirements of this specification. Additionally, based on the results of the test area and measured vibration levels, the Engineer will verify location of the stone columns as provided, or if an adjustment in location is necessary. Based on the test results, Contractor may propose a refusal criteria to be applied in locations where tip elevation is not reached. The refusal criteria must be submitted to the Engineer for approval prior to installation of production stone columns,
- (I) To ensure that stone columns are not installed at locations designated for future structural elements, install the stone columns only at the locations shown on the Contract Drawings. Advanced written authorization from the Engineer is required prior to relocating any stone column. The request to relocate a stone column shall indicate the stone column number, the proposed stone column location, the revised stone column location and why relocating the stone column is necessary.

#### **5.09 STONE COLUMN CONSTRUCTION.**

The general procedure for stone column installation shall be as follows:

- (A) **Stable Ground Conditions:** The following general procedures shall be followed when the pre-drilled hole remains open during construction.
- Pre-drilling to the design depth will be performed with an auger diameter equal to the finished column diameter.
  - Down-Hole Vibrator Method: The quantity of aggregate initially added shall be such that the vibrator tip is able to penetrate to within 12 inches of the design depth. The vibrator will be raised and lowered repeatedly, such that on each re-penetration, the tip of the vibrator advances to within 12 inches of the previous penetration depth.
  - Down-Hole Tamper Method: Following placement of the first 12-inch lift of aggregate, the tamper is to be lowered to the top of the aggregate and activated. The full energy of the impactor and weight of the excavator shall be used for at least 30 seconds per lift, and subsequent lifts shall not exceed 12 inches in thickness.
- (B) **Unstable Ground Conditions:** The following general procedures will be followed when a pre-drilled hole will not remain open before or during column construction.
- Down-Hole Vibrator Method: If the hole will remain temporarily stable, the hole may be filled with aggregate to a level above the instability as long as the vibrator is still able to penetrate to within 1 foot of the pre-drilled depth. If the hole will not remain temporarily stable, a Bottom Feed Down-Hole vibrator may be used.

- Down-Hole Tamper Method: A casing with a minimum outside diameter equal to 100% of the column diameter is advanced through the unstable zone to a depth where the soil is stable. If the bottom of the hole is unstable, the casing shall be advanced to the full treatment depth. The first 12-inch lift of aggregate will be placed, and the tamper lowered to the top of the aggregate. The full energy of the impactor and weight of the excavator shall be used for at least 10 seconds per lift, and subsequent lifts shall not exceed 12 inches in thickness.
  - Displacement Mandrel Method: A hollow-shaft mandrel equipped with a tamper foot and sacrificial cap is driven or pushed to the column design depth. The tamper foot shall be repeatedly raised and lowered to place and compact aggregate. Each compacted lift thickness shall not exceed 12 inches.
- (C) Obstructions: Stone columns shall be constructed within 6 inches of the design location. Obstructions encountered during excavation or drilling that will prevent installation of the stone columns to design depth or cause the stone column to stray from its specified location during installation shall be removed. To the extent the obstructions are shown in the geotechnical report, removal of obstructions shall be performed at no additional cost to the City. Obstructions include, but are not limited to, boulders, timbers, concrete, bricks, utility lines, etc., that prevent installing the stone columns to the required depth or cause the stone column to drift from the required locations. Dense natural rock or weathered rock shall not be deemed as obstructions.

#### **5.10 OBSTRUCTIONS.**

- (A) Subsurface strata may contain rubble, concrete, reinforced concrete slabs, timber piles, steel, bricks, stones, seawalls, abandoned foundations, utilities and other materials that can obstruct stone column operations. Where unknown obstructions are encountered during the installation of stone column, the Contractor shall remove or predrill obstruction or install additional stone columns, with the approval of the Engineer.
- (B) Each situation shall be resolved on a case-by-case basis. If such conditions are encountered, the Contractor shall notify the Engineer in writing, and provide all pertinent information relating to the nature, depth, plan location coordinates, expected extent of the obstruction, and proposed procedures to overcome the obstruction.
- (C) The Contractor may elect to remove or pre-drill through the object or submit an alternate stone column layout pattern, subject to the acceptance of the Engineer and at no additional cost to the City. Additional or abandoned column locations will be paid at the standard rate per cubic yard for stone columns.

#### **5.11 CONTAINMENT, COLLECTION, AND DISPOSAL OF SPOIL RETURN.**

- (A) At all times during stone column operations, the site shall be maintained cleared of all debris and water. Spoil return shall be piped or channeled to tanks or other collections structures. The Contractor shall regularly dispose of all waste materials in accordance with DEP requirements and all other agencies having jurisdiction.
- (B) All the soil collection, containment, and disposal methods for stone column installation shall be shown on the shop drawings in the Contractor's submittals to the Engineer prior to the start of operations. The Contractor shall be responsible

for and incorporate all sedimentation and turbidity control measures required by applicable federal, state, and city regulations.

- (C) The Contractor shall take all necessary precautions and implement measures to prevent any spoil return, other spoil material or stockpiles materials from entering the storm drain structures, drainage courses, and other utility lines or from leaving the site via surface runoff. The Contractor shall prevent the migration of spoil return, spoil material, or stockpiled materials into any surface water body, beyond the immediate limits of stone column operations.

## 5.12 **FIELD QUALITY ASSURANCE.**

- (A) Inspections

A ground improvement QA plan shall be prepared by the Contractor before commencement of work and submitted to Engineer for approval prior to any production work.

Monitoring and logging of stone column operations for both test and production work shall be done by the Contractor and submitted to the Engineer.

The Contractor will provide site observation and documentation to ensure the performance of the stone column work. This inspection may include the following: recording of predrill hole depth, observance of the procedures, and recording of compaction energy information.

A sample of the backfill material shall be submitted to the Engineer for a grain size distribution analysis to establish the suitability, the cost of which will be borne by the Contractor. Certification of grain size distribution provided by the quarry may be submitted in lieu of a sample.

- (B) SPT Verification Testing

Testing to evaluate specification compliance will be provided by the stone column contractor and will consist of at least one SPT boring per 22,500 ft<sup>2</sup> (150 ft by 150 ft) improved area at locations indicated by the Engineer.

The SPT verification testing shall be conducted in compliance with the following criteria:

- Testing at each SPT location shall be performed at 2.5 ft intervals through the entire depth of the improved soil zone.
- The normalized SPT blow count shall be equal to the sum of the hammer blows required to drive the sample from 6" to 18" below the cleanout depth adjusted for overburden pressure and for a hammer efficiency of 60%.
- SPT shall be conducted in accordance with ASTM D1586.
- SPT shall be conducted at midpoint locations between adjacent stone columns. Failure to satisfy the minimum normalized SPT blow count criterion requires the installation of additional stone columns at the Contractor's expense. The Engineer may elect to perform additional SPT verification testing at the SPT unit price.
- In lieu of borings, the Contractor may choose to perform Cone Penetrometer Test Soundings (CPTs) for the entire depth of the improved soil. CPTs, if conducted, shall be performed in accordance ASTM D5778.

**5.13 PERFORMANCE CRITERIA.**

- (A) For areas indicated on Contract Drawings where stone column is to be used as ground improvement, an area replacement ratio of 16.7% (minimum), shall be required.
- (B) Additionally, in-situ test methods (i.e., SPT and CPT) are to be performed and the following criteria needs to be achieved
- Static settlement calculated based on the results of SPT or/and CPT should be not more than one inch for a footing size of 15 ft X 15 ft with a load of 2,500 psf.
  - The minimum normalized SPT blow counts or CPT qc in the improved zone for cohesionless soil shall be such that a minimum FS of 1.1 is achieved against liquefaction for the design Earthquake with a PGA of 0.33g and a Magnitude of 5.5.

If a stone column is installed in an incorrect location or does not satisfy the specified tolerances, the Contractor shall install an additional column near the rejected column at a location approved by the Engineer. Alternate remedial procedures will also be acceptable only if they are approved by the Engineer. Unless the rejection is caused by obstruction, refusal in rock or dense soil, the cost of all labor and material required for the additional column shall not be the responsibility of the City and shall be borne by the Contractor.

**5.14 MEASUREMENT**

The quantity of stone columns to be measured for payment shall be by the cubic yard, measured to the nearest cubic yard per column, within only the neat plan area of the proposed stone column shown on the Contract Drawings or approved by the Engineer. The volume shall be determined by multiplying the neat area within this zone times the actual depth of the stone column. Additional quantities of stone column installed by the Contractor or that are outside the limits of the stone columns shown on the Contract Drawings without the acceptance of the Engineer will not be measured for payment.

**5.15 PRICE TO COVER.**

The contract unit price for stone columns shall cover the cost of all labor, materials, plant, equipment, insurance, samples, testing, and incidentals required to furnish and install the stone column within the plan area coverages over the depths and limits shown on the Contract Drawings, in full compliance with the requirements of this Specification. Stone Columns that do not meet the specific performance requirements shall be satisfactorily repaired or replaced by the Contractor at no additional cost to the City.

## SECTION ESCR-5.1 – GROUND IMPROVEMENT WITH RIGID INCLUSIONS

### 5.1.01 INTENT.

This section describes the detailing, furnishing, installing, monitoring, and testing of CMC/APGD/ORTD/RI/GCC (definitions provided in Paragraph 5.1.02), hereafter referenced as rigid inclusions up to the lines and grades designated on the plans and as specified herein that will be used in the flood protection system as ground improvement. The Contractor shall be responsible for selecting rigid inclusion parameters, equipment, and construction methods to meet the specified requirements of the Engineer. Design, consisting of area replacement ratio and depth of the elements or structures created by rigid inclusion has been performed by the Engineer and is shown on the Contract Drawings. Detailing to construct the required elements or structures is by the Contractor.

### 5.1.02 DESCRIPTION.

#### (A) Scope of the Work

The work shall consist of detailing, furnishing, installing, monitoring, and testing of rigid inclusions up to the lines and grades designated on the plans and as specified herein. Rigid inclusions are being considered for Reaches G, H, I, and J.

The installation of the rigid inclusions shall also include the hauling, stockpiling, removal, and disposal of excavation spoils resulting from the installation process of the rigid inclusions. The excavated material is all assumed to be unsuitable and shall be wasted and the possession of the Contractor, unless found suitable for reuse in accordance with these Specifications. The cost of installation of the rigid inclusions shall include the cost of hauling, stockpiling and disposal, of the excavated material.

#### (B) List of Approved Rigid Inclusion Types and Vendor Information are listed below:

- Controlled Modulus Column (CMC) by Menard, or their affiliate Nicholson Construction.
- Auger Pressure Grouted Displacement Piling (APGD) by Berkel & Company Contractors, Inc.
- Omega Rotary Torque Displacement Pile (ORTD) by Malcolm Drilling Company.
- Rigid Inclusions (RI) by Hayward Baker.
- Geo-Concrete Columns (GCC) by Tensar- GEOPIER FOUNDATIONS

The publications referred to in this specification are by the basic designation only, and the latest edition of the publications shall be applicable.

#### (D) Definitions

- Rigid Inclusions: Rigid inclusions may consist of CMC, APGD, RI, GCC, or ORTD. The purpose of the rigid inclusions is to provide ground improvement.

Rigid inclusions construction shall be conducted utilizing a displacement approach where minimal spoil is generated.

- **Demonstration Test Rigid Inclusion:** Demonstration Test Rigid Inclusion is a rigid inclusion that is installed at non-production rigid inclusion locations, adjacent to the waterfront, at a location agreed upon with the Engineer. Vibration monitoring shall be conducted during the installation of the demonstration test rigid inclusion. This test rigid inclusion shall be installed as demonstration to verify the installation technique, to assist in selecting location of load tests, develop installation criteria, and identify installation sequence. The rigid inclusions that will be selected for static load tests shall either be installed prior to production of rigid inclusions as verification load test, or during production installation to proof load test the rigid inclusions. Rigid inclusions installed prior to production rigid inclusions are to allow for selection, performance and evaluation of static load tests as well as developing of the installation criteria by the Engineer. For each additional different rig brought to the site, additional demonstration rigid inclusions shall be installed to assess the rig's capabilities. Based on the demonstration test results, the Contractor may propose a refusal criteria to be applied in instances where tip elevation is not reached. The refusal criteria must be submitted to the Engineer for approval prior to installation of production rigid inclusions.
- **Working Pad:** The working pad shall consist of an 18-inch layer of  $\frac{3}{4}$ " densely graded crushed stone that is placed and compacted above the existing ground surface after the topsoil is removed. The purpose of the working pad is to provide a stable bearing material for the rigid inclusion installation.

(E) Subsurface Conditions

Borings completed within the limits of the project encountered varying thicknesses of very loose to medium dense fill layer underlain by clay, silty sand or sandy till overlying weathered rock.

Installation of the rigid inclusions to the minimum tip elevation shall typically require penetration of the stone working pad. Although it may not be shown on the soil profile, the contractor shall anticipate that some obstructions such as, rocks, boulders, pavement, wood, debris, gravel, or concrete may still exist below the proposed working pad elevation. The cost to install the rigid inclusions through these obstructions shall be paid at the obstruction clearance rate.

**5.1.03 MATERIALS.**

(A) Working Pad

The working pad shall be  $\frac{3}{4}$  in. densely graded crushed stone.

(B) Grout

For CMC, APGD, RI, or ORTD, Contractor shall meet the following grout requirements:

- **Portland Cement:** Shall conform to requirements of ASTM C150 or AASHTO M85, and Materials Method (MM) 10 of NYSDOT.
  1. Type II cement.

2. Cement shall be from an Approved List of Materials and Equipment of Manufacturers and/or Suppliers issued by the Materials Bureau of NYSDOT. If the brand or type of cement is changed during the course of the project, additional grout mix tests shall be conducted to ensure consistency of quality and performance.
  - Fly ash shall meet the requirements of ASTM C618 or AASHTO M295 and Section 711-10, Fly Ash of the Standard Specifications and Procedural Directives of Material Bureau of NYSDOT for Class F.
  - Sand shall meet the requirements of Section 703-04, Grout Sand of the Standard Specifications of NYSDOT.
  - Admixtures shall meet the requirements of Section 2.09, Admixtures of Standard Highway Specifications Volume II of NYCDOT.
  - Water shall conform to requirements of Section 712-01, Water of the Standard Specifications of NYSDOT.
  - Grout Mix
    1. Proportion by weight to produce a grout capable of being satisfactorily pumped and of penetrating and filling all voids.
    2. Minimum Compressive Strength:
    3. 2,000 psi at 7 days as required prior to pile integrity testing
    4. 4,000 psi at 28 days
    5. Minimum Flow Cone Rate: 10 seconds to 25 seconds with modified 3/4-inch opening flow cone, ASTM C939.
    6. The grout mix shall be designed utilizing fluidifiers as needed to maintain the range of acceptable fluid consistency (flow cone rate) for a period of at least 2 hours.
  - A ready-mix truck shall be supplied from an approved ready-mix plant with certified plant inspection according to Section ESCR-3.05.08, Concrete Mixing, Transporting and Discharging.

(C) Concrete for GCC Construction

- All materials, proportioning, air entraining, mixing, slump, and transporting of PCC shall be according to Section 3.05, Concrete of ESCR Specification except as modified herein.
- Water/cement ratio: not to exceed 0.45.
- Use Class D PCC mixture with a slump of 6 inches  $\pm$ 1.5 inches.
- Portland cement: meet the requirements of ASTM C150 or AASHTO M85 Type II and Section 701-01, Portland Cement of the Standard Specifications.
- Fly ash shall meet the requirements of ASTM C618 or AASHTO M295 and Section 711-10, Fly Ash of the Standard Specifications and Procedural Directives of Material Bureau of NYSDOT for Class F.

- Sand shall meet the requirements of Section 703-07, Concrete Sand of the Standard Specifications of NYSDOT.
- Admixtures shall meet the requirements of Section 2.09, Admixtures of Standard Highway Specifications Volume II of NYCDOT.
- Do not use GGBFS.
- Minimum Compressive Strength:
  1. 4,000 psi at 28 days.
  2. 2,000 psi at 7 days as required prior to pile integrity testing.
- A ready-mix truck shall be supplied from an approved ready-mix plant with certified plant inspection according to Section ESCR-3.05.08, Concrete Mixing, Transporting and Discharging.

#### **5.1.04 EQUIPMENT.**

- (A) Utilize machines or combinations of machines and equipment that are in good working condition, safe to operate, cause no vibration, and will produce the results specified herein.
- (B) Utilize equipment that is capable of advancing the rigid inclusion through the subsurface materials efficiently to meet the project schedule.
- (C) The equipment shall be of sufficient size and capacity, and capable of installing rigid inclusions to the minimum depths shown in the plans or that required by the design, whichever is deeper.
- (D) The equipment shall be capable of installing rigid inclusions in the presence of very dense granular soils and/or obstructions, where encountered.
- (E) The rigid inclusion equipment must be equipped with installation monitoring capabilities including, as minimum, the following: (a) applied torque (b) applied static down pressure (crowd), (c) advance rate (penetration speed), (d) grout pressure, and (e) grout volume.
- (F) Rigid inclusions equipment shall be suitable for displacement installation, where minimal spoil is generated.

#### **5.1.05 SUBMITTALS.**

- (A) A certification that states that no techniques that cause vibration to install the element are used in the installation.
- (B) Shop drawings that include spacing, diameter, installation procedure, sequence of construction with sufficient details including transitions areas, planned cut-off and tip elevations, material, proposed equipment, and mix design.
- (C) A load testing program to verify the design in accordance with the requirements of this special provision. The load testing program should comply with the following:
  - It shall be performed prior and during production of rigid inclusions.

- The rigid inclusion production shall only start upon completion of four successful load tests and after the Engineer issues the final tip elevation, and installation criteria of the rigid inclusions.
  - The load test shall be performed on rigid inclusion in accordance with ASTM D1143. Verification rigid inclusion shall be tested to a maximum load equal to 200% of the design load. The location of the test rigid inclusion will be selected by the Engineer with input from the Contractor and depending on the work and traffic control sequence. The Contractor's schedule must accommodate the time required to perform and evaluate the load test and issue the installation criteria by the Engineer.
  - The Contractor, at their expense, may be required to repeat the construction of a test section if the results of the test program do not meet the project requirements. The test program shall confirm that the resultant soil-cement properties met the required design criteria prior to the Contractor proceeding with production work.
- (D) Calculations for the load test reaction piles including diameter, type, reinforcement, depth as well as the reaction frame and beams. All details and supporting calculations shall be submitted for review by the Engineer. Design the reaction piles and frame for minimum two times the maximum test load. All shop drawings and supporting calculations shall be signed and sealed by a Professional Engineer registered in the State of New York.
- (E) Calibration records load cells, hydraulic jacks, pumps and pressure gauges should be submitted at least 7 days prior to performing the load testing.
- (F) A complete load test report should be submitted within 3 days of completion of each test. The Engineer shall evaluate the results of the load tests and issue the final tip elevations and planned spacing for the production rigid inclusions within 14 days from the receipt of the last load test report. Shop drawings and any supporting calculations should be sent to the Engineer at least 15 days prior to start the installation of the production rigid inclusions. Each rigid inclusion shall receive a reference number, which will be indicated on the shop drawings. The shop drawing submittal shall also show cut-off elevations, typical sections, and detail drawings, as required.
- (G) As-built plans for the installed rigid inclusions based on actual locations and tip elevations. The surveyed locations shall be signed and sealed by a licensed surveyor and tip elevations shall be certified by the Contractor's Professional Engineer registered in the State of New York.
- (H) Rigid inclusion installation records as specified. Installation records shall include all recordable information versus penetration depth, including applied torque, applied static down pressure (crowd pressure), advance rate (penetration speed), grout pressure, and grout volume.
- (I) A work plan including details of the equipment, sequence of construction, and method of installation should be submitted to the Engineer for review. The submittal should include a detailed quality control plan and explain how the work plan will comply with all the requirements of the project safety plan.

- (J) Documentation for all imported materials including pertinent laboratory test results prior to arrival on site.

#### **5.1.06 SITE PREPARATION.**

- (A) Inspect the site prior to the start of operations to verify the depth ground improvements can be constructed using the proposed equipment.
- (B) Excavation for the working pad shall not begin until the results of the load testing program on rigid inclusions has been submitted and approved by the Engineer.
- (C) The final excavation for the working pad shall be made using an excavator equipped with a smooth-edged bucket to minimize disturbance of the in-situ soils. The prepared subgrade shall consist of in-situ soils compacted to moisture content within  $\pm 2\%$  of optimum moisture content. If compaction is not practical due to natural water contents far above optimum and/or wet weather conditions, the in-situ soils shall be over excavated to a depth of 12 inches and replaced with compacted granular fill. Any organic or otherwise unsuitable soils shall be removed and replaced with compacted granular fill.

#### **5.1.07 WORKING PAD CONSTRUCTION.**

- (A) Prior to construction of the working pad, topsoil and other unsuitable materials shall be removed.
- (B) Construct the working pad which consists of at least 18-inch layer of  $\frac{3}{4}$ " densely graded crushed stone, and proof roll and compact it.
- (C) Any rutting of the working pad that occurs during installation of the rigid inclusions should be measured and the Engineer notified. If practical, when rutting occurs, reroute construction traffic to avoid further damage to the underlying in-situ soils, or remove and replace the rutted material with compacted granular fill.

#### **5.1.08 INSTALLATION OF RIGID INCLUSION**

- (A) Provide adequate number of drilling rigs to meet the project schedule considering all facets of the project.
- (B) Evaluate the site and subsurface conditions and assess any need for working platforms. Such platforms, preparatory work, and material needed is considered part of the means and methods and no additional payment or time will be granted toward such work.
- (C) Install a total of 8 demonstration rigid inclusions at non-production locations throughout the site(s) at locations agreed upon with the Engineer. Demonstration rigid inclusions are necessary to assess any variation in soil conditions and select the locations of the rigid inclusions that will be load tested and to be used in the development of the production rigid inclusion installation criteria. These demonstration rigid inclusions shall be installed before the load tests and before installation of production rigid inclusions. The demonstration rigid inclusion shall be paid at the same unit rate as the production rigid inclusion and no separate mobilization or additional cost shall be borne by the City. Vibration monitoring to be performed during the installation of the demonstration rigid inclusion.
- (D) Perform a total of four load tests prior to the start of rigid inclusion production. One load test shall be performed for each of Reaches G, H, I, and J, where rigid

inclusions are proposed. The load test results will be signed and sealed by the Contractor's Professional Engineer and submitted to the Engineer. No payment shall be made for load tests which were unsatisfactorily performed as determined by the Engineer.

(E) Layout and Tolerances

Surveying: Prior to installation of the rigid inclusions, each rigid inclusion location shall be surveyed by a licensed surveyor. Provide all survey layouts, maintain utility clearances and provide any required coordination with the Engineer and any other local, state, and federal agencies having jurisdiction, prior to the start of construction. The location of each rigid inclusion shall be marked using numbered utility flags.

Plan position: The center of the completed rigid inclusion shall be within 3 inches of the plan location.

Verticality: The axis of the completed rigid inclusion shall not deviate more than 2% from vertical. The verticality of the mast of the rig shall be checked by the operator before start of the installation for each rigid inclusion. The operator shall indicate on the daily drilling log for each rigid inclusion that verticality was within tolerance by checking the appropriate box on the installation log.

Diameter: The completed rigid inclusion diameter shall not deviate more than 10% from the plan diameter.

(F) Rejection: Rigid inclusions improperly located or installed beyond the maximum allowable tolerances or reported to be defective as a result of pile integrity testing, shall be abandoned and replaced with new rigid inclusions unless the Contractor and the Contractor's designer propose a remedial measure which is acceptable to the Engineer, either of which will be done at no additional cost to the City.

(G) Schedule: Mobilize and maintain sufficient equipment, materials, and personnel to complete the work in accordance with project milestones, and Contractor shall coordinate operations with all other aspects of the project.

(H) Installation Sequence: Install the rigid inclusions in accordance with the sequence detailed in the approved work plan. If adjacent rigid inclusions are observed to be influenced by the installation of a neighboring rigid inclusion, the installation sequence shall be modified to prevent disturbance of already constructed rigid inclusions. Any required modifications to the sequence, or mitigation of rigid inclusions deemed unusable due to disturbance, shall be completed at no additional cost to the City or extension in the project schedule.

(I) Rigid inclusion spacing and length as noted in the contract plans will be optimized based on the static load tests. Any required modification to the sequence based on the optimization shall be completed at no additional cost to the City or extension in the project schedule.

(J) Depth: Install the rigid inclusions to the minimum tip elevation, or deeper as required to found the rigid inclusions on a suitable bearing stratum, as determined by the Engineer.

(K) Obstructions: Subsurface obstructions may include but are not limited to boulders, timbers, concrete, bricks, utility lines, foundations, slabs, etc. that prevent rigid

inclusions to be installed to the required depth. In the event that obstructions are encountered during installation of a rigid inclusions that cannot be penetrated with reasonable effort, one or more of the following procedures will be used:

- Position the element a short distance not more 1.5 feet away from the original position.
  - Pre-drill the obstruction.
  - Install additional elements to bridge over the obstruction.
- (L) Any change made to the design or rigid inclusion layout because of obstructions shall be approved by the Engineer. An as-built submittal should be provided to the Engineer no later than 7 calendar days after the modification has been performed on site. This submittal shall be signed and sealed by the Registered Professional Engineer responsible to the Contractor. All elements that are abandoned due to obstructions or equipment malfunction shall be completely backfilled with grout.
- (M) The Contractor will be paid for the abandoned rigid inclusion elements per the contracted price per cubic yard of rigid inclusions. No additional compensation or time for any items related to obstructions shall be awarded for delays, or mobilization to the relocated position of the rigid inclusion.
- (N) **Cut-off Elevation**  
Cutoff the rigid inclusions 12 inches below the top elevation of the working pad, or slightly higher to allow any required trimming or removal of low strength material at the top of the rigid inclusion.
- (O) **Ground Heave**  
Heave of the working pad is expected due to rigid inclusion installation. The rigid inclusions may need to be cut down prior to construction of upland work. Any cut to the rigid inclusion shall be performed using methods that do not crack or damage the rigid inclusion. Such work is considered incidental and shall be performed at no additional cost to the City.
- (P) Axial load test on selected rigid inclusions shall be performed after the design strength has been achieved. The working pad should be excavated to the original ground surface at the test location. Perform the excavation, load test setup, load testing, and backfill the excavation, in a single shift. The load test loading schedule given below shall be followed:
- Apply the load in increments of approximately 25 percent of the design load up to 200 percent of the design load.
  - Maintain the applied load at each increment for 5 minutes during loading and unloading except at 100 and 200 percent of design load. Record the deformation and strain two minutes after applying the test load and just prior to applying the next load increment.
  - At 100 and 200 percent of the design load, hold the load for at least 10 minutes. Deformation readings shall be recorded at 1, 2, 4, 6, and 10 minutes. If the average deformation between 1 and 10 minutes increases by more than 0.04

inches, hold the load for 60 minutes and record the deformation every 10 minutes.

- After completing the required hold time at 200 percent of the design load, unload the rigid inclusion in increments of 25 percent of the design load until the alignment load is reached.

(Q) Disposal of Excavation Spoils

Stockpile all spoil material, including any topsoil and spoils generated by rigid inclusion installation, at the locations designated for spoil storage. Handling and disposal of spoils shall be performed at no additional cost to City.

**5.1.09 OBSTRUCTIONS.**

- (A) Subsurface strata may contain rubble, concrete, reinforced concrete slabs, timber piles, steel, bricks, stones, seawalls, abandoned foundations, utilities and other materials that can obstruct rigid inclusion operations. Where unknown obstructions are encountered during the installation of rigid inclusion, the Contractor shall remove or predrill obstruction or install additional rigid inclusions, with the approval of the Engineer.
- (B) Each situation shall be resolved on a case-by-case basis. Payment shall be based on an agreed upon unit rate for handling obstructions. If such conditions are encountered, the Contractor shall notify the Engineer in writing, and provide all pertinent information relating to the nature, depth, plan location coordinates, expected extent of the obstruction, and proposed procedures to overcome the obstruction.
- (C) The Contractor may elect to remove the object or submit an alternate rigid inclusion layout pattern, subject to the acceptance of the Engineer and at no additional cost to the City. Alternately, subject to the Engineer's approval, the Contractor may terminate a rigid inclusion column or drill through the obstruction using impact, vibratory, drilling methods, or any combination of these as the Contractor deems necessary to allow for the advancement to the specified tip elevation as indicated on the Drawings. Additional or abandoned column locations will be paid at the standard rate per cubic yard for rigid inclusion columns.

**5.1.10 CONTAINMENT, COLLECTION, AND DISPOSAL OF SPOIL RETURN.**

- (A) At all times during rigid inclusion operations, the site shall be maintained cleared of all debris and water. Spoil return shall be piped or channeled to tanks or other collections structures. The Contractor shall regularly dispose of all waste materials in accordance with the DEP requirements and all other agencies having jurisdiction. Spoil generated from Reaches G, H, I, and J may be found to be environmentally contaminated.
- (B) All the soil collection, containment, and disposal methods for rigid inclusion installation shall be shown on the shop drawings in the Contractor's submittals to the Engineer prior to the start of operations. The Contractor shall be responsible for and incorporate all sedimentation and turbidity control measures required by applicable federal, state, and city regulations.
- (C) The Contractor shall take all necessary precautions and implement measures to prevent any spoil return, other spoil material or stockpiles materials from entering

the storm drain structures, drainage courses, and other utility lines or from leaving the site via surface runoff. The Contractor shall prevent the migration of spoil return, spoil material, or stockpiled materials into any surface water body, beyond the immediate limits of rigid inclusion operations.

#### **5.1.11 QUALITY CONTROL / QUALITY ASSURANCE.**

The following describes the minimum inspection and testing required in the Contractor's Quality Control (CQC) Plan and Program for the work of this section and is for the CQC only. The implementation of the Contractor Quality Control Program does not relieve the Contractor from the responsibility to provide the work in accordance with the contract documents, applicable codes, regulations, and governing authorities.

(A) Supervision, inspection, and records

The Contractor shall have an on-site field engineer to manage all of the QC activities on the project including pile integrity testing, grout sampling (if applicable), and other testing. These tests should be performed as defined in the Design Submittal and approved by the Engineer. Load tests, production rigid inclusions, subgrade preparation, and working pad shall be done under the direct supervision of a professional geotechnical engineer registered in the State of New York from the Contractor's side. The geotechnical engineer shall have supervised a minimum of five similar deep ground improvement projects.

An accurate installation record shall be kept for all rigid inclusions. The record shall indicate the location, length, cut-off elevation, date and time of construction, applied torque, applied static down pressure (crowd pressure), advance rate (penetration speed), grout pressure, and any other pertinent installation details as indicated in the Design Submittal and approved by the Engineer. Any unusual conditions encountered during installation should be immediately reported to the Engineer and any corrective measures recorded. Daily records shall be signed by the Contractor's superintendent and by the inspector. A complete tabulation of all records pertaining to the approved rigid inclusions installation shall be certified by the Contractor's engineer and shall be delivered to the Engineer no later than 14 days after the completion of the rigid inclusion work. All testing and inspection documents certifying that the rigid inclusions and working pad were installed based on the construction and installation criteria shall be reviewed and approved by the Contractor's engineer.

Pertinent installation data as defined in the Design Submittal and approved by the Engineer should be provided on a daily basis. These documents shall be prepared continuously as the production progresses and shall be submitted to the Engineer no later than one working day after the installation of a rigid inclusion. The Contractor has to ensure that the Engineer has complete access at all times to the data for the rigid inclusion installation, as required.

(B) Working Pad

Perform proof-rolling of the top of the working pad prior to and following completion of the rigid inclusion installation. The proof-rolling shall cover the entire work area, and the wheel pass spacing shall be equal to the axle length of the dump truck.

All required testing will be completed to the satisfaction of the Engineer at no additional cost to the City.

Following installation and curing of the rigid inclusions, proof-roll the working pad using a fully loaded dump truck. Where deflections more than 1/4 inch are observed, remove the working pad, over excavate 12 inches and reconstruct the working pad. The excavation shall not damage the rigid inclusions.

Backfilling and raising grades to required subgrade levels shall be conducted in a controlled manner as specified in Section ESCR-4.11.

(C) Concrete and Grout

Conduct strength testing of the concrete in accordance with ASTM C39. For concrete testing, cured cylinders measuring 3 inches in diameter by 6 inches high are required. For testing grout, 2-inch cubes are used. For the cylinders and molds, molds and a curing environment conforming to the requirements of ASTM C39 should be provided. At a minimum, prepare a set of four test cylinders or cubes for each 50 cubic yards of concrete or grout placed or a minimum of two sets of four cylinders or cubes per day (whichever is greater). One cylinder or cube from each set shall be tested for strength at 3, 7, and 28 days, and final one shall be stored as a reserve sample. Certified strength test results shall be provided to the Engineer for acceptance.

(D) Rigid Inclusions

**Pile Integrity Testing:** Pile Integrity Testing (PIT) shall be performed on all the inclusions used for load test and approximately 25% of the rigid inclusions. The PIT shall be performed in accordance with ASTM D5882. The production elements selected for the PIT shall be at the discretion of the Engineer based on daily records indicate likelihood of anomalies in the inclusions.

The PIT shall be performed by a firm qualified to do such testing. Documentation of the firm's qualifications shall show that it has successfully performed PIT testing for at least 5 years, and for a minimum of five similar projects. A list of previous projects including name, description, number of tests performed, and contact person with phone number shall be provided.

The firm performing PIT will be responsible for testing and assessing the integrity and condition of the pile, including but not limited to significant reductions in pile cross-sectional area (necking) or pile material strength/stiffness above the pile toe. In addition, the firm performing PIT shall confirm the pile lengths where clear pile toe reflection is obtained or state to which pile length the test appears to be conclusive.

The PIT submittal shall include:

1. A record of each rigid inclusions tested
2. Low-Strain Dynamic Testing (LSDT) Report: In accordance with referenced standard for test performed.
3. Submit report to the Engineer within 48 hours of test completion
4. Installation Record
5. Pile Length
6. Unusual occurrence(s) during installation

7. A report with complete interpretation of PIT results.

(E) Strain Gauges

The test rigid inclusion shall be instrumented with five levels of strain gauges. The strain gauges shall be Geokon model 4911, 4911A or approved equivalent. The strain gauges shall be compatible with a real time monitoring system. The test rigid inclusions shall include a rebar to facilitate installation of the strain gauges. The test rigid inclusion may include, to the Contractor's choice, a lightly reinforcement cage for the top five feet of the rigid inclusion to avoid any risk while transmitting the load effectively into the rigid inclusion. Strain gauges elevations can be assumed preliminarily at the soil layering breakdown, 2 feet below to top of rigid inclusion and 2 feet above the rigid inclusion tip elevation. Strain Gauges final elevations shall be adjusted by the Engineer on site based on the confirmation borings and length of the rigid inclusion.

Take initial readings 24 hours after completing installation and testing of each strain gauge. During the load test, the strain gauges shall be monitored prior to construction of production rigid inclusions. After monitoring the strain gauges during load tests, the strain gauges cables or wires shall be routed through a buried schedule 80 PVC pipe and shall be connected to the real time monitoring system to be monitored during placement of embankment. Strain gauges shall be compatible with the real time monitoring system. Readings shall be taken daily and made available online to the Engineer. Any strain gauge that malfunctions or becomes inoperable during the load test shall be replaced and the load test shall be redone by the contractor at no additional cost to the City.

After the load tests, the strain gauges will continue to be monitored as filling operations are performed. A minimum of three readings weekly shall be taken using real time automated monitoring system for each strain gauge as backfilling operations are being performed.

Additional provisions for instrumentation related to the grading works are included in the Contract Documents.

**5.1.12 PERFORMANCE CRITERIA.**

- (A) For areas indicated on Contract Drawings where rigid inclusions are to be used as ground improvement, an area replacement ratio of 7.1% (minimum) using 18 in. diameter rigid inclusion, shall be required.
- (B) Allowable load per rigid inclusion, to be verified by pile load testing, shall be 30 T.
- (C) If a rigid inclusion is installed in an incorrect location or does not satisfy the specified tolerances, the Contractor shall install an additional rigid inclusion column near the rejected column at a location approved by the Engineer. Alternate remedial procedures will also be acceptable only if they are approved by the Engineer. Unless the rejection is caused by obstruction, refusal in rock or dense soil, the cost of all labor and material required for the additional column shall not be the responsibility of the City.

**5.1.13 MEASUREMENT AND BASIS OF PAYMENT.**

- (A) Rigid Inclusions

Measurement for Rigid Inclusions shall be in cubic yard, and will be measured using the cut-off elevation to tip elevation of installed rigid inclusions (rounded to the nearest foot) and the design cross-section. This includes:

- Furnishing and installing demonstration and production rigid inclusions
- Performing detailed layout design
- Performing site preparation and load transfer platform
- Handling and disposal of cuttings
- Performing any associated inspection and laboratory testing
- Performing rigid inclusion load testing
- Performing PIT for demonstration and production rigid inclusions

(B) Load Transfer Platform (Working Pad)

Measurement for the Rigid Inclusions Working Pad shall be in cubic yard, and will be the quantity shown in the plans. Payment is full compensation for furnishing and installing working pad, and performing inspection and laboratory testing.

(C) Rigid Inclusions Test Program

Measurement for the Rigid Inclusion Test Program will be on a lump sum basis. Payment is full compensation for furnishing and installing the rigid inclusion test element with strain gauges for static load test, all components for load application mechanism/reaction frame, all components for measuring load magnitude and rigid inclusion displacement, performing PIT testing on the rigid inclusion test element and assessing the results, performing load test, providing all associated supervision and inspection, record data and provide load test results report. Monitoring of strain gauges after completion of load test will be compensated as part of the rigid inclusion testing program.

(D) Obstruction Clearance

Measurement for obstruction clearance to allow for rigid inclusion placement shall be the number of linear feet, measured to the nearest half foot, of pre-drilling required to advance beyond the obstruction, to the satisfaction of the Engineer, Payment is full compensation for removal of the obstruction, including all setup, removal, and proper disposal of the removed obstruction as required.

**5.1.14 PRICE TO COVER.**

The contract unit price for rigid inclusion shall cover the cost of all labor, materials, plant, equipment, insurance, samples, testing, and incidentals required to furnish and install the rigid inclusion within the plan area coverages over the depths and limits shown on the Contract Drawings, in full compliance with the requirements of the specifications. Rigid inclusion that does not meet the specific performance requirements shall be satisfactorily repaired or replaced by the Contractor at no cost to the City.

Additional quantities of rigid inclusion installed by the Contractor that are outside the limits shown on the Contract Drawings without the acceptance of the Engineer will not be measured for payment.

The contract unit price for obstruction clearance shall cover the cost of all labor, materials, plan, equipment, insurance, samples, disposal, and incidentals required to pre-drill through the obstruction for proper installation of the rigid inclusion.

The contract unit price for installation of the load transfer platform shall cover the cost of all labor, materials, plan, equipment, insurance, samples, testing, and incidentals required to install the platform as shown on the Contract Drawings, in full compliance with the requirements of the specifications.

The lump sump price for the test program shall cover the cost of all labor, materials, plant, equipment, insurance, samples, testing, reporting, and incidentals required to perform the test program in full compliance with the requirements of the specifications.

*Payment will be made under:*

**END OF SECTION**

**SECTION ESCR-6.20 – RIP RAP STONE****6.20.1 INTENT.**

This section describes the placing of rip rap stone in the embayments at East River Park.

**6.20.2 DESCRIPTION.**

Rip rap stone shall be placed where indicated on the Contract Drawings or directed.

Where the material underlying the structure is unsatisfactory the unsuitable material shall be removed and replaced with rip rap stone of the size designated by the Engineer.

**6.20.3 SUBMITTALS.****(A) DATA**

1. Certification from stone supplier that the rip rap stone meet the specified properties and gradation
2. Surveys
  - a) The Surveys, original and one copy of all field notes, cross sections, computations, computer storage disks, and all other records relating to the survey or layout of work shall be submitted to the Engineer, who will use them as necessary to verify placement of material to required line and grade.
3. Cross Sections
  - a) The same scale for the cross sections shall be used as in the Contract Drawings. The cross section profile shall be digitally captured. The final cross sections and the theoretical design templates shall be superimposed over the original cross sections.
  - b) Cross sections shall be taken on 25-foot intervals and shall include elevations at 1-foot ranges and at the top and toe of the slope. All stations, ranges, and elevation points taken from field books shall be clearly lettered as the profiles.
  - c) In addition to the above, the original and final cross sections shall be furnished as X, Y, Z and descriptor ASCII files for each cross section line, and one X, Y, Z and descriptor ASCII file with all data included on a thumb drive or CD.

**(B) STONE PLACEMENT PLAN**

A detailed stone placement plan shall be submitted for approval by the Engineer prior to starting any work. The plan shall detail:

- a) The method of transporting stone from the stone source to the construction site.
- b) The method of stone placement and the type of equipment to be utilized.

**6.20.4 EXCAVATION.**

Excavation for the purpose of removing unsatisfactory material shall be made to the dimensions as directed.

**6.20.5 METHODS.****(A) ACCEPTANCE OF MATERIALS**

During construction, both prior to and after materials are delivered to the site, visual inspections and measurements of the stone materials may be performed by the Engineer.

If the Engineer, during the inspections, finds that the stone quality, gradation or weights of stone being furnished are not as specified or are questionable, re-sampling and re-testing by the Contractor shall be required. Sampling of the delivered stone for testing and the manner in which the testing is to be performed shall be as directed by the Engineer. This additional sampling and testing shall be performed at no additional cost to the City.

Any material rejected shall be removed or disposed of as specified and at the Contractor's expense.

**(B) BASE PREPARATION AND GEOTEXTILE PLACEMENT**

Areas on which geotextile is to be placed shall be graded and/or dressed to conform to cross sections shown on the Contract Drawings within an allowable tolerance of plus 2.0 inches and minus 2 inches from the theoretical slope lines and grades. The prepared base shall be approved by the Engineer.

Installation of geotextile shall be as specified in Section ESCR-6.68.

Immediately prior to placing the geotextile, the prepared base will be inspected by the Engineer and no material shall be placed thereon until that area has been approved.

**(C) ARMOR STONE PLACEMENT**

Armor stone shall meet the requirements in ESCR-2.27 and shall be placed only after the upper underlayer stone has been approved.

Armor stone shall be placed on the upper underlayer in such a manner as to produce a well-graded mass of stone with minimum voids and shall be constructed to the lines and grades indicated on Contract Drawings.

Armor stone shall be placed to its full course thickness in one operation and in such a manner as to avoid displacing the underlying material. The larger stones shall be well-distributed and the entire mass of stones shall be roughly graded to conform to the specified gradation in ESCR-2.27.

The finished slope shall be free from objectionable pockets of small stones, clusters of larger stones, or large voids. Selective placing may be required but only to the extent necessary to secure the results specified above. The desired distribution of the various sizes of armor stones throughout the mass shall be obtained, at the option of the Contractor, either by selective loading at the quarry or other source, by controlled dumping of successive loads during final placing, or by a combination of these methods.

Armor stone shall be placed from bottom to top of slope. Placing armor stone by dumping it at the top of the slope and pushing it down the slope will not be permitted. Placing armor stone by dumping into chutes or by similar methods will not be permitted.

Protection of uncompleted work is solely the Contractor's responsibility and any repairs needed to the damaged portions of already completed work shall be at no cost to the City.

Contractor shall account for variations in quantities that may need to be considered as a result of localized settlement, removal of large pieces of debris, and or field conditions. Additional quantities of stone material which may be needed to achieve the design elevations shall be at no additional cost to the City.

(D) MISPLACED STONE

Areas in the vicinity of completed stone protection shall be thoroughly examined and stone found outside the indicated cross section or limits of the stone protection shall be recovered and used in the work or disposed of at no additional cost to the City.

(E) TURBIDITY CURTAIN

A turbidity curtain shall be installed and maintained within the embayment area during stone placement operations to protect the "in water" work area. Refer to Section ESCR-9.30 for erosion and sediment control specifications. Products shall be capable of working in the below defined operational conditions:

Operational Conditions

Maximum Significant Wave Height:	2 ft
Maximum Current Speed:	2.7 knots (flood); 2.9 knots (ebb)
Water Depth:	-12 ft NAVD88 or deeper
Wind Speed:	40 miles per hour

(F) CHECK SURVEYS

Check surveys shall be performed by the Contractor to demonstrate that the armor and underlayer stone has been placed to the specified grades and thicknesses. Check surveys shall be done as the work progresses to verify lines, grades and thicknesses established for the completed work. At least one (1) check survey as specified below shall be made for each twenty-five (25) foot section as soon as practicable after completion.

Following placement of the armor stone, the cross section of the work shall be approved by the Engineer before proceeding with the next step of the work. Approval of cross sections based upon check surveys shall not constitute final acceptance of the work. Cross sections shall be taken on lines 25 feet apart, measured along the structure baseline, with readings at elevations in 1-foot ranges and at the top and toe of the slope. However, other cross section spacing and reading intervals may be used if determined appropriate by the Engineer. Additional elevations and soundings shall be taken as the Engineer may deem necessary at no additional cost.

The elevation of stone above the water surface shall be determined by the use of a leveling instrument and a rod having a spherical end of (i.e. base) six (6) inches in diameter per CIRIA (2007). The elevation of stone below water shall be

surveyed using single-beam instrument or other techniques approved by the Engineer.

(G) **CONSTRUCTION TOLERANCES**

Variation in slope lines and grades from the indicated slope lines and grades shall be within the tolerances specified on the Contract Drawings.

The specified tolerance for the armor and underlayer stone is for the average difference between design profiles to actual profile (i.e., mean actual profile) over a 50 ft length along the structure's axis. The tolerances on two consecutive mean actual profiles shall not be negative. Notwithstanding any accumulation of positive tolerances on the underlayer, the thickness of layer shall not be less than 80% of the nominal thickness when calculated using mean actual profiles.

The intention is that the work shall be built generally to the required elevations, slope and grade and that the outer surfaces shall be even and present a neat appearance. Placed material not meeting these limits shall be removed or reworked as directed by the Engineer at no additional cost to the City. Payment will not be made for excess material that the Engineer permits to remain in place.

Variation in slope lines and grades from the indicated slope lines and grades shall be within the tolerances specified in Table 1 per CIRIA 2007 (CIRIA/CUR C683 Chapter 9) and the Contract Drawings, or as approved by the Engineer.

Table 1: Construction Tolerances

LOCATION OF STONE	TOLERANCES
Armor Stone	± 6 inches

**6.20.6 MEASUREMENT AND PAYMENT.**

The quantity to be measured for payment shall be the number of cubic yards of rip rap stone placed as shown on the Contract Drawings or as ordered by the Engineer, in accordance with the specifications.

**6.20.7 PRICE TO COVER.**

The contract price, per cubic yard, for rip rap stone, in place, shall cover the cost of all labor, materials, plant, equipment, insurance, and incidentals required to furnish and place rip rap stone, complete, in place, and shall include all excavation (except stone excavation); the furnishing of such samples for testing as may be required; check surveys; installation of turbidity curtain; and furnishing all other necessary incidentals; all, in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-6.20	RIP RAP ROCK	C.Y.

**END OF SECTION**

## SECTION ESCR-6.27 – DEMOLITION OF STRUCTURES

### 6.27.1 INTENT.

This section describes the demolition of barriers, curbs, manholes, sewers, vaults, esplanade, embayment, sheet pile bulkheads, tie rods, relieving platform decks, piles, electrical bunker sheds, irrigation pump bunker sheds, and other structures that need to be removed to facilitate the installation of the flood protection system, which includes the floodwall, floodgates, regulators/tide gate chambers, manholes, and reconstruction of adjacent elements affected by the flood protection system.

### 6.27.2 DESCRIPTION.

In addition to furnishing all necessary labor, materials, plant, equipment, and necessary incidentals required, the work shall include the demolition, removal and disposal of entire or portions of structures, as indicated on the Contract Drawings, specified or directed by the Engineer, together with all appurtenances, debris and refuse of all kinds, and other miscellaneous structures. Asbestos testing is required. Based on the results, abatement may be required prior to demolition. Results to be filed with DEP.

### 6.27.3 GENERAL.

#### (A) LAWS, PERMITS, ETC.

The Contractor shall comply with all laws, ordinances, statutes, rules and regulations relating to the demolition of buildings or structures; the removal and disposal of materials resulting from demolition operations; the protection of adjacent properties and the general public; and the furnishing and maintenance of passageways, guard fences and other protective facilities. The Contractor shall obtain all required permits and licenses, pay all fees and give all notices necessary for the prosecution of the work.

#### (B) DISPOSAL

All materials resulting from demolition operations or required to be excavated in connection with such operations, except as otherwise provided or directed, shall be disposed of by the Contractor away from the demolition site and the site of the contract work. Said materials shall not be dumped, placed, stored or disposed of within the limits of any existing or projected public street or road. The burning of debris or other demolition materials will not be permitted except as approved and authorized by the New York City Fire Department, the New York State Department of Environmental Conservation, and the Engineer.

#### (C) CLEAN AIR ACT

The U.S. Environmental Protection Agency (E.P.A.) requires that, under the Clean Air Act and its implementing regulations, New York City agencies must notify the E.P.A. at least ten (10) days prior to demolition of any institutional, commercial or industrial building in which asbestos is used for insulation or fireproofing. Under the demolition provisions of the National Emissions Standards for Hazardous Air Pollutants Program, the U.S. Government exercises jurisdiction over the uses of asbestos, beryllium and mercury, including their disposal.

These regulations specify that E.P.A. shall be notified of such information as to the methods of demolition to be employed, description and location of the building(s) to be demolished, and scheduled starting and completion dates. Advance

notification enables E.P.A. to send observers to the site to ensure that proper demolition procedures are being followed.

The Contractor shall therefore notify the Engineer at least twenty (20) days in advance of any building demolition work to be performed under the contract, furnishing him the information required above, so that the Engineer can notify the E.P.A. at least ten (10) days prior to building demolition work, of the said information.

(D) DAMAGES AND ACCIDENTS

The Contractor shall be responsible for all damages resulting from and due to the Contractor's demolition operations. Said responsibility shall include, but not be limited to, the grounds; buildings; structures; and portions of buildings or structures which are adjacent to the demolition site and are to remain. No additional payment or compensation will be made or allowed the Contractor for costs incurred for repairs and replacements required to satisfactorily remedy the aforesaid damages or for the settlement of any claims resulting therefrom.

The Contractor shall provide all materials, labor and machinery necessary and shall place proper and sufficient guard and fences and warning signals by day and by night for the prevention of accidents.

(E) RODENT EXTERMINATION

When required by any code, law, ordinance, statute, rule or regulation, the Contractor shall employ a licensed exterminator to rid a building or structure of rats; file an extermination certificate with the regulating agency; and submit a copy of the said certificate to the Engineer, before starting demolition operations.

(F) SALVAGE

The City assumes no responsibility for the condition or presence of salvageable materials in or on the premises. All damage to or loss of salvageable materials, whether by reason of fire, theft or other happening, shall be at the risk of the Contractor and no such loss or damage shall relieve the Contractor from any obligation under the contract or form the basis of any claim against the City.

(G) FIRE PROTECTION, ETC.

The Contractor shall furnish, employ and pay for all necessary appliances required for the adequate protection of the work against fire and to safeguard existing structures and the public. The Contractor shall at all times maintain adequate facilities for the thorough saturation of all debris and materials with water to the extent required to prevent dust arising from the work. All water used including temporary piping, connections, permits therefor, and removal of piping, when directed, shall be provided and paid for by the Contractor. Do not use water when it may create hazardous or objectionable condition such as ice, flooding and pollution.

(H) DISCONNECTING UTILITY AND PUBLIC SERVICES

- a. Prior to commencement of work, the Contractor shall give notice to the New York City Department of Citywide Administrative Services to have the steam, gas and electricity to the buildings to be demolished, disconnected by the utility companies owning the services. The Contractor shall obtain certifications from the utilities that

the services have been terminated, and shall submit them to the Engineer for approval, prior to commencement of demolition operations.

- b. The Contractor shall seal or plug all storm or sanitary sewers or other connections to the sewers leading from the structure to be demolished. The Contractor shall disconnect all water services and shall make the necessary arrangements with the New York City Department of Environmental Protection, Bureau of Water and Sewer Operations, to destroy or plug the tap in the City water main. The Contractor shall obtain all permits necessary to do such work prior to the commencement of demolition. All such work shall be done in full accordance with the rules and regulations of, and to the satisfaction of the City of New York Bureaus having jurisdiction thereof.

The Contractor shall remove all gas services back to the main gas lines in the streets and the openings in the main gas lines shall be properly closed in compliance with the directions of the utility company having jurisdiction in the respective borough. All work shall be done in full accordance with the rules and regulations of, and to the satisfaction of, the utility company having jurisdiction thereof.

Electric, telephone and other wires shall be disconnected in strict accordance with the rules and regulations of the Department of the City or State and of the company or companies having jurisdiction, control or ownership of such utilities. After disconnection has been completed, telephone poles located on the property shall be removed by the utility having jurisdiction over the poles.

- c. The Contractor shall maintain and preserve all utilities, other than those covered by paragraphs a and b above, traversing the premises. Contractor shall maintain in a safe condition all street openings made by the Contractor, and shall backfill and tamp them.
- d. All expenses arising from or in connection with the performance of the provisions of paragraphs b and c above shall be borne by the Contractor.
- e. When existing sprinkler systems with Siamese hose connections are present in structures undergoing demolition, they shall be maintained as a non-automatic sprinkler system. Sprinkler risers shall be capped immediately below the floor being demolished maintaining the sprinkler systems on all lower floors for Fire Department use.

(I) **BLASTING**

Blasting of any kind shall not be permitted.

(J) **CITY MONUMENTS**

The Contractor shall not progress demolition operations within five (5') feet (or such greater distance which the Engineer shall direct) of any City monument which may be within the limits of or be disturbed by the herein contemplated work, nor in any manner disturb the same, but shall cease work at such places until the said monuments have been referenced and reset or otherwise disposed of, except upon special permit from the Commissioner, in accordance with the City ordinances therefor.

After permission is given to remove any monument, the Contractor shall take up and preserve such monument, and if required remove same to the nearest Department yard. The Contractor shall preserve all benchmarks, reference points

and stakes placed or established on the line of the work until authorized to remove the same.

(K) SUBMITTALS

- a. Submit a schedule indicating proposed methods and sequence of operation for demolition and removals to the Engineer for review prior to commencement of Work. A pollution control plan for demolition activities shall be submitted by the Contractor not more than 30 days prior to the commencement of demolition work and must be approved by the Engineer.

(L) QUALITY ASSURANCE

- a. The Refrigerant Recovery Technician shall be certified by the EPA-approved certification program.

**6.27.4 METHODS.**

(A) EXTENT OF REMOVAL

a. Thoroughly inspect and examine the building and premises for any hazardous materials. If any asbestos or other hazardous material is found other than what is included in the Contract and was to be removed as per Section 6.27.4.E, notify the Engineer immediately and do not commence the Work until receipt of written notification from the Engineer. Comply with all applicable regulations, laws, and ordinances concerning removal, handling, and protection against exposure or environmental pollution. Asbestos abatement is to occur prior to the demolition Work.

b. Visually inspect and photograph the adjacent areas, and structures and appurtenances of the surrounding properties. Record the existing conditions; submit all information to the Engineer.

c. Thoroughly examine the building for any of the following: Historical artifacts, including cornerstones and their contents; plaques and tablets; and other remaining articles of historic significance. If any is found (either prior to commencing demolition or during demolition Work), the Contractor must carefully remove, clean, and deliver to a NYCDPR yard within the five boroughs, as directed by the Engineer.

d. Before demolition has commenced, NYC Parks, along with the Contractor, will inspect the building(s) and the premises and identify equipment, materials, and items desired to be retained by NYC Parks in addition to those items already indicated to be salvaged. The Contractor shall remove such equipment, materials and items either before demolition or during the process of the Work and store and protect on the Site in a location designated by the Engineer.

e. Items of salvageable value that are not desired to be retained by NYC Parks are to become the property of the Contractor and may be removed from the structure as Work progresses. Transport salvageable items from site as they are removed. Storage or sale of removed items on site will not be permitted.

Remove structures to the limits shown on the Contract Drawings.

(B) PARTIAL DEMOLITION

Where the demolition consists of only a portion of a structure, the Contractor shall provide all necessary temporary shoring and support to maintain the stability of the partially demolished structure.

(C) PREPARATION AND PROTECTION

- a. Employ a certified exterminator and treat building(s) in accordance with governing regulations for rodent and insect control. Submit certificate to the Engineer.
- b. Protect structures, underground utilities and other construction to remain from damage caused by demolition operations. If unmarked or unknown utilities are uncovered during excavation, notify the Engineer of Record to receive further instructions prior to proceeding further. Should damage to adjacent construction or utilities occur due to Work under this Section, all costs in connection with the repair of such damage and the restoration of damaged construction to its original condition shall be borne by the Contractor.
- c. Protect materials and surfaces and structure, which are to remain, from damage; if damage occurs, repair or replacement shall be made by the Contractor, to the satisfaction of the Engineer, and at the expense of the Contractor.

(D) DELAYS IN VACANCY

Structure shall be demolished as they become vacant and in coordination with all other works. There is no guarantee as to when such vacancy will occur. The Contractor will be notified when a vacancy occurs. The Contractor agrees that this has been taken into consideration and allowances have been made for delays and expenses resulting from the uncertainty of the time when a structure may be vacated and made available for demolition.

(E) REMOVAL AND DISPOSAL OF MATERIALS

All materials in structures, demolished hereunder, shall become the property of the Contractor, unless otherwise provided, and shall be removed and disposed of away from the site by the Contractor. Before issuance of a final certificate, the Contractor shall remove all falsework, temporary structures, plant of all description, equipment, and debris of every nature from the demolition area, and dispose of them away from the site.

(F) FIELD QUALITY CONTROL

Mechanical Demolition and the construction and installation of all underpinning, shoring, sheeting, and bracing required for or affecting the support and adjacent properties or buildings is subject to Special Inspection. The Contractor's licensed professional engineer is to file all design documents.

(G) CLEAN UP

The demolition areas and the portions of the streets affected by the work shall be cleaned of all materials resulting from or used in the work to be done hereunder and shall be left in a condition satisfactory to the Engineer.

(H) IN-WATER DEMOLITION

All demolition work taking place within the water column or affecting the water column shall require the installation of a turbidity curtain along the offshore edge

of the esplanade to minimize the spreading of disturbed sediment. The turbidity curtain shall extend from the water surface down to the mudline and be deployed in the area of the demolition work. In addition, any debris or material from the demolition work that falls into the waterway shall be retrieved and disposed of by the Contractor. Refer to ESCR-9.30 for erosion and sediment control specifications.

Where indicated to be removed, the existing timber/steel piles and steel sheet piles shall be extracted and removed in their entirety to facilitate installation of the proposed cut-off wall, unless otherwise indicated on the Contract Drawings.

#### **6.27.5 PAYMENT.**

The quantity to be measured for the removal of curb, concrete barrier, embayments, and esplanade structures shall be the linear foot of removed and properly disposed structure as shown on the Contract Drawings. No payment will be made for removals taken past the specified limits.

The survey of the existing pile caps supporting the esplanade shall be included in the unit price for the demolition of the existing esplanade for Type A, Type C, Type D, Type F, and Type G. Survey data shall be required for confirmation of existing span lengths for prestressed and precast concrete beams and slabs prior to fabrication of the new superstructure components. The survey shall be performed by a New York State licensed surveyor and all survey work shall be performed in accordance with Section 625 of the NYSDOT Standard Specifications.

The quantity to be measured for the removal of concrete structures (including timber cribbing), except for the amphitheater bandshell and seating area, shall be the cubic yard of removed and properly disposed structure as shown on the Contract Drawings. No payment will be made for removals taken past the specified limits.

The quantity to be measured for the removal of the security bollards shall be the number of removed and properly disposed bollard units and the associated concrete foundation as shown on the Contract Drawings. No payment will be made for removals taken past the specified limits, nor will additional payment be made for the removal of the concrete foundation and any appurtenances.

The quantity to be measured for the removal of timber piles shall be the number of removed and properly disposed timber piles as shown on the Contract Drawings. No payment will be made for partial removals.

The quantity to be measured for the removal of miscellaneous utilities shall be the number of removed and properly disposed utility as shown on the Contract Drawings. No payment will be made for partial removals or removals taken past the specified limits.

The removal and disposal of building structures, electrical bunker sheds, irrigation pump sheds, and the amphitheater bandshell and seating area shall be on a lump sum basis as shown on the Contract Drawings and as approved by the Engineer. No payment will be made for partial removals or removals taken past the specified limits.

#### **6.27.6 PRICE TO COVER.**

The unit price bid shall cover the cost of furnishing all labor, materials, plant, equipment, insurance, disposal, and necessary incidentals required and completing the work in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

<b>END OF SECTION</b>		

**SECTION ESCR-6.68 – GEOTEXTILE FILTER FABRIC****6.68.01 INTENT.**

This section describes the geotextile for use in the revetments inside the embayment, as well as the geotextile for use at the crushed stone fill for the L-wall drainage.

**6.68.02 DESCRIPTION.**

Under this section, the Contractor shall furnish and install geotextile filter fabric in the manner shown on the Contract Drawings. The purpose of the geotextile filter fabric is to provide a permeable layer which allows water but not soil particles to pass through. The geotextile filter fabric shall be installed in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

Provide all labor, material, and equipment and perform all operations necessary for the complete and satisfactory installation of the geotextile. The work shall include, but not be limited to, placement of geotextile, material and associated equipment and operation used in laps or extra length; and associated material, equipment, and operations; and material and associated equipment and operations used to provide cushioning layer of sand or gravel or both to permit increase in allowable drop height of stone.

Contractor performing the Work of this section shall have at least five years minimum experience in similar projects.

**6.68.03 SUBMITTALS.****(A) SAMPLES**

Submit geotextile samples for testing to determine compliance with the requirements in this specification, a minimum of 60 days prior to the beginning of installation of the same textile.

**(B) CERTIFICATES**

Upon delivery of the geotextile, submit duplicate copies of the written certificate of compliance signed by a legally authorized official of the manufacturer. The certificate shall state that the geotextile shipped to the site meets the chemical requirements and exceeds the minimum average roll value listed in Table 1. Upon request, supply quality control and quality assurance tests for the geotextile.

**6.68.04 MATERIALS.**

The filter fabric for the revetment shall consist of non-woven geotextile matching or exceeding the minimum average roll values listed in Table 1. Strength values indicated in the table are for the weaker principal direction.

Table 1: Minimum Physical Requirements for Geotextile

Property	Unit	Acceptable Values	Test Method
Tensile strength	Lbf	300 (Min)	ASTM D 4632
Puncture resistance	Lbf	180 (Min)	ASTM D 4833
Trapezoidal tear	Lbf	115 (Min)	ASTM D 4533
Burst strength	psi	580 (Min)	ASTM D 3786/D 3786M
Flow rate	gpm / ft <sup>2</sup>	65 (Min)	ASTM D 4491
Permittivity	sec <sup>-1</sup>	0.8 (Min)	ASTM D 4491
Apparent opening size	US Sieve	100	ASTM D 4751
Ultraviolet degradation	%	70% at 500 hrs (Min)	ASTM D 4355

Fibers used in the manufacturing of the geotextile shall consist of a long-chain synthetic polymer composed of at least 85 percent by weight of polyolefins, polyesters, or polyamides. Add stabilizers and/or inhibitors to the base polymer, if necessary to make the filaments resistant to deterioration caused by ultraviolet light and heat exposure. Reclaimed or recycled fibers or polymer shall not be added to the formulation. Geotextile shall be formed into a network such that the filaments or yarns retain dimensional stability relative to each other, including the edges. Finish the edges of the geotextile to prevent the outer fiber from pulling away from the geotextile.

Seams are not permitted.

Geotextiles and factory seams shall meet the requirements specified in Table 1. Randomly sample geotextiles in accordance with ASTM D 4354 (Procedure Method A). Sample factory seams at the frequency specified in ASTM D 4884.

Provide all samples from the same production lot as will be supplied for the contract, of the full manufactured width of the geotextile by at least 10 feet long, except that samples for seam strength may be a full width sample folded over and the edges stitched for a length of at least 5 feet. Samples submitted for testing shall be identified by manufacturer's lot designation. For needle punched geotextile, the manufacturer shall certify that the geotextile has been inspected using permanent on-line metal detectors and does not contain any needles.

Collect samples at approved locations upon delivery to the site in accordance with ASTM D 4354 (Procedure Method B). Test samples to verify that the geotextile meets the requirements specified in Table 1. Identify samples by manufacturer's name, type of geotextile, lot number, roll number, and machine direction. Perform testing at an approved laboratory. Submit test results from the lot under review for approval prior to deployment of that lot of geotextile. Rolls which are sampled shall be immediately rewrapped in their protective covering.

The fabric shall be free of any treatment which might significantly alter its physical properties.

During all periods of shipment and storage, the fabric shall be wrapped in a heavy-duty protective covering to protect it from direct sunlight, mud, dirt, dust and other debris.

The manufacturer shall submit certified test data to cover each shipment of material.

#### **6.68.05 CONSTRUCTION DETAILS.**

##### **(A) DELIVERY AND STORAGE**

Deliver only approved geotextile rolls to the project site. All geotextile shall be labeled, shipped, stored, and handled in accordance with ASTM D4873. No hooks, tongs, or other sharp instruments shall be used for handling geotextile. Geotextiles shall be protected at all times against physical or chemical damage. Geotextiles shall be kept in the wrappings provided by the manufacturer until required for use in the works. The rolls of geotextile shall be stored on level ground and stacked not more than five rolls high and no other materials shall be stacked on top of the geotextile. Geotextile shall not be exposed to direct sunlight for longer than thirty days.

Geotextile filter fabrics which are subject to deterioration by ultraviolet rays shall be protected from sunlight during transport and storage. For those fabrics which are subject to damage from sunlight, the information on the packaging material shall warn against exposing the filter fabric to sunlight.

Prepare surface, on which the geotextile will be placed, to a relatively smooth surface condition in accordance with the applicable portion of this specification and shall be free from obstruction, debris, depressions, erosion feature, or vegetation. Remove any irregularities so as to ensure continuous, intimate contact of the geotextile with all the surface. Any loose material, soft or low-density pockets of material, shall be removed; erosion features such as rills, gullies etc. shall be graded out of the surface before geotextile placement.

##### **(B) INSTALLATION**

The filter fabric shall be spread on a prepared surface as described above and called for on the Contract Drawings or as directed by the Engineer. The fabric shall be laid loosely, so that placement of overlaying materials will not stretch or tear it. Stone placement shall be done in a manner that will not prove injurious to the fabric. Should the fabric become torn or otherwise damaged by any cause, it shall be patched by placing an additional section of geotextile filter fabric over the tear with a three-foot overlap on all sides.

Place the geotextile in the manner and at the locations shown on the Contract Drawings. At the time of installation, the geotextile shall be rejected if it has defects, rips, holes, flaws, deterioration or damage incurred during manufacture, transportation or storage. Any additional costs incurred by this rejection shall be borne by the Contractor.

The overlaying material shall be placed within a period of two (2) weeks whether the fabric is subject to damage from sunlight or not. Fabric shall be anchored in an approved manner that will hold it in position. Place the geotextile with the long dimension perpendicular to the shoreline and laid smooth and free of tension, stress, folds, wrinkles, or creases. Place the strips to provide a minimum width of 3 feet of overlap for each joint. The placement procedure requires that the length

of the geotextile be approximately 10 percent greater than the slope length. Adjust the actual length of the geotextile used based on initial installation experience.

Adjacent sheets shall be overlapped by at least thirty-six (36") inches. Appropriate measures shall be taken to ensure required overlap exists after cushion placement. No traffic or Contractor's equipment will be permitted to travel directly on the geotextile filter fabric.

Protect the geotextile at all times during construction from contamination by surface runoff; remove any geotextile so contaminated and replaced with uncontaminated geotextile. Replace any geotextile damaged during its installation or during placement of stone or other materials: cost of replacement shall be borne by the Contractor. Schedule the work so that the covering of the geotextile with a layer of the specified material is accomplished within 7 calendar days after placement of the geotextile. Failure to comply shall require replacement of geotextile at no additional cost to the City. Protect the geotextile from damage prior to and during the placement of stone or other materials. Before placement of stone or other materials, demonstrate that the placement technique will not cause damage to the geotextile. In no case shall any type of equipment be allowed on the unprotected geotextile.

**6.68.06 MEASUREMENT.**

The quantity of Geotextile Filter Fabric to be measured for payment shall be the number of square yards computed between the limits shown on the Contract Drawings or within the limits established in writing by the Engineer prior to performing the work. No quantity will be included for material used for repair of tears or for material used to provide the overlaps.

**6.68.07 PRICE TO INCLUDE.**

The unit price bid per square yard for this item shall include the cost of furnishing all labor, materials, plant, equipment, insurance, samples, and incidentals necessary to complete the work including the cost of preparing the surface upon which the geotextile filter fabric is placed, all in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-6.68	GEOTEXTILE FILTER FABRIC	S.Y.

□

**END OF SECTION**

## SECTION ESCR-7.18 – CONTROLLED LOW STRENGTH MATERIAL (CLSM)

### 7.18.01 DESCRIPTION.

The work consists of mixing and placing Controlled Low Strength Material (CLSM) with or without slag at the locations shown on the Contract Drawings or where ordered by the Engineer.

### 7.18.02 MATERIALS.

#### (A) GENERAL

The Contractor shall provide CLSM containing aggregate, cement and water. It may also contain, at the Contractor's option, slag, or chemical admixtures in any proportions such that the final product meets the strength and flow consistency requirements included in this specification. The use of fly ash shall not be permitted.

Materials used in this work shall conform to the following requirements of the NYS Department of Transportation, Standard Specifications:

Portland Cement, Type 1 or Type 2:	§701-01
Aggregates:	§703-01
Chemical Admixtures:	§711-08 (The mix may include high air generators manufactured for CLSM)
Slag:	§712-12
Water:	§712-01

#### (B) TESTS AND CONTROL METHODS

Certification from an approved testing laboratory that the CLSM will have a 28-day compressive strength between 100 PSI and 150 PSI shall be furnished by the Contractor and provide to the Engineer prior to delivery of any materials.

Hardened mixtures shall reach a minimum compressive strength of 15 PSI within 48 hours; a long-term density between 90 to 110 PCF; and, a minimum of 20% and a maximum of 40% Air, when measured in accordance with ASTM D 6023. In order to allow for future manual excavation the 28 days density shall be 90 to 110 PCF.

Design the CLSM mix so that it sets within the time stated in the contract documents. If no set time is required by the Department, the set time shall conform with the Maintenance and Protection of Traffic scheme and requirements of the project.

The CLSM shall have a minimum diameter spread of 8 in. as determined by the following procedure to be performed by the Engineer:

- Fill a hollow plastic or metal cylinder 8 in. in length and 3 in. inside diameter with the CLSM and strike off the surface. Raise the flow cylinder in a continuous motion without rotation.
- Immediately measure the spread of the CLSM along two diameters which are perpendicular to each other.

The Contractor shall cast four (4) specimens (cylinders) for each batch in accordance with the Department's Materials Method 9.2 - Field Inspection of Portland Cement Concrete, and deliver them to a DDC's Quality Assurance (QA)

Bureau approved Material Testing Laboratory within seven days of the pour date for evaluation.

For each 50 Cubic Yard or portion thereof, the following Field Testing shall be performed to confirm the material conformance with the approved design mix:

ASTM D 6023	Unit Weight, Yield Cement Content & Air Content
ASTM D 5971	Sampling Freshly Mixed CLSM
ASTM D 4832	Preparation and Testing of CLSM
ASTM D 6103	Flow Consistency of CLSM

Prior to proceeding with subsequent construction operations, either one of the following Field Tests shall be performed on the surface of the in-place CLSM to estimate its surface bearing value and its suitability for load application.

ASTM D 6024	Ball Drop on CLSM
ASTM D 3441	Cone and Friction Cone Penetration Tests

A minimum of three (3) tests shall be performed for each 200 Square Feet or portion thereof, and evaluated against the following criteria:

ASTM D 6024	Inspect the indentations for visible water or sheen brought to the surface by the dropping action of the ball.
-------------	--

If the diameter of the indentation is equal or less than 3 inches, than the CLSM is suitable for load application, provided that:

- a. The surface looks similar to that before the test with the exception of the indentation, and;
- b. There is no visible surface water or sheen visible in the indentation.

ASTM D 3441	The average value of the three (3) tests shall be not less than Four (4) Tons/Square Foot. The minimum value per individual test shall not be less than Three (3) Tons/Square Foot.
-------------	---

### 7.18.03 CONSTRUCTION DETAILS.

#### (A) GENERAL

The Contractor shall provide all equipment for this work subject to approval of the Engineer. Mix the materials at a stationary mixing plant which is either a continuous or a batch type plant, designed to accurately proportion either by volume or by weight, so that when the materials are incorporated in the mix, a thorough and uniform mix will result.

The mix may be transported in open haul units provided the material is placed within 30 minutes of the end of mixing. Use a rotating drum unit capable of 2 - 6 rpm to transport material that cannot be placed within 30 minutes after the end of mixing. In cases where placement cannot take place within 30 minutes from the end of mixing, the material shall be transported in a rotating drum capable of 2 – 6 rpm.

Provide a mixer capable of mixing CLSM that has the specified compressive strength and flow consistency. Mix all components so as to produce a uniform product. For work involving CLSM quantities of less than two (2) cubic yards, the Engineer may permit the Contractor to use a small construction mixer.

Narrower trench widths can be employed when using CLSM due to the self-compacting properties of the material. Construction personnel and equipment are not required to be in the trench for compaction operations. Refer to the current NYSDOT Metric Standard Sheet No. M204-1, issued under EB 02-003, for Controlled Low Strength Material (CLSM) Installation Details for Circular and Elliptical Corrugated Metal Pipes, Structural Plate Pipes and Pipe Arches, and Reinforced Concrete and Other "Rigid" Pipes for additional requirements.

For installations that require construction personnel to temporarily occupy the trench, the Contractor shall follow all OSHA requirements.

**(B) FILL AND BACKFILL AT STRUCTURES, CULVERTS, PIPES, CONDUITS AND DIRECT BURIAL CABLES.**

The Contractor shall place the CLSM using a method approved by the Engineer, in accordance with the appropriate NYSDOT Standard Sheet for additional guidance on the use of CLSM as backfill material.

When placing CLSM for pipe backfill, discharge the material onto the top of the pipe at the center.

Do not place CLSM in contact with aluminum pipe, including connections, fixtures, etc., unless the aluminum has been coated with an approved primer.

CLSM should be kept encapsulated with soil, as it is highly erodible and disintegrates when left exposed to the environment.

**7.18.04 MEASUREMENT.**

The quantity to be measured for payment shall be the number of cubic yards of satisfactorily placed CLSM computed between the payment lines shown on the Contract Documents or from payment lines established in writing by the Engineer.

A deduction shall be made for pipes (based on nominal diameters) and other payment items when the combined cross-sectional area exceeds one (1) sq. ft.

Unless otherwise shown, no deduction will be made for the cross-sectional area of an existing facility. No additional quantity shall be measured for payment to make up losses due to foundation settlement, compaction, erosion, or any other cause.

Cross sectioning, for the purpose of determining quantities for payment, shall be employed only where payment lines are not shown on the Contract Drawings, and cannot be reasonably established by the Engineer.

**7.18.05 PRICE TO COVER.**

The unit price bid per cubic yard of CLSM shall include the costs of furnishing all labor, materials, equipment, insurance, and incidentals necessary to complete the work, except where specific costs are designated or included in another pay item of work. The unit price also includes any temporary supports for the exposed utilities which will be encapsulated in the CLSM.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-7.18	CONTROLLED LOW STRENGTH MATERIAL	C.Y.

**END OF SECTION**

## SECTION ESCR-13 – ARCHITECTURAL CONCRETE TEXTURED FINISHES

### DESCRIPTION

This work shall consist of all labor, materials, and equipment to complete the Architectural Concrete Textured Finishes as shown on the Drawings with designated patterns and textures. Work in this section is supplementary to project cast-in-place concrete. All work shall be in accordance with the contract documents:

### MATERIALS

**Formliner Panels:** Shall be custom manufactured 100% pure urethane form liners mold bonded to ACX plywood. Urethane form liner thicknesses as required to obtain pattern indicated. Ensure support systems required to carry all loads while maintaining all finish requirements, alignment of joints and seams, thickness of materials, location of surface in space, true to line and plane, and designed to provide for leak-proof seams between panels.

Liner types shall be a “Varied Weave Pattern” with multiple modules as shown on Drawings.

- Formliner/facing modules shall be sized to minimize seams or joints in the finish surface and follow module variations as shown on Drawings.
- Mating edge surfaces of form liner shall be accurately formed and fabricated so that individual alignment of panels is accurate and remains tight resulting in monolithic appearance of finish surface.
- Anchors for fastening formliner/facing system to backup form shall be concealed, providing secure positive anchorage, use screw type fasteners of size and shape required to firmly anchor formliner to form system facing. Formliner shall be back-fastened to backup form system so that no fasteners appear in the finish concrete surface.
- Integrate plywood or other suitable reinforcing into formliners for anchorage, back-fastening, and proper support of formliner, to prevent distortion of surfaces under loads encountered preparing and placing concrete, and to maintain shape, size, and stability of formliner.
- Right angle edges of forms where surface to be exposed in finish concrete shall be without radius, arris or bevel, unless otherwise indicated in the Drawings. Fabricate flanges to provide accurate alignment between units, to provide uniform compressive pressure between forms, to prevent loss of fluid during concrete placement, and dimensional support for formliner.

Acceptable Form Liner Manufacturers:

- Architectural Polymers, Inc., 1220 Little Gap Road, Palmerton, PA 18071, PH: 610.824.3322, W: [www.apformliner.com](http://www.apformliner.com)
- Scott System, 10777 E. 45<sup>th</sup> Avenue, Denver, CO 80239, PH: 303.373.2500, W: [www.scottsystem.com](http://www.scottsystem.com)
- Fitzgerald Formliners, 1500 East Chestnut Avenue, Santa Ana, CA 92701, PH: 714.245.9715, W: [www.formliners.com](http://www.formliners.com)

Or, an approved equal.

**Smooth Surface Panels:** Flat form surfaces shall be plastic coated material as follows:

- Panels shall be ¾" thick, in sizes to minimize joint lines and produce required straight, uniform, square edge, level seams, construction joints and edges.
- Pine plywood, minimum 7 plies per inch thickness. Panels shall be faced with a high-density plastic overlay (HDO).
- Birch plywood, minimum 14 plies per inch thickness, with heavy duty plastic overlay surface on both sides. Edges shall be sealed in manufacture.

All smooth surface formwork panels shall have sealed, square edges, and have square corners. Butted edges of panels, when multiple panels are assembled together, shall not vary more than 1/16 inch in 10 ft. in any butted joint.

**Release Agents:** For all formwork surfaces shall be colorless, non-staining and have no deleterious effects on the finished concrete, manufactured specifically for non-absorbent surfaces and for reducing surface voids. Formwork for custom formliners shall also be treated as directed by the custom form liner manufacturer. Form release material shall be on the NYSDOT's Approved List of Manufacturers and compatible with the formliner material.

**Form Ties:** Shall be manufactured specifically for use as concrete ties and shall be designed to seal tightly to the form face material without fluid loss. Ties shall be of sufficient strength to resist fluid concrete placing pressures and formwork elongation at the longest span of support used in the project. Ties shall be one of the following as approved by the Engineer:

- Fiberglass rod tie system with screw tie clamp grippers:
  - Gripper shall have a screw adjustable device between the rod gripper and the form contact surface. Rod size shall be minimum 3/8 in. and maximum 3/4 in. diameter as approved after use on the mockup.
- Cone/Tube/Rod or Cone/Coil/Rod tie system with screw tie clamps.
  - Cone size shall be maximum 1-1/2 in. diameter for coil spreader and 2 in. for tube spreader. Depth of cone shall be minimum 1-1/2 in.

All ties proposed for the work shall be used in the mockup structure for review and selection by the Engineer.

**Joint Sealer:** Seal formwork abutting edge conditions against fluid loss utilizing the following:

- Foam gaskets for sealing field erected corner form joints shall be highly compressible foam rubber or neoprene tape, paper backed, with pressure sensitive adhesive on one side, and shall be of sufficient width and thickness for specific use.
- Sealant for sealing permanent shop or bench fabricated unrevealed joints shall be non-staining, silicone caulking.

Large field joint gaps use aerosol applied expanding foam, type suitable for use intended. Use where form units abutting irregular materials and foam tape not sufficiently compressed or strong enough to stop fluid concrete leakage from formwork. Do not allow foam to expand into surface contact area of exposed concrete.

**Patching Material:** The patching material, technique, and match with adjacent surfaces shall be approved by the Engineer prior to any patching. Plastering and skim coating of surfaces will not be allowed.

## **CONSTRUCTION DETAILS**

**General:** Responsibility for the design of architectural concrete textured finishes to be in conformance with requirements of the contract documents, and as approved by the Engineer. All work shall be performed using the highest standards of quality for visual and durable concrete and shall rest with the contractor.

**Performance Criteria:** The completed formed concrete surfaces shall match the color and texture of the approved sample panels. All textured finish work shall be performed so that no evidence of the following will be evident when the formwork is removed:

- Damage of any kind.
- Formwork fastening penetrations or formwork anchoring devices or projections other than approved embedded items.
- Out of alignment or incorrect profiles.
- Discoloration caused from form liner staining.
- If any of the above-mentioned deficiencies occur, the Engineer may order the affected concrete replaced or repaired with acceptable results. Repair only when directed by the Engineer. Corrected deficiencies must meet with the Engineer's approval. All remedial work shall be performed at a location approved by the Engineer and shall be submitted as tests prior to any repair work being accomplished.

**Quality Assurance:** The work of this section shall be performed by a concrete contractor who specializes in the type of finish work required for this project, with a minimum of five years documented successful experience and shall be performed by skilled workers thoroughly trained in the necessary trades to perform the work. Prior to commencing with the work, the contractor shall submit resumes, references, and photographs/locations of prior work examples of textured finish concrete surfaces for approval by the Engineer.

The concrete contractor shall assign a quality control person to oversee the architectural concrete textured finish work. The primary duty is to be responsible for the required execution of the work. The Concrete Quality Control Technician shall develop a check list for execution of the work and for sign off by the concrete superintendent and be submitted to the Engineer. The Quality Control Technician shall understand and be familiar with the requirements of this section.

After approval of products and samples and as early as possible, but not less than 30 days prior to the fabrication of the formwork, a pre-installation meeting shall be scheduled with the manufacturer's representative, contractor, and Engineer to discuss the materials, methods of forming, coordinating and quality control procedures involved in the Architectural Concrete Textured Finish work and the interface with related work.

The success of this Project depends greatly upon visual elements of construction that require review, selection and acceptance of samples and mockups at an early stage. Items of primary visual concern – concrete mix materials, urethane liner facing materials, concrete samples, and mockups shall be submitted as soon as possible. Verify list of priority items with the Engineer, notify Engineer of any impediments to providing priority samples.

**Submittals:** Do not proceed with the construction of the architectural concrete textured finish in the project, including fabrication of the formwork, until all samples, product data, mock-up and shop drawings have been approved by the Engineer. Contractor shall submit for approval:

1. Product Data / Qualifications for the materials specified herein, including but not limited to:
  - Custom urethane form liner manufacturer; liner tolerances, anchoring methods, backing requirements
  - Smooth surface panel
  - Form release agent
  - Form tie solution
  - Joint sealers
  - Concrete patching material
2. List – project names and locations of three similar past projects of the manufacturer and installer.
3. Item Samples – custom urethane form liner, joint seal material, and form ties.
4. Shop Drawings – plans, elevations, and sections to show detailed layout of all textured finish concrete work and interfacing adjacent concrete work, including the mockups. Show all flood walls and retaining walls. Include relevant liner panels, ties, depressions, openings, recesses, reveals, control joints, and construction joints. Shop drawings shall include detailed numbering and/or identification system used to positively identify urethane liner modules.
5. Construction Procedure Documents – develop and submit written procedures for the execution and sequencing of the work. These procedures shall be used by the contractor and incorporated into a Quality Control Checklist.

**Sample Panels:** Prepare formwork and cast concrete for sample walls as follows:

1. Cast up to six 4' wide x 4' high x 12" thick wall panels, with reinforcement replicating design wall reinforcing, and specified weave pattern indicated on Drawings. Each tombstone showing different liner module on one entire face. Each tombstone to show panel seams and reveals, cast vertically to test proposed design mix, and formwork facing materials.
2. Cast two (2) – 4' wide x 4' high x 12" thick smooth surface wall panels, with reinforcement replicating design wall reinforcing and each type of wall tie proposed. Show sample facing panel seams, cast vertically to test proposed design mix, formwork facing materials and tie recesses.
3. Cast panels simulating techniques to be used in production to reduce surface area voids and achieve the specified criteria. Forms shall be constructed with fluid tight square corner seams.
4. Adjust mixes and placing techniques as required between each panel to achieve the best placing technique for the mix. Submit as required to obtain approval of Engineer.
5. Apply water repellent sealer to half of finish surface of each tombstone.
6. Apply anti-graffiti treatment over half of water repellent finish treatment following manufacturer's written instructions.

**Mock-up for Formed Concrete Work:** After all samples, product data, and the shop drawings for the Mock-up are approved, construct mock-ups of the architectural concrete textured finish work in a location approved by the Engineer and as described below. Mock-ups and mock-up submissions for the concrete work shall consist of the following:

- Mock-ups shall be as detailed.
- Prepare and submit a "Lessons Learned" report after completion of each mock-up for review and discussion with the Project Team.
- Additional mock-ups or partial mock-ups shall be required if the above mock-ups are deficient in producing the quality required for the project.

1. Mock-ups shall consist of the following:

- Foundation of a size and reinforcement adequate to support the work at the designated location.
- Scope of Visual Mock-up: Bridge abutment and flood wall section using form liner weave ribbon pattern: “J” shaped in plan, 10 feet high and 12” thick, show radius abutment and 24-foot-long straight section with transition from A to B to C panel types, form liner seams, and typical joints in the project.
  - Mock-up shall be placed in a minimum of two placements.
  - One vertical construction joint in wall.
  - Include any embeds as they would be required for wall construction and cast-in elevation markings as shown on Drawings.
  - Include typical wall elevation step and radii bulk heads with dimensions as shown on the Drawing’s.
  - Apply 717-03 - Penetrating Type Protective Sealer (ITEM 559.16960118) to one half of the mockup according the manufacturer’s instructions.
  - Apply anti-graffiti protection coating (ITEM 559.90010011) over Penetrating Type Protective Sealer according to manufacturer’s instruction in an area approved by Engineer.
- Reinforce as in a similar detail on the drawings and add necessary reinforcing and/or supports to maintain stability.
- Use approved form facing materials, reinforcement and accessories and assemble formwork using methods as intended for construction and to achieve the specified requirements.
- Place concrete with methods to be used in construction, including anticipated time delays between placements. Place concrete to achieve the specified requirements.
- Finish exposed hardened surfaces of the walls with specified finish treatments when directed by the Engineer.
- Use approved concrete design mixes, inclusive of specified admixtures, for the mock-ups as will be used in the construction of the formed surfaces.

If mock-ups do not meet the specified quality and are not approved, remove and replace in full or in part at no additional cost. Mock-ups shall be located so they will remain throughout construction. Protect mock-up from damage. Remove mock-up only when directed by the Engineer.

**Formwork:**

General Requirements: Use only form units that are in like new condition and replace panels with defects with new panels. Use screw type fastening and clamping devices to maintain alignment, and to tightly close joints at corners, end forms, and at bulkheads. Apply pressure at joint to resist concrete placing pressure as close to the joint as possible. Vertical and horizontal construction joints shall be at locations approved by the Engineer and before the erection of formwork begins and shall be formed so the joint is straight, in plane and flush with the adjacent surface. Construction joints shall be at a panel joint seam and shall not interrupt the pattern of the formliner. Gaskets shall be installed in formwork corner joints and bulkheads assembled and disassembled in field. Place the gasket within the form joint. Install gasket away from contact edge 1/16 in. to 1/8 in.. Clean all formwork contact surfaces prior to use. Take care in cleaning to not damage

the surface. Prior to first use, all urethane liners shall be cleaned per manufacturer's recommendations.

Fabrication: Design formwork to permit easy removal. Prying against the concrete will not be permitted. Care shall be taken so as not to damage the finished concrete surface in cutting or removal of the forms. The forms shall be completely rigid and strong enough to withstand without deflection or elongation, movement or fluid loss at the high hydraulic pressures that result from the rapid filling and vibration required for architectural concrete placing. Forms shall be fabricated so the concrete can be adequately placed, vibrated and finished to achieve the specified finishes.

Layout form ties, form joints, reveals and exposed embedments as shown on the Drawings.

- Ties: Locate ties to fall at centers of individual weaves in the textured concrete. No ties shall fall on weave edge or liner butting seams.
- Embedments: Numbers, wayfinding signage, and similar items are to be cast as part of the architectural concrete textured finish as shown on the Contract Drawings. Coordinate as required. Securely and accurately locate and anchor embedment's with correct orientation. Anchor using screw type fasteners to provide compression connection to prevent loss of concrete fluid or movement of embedment. Seal or gasket at interface with urethane formliner.

Smooth surfaces shall be square and flat. Protect all cut edges to avoid swelling. Install joint sealer in all fabricated butt joints of smooth surface panels to prevent fluid loss. At butting plywood panel edges place a bead of sealant 1/8" max at back edge (away from contact face) of one panel prior to butting interface edge surfaces. Take care not to allow sealant to come in contact with form surface.

Prior to use, all form surfaces shall be coated with form release agent. Only manufacturer recommended and NYSDOT approved form release agents shall be utilized. Release agents shall be applied in strict accordance with release agent manufacturer recommendations. Hand-charged sprayers will only be allowed if a thin uniform coating of release agent is obtained on the form.

Wherever forms are to be refurbished and reused adjacent to or in combination with new forms or forms in like-new condition, locate the older forms so that any variation in texture or finish that might appear will be inconspicuous. Locate transition only at corners or other changes of plane.

Transitions between adjacent planes of surfaces shall be without the use of chamfers or radiused forms, unless otherwise specifically shown on the Architectural Drawings.

**Formwork Erection Tolerances:** Fabricate and position formwork surfaces to maintain hardened concrete finish lines within the following allowable variations:

- From designed edge elevation in 10 ft: +/- 1/4"
- From designed vertical plane in 10 ft: +/- 1/4"
- Cross-sectional dimensions: +/- 1/4"
- In-place concrete finish surface to new formed finish surface: +/- 1/4"
- Liner form surface to surface at butt joint: Maximum variation of urethane liner thickness – Fabricate so that liner plywood backing is tight to back-up form system.
- It is the intent of this specification that the formwork will be erected in such a manner that lines and surfaces are visually presentable without obvious defects. Where lines and planes require adjusting from one placement to another, adjust the forms to realign in a visually acceptable manner.

**Finishes and Patching:** All exposed work shall be finished with the approved finishes determined from sample tests executed in the mock-ups. Finishes shall be as specified herein where indicated on the drawings. Minor defects may require fins to be removed (i.e. top edges) or minor patching performed, however, it is the intent of this specification that the work will be performed in such a manner that only the cleaning treatments and sealer/anti-graffiti applications will be required after stripping.

Prior to treating, all surfaces shall receive the following preparation and cleanup: All surfaces to receive treatment shall be a minimum of 21 days old, or as recommended by the manufacturer. All surfaces can be treated at end of project.

- Remove all stains using an appropriate non-abrasive stain remover for each type.
- Protect all adjacent work during operations. At completion of day's work leave area clean. At completion of work, remove all equipment, waste and excess material and leave area clean.
- All treatments shall be applied to the mock-up surfaces as directed by the Engineer. Finish treatments shall be applied to the building concrete surfaces only when and as directed by the Engineer.

Treat the formed concrete surfaces with cleaning applications as determined from tests on the mock-ups:

- "Non-acid" Treatment for concrete surfaces: After stripping, the surface shall be treated for stain removal and cleaning when directed by the Engineer.

Sealer treatment for all architectural concrete surfaces: Treat all exposed vertical wall surfaces with NYSDOT approved 717-03 – Penetrating Type Protective Sealer per the manufacturers written instruction.

- All surfaces receiving treatment shall be dry.
- All surfaces receiving treatment shall be clean and free of stains and laitance.
- Any curing agents used to be completely dissipated prior to application of sealer so that sealer will be absorbed into the concrete. Test sealer in small area in inconspicuous location to determine if concrete curing material has sufficiently dissipated for proper application of sealer.

Formed Square Corner Edge Treatment: After concrete is hard use a fine masons stone or fine grit sanding block on the edge to achieve an eased edge with a 1/16-inch radius. Take care not to damage the adjacent surface. This applies to two adjacent vertically formed corner surfaces and to a formed surface adjacent to a trowel finished top surface. This treatment to be done only to edges as directed by the Engineer.

Tie Hole Treatment: Finish holes for approved ties as follows:

- At cone tie holes, plug the hole with either a field cast plug using same concrete as used in the wall, or by the following method. All tie hole treatments as determined on the mock-up.
  - Fill the hole void with a color matching mortar and tool the hole to recess the mortar surface in the hole, depth as directed by the Engineer. Take care not to allow mortar to be in contact with the finished wall surfaces.

- Fill the cone hole by tamping in the mortar to a dense filling and finish with a dowel type tool with limiting collar to the recess required. Smooth the recessed mortar. After finishing remove excess mortar on tape and remove the tape.
- Where through-the-wall-tie holes occur, plug the holes with backer rod material and leave 2-inch void at end. Fill void with patching mortar as indicated above

Patching: Only areas designated by the Engineer shall be patched. Where minor patching is required, as approved by the Engineer as a means of rendering the surface acceptable, it shall consist of patching with a texture matching technique and color matching mortar mix. Test patches shall be placed on the mock-up or other approved surface and be approved by the Engineer prior to commencing any patching of the work.

Apply all treatments in a manner that conforms to applicable environmental regulations. Provide protective materials, neutralizing materials, and supports to guide any run-off, overspray, or application to a collection point for proper removal. Protect adjacent water and ground surfaces from contamination from any deleterious substances, contaminants, liquids or powders. Render any spills benign; remove from site and dispose of in environmentally friendly manner.

**Protection:** Protect all Architectural Concrete Textured Surfaces from damage of any kind. Pay special attention to surfaces near work of other trades. All surfaces shall be free of damage at time of acceptance. Allowing damage and patching or cleaning at end of project is not acceptable. Locate material staging areas where operations will not damage textured surfaces. Protection shall assure protection from paint, oils, rust, stains, impact, or any other kind.

#### **MEASUREMENT AND PAYMENT:**

The quantity of Architectural Concrete Textured Finishes to be paid for under this item shall be the number of SQUARE FEET constructed in accordance with the plans and specifications and as directed by the Engineer.

Item No.	Item	Pay Unit
ESCR 13.BRDG	Architectural Concrete Textured Finishes (Pedestrian Bridges)	SF
ESCR 13.FLWL	Architectural Concrete Textured Finishes (Floodwalls)	SF
ESCR 13.BLDG	Architectural Concrete Textured Finishes (Buildings)	SF

**END OF SECTION**

## SECTION ESCR-60.29 – CATHODIC PROTECTION FOR PILES

### 60.29.1 INTENT.

This section describes the sacrificial cathodic protection system for the existing steel pipe piles supporting the esplanade and the proposed cut-off wall and integrated floodwall/cut-off wall.

### 60.29.2 DESCRIPTION.

Cathodic protection, under this section, shall refer to all anodes and associated appurtenances needed for the installation of a functioning sacrificial cathodic protection for the proposed integrated floodwall/cut-off wall, cut-off wall, and the existing pipe piles supporting the esplanade.

### 60.29.3 MATERIALS.

#### (A) Anodes: Aluminum

Chemical composition shall be as follows:

- Zinc 2.5 to 5.75 percent
- Indium 0.015 to 0.040 percent
- Silicon 0.12 percent maximum
- Copper 0.003 percent maximum
- Iron 0.09 percent maximum
- Cadmium 0.002 percent maximum
- Lead 0 maximum
- Aluminum Remainder

The current output and capacity of the alloy are dependent on the alloy's galvanic properties, the anode/core size and geometric shape. Therefore, the anode supplied shall not deviate in any geometric dimension by more than 10 percent and shall have the following galvanic properties in sea water:

- Closed Circuit Potential 1,050 mv (Ag/AgCl ref.)
- Efficiency Min. 85 percent
- Current Capacity Min. 1,150 amp-hrs/lb

Workmanship shall be in accordance with MIL-A-24779.

#### (B) Anode core and bonding straps shall be as indicated on Contract Drawings

#### (C) Steel material shall be in accordance with ASTM A36. Surface preparation shall be in accordance with MIL-A-24779.

#### (D) WELDS FOR UNDERWATER WELDING

The wet weld electrode shall be high deposition, all position, Class E7014 AWS A5.1 designed for wet weld conditions. The weld metal typical properties shall be as follows:

<u>Wet Metal</u>	<u>Chemistry (%)</u>
• C	0.06
• Mn	0.54
• Si	0.35
• P	0.026
• S	0.013

Mechanical Properties

• Ultimate Tensile Strength	74,600 psi
• 0.2 % Offset Yield Strength	68,400 psi
• Elongation in 2"	7.3%

**60.29.4 SUBMITTALS**

(A) GENERAL CERTIFICATES

Qualifications of Corrosion Engineer.

Qualifications of Underwater Welders.

(B) SHOP DRAWINGS

Anode dimensional drawing.

(C) ANODE MANUFACTURER'S QUALITY CERTIFICATES AND REPORTS

Manufacturer shall submit all the following documents/certificates for anode approval.

Each delivery will be completed with the following certificates:

- a. Certificate of Conformity and Identification
- b. Material chemical analysis reports for 5% of all anodes
- c. Visual inspection of cracks, imperfections reports for all anodes
- d. Dimension inspection reports for 10% of all anodes
- e. Weight list anode production reports for 10% of all anodes

Visual inspection of cracks – 100% of total quantity.

Random chemical analysis must be performed according to NACE RP0387. Provide weight test and dimensional inspection for two (2) samples of each batch / heat.

The anodes shall not be approved by the Engineer unless all quality control documents/certificates are obtained by the Engineer in an orderly manner prior to delivery, as previously noted.

(D) OPERATION AND MAINTENANCE DATA

Cathodic Protection System (test reports, shop drawings, test/inspection schedule). Reports must include details of all test equipment used and its calibration.

(E) CLOSEOUT SUBMITTALS

Initial Cathodic Protection System Field Test Report;  
One Year Warranty Period Cathodic Protection System Field Test Report;  
Final Cathodic Protection System Field Test Report;

**60.29.5 METHODS.**

(A) SAFETY

Personnel shall be protected in accordance with 29 CFR 1910.

(B) QUALIFICATIONS

Service of Corrosion Engineer: The Contractor shall obtain the services of a Corrosion Engineer to supervise, inspect and test the installation of the cathodic protection system. Corrosion Engineer refers to a registered professional engineer with certification, licensing or other documented education or experience in the field of cathodic protection for marine structures. Minimum documented experience shall be five years specifically in this field. Alternately, the services of a person accredited or certified by the NACE International at the level of Corrosion Specialist or Cathodic Protection Specialist shall be obtained with a minimum of five years of documented experience in the field of cathodic protection for marine structures. The Contractor shall submit evidence of the qualifications of corrosion engineer to the Engineer for review and approval.

(C) DELIVERY, STORAGE AND HANDLING

Only acceptable materials will be permitted on-site. Deliver products to site with each anode identified and complete with factory documentation. Each delivery shall be completed with the Anode Factory Quality Control Test Certificate and Reports for verification by the Engineer.

Store products in a dry location as directed by the Engineer and protect products from physical or corrosive damage or vandalism.

(D) ANODES MOUNTED TO PILES

Entire operation shall be performed underwater. After pile installation and prior to welding, remove coating, mill scale and any other contaminants and clean to bare metal. Attach anodes onto piling at the elevations indicated by underwater welding steel anode straps to face of pile. After welding, re-coat straps and pile to match the quality of the adjacent surfaces with two-part epoxy splash guard compound manufactured for underwater application. All underwater welding shall be performed in accordance with requirements above.

(E) BONDING

Above water: Clean the steel structure surface by scraping, filing or wire brushing to produce a clean, bright surface. Weld steel bar to pile surface as shown. The weld shall be cleaned to bright metal and coated with a durable waterproof compound such as a two-part coal tar epoxy.

Underwater: Clean the steel structure surface by scraping, filing or wire brushing to produce a clean, bright surface. Weld steel bar to pile surface as shown. After welding, re-coat straps and pile to match the quality of the adjacent surfaces with two-part epoxy splash guard compound manufactured for underwater application.

All underwater welding shall be performed in accordance with requirements shown above.

(F) ENGINEER TESTING AND THIRD-PARTY TESTING FACILITY

All welds shall be subject to visual examination during production by Engineer. The Engineer reserves the right to visually examine the welds prior to coating touch-up. The Contractor shall provide assistance, as required, to the Engineer's inspector. In addition to this, the Engineer reserves the right to carry out additional independent non-destructive testing, at the City's expense.

**60.29.6 FIELD QUALITY CONTROL**

Field tests may be witnessed by the Engineer. Notify the Engineer 5 days prior to performing each field test.

(A) FIELD TESTING

The systems shall be tested and inspected by the Contractor's Corrosion Engineer in the presence of the Engineer. Record test data, including date, time, and locations of testing. A plan drawing must accompany the data and a logical system must be used to identify the corresponding points on the plan. Submit to the Engineer as a formal, bound Test Report. Contractor shall correct and retest, at own expense, deficiencies in the materials and installation observed by these tests and inspections. Testing shall include the following measurements:

Native Potential Measurements

After bulkhead piles have been installed and before placement of anodes on new bulkhead piles and existing pipe piles measure potentials on piles using a hand-held buffered, Silver-Silver Chloride (Ag-AgCl/0.5M KCl) reference electrode. The locations of these measurements shall be at the mud line, at the waterline and at the mid-point between these. In all cases, the measurement shall be taken approximately 4-inches from the pile surface, for pipe piles on the side opposite from where the anode will be mounted, for bulkhead piles in between anode positions. Bulkhead piling shall be measured at ends, corners and approximately every 25 feet thereafter at the above elevations. Measurements shall be recorded with pile numbers or stationing. These locations shall be used again for the next testing procedure (see below: Protected Structure Potential Measurements).

Protected Structure Potential Measurements

With the entire galvanic protection system operating for at least one month but no more than three months, measure potentials on piles as described above. In all cases, the measurement shall be taken approximately 4-inches from the pile surface, for pipe piles on the side of the pile opposite from the anode, for bulkhead piles at each end, corners and approximately every 25 feet thereafter at the above elevations.

(B) CRITERIA FOR CATHODIC PROTECTION

Criteria for determining the adequacy of protection shall be a negative voltage of at least 0.80 volt (ref. to Ag/AgCl) as measured between the structure surface and a reference electrode contacting the sea.

**60.29.7 ONE YEAR WARRANTY**

- (A) The Contractor shall inspect, test, and adjust the cathodic protection system for one year after the initial inspection and must test the system to ensure its continued conformance with the inspections outlined above. Copies of test data, including the final test at the end of the one year period, must be certified by the Contractor's corrosion engineer and submitted to the Engineer.

**60.29.8 DEMONSTRATION****(A) FINAL SYSTEM TEST REPORT**

Upon completion of testing of the one year performance period and prior to its acceptance by the Engineer, submit a final system testing report and an operation and maintenance manual for the cathodic protection systems installed, in accordance with Project Record Documents paragraph of this Section.

The testing report shall include as a minimum the following:

1. Native potential tests
2. Protected potential tests (including the initial test, performed one to three months after installation and the Final test, performed one year later)
3. Method of recording test point locations for repeatability in subsequent tests.
4. Statement of protected condition based on potential test results
5. Statement of protected condition based upon change in voltage from native potential to protected potential.

**(B) INSTRUCTING FACILITY PERSONNEL**

At a time designated by the Engineer, make available the services of a technician regularly employed or authorized by the manufacturer of the Cathodic Protection System for instructing Facility personnel in the proper maintenance and measurement techniques for the Cathodic Protection System. The period of instruction shall be not less than 4-hours. Conduct the training at the jobsite or at another location directed by the City. The instructions shall include a visual presentation and discussion of the anodes and bonding which makes up the CP system, and shall cover the topics of testing, measurement and inspection.

**60.29.9 OPERATIONS AND MAINTENANCE MANUAL**

- (A) The O&M manual shall consist of the following items provided in an electronic folder and in a hard-copy binder (provide 2 copies):

1. CP system drawings and as-builts.
2. Shop drawing submittals of the anodes used in the CP system.
3. Test reports of the Native and Protected tests.
4. Schedule or frequency of future tests and inspections (generally performed along with routine structural inspections).
5. Description of potential testing and inspection methods and procedures.
6. A statement requiring that a visual inspection be performed to obtain accurate dimensions of remaining anode material, used to determine depletion rate and

remaining service life. The quantity of selected indicative anodes to be measured shall be 5%, but should be changed based on similar or varied depletion rates observed.

**60.29.10 MEASUREMENT.**

The quantity of anodes to be measured for payment shall be the number of discrete anodes installed that have been installed to the satisfaction of the Engineer. No payment or allowance will be made for damaged or non-functioning anodes.

**60.29.11 PRICE TO COVER.**

The contract unit price shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish and install functioning anodes, complete, in full compliance with the requirements of the specifications. The unit price shall also include the cost of installing bonding bars, cables, connection tabs, any excavation that might be required to facilitate installation of the anodes, surface preparation, and any remedial actions that may be needed to have a fully functional cathodic protection system.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-60.29	INSTALLATION OF ANODE	E.A.

**END OF SECTION**

## SECTION ESCR-61 – WILLIAMSBURG BRIDGE SECURITY FEATURES

### 61.01 DESCRIPTION.

The Williamsburg Bridge footings within East River Park shall be protected by a fixed and retractable bollard system, as well as a concrete security wall system, as shown on the Contract Drawings and specified herein.

### 61.02 MATERIALS.

#### (A) MANUALLY RETRACTABLE BOLLARD SYSTEM

The total bollard height when in the raised position shall be no less than 36 inches above the roadway surface and shall have an outside diameter of no less than 12 inches. The retractable bollard system shall satisfy ASTM F2656 Class M50/P1.

The manual bollard shall be capable of being raised and lowered by manual means such as levers, manual handle and driving shaft or battery charged portable motor unit drive. Hydraulic, pneumatic or electric powered bollard systems are not permitted.

The manually retractable bollard system shall be HARD POST MP-354A/ST-950(SS), modified with security features at top of bollard with internal locking mechanism. Bollards shall be manufactured by US Koei Technologies, Inc. In addition, all manually retractable bollards shall have a polished finish which shall be applied during the bollard manufacturing process. Casing pipe and retractable pipe must be high-carbon steel with Kanigen plating. Top cover and screws must be stainless steel.

For the retractable bollards, the system must be secured by an anti-tamper locking mechanism encasing the locking pin complying with New York City Fire Code Chapter 5, Section FC 506 for "Keys and Key Access" and provide FDNY standard "1620" compliant keys. Lock must not be case hardened. Means and methods for bollard lifting mechanism and removal procedures shall be submitted for approval by the Engineer prior to installation.

#### (B) FIXED BOLLARD SYSTEM

The fixed bollard system shall meet the following material requirements:

1. Steel pipe shall be ASTM A53, Grade B,  $F_y = 36$  ksi; Schedule 140 (1" wall thickness) or Schedule 80 (0.5" wall thickness with 1" x 83" plate)
2. Steel plate shall be ASTM A36,  $F_y = 36$  ksi

#### (C) CONCRETE

Concrete for the fixed and retractable bollard foundations must be 5000 psi concrete.

Concrete for the security wall system must conform to the Flood Protection System features class of concrete per Section ESCR-4.06.

All steel reinforcing must conform to Section ESCR-4.14.

#### (D) WELDING

Welding shall be in accordance with AWS D1.1/D1.1M.

(E) FINISHING

For retractable bollards, the retractable pipe shall include brushed hard chrome finish. Stainless steel top cover shall have a brushed finish.

All exposed surfaces of the fixed steel bollards shall be thoroughly cleaned of all rust, oil, grease, scale, or foreign matter and painted with one (1) shop coat of Primer. All steel surfaces which will be exposed to view after installation shall be given one (1) shop coat of Intermediate and one (1) shop coat of Finish topcoat. The color of the Finish paint shall be black, as approved by the Engineer. All paints shall be applied in compliance with the paint manufacturer's data sheets. All components of paint shall be compatible and supplied by a single manufacturer.

Approved paint types and manufacturers must be as listed in NYSDOT Approved List 708-01.

**61.03 SUBMITTALS.**

(A) SHOP DRAWINGS

Detail drawings containing complete schematic diagrams, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including foundation and clearances for maintenance and operation. The Contractor shall submit shop drawings no later than four (4) months prior to the scheduled completion of the project. The Contractor shall submit the following information as required by the Engineer: materials, finishes, supports, hardware, fasteners, fittings, and accessories. Shop drawings to show relations to adjacent work, location of concrete footings, and reinforcement information. All drawings shall show English units. Metric units can be shown in addition to English units.

(B) PRODUCT DATA

Submit a complete list of equipment, materials, including industrial standards used and how they apply to the applicable component and manufacturer's descriptive data and technical literature, catalog cuts, and installation instructions. Submit list of product installations comparable to the subject job as reference. Include date of product installation, installer, and owner's name and location of the project. All engineering calculations, standard and deviations, must be submitted to the Engineer for approval.

Color and finish samples for each bollard system shall be provided to the Engineer.

(C) SPECIALTY TOOLS AND OPERATING EQUIPMENT DATA

Specialty tools and operating equipment required for the operation of the barrier, after approval of the shop drawings. The data shall include a complete list of parts and supplies, with current unit prices and source of supply.

(D) TEST REPORTS

Test reports in booklet form showing all field tests, including component adjustments and demonstration of compliance with the specified performance

criteria, upon completion and testing of the installed system. Each test report shall indicate the final position of controls. The Contractor must submit a concrete mix design report per the requirements of Section ESCR-4.06.

(E) OPERATION AND MAINTENANCE DATA

Operation manuals shall outline the step-by-step procedures required for system startup, operation, and shutdown. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Maintenance manuals shall include routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guide.

Submit one complete set prior to performance testing and the remainder upon acceptance. Manuals shall be approved prior to acceptance. Submit manufacturer's completed warranty registration form to the Engineer. Provide a warranty against all defects in materials or workmanship for five (5) years after the date of installation. Defective materials shall be replaced by manufacturer at no additional cost to the City. Defective materials may be replaced with new or reconditioned materials furnished by the manufacturer, at the manufacturer's discretion.

A minimum of six copies of the operation and maintenance manuals shall be provided a minimum of 2 weeks prior to field training.

**61.04 METHODS.**

(A) DELIVERY AND STORAGE

Components placed in storage shall be protected from the weather, humidity, and temperature variation, dirt and dust, or other contaminants. Structural materials shall be stored on sleepers or pallets and shall be protected from rust and objectionable materials such as dirt, grease, or oil.

(B) SPECIALTY TOOLS AND OPERATING EQUIPMENT

The barrier manufacturer's standard recommended specialty tools and operating equipment package, with current unit prices and source of supply complete with detailed manuals on parts replacement, shall be provided with each barrier to facilitate 1 year of normal operation. Particular consideration shall be given to system components which are not readily available from local or commercial sources and which are critical to the operation of the system.

The following specialty tools and operating equipment shall be furnished to NYCDOT as part of the barrier installation.

<u>Qty</u>	<u>Item</u>
75	Keys to Master Lock 6121KALJ Stamped WBP1 to WBP75 (to be kept under lock & key)
2	Easy Rider Devices with Four (4) Spare batteries
14	Crank Handles for Retractable Bollards
19	Penta Plus Keys
36	Penta Plus Screws
9	Special Pin-Torx Allen Keys (to be kept under lock & Key)
30	Special Pin-Torx Screws

9	Special Rex Keys
30	Special Rex Bolts
30	Silicone Grease Tubes
30	Dust Seals
60	Cover Plate Screws
2	As built drawings on CD

(C) MANUFACTURER'S SERVICES

Services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment supplied shall be available. The representative shall supervise the installation, adjustment, and testing of the equipment. For security bollards, manufacturer to have a minimum of 5 years with documented field experience with similar vehicle barriers.

Provide a warranty against all defects in materials or workmanship for five (5) years after the date of installation. Defective materials shall be replaced at manufacturer's discretion with new or reconditioned materials furnished by the manufacturer, at no cost to the owner.

(D) INSTALLATION

Installation shall be in accordance with manufacturer's instructions and in the presence of a representative of the manufacturer. Manufacturer's representative shall be experienced in the installation, adjustment, and operation of the equipment provided. The installer must have a minimum of three (3) years' experience installing similar equipment. The representative shall also be present during adjustment and testing of the equipment.

The posts for the bollards shall be set in concrete footings as shown on the plans or as directed by the Engineer. The sleeves for removable bollards shall be set in concrete footings, as shown on the plans or as directed by the Engineer.

All posts and sleeves shall be set plumb and true to line and grade. Any post and sleeve not set true to line and grade shall be removed and replaced at the Contractor's expense. Bending posts to make them plumb will not be permitted.

(E) DRAINAGE

An automatic self-drain system shall be provided in each bollard system as shown in the Contract Drawings that requires no hookups between the storm drains and the bollard system.

(F) FIELD TESTING

Upon completion of construction, a field test shall be performed for each vehicle barrier. The test shall include raising and lowering the barrier through its complete range of operation. The Engineer shall be notified at least 7 days prior to the beginning of the field test. The Contractor shall furnish all equipment and make all necessary corrections and adjustments prior to tests witnessed by the Engineer. Any conditions that interfere with the proper operation of the barrier disclosed by the test shall be corrected at no additional cost to the City.

Adjustments and repairs shall be done by the Contractor under the direction of the Engineer. After adjustments are made to assure correct functioning of components, applicable tests shall be completed.

(G) **FIELD TRAINING**

A field training course shall be provided for designated operating staff members. Training shall be provided for a total period of not less than 8 hours of normal working time and shall start after the system is functionally complete but prior to final acceptance tests. Field training shall cover all of the items contained in the operating and maintenance instructions.

**61.05 MEASUREMENT.**

The quantity of fixed and retractable bollards to be measured for payment shall be the number of bollards, including all coatings, foundations, drainage systems, and incidentals as shown on the Contract Drawings installed to the satisfaction of the Engineer. No payment or allowance will be made for additional bollards placed beyond the limits specified.

The measured volume of concrete for the security wall system shall be the Cubic Yards of concrete, including all incidentals as shown on the Contract Drawings installed to the satisfaction of the Engineer.

**61.06 PRICE TO COVER.**

The contract unit price for the fixed and retractable shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish, install, test, and train in full compliance with the requirements of the specifications.

The contract price per cubic yard for the concrete security wall, measured in place, shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish and construct the concrete structure complete in full compliance with the requirements of the specifications and as shown on the drawings, inclusive of steel reinforcement, and to furnish such samples for testing and to provide such testing equipment, laboratory space and facilities as may be required. All joints, waterstops, and sealants shall be included in the contract price.

*Payment will be made under:*

**END OF SECTION**

## SECTION ESCR-76.11 – CONSTRUCTION REPORT

### 76.11.1 INTENT.

The intent of this section is to prepare preconstruction reports for work to be performed under the contract to ensure that the Contractor's proposed means and methods of construction do not create or aggravate any potentially dangerous conditions. In order to ascertain the effects of construction on structures, the Contractor will be required to retain the services of a qualified firm with experience in structural engineering, soil mechanics, foundations, installation of piles, evaluation of the effect of construction on buildings and structures, effects of tunneling operations and tunneling shaft construction on buildings and structures, effects of dewatering and the associated movement of soil due to dewatering and the effect of vibrations upon structures. All construction work (bulkhead, floodwalls, ground improvement, roadway, sidewalk, curb, sewer, water main, regrading etc.) is subject to the preconstruction report.

### 76.11.2 SPECIAL EXPERIENCE REQUIREMENTS.

The Contractor shall submit to the Engineer qualifications of the firm it proposes to provide the engineering services described in this section. The proposed firm must meet the following special experience requirements.

- (1) Such firm must, within the last three (3) consecutive years, have successfully provided engineering services similar to the services described in this section on a minimum of two (2) comparable projects.
- (2) Such firm must carry professional liability insurance as specified in Schedule "A".

Compliance with such special experience requirements will be determined solely by the Engineer. Once a firm is approved, no substitution will be permitted, unless the Engineer has approved the qualifications of the proposed replacement in writing in advance. If the qualifications of the proposed firm are not acceptable, the Contractor shall submit the qualifications of another proposed firm within fifteen (15) days of notice to do so.

### 76.11.3 SUBMISSION OF PRECONSTRUCTION REPORT.

Upon approval and prior to construction the chosen firm (hereinafter referred to as the firm) shall submit six (6) copies of report(s) incorporating their findings and recommendations. The report(s) shall be prepared by or under the immediate direction of a New York State Licensed Professional Engineer as evidenced by the imprint of the Professional Engineer's seal and signature on the document. The report(s) shall include but not be limited to the following:

- (A) A detailed description of the Contractor's proposed means and methods of construction including the installation of the bulkhead sheeting system, floodwalls, pile system, ground improvement, utilities, and dewatering system.
- (B) An inspection of the interior and exterior (including photographs and digital audio-visual recordings as required) of all building, tunnel, and/or structures that may be affected by the proposed means and methods of construction and dewatering.
- (C) A definition of the "radius of influence" that the proposed dewatering, bulkhead and floodwall installation, pile installation, ground improvement, and other construction activity that will impart on the surrounding soil.
- (D) A definition of the limits of horizontal and vertical movement, including tilting, each building and/or structure within the "radius of influence" can tolerate without

damage to the structural integrity of that building and/or structure, should these values be different than those provided for critical structures in Section ESCR-76.21; however, these limits shall be subject to the approval of the Engineer, and shall not exceed twice the limits provided for critical structures. Movements which shall be considered include, but are not limited to, vibration-related settlements, differential settlements, settlements from dewatering, and building movement and/or rotation (tilting) due to excavation or construction-related work.

- (E) A complete study of the vibrations that each building/structure can tolerate along with the anticipated vibrations promulgated by the means and methods of construction, taking into account the age and condition of the buildings.
- (F) A statement that the limits of movement and vibrations, including tilt at some critical structures, specifically the Williamsburg Bridge foundation and the MTA L-Train tunnel, as defined in (D) and (E) above will not be exceeded as a result of the proposed means and methods of construction, as well as means and methods the Contractor, at the Contractor's own expense, will employ should any limits be exceeded. Limits of movement and vibrations, including tilting of critical structures, shall be proposed by the Contractor and the firm hired by the Contractor, should those values be different than those provided for critical structures in Section ESCR-76.21, but not exceed twice the values for critical structures; however, these limits shall be subject to the approval of the Engineer.
- (G) A geological profile of the soils in the area. This profile shall be based upon the boring logs taken for this project. The Contractor, at own discretion, may make additional borings to supplement the boring logs taken for the project. Supplemental borings made by the Contractor shall be at no additional cost to the City, the cost for these borings shall be deemed included in the price bid for the various items under Section ESCR-76.11CR - CONSTRUCTION REPORT.
- (H) A geotechnical data summary including assumed values for the physical and strength characteristics of the soils shown on the Record(s) of Borings, developed from, but not limited to available soil and/or rock descriptions, blow counts, and available geotechnical laboratory testing. Such physical and strength characteristics include, but are not limited to, a soil's unit weight, friction angle, cohesion, consolidation properties, and permeability/drainage properties.
- (I) Engineering computations to substantiate any values stated, recommended, or defined in (C), (D) and (E), using the appropriate data from (G) and (H).

The report(s) shall include all field notes, measurements and photographs and digital audio-visual recordings, as required, of existing conditions which may be aggravated by the proposed construction work and shall include a visual inspection of the interior and exterior of all buildings and structures within the radius of influence of construction activity and dewatering. A view of each exterior face of the building and/or structure is required. Additional interior photographs shall be taken to show any existing cosmetic or structural damage on buildings and tunnels.

Applications for consents to enter buildings and/or structures for the purpose of inspection shall state that the inspection is necessary to ensure the structural integrity of the building. One counterpart of each consent, duly signed and acknowledged by the owner or one of the owners, executors or administrators for the owner and for the owner's agents, lessee and any other persons who shall have a vested or contingent interest in the building, or notice of refusal if consent is not

obtained shall be filed with the Engineer at least ten (10) days before the commencement of work which affect the building or structure.

The report shall also include recommendations or comments regarding any potentially dangerous and/or unsafe conditions uncovered along with all other additional information required pursuant to other sections of the specifications.

All results of the building or structure examinations shall be incorporated into the preconstruction report.

No work may begin until the Department of Design and Construction has accepted the preconstruction report. This pertains to all contract work and no exceptions will be allowed unless otherwise stated in these specifications.

#### **76.11.4 PRICE TO COVER.**

The contract price for Item CONSTRUCTION REPORT shall be a lump sum price and shall include the cost of all labor, materials, plant, equipment and insurance necessary or required to prepare the preconstruction report, including building examinations and do all other work incidental thereto all in accordance with the specifications and as directed by the Engineer.

#### **76.11.5 PAYMENT.**

No payment for the preconstruction report will be made until after the Department of Design and Construction has accepted the preconstruction report.

**END OF SECTION**

## SECTION ESCR-76.21 – MONITORING AND POST-CONSTRUCTION REPORT

### 76.21.1 INTENT.

The intent of this section is to monitor and summarize the effects of construction activities on structures located within the influence line of work to be performed under the contract to ensure that the Contractor's proposed means and methods of construction do not create or aggravate any potentially dangerous conditions.

The Contractor will be required to adhere to all criteria, requirements and recommendations of the Engineer approved preconstruction report(s); if not, the Contractor must cease work until corrective actions are taken.

### 76.21.2 SPECIAL EXPERIENCE REQUIREMENTS.

The Contractor shall submit to the Engineer qualifications of the firm it proposes to provide the engineering services described in this section. The proposed firm must meet the following special experience requirements:

- (1) Such firm must, within the last three (3) consecutive years, have successfully provided engineering services similar to the services described in this section on a minimum of two (2) comparable projects.
- (2) Such firm must carry professional liability insurance as specified in Schedule "A".

Compliance with such special experience requirements will be determined solely by the Engineer. Once a firm is approved, no substitution will be permitted, unless the Engineer has approved the qualifications of the proposed replacement in writing in advance. If the qualifications of the proposed firm are not acceptable, the Contractor shall submit the qualifications of another proposed firm within fifteen (15) days of notice to do so.

The firm approved for the preparation of the preconstruction report(s) in accordance with Section ESCR-76.11 - Construction Report, may also be submitted for approval to perform the monitoring and post- construction report work.

### 76.21.3 SUBMITTALS.

#### (A) MONITORING REPORTS

The firm will be required to perform the monitoring during construction activity, including installation of sheet piles, piles, and ground improvement, and submit reports to the Engineer on a weekly basis. These reports shall include sketches noting the location of all monitoring points. The minimum monitoring points required are shown on the Contract Drawings; however, the Contractor and the consulting firm hired by the Contractor may add monitoring points as they see fit. Should any of the criteria set forth in the preconstruction report(s) be exceeded, the Engineer shall be notified immediately. Monitoring shall include but not be limited to the following:

#### (1) Settlement Monitoring

- (a) For Existing Structures And/Or Buildings (other than Critical Structures as defined below):

- (i) A series of reference points shall be established outside of the “radius of influence” (as previously described in Subsection 76.11.3, paragraph (C)) for monitoring structural settlements. All initial and subsequent readings shall be taken to the nearest one-hundredth (0.01) of a foot.
  - (ii) Structures and/or buildings shall be monitored daily for vertical and horizontal movement with respect to when work is being performed within the radius of influence. Upon completion of work within the radius of influence, buildings and/or structures shall be monitored weekly for the first month then monthly for the next five (5) months. In the event of an unusual or unexpected event, monitoring shall be performed within twenty-four (24) hours of the event.
  - (iii) Should the limit of horizontal and/or vertical movement, as set forth in the preconstruction report, of any building and/or structure be exceeded, the Contractor shall immediately and concurrently notify the Engineer and, at the Contractor’s own expense, follow the steps included in the preconstruction report outlined in Subsection 76.11.3, paragraph (F) to rectify the situation and prevent any further settlement of such building and/or structure. The Contractor shall be fully responsible for any damages to any foundations, walls or other portions of buildings and/or structures that may result during the courses of this construction. Any damage done by the Contractor, whether it is accidental or due to negligence or carelessness in performing the work included in this contract shall be made good by the Contractor at the Contractor’s own expense.
  - (iv) Permissible settlement for structures, other than critical structures, may be established by the Contractor’s consulting firm, but shall not exceed twice the amounts specified below for critical structures.
- (b) For Critical Structures when pile and ground improvement installation is being performed:
- (i) Critical structures include:
    - (1) The elevated FDR Drive structure,
    - (2) The Williamsburg Bridge,
    - (3) Houston St over the FDR Drive,
    - (4) 6<sup>th</sup> Street pedestrian bridge over the FDR Drive,
    - (5) The Con Edison conveyor tunnel,
    - (6) The MTA L-train tunnel,
    - (7) The Fireboat House,
    - (8) The former Gouverneur Hospital and Dispensary,
    - (9) East River Housing,
    - (10) Jacob Riis Houses,
    - (11) Public School 110, and
    - (12) Gouverneur Gardens.
  - (ii) Settlement points shall be installed at all critical structures, including columns of overhead structures adjacent to proposed construction work. A minimum of two (2) settlement points shall be established at each component of a critical structure or column. Additionally, for the Williamsburg Bridge and the MTA L-train tunnel, tiltmeters shall also be installed to monitor movement or tilting of these structures. Tiltmeters shall be provided on each Williamsburg Bridge foundation affected by the work, and within the MTA L-train tunnel at 50 ft spacing within the affected tunnel length.

- (iii) A minimum of two (2) benchmarks shall be established for the settlement monitoring. The benchmark should be a minimum of fifty (50) feet distance from the component of the critical structure or columns and construction work alignment.
  - (iv) The initial survey of the settlement points shall be done prior to pile, sheet pile, or any ground improvement (jet grouting, rigid inclusions, or stone columns) or construction activity within one hundred (100) feet of the component of the critical structure or columns.
  - (v) A warning shall be issued if settlement reaches 1/8-inch, or tilt greater than 1/500.
  - (vi) All pile, sheet pile, or any ground improvement work (jet grouting, rigid inclusions, or stone columns), or construction activity within one hundred (100) feet of the critical structure or its columns shall be stopped if settlement reaches 1/4-inch.
  - (vii) Frequency of settlement/tiltmeter monitoring shall be as follows:
    - (1) Pile, sheet pile, or ground improvement installation between fifty (50) feet and one hundred (100) feet distance from the critical structure or its columns; once every four (4) days.
    - (2) Pile, sheet pile, or ground improvement installation within fifty (50) feet of the critical structure or columns; once every two (2) days.
    - (3) If the settlement reaches 1/8-inch or tilt is greater than 1/500; once a day.
  - (c) All survey readings shall be done by or under the immediate supervision of a Licensed Land Surveyor, currently registered in the State of New York. All survey readings shall include the imprint of the Surveyor's seal and signature.
  - (d) The Contractor shall transmit a copy of all readings to the Engineer on the same day they are taken.
- (2) Vibration Monitoring
- (a) For Existing Structures And/Or Buildings (other than critical structures as defined below):
    - (i) Should the Contractor employ means and methods of construction that will result in vibrations being imparted to the surrounding soil and/or buildings and/or structures, the Contractor shall monitor and record particle velocity. Locations of the monitoring points shall be placed in such a manner so as to ensure recordings that reveal any possibility of damage to existing structures and/or buildings. Location of the monitoring points shall be subject to the Engineer's approval.
    - (ii) These points shall be monitored at all times when means and methods of construction resulting in vibrations are employed. The maximum permissible peak particle velocity shall be that noted in the preconstruction report. Should particle velocities be exceeded the Contractor shall immediately cease operations and resort to another method which will eliminate or minimize the effect of vibrations.
    - (iii) It shall be the Contractor's responsibility to restore any buildings or structures damaged as a result of the Contractor's operations to its original condition or better.
    - (iv) The maximum permissible peak particle velocity may be established by the

Contractor's consulting firm, but shall not exceed twice the value specified for critical structures.

- (b) For Critical Structures when piles, sheet piles, and ground improvement installation is being performed:
  - (i) Critical structures include:
    - (1) The elevated FDR Drive structure,
    - (2) The Williamsburg Bridge,
    - (3) Houston St over the FDR Drive,
    - (4) 6<sup>th</sup> Street pedestrian bridge over the FDR Drive,
    - (5) The Con Edison conveyor tunnel,
    - (6) The MTA L-train tunnel,
    - (7) The Fireboat House,
    - (8) The former Gouverneur Hospital and Dispensary,
    - (9) East River Housing,
    - (10) Jacob Riis Houses,
    - (11) Public School 110, and
    - (12) Gouverneur Gardens.
  - (ii) Vibrations at critical structures shall be monitored during the installation of piles, sheet piles, and ground improvement (jet grouting, rigid inclusions, and stone columns) that are between fifty (50) feet and one hundred (100) feet from the critical structure component or columns.
  - (iii) A total of two (2) seismographs shall be used for the monitoring; one (1) at each of the closest critical structure component or two (2) columns from pile installation.
  - (iv) Check the ambient vibration prior to vibration monitoring.
  - (v) The allowable limit of vibration during pile driving is 0.5-inch per second (in particle velocity) above the ambient vibration level. Stop pile driving if the vibration exceeds 0.5- inch per second above ambient.
- (c) The results of the vibration monitoring shall be submitted to the Engineer on the same day of monitoring.

**(B) POST-CONSTRUCTION REPORT**

Within thirty (30) days of the completion of all work that necessitated monitoring, the chosen firm shall prepare and submit six (6) copies of a report(s) detailing the results of the monitoring program. The report(s) shall include a comparison of all assumptions and field-measured values. Should there be excessive discrepancies between the assumptions and field-measured values, an explanation shall be presented within the report(s). These reports shall include sketches of all monitoring points. The reports shall include the location and length of all piles and sheet piles driven superimposed on the geological profile. The location and lengths of piles and sheet piles to be installed are shown on the Contract Drawings. The post- construction report(s) shall be prepared by or under the immediate direction of a New York State Licensed Professional Engineer as evidenced by the imprint of the Professional Engineer's seal and signature on the document.

**76.21.4 RESPONSIBILITIES OF THE CONTRACTOR.**

Prior to bidding the Contractor shall examine the site and available subsurface inspection information and formulate means and methods of construction that will not result in any damage

to existing structures. Should the Contractor lack the expertise in evaluating the effects of the Contractor's means and methods of construction, the Contractor should prepare its bid in consultation with an experienced firm or authority. In any event, the Contractor will be held liable for any damage to any existing structures due to the Contractor's means and methods of construction.

In addition, should the results of the preconstruction report(s) indicate that damage will result from the Contractor's proposed means and methods of construction, the Contractor will be required to amend the Contractor's means and methods of construction in accordance with the preconstruction report, at no additional cost to the City.

#### **76.21.5 PRICE TO COVER.**

The contract unit price shall be the lump sum price bid and shall include the cost of all labor, materials, plant, equipment and insurance necessary or required to prepare weekly reports, examine buildings and structures, perform the construction monitoring, prepare the post-construction report(s) and do all other work incidental thereto all in accordance with the specifications, and as directed by the Engineer.

No separate or additional payment will be made for compliance with the requirements of the preconstruction report(s) including, but not limited to, any modification to the Contractor's means and methods of construction.

Payment for this work shall be made proportional to the work completed as follows:

Completion of Field Monitoring	60%
Acceptance of Post-Construction Report	40%

Item No.	Description	Pay Unit
ESCR-76.21MR-A	MONITORING AND POST-CONSTRUCTION REPORT FOR REACH A	L.S.
ESCR-76.21MR-B	MONITORING AND POST-CONSTRUCTION REPORT FOR REACH B	L.S.

**END OF SECTION**

## SECTION ESCR-77 – ECO TIDE POOL ARMOR, ECO ARMOR BLOCKS, AND ECO SEA PILLARS

### 77.01 INTENT.

This section describes the use of ECO Tide Pool Armor, Armor Blocks, and Sea Pillars manufactured by EConcrete.

### 77.02 DESCRIPTION.

The EConcrete® products covered by this section include:

1. ECO Armor Blocks (Units) – a concrete cube with edges having lengths of 4 ft. shall be cast utilizing a wet-cast concrete mix and exhibit a final handling weight in excess of 5,575 pounds (2,530 kg) per unit.
2. Tide Pool Armor (Units) – a concrete semi-parallelepiped unit having length of 4 ft., width of 3.6 ft., and height of 2.3 ft. shall be cast utilizing a wet-cast concrete mix and exhibit a final handling weight in excess of 3,100 pounds (1,400 kg) per unit.
3. Sea Pillars (Units) – a bespoke concrete covering for 24.625 inch diameter concrete filled piles. Unit dimensions and weight, as well as surface design shall be as shown on the Contract Drawings.

### 77.03 PERFORMANCE REQUIREMENTS

The EConcrete® products shall comply with ACI 318 and design recommendations of PCI MNL 120, "PCI Design Handbook - Precast and Prestressed Concrete," applicable to types of architectural precast concrete units indicated.

### 77.04 MATERIALS.

#### (A) CONCRETE

Concrete used in the production of the Units shall be first purpose, fresh concrete. It shall not consist of returned, reconstituted, surplus, or waste concrete. It shall be an original production mix meeting the requirements of ASTM C94 and include the following:

1. Portland Cement: ASTM C 150/C 150M, Type V, gray, unless otherwise indicated. Supplementary Cementitious Materials may include:
  - Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120
2. Normal-Weight Aggregates: Except as modified by PCI MNL 116, ASTM C 33/C 33M, with coarse aggregates complying with Class 4S.
3. Water: Potable, according to ASTM C1602; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 116 including "A" prefix therein.
4. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.

5. Chemical Admixtures: Certified by manufacturer to be compatible with other admixtures and to not contain calcium chloride, or more than 0.15 percent chloride ions or other salts by weight of admixture.
6. EConcrete® admix., a bio-enhancing admixture.

(B) REINFORCEMENT

1. Reinforcing Fibers: ASTM C1116 (Standard Specification for Fiber-Reinforced Concrete).
2. Only non-metallic structural fibers shall be utilized for the casting of units.

**77.05**

**SUBMITTALS.**

(A) CONCRETE MIX DESIGN

Concrete mix design with product and test data demonstrating compliance with Paragraph ESCR-77.04

Concrete mix design shall indicate strength and type of concrete; materials, type, brand and amounts of material constituents, including but not limited to cement, admixtures and applicable reference specifications.

Re-qualifications of materials or mix proportions required as a result of changes, test failures, or failure to gain initial approval for any reason.

(B) CERTIFICATES

1. Cement – supplier's certified mill reports for cement produced within 30 days of the project start date and every other mill report thereafter throughout the project.
2. Admixtures – manufacturer's letter of certification, signed by a duly authorized manufacturer's representative, dated not less than 30 days from the project start date, and manufacturer's product data
3. Aggregate – supplier's test reports generated within one year of the project start date showing evaluation and compliance of product in accordance with the specification requirements of ASTM C33.
4. Water – supplier's test reports generated within three months of the project start date showing evaluation and compliance of product in accordance with the specification requirements of ASTM 1602.
5. Manufacturers' certification of compliance with specified materials and products

(C) CONCRETE PLACEMENT PLAN

Concrete placement plan, plan for mixing, transporting, conveying, placing, finishing, and curing concrete.

(D) SHOP DRAWINGS

Shop Drawings and required structural computations for formwork

**77.06 FABRICATION.****(A) GENERAL**

1. Comply with requirements in PCI MNL 116 including "A" prefix therein and requirements in this Section for measuring, mixing, transporting, and placing concrete. After concrete batching, no additional water may be added.
2. Place concrete in a continuous operation to prevent cold joints or planes of weakness from forming in precast concrete units.
3. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging built-in items, and minimize pour lines, honeycombing, or entrapped air voids on surfaces. Use equipment and procedures complying with PCI MNL 116 including "A" prefix therein.
4. Place self-consolidating concrete without vibration according to PCI TR-6, "Interim Guidelines for the Use of Self-Consolidating Concrete in Precast/Prestressed Concrete Institute Member Plants." Ensure adequate bond between face and backup concrete, if used.
5. Comply with PCI MNL 116 including "A" prefix therein for hot and cold weather concrete placement.
6. Identify pickup points of the Units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each Unit on a surface that does not show in finished structure.
7. Cure concrete, according to requirements in PCI MNL 116 including "A" prefix therein, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture. Cure units until compressive strength is high enough to ensure that stripping does not have an effect on performance or appearance of final product.
8. Discard and replace Units that do not comply with requirements, including structural, manufacturing tolerance, and appearance, unless repairs meet requirements in PCI MNL 116 including "A" prefix therein and Engineer's approval.

**(B) FABRICATION TOLERANCES**

Fabricate Units to shape, lines, and dimensions indicated so each finished Unit complies with PCI MNL 116 including "A" prefix therein product tolerances as well as position tolerances for cast-in items.

**(C) FINISHES**

Finishes shall be the as-cast surface finish. Provide surfaces to match approved sample for acceptable.

**(D) QUALITY-CONTROL TESTING**

Test and inspect precast concrete according to PCI MNL 116 including "A" prefix therein requirements. If using self-consolidating concrete, also test and inspect according to PCI TR-6, ASTM C1610/C1610M, ASTM C1611/C1611M, ASTM C1621/C1621M, and ASTM C1712.

**(E) PRODUCT TESTING AND INSPECTION.**

All Units shall be sound and free of defects that would interfere with either the proper placement of the unit or impair the performance of the system.

The following defects as identified by the Engineer, shall be deemed grounds for rejection:

1. Cracks exceeding 0.016 inches (0.04 mm) in width and/or 0.1 inches (2.54 mm) in depth
2. Chipping resulting in a weight loss exceeding 0.5% of the minimum concrete unit weight as specified in Paragraph ESCR-77.02

Rejected products shall be replaced at no additional cost to the City.

**77.07 MEASUREMENT.**

The quantity of ECO Armor Block, Tide Pool Armor, and Sea Pillar to be measured for payment shall be the number of units satisfactorily installed as measured in its final position.

**77.08 PRICE TO COVER.**

The contract price shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish and install complete in full compliance with the requirements of the specifications.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-77	ECO ARMOR BLOCK	EA
ESCR-77-1	ECO TIDE POOL ARMOR	EA
ESCR-77-2	ECO SEA PILLAR	EA

**END OF SECTION**

## **SECTION ESCR-203– OBSTRUCTIONS TO PREFABRICATED VERTICAL DRAINS OR DEEP SOIL MIX COLUMN INSTALLATION**

### **ESCR-203.1 INTENT.**

In parts of the construction area, debris, boulders, or other obstructions may be encountered, making it difficult to install Prefabricated Vertical Drains (PVDs) or Deep Soil Mix (DSM) columns in the location(s) required in the projects plans and by the Engineer. In such cases, the Engineer may order the Contractor to resort to augering, drilling or may order the PVDs or DSM columns to be abandoned and additional PVDs or DSM columns installed.

This section describes procedures in the event an obstruction is encountered during the installation of PVDs or DSM columns.

### **ESCR-203.2 DESCRIPTION.**

Under this section the common means and procedures to auger or drill through obstructions during PVDs and DSM columns installation are defined with respective payment to cover the work to remove the obstruction as directed by the Engineer.

An obstruction shall be defined as any natural or man-made object which does not permit the PVD or DSM column to be advanced with mandrel insertion or a mixing tool, respectively. Soils with naturally high driving resistance shall not be considered to be an obstruction.

It shall be the sole determination of the Engineer as to whether or not an obstruction has been encountered during PVD or DSM column installation.

NYSDOT Special Specification Item 203.12030017 Prefabricated Vertical Drains and NYSDOT Special Specification Item 203.99010039 Deep Soil Mixing will define the work for the PVDs and DSM columns, respectively.

### **ESCR-203.3 MATERIALS.**

Not Applicable.

### **ESCR-203.4 SUBMITTALS.**

Not Applicable

### **ESCR-203.5 METHODS.**

#### **(A) NOTIFICATION**

Notify the Engineer immediately in writing of the failure of a PVD or DSM column to meet any requirement of the respective PVD or DSM column section. Include all information required for the evaluation of augering, drilling or abandonment.

If the Engineer determines that a PVD or DSM column cannot be advanced due to an obstruction and concurs with the Contractors suggested means and methods, the engineer will define items of payment and define units of measure per the guideline below.

## (B) AUGERING OR DRILLING

The Contractor shall have on hand suitable equipment for augering or drilling through buried timbers, cribbing, boulders and other obstructions, and shall employ this equipment, when directed, in a manner satisfactory to the Engineer.

Augering or drilling depth shall be as computed by the Engineer from the tip of the drilled-out obstruction to the ground surface. No augering or drilling shall be performed unless approved by the Engineer and done in the presence of the Engineer.

**ESCR-203.6 MEASUREMENT AND PAYMENT**

Payment for OBSTRUCTION CLEARANCE FOR PREFABRICATED VERTICAL DRAIN INSTALLATION (PRE-DRILLING) AND OBSTRUCTION CLEARANCE FOR DEEP SOIL MIX COLUMN INSTALLATION (PRE-DRILLING) shall be the number of vertical LINEAR FEET of augering or drilling when ordered by the Engineer. Estimated vertical footage shall be as defined by this section and approved to the satisfaction of the Engineer.

No separate or additional payment will be made for any mobilization or other work incidental thereto.

Where due to an obstruction the Engineer deems it necessary to abandon a PVD in place, payment for the cost of the length of PVD abandoned from the tip of the abandoned PVD to the ground surface shall be made under the prices bid per vertical foot for the respective PVD item, Item No. 203.12030017.

Where due to an obstruction the Engineer deems it necessary to abandon a DSM column in place, payment for the cost of the DSM column abandoned from the tip of the abandoned DSM column to the ground surface multiplied by the cross-sectional area of the DSM column shall be made under the prices bid per cubic yard for the respective Deep Soil Mixing item, Item No. 203.99010039. No separate or additional payment will be made for any mobilization or other work incidental thereto.

Item No.	Item	Pay Unit
ESCR-203.12 PVD	Obstruction Clearance for Prefabricated Vertical Drain Installation (Pre-Drilling)	LF
ESCR-203.99 DSM	Obstruction Clearance for Deep Soil Mix Column Installation (Pre-Drilling)	LF

## SECTION ESCR-551 – STEEL PIPE PILES

### 551.01 INTENT.

This section describes steel pipe piles for use in the esplanade, esplanade cut-off wall, esplanade/waterfront Type III light pole foundations, floodgate and floodwall foundations.

### 551.02 DESCRIPTION.

Steel pipe piles, under this section, shall refer to all permanent steel pipe piles used to support the floodwall and floodgate foundations and the esplanade and esplanade cut-off wall.

### 551.03 MATERIALS.

- (A) Steel pipe piles shall be ASTM A252 Grade 3 (Mod), 50 ksi yield, unless otherwise shown on the Contract Drawings. Pipe piles shall be either seamless pipe or full penetration electric resistance butt welded with straight or spiral seams.
- (B) Pipe shall be welded in a manner that welding shall not crack or fail when the pile is subjected to its intended use, including during driving. Arrange for welds on pipes to be ultrasonically tested by the manufacturer in accordance with the provisions for Nondestructive Electric Test of Weld Seam of ASTM A53. Diameter and wall thickness shall be as shown on the Contract Drawings.
- (C) Steel pipe piles shall be coated in accordance with Section ESCR-559 Protective Coating for Waterfront Structures.

### 551.04 SUBMITTALS.

#### (A) EQUIPMENT

Contractor shall submit complete descriptions of the equipment for the Work, including caps, leads, and guides where required. The description of the hammer proposed for driving piles shall include make and model number, weight and length of stroke of striking parts, the number of blows per minute at which it operates the area of the piston, and the effective pressure on the piston to be maintained during driving for double acting hammers.

#### (B) SHOP DRAWINGS AND AS-BUILT DRAWINGS

Fabrication drawings of piles showing location of all splices and weld details.

As-built drawing(s) showing the exact location of all piles driven and identifying abandoned piles, prepared by a surveyor licensed in the State of New York.

#### (C) DESIGN DATA

##### Computerized Pile Driving Wave Equation Analysis (WEAP)

The Contractor shall perform computer pile driving wave equation analysis to determine the suitability of the driving equipment proposed to drive the pile to the required ultimate capacity, and to insure against overstress during driving, including initial driving through soft soils. Submit wave equation analyses with pile driving equipment submittal. Wave equation computer programs such as "Wave Equation Analysis of Pile Driving, WEAP Program" and "TTI (Texas Transportation Institute) Program, Pile Driving Analysis Wave Equation," are acceptable. The results of the analysis shall be bound in a comprehensive report and submitted to the Engineer for approval prior to the ordering or driving of any piles.

High-Strain Dynamic Pile Testing by means of Pile Driving Analyzer (PDA)

The Contractor shall submit the results of all PDA testing, including CAPWAP analyses to the Engineer for review and approval. PDA and CAPWAP results report shall be provided for initial driving and restrrike.

Pile Load Test Procedure and Set-Up

Submit the proposed set-up plan and procedure for performing the required static and dynamic pile load tests, and lateral pile load tests, for review and approval by the Engineer. The proposed location of the test piles is indicated on the Drawings.

Contractor shall submit static compression load test reports and lateral pile load test reports for the Engineer for review and approval.

## (D) CERTIFICATES

Submit certificate stating that all materials and procedure meet or exceed the specified requirements of this Section.

Certified mill test reports for steel pipe piles.

A certification by pile hammer manufacturer of the energy, condition and operational characteristics of each pile hammer.

Test reports for welding.

## (B) CONSTRUCTION PLAN

Plan for positioning coated section of pipe within limits specified in this Section.

The proposed procedure for splicing piles, including a plan for positioning all field and shop splices to meet requirements specified in this Section, and detailed procedures for performing field splices.

Verification of welder qualifications.

The proposed sequence for driving all piles.

Test and production pile driving plan and driving resistance criteria including but not limited to the following which shall be approved by the Engineer prior to start of production pile driving:

Minimum blows per foot

Maximum blows per foot

Minimum tip elevation(s)

Coating system and extent

## (C) NOISE MITIGATION PLAN

Submit written plan certifying that all tools and equipment have been maintained so that they operate at normal manufacturer's operating specifications, including at peak loading, in accordance with the Rules of the City of New York (RCNY). The approved plan must be posted conspicuously and readily available on site for inspection.

**551.05 METHODS.****(A) PILE DRIVING EQUIPMENT**

Use rigid frame, fixed-lead type driving equipment capable of supporting the pile firmly in a vertical position or to the required batter.

Leads for the hammer shall be of sufficient length so that use of a follower will not be necessary, unless otherwise approved by the Engineer.

Use an approved driving head designed to properly fit the head of the pile or a cast steel, outside type drive sleeve to prevent damage to the top of the pile during driving.

Use an approved cap block cushion consisting of alternating plates of phenolic laminate and aluminum designed to prevent damage to the piles while also transmitting the amount of transferred energy to the pile top required by the Contract Drawings. The phenolic laminated plates shall be either "Micarta" as manufactured by Norplex Micarta, 665 Lybrand Street, PO Box 977, Postville, Iowa 52162, or "Conbest" as manufactured by Hammer & Steel, Inc., 11916 Missouri Bottom Road, St. Louis, MO 63042. Substitutes not employing phenolic laminate will not be permitted.

Do not use wood chips, small wood blocks, shavings or any extraneous material to absorb the energy of the hammer.

If piles cannot be installed using fixed-lead type driving equipment due to inaccessibility, use of hanging leads may be considered if the following provisions are complied with:

1. Furnish a plan showing the piles that are considered inaccessible and that will not be driven using fixed-lead type driving equipment. The determination of the acceptability of using hanging leads will be made solely by the Engineer.
2. Use a driving frame template or false work to maintain location tolerance and orientation (batter) requirements specified in ESCR-551.05F and on the Contract Drawings.
3. Specify the type of piles or other method of support and minimum tip elevation of piles used to support frame template and false work.
4. Specify the methods of retaining the driven piles in place upon removal of the frame template and prior to cap construction.
5. Surveying requirements

Prior to driving piles at each bent or cap, furnish the following to the Engineer:

- Sequence of installation for all inaccessible piles.
- Survey of frame location and elevation at each bent or for each row of piles.

Survey location and orientation of piles upon completion of all piles in a bent or cap prior to driving piles in next bent or cap. Furnish access for the Engineer to perform visual inspection of piles.

**(B) PILE DRIVING ANALYZER (PDA)**

PDA measurements will be performed by the Contractor at the start of pile driving. If, as a result of using hanging leads, the Engineer determines that additional PDA

measurements are required to verify the consistent performance of driving system, the number and frequency of additional testing shall be as determined by the Engineer. Contractor shall provide assistance to the Engineer by performing the additional testing requested, and as required on the Contract Drawings at no additional cost. Contractor shall perform CAPWAP analyses for each PDA tests performed. PDA and CAPWAP analyses shall be performed for all test piles during initial driving and restriking. All dynamically tested piles shall be restriking at no additional cost. Contractor shall provide a report for all test piles providing PDA and CAPWAP results for initial driving and restriking.

(C) PILE LOAD TESTS

The proposed locations of the test piles are indicated on the Contract Drawings. Static compression load tests shall be performed in accordance with ASTM D1143, Standard Procedure, to 200% of the allowable compression pile load, as specified in the New York City Building Code. Lateral load tests shall be performed in accordance with ASTM D3966, Standard Procedure, to 200% of the allowable lateral pile load, as specified in the New York City Building Code.

The Contractor shall retain the services of a New York State Licensed Professional Engineer to perform load tests on the pile piles, both in compression and lateral, at the locations shown in the Contract Drawings.

A test report, in accordance with ASTM D1143, shall be submitted for each compression pile load test.

A test report, in accordance with ASTM D3966, shall be submitted for each lateral pile load test.

(D) PILE HAMMER

Use a pile hammer complying with this specification section. Hammer used shall be subject to prior approval by the Engineer.

Furnish hammer of the type and energy rating as approved by Engineer; hammer capable of developing the indicated ultimate pile capacity considering hammer impact velocity; ram weight; stiffness of hammer and pile cushions; cross section, length, and total weight of pile; and character of subsurface material to be encountered. Maximum stress during pile driving shall not exceed 90% of the steel yield strength. Obtain required driving energy of hammer, except for diesel hammers, by use of a heavy ram and a short stroke with low impact velocity. At final driving, operate diesel powered hammers at rate recommended by manufacturer for hard driving. Maintain pressure at steam or air hammer so that: (1) for double-acting hammer, the number of blows per minute during and at completion of driving of a pile is equal approximately to that at which hammer is rated; (2) for single-acting hammer, there is a full upward stroke of the ram; and (3) for differential type hammer, there is a slight rise of hammer base during each downward stroke.

Keep hammer in good mechanical condition and operate it at the speed and pressure recommended by the manufacturer.

During pile driving operations, the Engineer may make occasional measurements of the velocity of the hammer ram using a Hammer Performance Analyzer (radar gun device), manufactured by Pile Dynamics, Inc., or similar. If the energy per blow computed on the basis of the measured ram velocity at impact is less than

80 percent of the rated energy per blow as specified by the manufacturer of the pile hammer, make all necessary repairs so as to improve the energy output to a value of at least 80 percent of the rated energy per blow or, alternatively, replace the pile hammer.

Use air compressor or hydraulic pump that meets minimum requirements for capacity or horsepower, as recommended by hammer manufacturer.

(E) WELDING AND SPLICING

Perform welding in accordance with requirements for shielded metal arc welding of AWS D1.1 for buildings and other structures.

AWS provisions for bridge construction shall apply where applicable. All splices shall be of the full penetration butt weld type and shall develop the full strength of the pile. All welds shall be visually inspected and all shop splices shall be ultrasonically tested. All protective coating shall be repaired after welding is completed.

Field welding, qualification of welders, and inspection of welds shall be in accordance with AWS D1.1. All pipe pile field splices shall be of the full penetration butt weld type and shall develop the full strength of the pile.

All field welds shall be visually inspected by an AWS certified weld inspector and 10% of field splices shall be ultrasonically tested.

Coordinate the Work and timely notify the Engineer to ensure compliance with all testing and inspection procedures required by the Engineer. Notify the Engineer 24 hours prior to performing field welding.

All pile splice shall be full penetration butt welds. An approved jig or alignment device shall be used to maintain the required straightness of pipe. For splices made during pile installation, rigid frame pile leads may be used as a jig in a manner approved by the Engineer.

Unless otherwise permitted by the Engineer based on field conditions, the number and location of splices shall comply with the following limitations:

1. No more than three splices per pile over 100 feet long.
2. No more than two splices per pile up to 100 feet long.
3. No splice closer than 25 feet from the tip.
4. No splice closer than 35 feet from the top.

(F) ALIGNMENT AND TOLERANCES

After splicing, the alignment of the centering of the undriven portion of the pile shall not deviate from the alignment of the centering of the driven portion of the pile by more than 3/8 inch in 40 feet.

Alignment deviation is defined as the horizontal offset of the centerline of the pile at the top of the pile divided by the length over which the offset is measured. After installation, the alignment deviation of the pile centerline shall not exceed two percent from vertical for vertical piles and two percent (shallower or steeper) from the batter shown on the Contract Drawings for batter piles.

Horizontal deviation is defined as the difference in horizontal position of any point on the centerline of the pile below the pile top from the design horizontal position

of the corresponding point as shown on the Contract Drawings. After installation, the horizontal deviation of any point shall not be greater than an amount equal to four percent of the vertical distance from the cut-off elevation to the point in question, unless otherwise shown on the Contract Drawings.

A light source lowered to the bottom of the pile shall remain visible. However, if eye contact with the light source is lost, a measurement will be made by the Engineer with an inclinometer to determine if the pile meets the requirements of this Section.

Piles at cut-off elevation shall not deviate laterally from required location by more than 1.5 inches, and as shown on the Contract Drawings. Piles shall not be pulled into location by more than amount shown on the Contract Drawings.

(G) PILE DRIVING

Do not drive piles until excavation or filling in the area they are to occupy has been completed to the design grades shown on the Contract Drawings.

Do not drive piles until the surface is clear of debris or other materials that may interfere with pile driving. Protect existing structures, including overhead and buried utility lines. Contractor shall perform exploratory test pits in the area of the proposed pile driving as required to first expose any buried utilities prior to any pile driving at no additional cost to the City.

Do not drive piles until the Engineer has approved sequence of driving for all piles.

The Contractor shall follow the requirements in Con Ed Specification CE-SI-1080 Guidelines for Protecting Existing Underground Transmission Electric Facilities from Nearby Construction Activities for any pile driving adjacent to Con Ed electric facilities.

Perform driving operations only in the presence of the Engineer.

Maintain top of pile normal to the driving force. Maintain accurate alignment of the pile, hammer and leads to minimize bowing of pile during impact of the hammer ram.

Drive piles to the minimum tip penetration(s) and to the driving resistance shown on the Contract Drawings. Take corrective action, if required, to prevent observable impact bowing of pile at final driving resistance.

Drive piles without interruption from the first hammer blow until required penetration and driving resistance have been attained, unless otherwise approved by the Engineer. If interruption of driving is necessitated by job requirements as approved by the Engineer, upon resuming driving, overcome friction due to the stoppage and drive or use other approved means of advancing the pile to the approximate tip elevation of immediately adjacent piles and to the required driving resistance shown on the Contract Drawings.

When resistance to driving makes it impossible to advance the pile to the required minimum tip penetration, spud, drill and drive or use such other means as necessary to permit advancement to required minimum tip penetration, and then drive to the resistance shown on the Contract Drawings. Jetting will not be permitted.

Obstructions encountered during driving must be removed or the Contractor may penetrate the obstruction by pre-drilling, pre-augering, spudding, or other means.

At the completion of the driving operation on a pile, the pile shall be undamaged, free of leaks and other defects and in compliance with the requirements of this Section.

Cut piles off at cut-off elevation shown on the Contract Drawings as soon as practical after driving and any required redriving.

When required, install indicator piles in locations and sequence shown on Contract Drawings. Indicator piles shall be dynamically tested piles, with PDA and CAPWAP analyses performed for initial driving, and restriking of the piles.

(H) **ROCK SOCKETS**

Rock sockets shall be installed as shown on the Contract Drawings.

Pipe Pile Installation

The Contractor shall choose such means as necessary to seal the pipe piles onto or into the rock. The Contractor may use impact, vibratory, or drilling methods, or any combination of these, as the Contractor deems necessary, to produce the finished pipe pile as shown on the Drawings. Blasting is prohibited, and no means shall be employed which disturb existing construction.

The socket shall be cut into the rock, and the bottom of the socket shall be level so that horizontal bearing is achieved. The diameter and depth of the socket shall be shown on the Contract Drawings. The diameter of the socket specified shall be maintained the entire length of the socket. The Engineer may direct the Contractor to cut the socket deeper than specified, if in the Engineer's opinion, this becomes necessary.

Concrete Grout

Concrete/grout 28-day compressive strength shall be as shown on the Contract Drawings.

Concrete/grout shall be tremied or pumped in a continuous operation. If the placement is interrupted, special procedures may be required prior to resumption of the pour, as directed by the Engineer.

Concrete/grout may be placed underwater by pumping, or by the tremie method.

The bottom of the socket shall be sounded and the depth determined immediately before concrete placement. Not more than ½-inch of soil residue shall be permitted at the bottom of the socket.

If the soil or any other material persists in entering the drilled socket, the socket may be grouted, the grout allowed to harden, and the socket re-drilled.

The tremie pipe or grout pipe shall extend to within six (6) in. of the bottom of the socket. The pipe shall remain a minimum of six (6) ft below the top of the concrete at all times after attaining that depth.

The tremie operation shall continue until a minimum of one-third of a cubic yard of concrete is pumped over the top of the required concrete top.

(I) CORRECTIONS OF DEFICIENCIES

Notify the Engineer immediately in writing of the failure of a pile to meet any requirement of this Section. Include all information required for the evaluation of remedial measures, including information required for redesign.

If the Engineer determines that a pile does not meet the requirements of this Section due to encountering an obstruction, then the following shall apply:

If the Engineer determines that a pile does not meet the requirements of this Section for any reason other than encountering an obstruction, the Contractor shall perform all remedial work associated with the deficient pile, including changes to concrete and reinforcement steel, at no additional cost.

An obstruction shall be defined as any natural or man-made object which does not permit the pile to be advanced by driving or driving and spudding with the approved pile driving hammer. Soils with naturally high driving resistance shall not be considered to be an obstruction.

It shall be the sole determination of the Engineer as to whether or not an obstruction has been encountered during pile driving.

If a pile fails to comply with the alignment or location requirements of Section 551.05F, the Engineer will calculate the load capacity requirements of that pile or, if in a pile group, each pile in that pile group, based on the actual "as-driven" alignment and locations. If the calculation indicates that the loading on that pile or, if in a pile group, on any pile in that pile group, exceeds 110 percent of the design load, then perform such remedial work as approved by the Engineer, including but not limited to re-driving piles, furnishing and driving additional piles at locations approved by the Engineer and modifying concrete or reinforcement steel.

In the case of a pile with some deficiency that affects load capacity, the Engineer will calculate the load capacity requirements of that pile, based on its actual, "as-driven" location and alignment. If the calculation indicates that the loading on the pile exceeds some reduced allowable loading less than the design load, including a zero loading, as determined in the sole judgment of the Engineer, then perform such remedial work as approved by the Engineer, including but not limited to re-driving piles, furnishing and driving additional piles at locations approved by the Engineer and modifying concrete or reinforcement steel.

If a pile fails to comply with the requirements of this Section and the Engineer determines that modification to concrete or reinforcement steel or the driving of additional piles is necessary, the City will perform all required redesign and detailing.

The Contractor, at their option and at any time as determined by the Contractor that a pile will not satisfy the requirements of this Section for a reason other than encountering an underground obstruction, may abandon such pile and replace it with a new pile or piles rather than await direction or approval from the Engineer. However, in exercising this option, the Contractor assumes the risk that such replacement pile or piles have not been installed at the proper design location and alignment so as to carry satisfactorily the design load as determined by subsequent analysis performed by the Engineer. Such abandonment shall be for the Contractor's convenience at no cost to the City and subject to all applicable provisions of the Contract.

Abandoned piles shall be cut off one foot below the elevation of the bottom of the pile cap as shown on the Contract Drawings and filled with sand. If directed by the Engineer to fill an abandoned pile with concrete, the Contractor will be compensated for the difference between the cost of sand and concrete for the volume of concrete used to fill the pile.

(J) REDRIVING PILES

Unless otherwise shown on the Contract Drawings, take optical survey measurements to establish the elevation of the top of each pile immediately after driving (or redriving) and, subsequently, after driving (or redriving) the entire pile group. Redrive piles that the Engineer determines have heaved or uplifted 0.25 inch or more from their original elevations and piles immediately adjacent thereto as directed by the Engineer.

Redrive until both the original tip elevation and the driving resistance shown on the Contract Drawings have been obtained, except that if original tip elevation cannot be reached, driving may be discontinued at a resistance of 200 percent of the allowable capacity shown on the Contract Drawings. All piles must achieve an ultimate pile capacity equivalent to 200% of the allowable pile capacity required.

Perform redriving if pile was not initially driven to the verified and agreed upon driving criteria, and pile set up is being relied on. The sequence and scheduling of redriving must be approved by the Engineer.

Equipment for redriving shall be as specified for original driving except that use of a free hanging hammer will be permitted.

Do not cut off piles until the Engineer has determined that no further redriving is required.

(K) INSPECTION

Cooperate with the Engineer and furnish services as the Engineer may require for inspecting and obtaining data. Typical of these services shall be the measurement of length of piles, painting footmarks on piles, furnishing light and ladder if required, and moving materials or equipment as required to provide access to and clear observation of the piles.

After all piles for each pile group have been driven, the Engineer will inspect each pile.

The Engineer will keep a record of each pile driven. This record will include the following data:

1. Date of driving.
2. Pile number.
3. Type and size of pile.
4. Type, number and location of splices.
5. Pile length before driving.
6. Length of cut-off.
7. Elevation of pile top and tip to nearest 0.1 inch immediately after driving.
8. Elevation of pile top after driving entire pile group to the nearest 0.1 inch to determine amount of heave.
9. Final elevation of pile tip after required redriving of entire pile group.
10. Lower limit (elevation) of pile coating after driving.
11. Hammer type and size.

12. Hammer speed.
13. For impact hammers, blows per foot of driven length, and blows per inch where driving resistance exceeds 75 blows per foot.
14. Blows per 1/2 inch of redrive.
15. The time pile driving is started, interrupted, resumed and stopped.
16. Description of any unusual circumstances affecting the driving of the particular pile.
17. Sounded length of each pile.
18. Slope of pile.
19. Lowest elevation at which light source is fully visible and elevation at which eye contact with light source is lost.

(L) WELDING OF HEADED SHEAR STUDS ON PILES

Headed shear studs shall be welded to the pipe piles at the locations indicated on the Contract Drawings, and as directed by the Engineer. The studs shall be installed on-site, following pile installation. The pipe piles shall not be coated in the immediate area surrounding the shear studs, or the coating shall be removed prior to stud installation.

The headed shear studs shall be of the size indicated on the Contract Drawings. They shall not be coated. They shall be Nelson Type H4L or S3L, or approved equal, flux filled, welded as shown on the Drawings. Studs shall be from cold drawn steel Grades C-1010 through C-1020, per ASTM A108, and shall be welded per the manufacturer's recommendations. The minimum ultimate tensile strength shall be 60 ksi, and the minimum yield strength shall be 50 ksi.

(M) PRE-DRILLING

Pre-drilling or pre-augering for installation of pipe piles shall be performed to clear obstructions and remove portions of existing historic structures to allow for installation of pipe piles to the specified tip elevation as shown on the Contract Drawings.

Pre-drilling or pre-augering a hole of maximum diameter two inches smaller than the pile diameter may be used to advance the pile to a penetration no deeper than the required minimum tip penetration, subject to approval of the Engineer, providing the pile is driven to the required driving resistance shown on the Contract Drawings. In granular soils below the ground water level, stabilize the hole by use of drilling fluids as approved by the Engineer.

Waterfront Cut-off Wall (Continuous Pipe Pile Wall)

Where indicated in the Contract Drawings, the Contractor shall drill through obstructions, including those caused by the timber piles of the existing waterfront retaining structure to allow for installation of the proposed steel pipe pile wall. The Contractor shall choose such means as necessary to clear obstruction of existing timber pile(s) to allow for installation of proposed cut-off wall. The Contractor may use impact, vibratory, or drilling methods, or any combination of these, as the Contractor deems necessary, to advance the pipe piles to the specified tip elevation as indicated on the Drawings.

Prior to commencement of pile installation, the Contractor and the Engineer must mutually agree on the pre-drilling criteria.

FDR Drive Floodgate Foundations (Pipe Pile)

As indicated in the Contract Drawings, historic bulkhead structures may be located below the alignment of the proposed FDR Drive flood gates. Where installation of proposed pipe pile foundations requires, the Contractor shall remove portions of the existing structure through pre-drilling. The Contractor shall choose such means as necessary to remove the existing timber cribbing within the FDR Drive roadway to allow for installation of the proposed pipe piles of the

flood gate foundations. The Contractor may use impact, vibratory, or drilling methods, or any combination of these, as the Contractor deems necessary, to allow for the advancement of the pipe piles to the specified tip elevation as indicated on the Drawings. The Contractor shall fill any pre-drilled hole (or casing) with pea gravel, to be approved by the Engineer, prior to installation of the pipe pile. The Contractor's proposed methodology for pre-drilling shall accommodate requirements for work periods and roadway closures/openings as dictated by NYCDOT OCMC.

#### **551.06 MEASUREMENT.**

The quantity of steel pipe piles to be measured for payment shall be the number of linear feet, measured to the nearest half foot, installed to the satisfaction of the Engineer. Pile length shall be measured from final cut-off elevation to pile tip elevation. No payment or allowance will be made for steel pipe piles installed beyond the limits specified.

The quantity of steel pipe piles installed in predrilled locations to be measured for payment shall be the number of linear feet, measured to the nearest half foot, of drilling performed to clear obstructions for installation of the pipe pile. Predrilling quantities shall be measured as the vertical pile length along which drilling is required for advancement of the pile. No payment or allowance will be made for predrilling which does not meet the agreed upon criteria between the Contractor and the Engineer.

The quantity of rock socket to be measured for payment shall be the number of rock sockets installed to the satisfaction of the Engineer. The rock socket shall include all drilling, removal of materials within the pile, cleaning, installation of anchors, temporary supports, concrete/grout fill, and other hardware required to install the rock sockets. No payment or allowance will be made for rock sockets installed beyond the limits specified.

Payment for pile load testing shall be per test performed. Dynamic pile load testing shall include providing PDA and CAPWAP results for the test pile initial driving, and subsequent restrikes, and results shall be presented in a report for the Engineer's review for each pile tested.

Static compression pile load testing shall include test set up, conducting the testing, and developing a report for the Engineer's review for each pile tested. Lateral pile load testing shall include test set up, conducting the testing, and developing a report for the Engineer's review for each pile tested.

#### **551.07 PRICE TO COVER.**

The contract unit price for steel pipe piling and rock sockets shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish and install in full compliance with the requirements of the specifications and drawings. The cost to perform exploratory test pits and to remove any obstructions that may interfere with the installation of the steel pipe piles or rock sockets to the specified elevations will be included in the unit price.

The contract unit price for pile load testing, including dynamic pile load testing, static compression pile load testing, and lateral pile load testing shall be per test performed and reported on, and cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to complete the tests in full compliance with the requirements of the specifications.

**END OF SECTION**

**SECTION ESCR-551.993 – MICROPILES****551.993.01 INTENT.**

This section describes micropiles for use in the flood protection structures.

**551.993.02 DESCRIPTION.**

Micropiles, under this section, shall refer to all micropiles used for the floodwall, floodgate, interceptor gate and parallel conveyance structures.

**551.993.03 MATERIALS.**

- (A) Drill Casing. Provide drill casing consisting of flush joint type steel pipe of appropriate thickness to withstand the stresses associated with advancing it into the ground, in addition to the stresses due to hydrostatic and earth pressures.
- (B) Drill Casing/Pipe used as Reinforcement. Provide steel drill casing/pipe used as reinforcement conforming to API 5CT N80 steel with 80 ksi yield strength. Mill secondaries cannot be used for reinforcement.
- (C) Bar Reinforcement. Provide bar reinforcement meeting the requirements of ASTM A615, Grade 80, or continuously threaded "uncoated high-strength steel bars for prestressing concrete" - ASTM A722.
- (D) Casing shall be flush joint and the pipe joint shall be completely shouldered and with no stripped threads.
- (E) Grout. Provide a pumpable grout consisting of, as a minimum, Portland Cement - type 2 and water that provides a stable, homogenous neat cement grout with a minimum 28-day unconfined compressive strength of 5,000 psi.
- (F) Centralizers and Spacers. Provide centralizers and spacers fabricated from schedule 40 PVC pipe, tube, steel, or material non-detrimental to the reinforcing steel. Wood shall not be used.

**551.993.04 SUBMITTALS**

- (A) Shop Drawings  
Prepare and submit to the Engineer, for review and approval, working drawings and relevant calculations for micropile installation at least 21 days prior to planned start of construction.
- (B) Submit a detailed description of the construction procedures proposed for use. This shall include a schedule of major equipment resources. Indicate methods and equipment that will be used to containerize waste, including but not limited to soil cuttings, spoils, and drilling fluid, generated as part of the micropiles installation. The construction procedures shall be submitted for Engineer review and approval prior to the start of any work.
- (C) The working drawings shall include micropile installation details giving the following:
  - a. Micropile number, location and installation sequence.
  - b. Micropile design load.

- c. Type and size of reinforcing steel.
  - d. Minimum total bond length.
  - e. Grout volumes and maximum pressures.
  - f. Micropile cut-off elevation.
- (D) For reinforcing steel submit certified mill test reports, properly marked, for reinforcing steel, as the materials are delivered. The ultimate strength, yield strength, elongation, and composition shall be included. For steel pipe used as permanent casing, or core steel, submit a minimum of two representative coupon tests or mill certifications (if available) on each steel heat delivered to the project site.
- (E) Submit the grout mix designs, including details of all materials to be incorporated, and the procedure for mixing and placing the grout to Engineer for review and approval prior to ordering any materials. This submittal shall include certified test results verifying the acceptability of the proposed mix designs.
- (F) Installation Records: The following records shall be prepared for each micropile installed, within 24 hours after each pile installation is completed. The records shall include the following minimum information:
- a. Pile drilling duration and observations (e.g., flush return).
  - b. Information on soil and rock encountered, including description of strata, water, etc.
  - c. Final elevation of micropile including top and bottom of bond length.
  - d. Cut-off elevation.
  - e. Design loads.
  - f. Description of unusual installation behavior, or conditions.
  - g. Any deviation from the intended parameters.
  - h. Grout pressure attained, where applicable.
  - i. Grout quantities pumped.
  - j. Pile materials and dimensions.
  - k. Micropile test records, analysis, and details.
- (G) Pile Load Test Procedure and Set-Up
- Submit the proposed set-up plan and procedure for performing the required static compression pile load tests and static uplift pile load tests, for review and approval by the Engineer prior to starting any tests. The proposed location of the test piles is indicated on the Drawings.

#### Test Reports

Provide pile load test results for both compression and tension load tests as required in this section of the Specifications.

- (H) As-built drawings showing the location of the piles, their depth and inclination, and details of their composition shall be submitted within 15 days after installation of all production piles.

**551.993.05 METHODS.****(A) DRILLING AND EXCAVATION**

Protect existing structures, including overhead and buried utility lines. Contractor shall perform exploratory test pits in the area of the proposed micropile installation as required to first expose any buried utilities prior to any drilling at no additional cost to the City.

The Contractor shall follow the requirements in Con Ed Specification CE-SI-1080 Guidelines for Protecting Existing Underground Transmission Electric Facilities from Nearby Construction Activities for any micropiles being installed adjacent to Con Ed electric facilities.

Advance the hole using a duplex drilling method. Do not drill or flush ahead of the drill casing by more than 1 foot. Perform drilling and excavation in such a manner to prevent collapse of the hole. Use of bentonite slurry is not permitted. Use of polymer slurry to remove cuttings from the cased hole shall be approved by the Engineer.

If obstructions are encountered during excavation for a pile, progress through them by means of coring or a tri-cone roller bit. Use of drop-type impact hammers and blasting are not permitted.

Use of a down-the-hole hammer must be approved by the Engineer.

Control the procedures and operations so as to prevent mining, damage, or settlement to adjacent structures, tunnels, utilities, or adjacent ground. If any mining, damage, or settlement occurs, halt operations. Provide a written plan to the Engineer for review with procedures to avoid reoccurrence. Resume work only after the Engineer has approved the plan in writing. Repair all damage and settlement at no additional cost to the City.

Control the procedures and operations so as to prevent the soil at the bottom of the hole from flowing into the hole at all times during installation and cleaning out. Monitor the rate of fluid flow used to progress the holes.

Control drilling fluid and dispose of spoil in accordance with the approved procedure.

Do not progress a hole, pressure-grout, or post-grout, within a radius of 5 pile diameters or 5 feet, whichever is greater, of a micropile until the grout for that micropile has set for 24 hours or longer if a retarder is used.

Obstructions, including but not limited to rock fragments, cobbles, boulders, and rubble fill are expected during installation of micropiles. It is Contractor's responsibility to assess the impact of obstructions on micropile installation and take measures to overcome the obstructions without causing additional cost to the City.

If, during installation of a pile, an obstruction is encountered that prevents the practical advancement of the hole, the hole shall be abandoned and filled with grout. A new pile shall be drilled at a location to be determined by the Engineer, although it must be acknowledged that in certain structures, relocation options may be severely limited, and further attempts at the original location with different methods may be required.

Existing utilities shall be field verified prior to drilling. The Contractor shall expose all existing utilities prior to installation of micropiles. It is the Contractor's

responsibility to avoid damaging existing underground utilities during micropile installation.

The micropiles shall be constructed according to the size and depth shown on the Contract Drawings. Casing shall be drilled down to the level/elevation in the sand layer or top of bedrock as indicated on the Contract Drawings.

(B) REINFORCEMENT AND POST GROUT TUBE PLACEMENT

Provide centralizers sized to position the reinforcement within 3/8 inch of plan location from the center of the pile; sized to allow grout tremie pipe insertion to the bottom of the drillhole; and sized to allow grout to freely flow up the drill hole and casing and between adjacent reinforcing bars. Centralizers, spaced not to exceed 10 feet, must be used to center the reinforcement for its entire length. Securely attach the centralizers to withstand installation stresses. Do not drop, but lower the steel reinforcement to its specified location in the hole. If a post grout tube is used, attach it to the steel reinforcement prior to lowering it.

(C) GROUTING

The Contractor shall provide systems and equipment to measure the grout quality, quantity, and pumping pressure during the grouting operations. This information is to be measured and recorded by the Contractor. The grouting shall be performed immediately after the finish of drilling and flushing of the hole. No drilling of one micropile shall be performed if grouting is not expected to be finished for the same micropile immediately after drilling.

After drilling, the hole shall be flushed with water and/or air to remove drill cuttings and/or other loose debris. All drilling fluid along with cuttings and debris shall be collected in containers for future disposal. Prior to placement of grout, the Contractor shall verify that the bottom of the pile is clean and has reached the required tip elevation and that the bond length in soil or rock as shown in the Drawings has been achieved. The grout shall not contain lumps or any other evidence of poor or incomplete mixing. Admixtures, if used, shall be mixed in accordance with manufacturer's recommendations. The pump shall be equipped with a pressure gauge to monitor grout pressures. The pressure gauge shall be capable of measuring pressures of at least 150 psi or twice the actual grout pressures used by the Contractor, whichever is greater. The grouting equipment shall be sized to enable the grout to be pumped in one continuous operation. The grout should be kept in constant agitation prior to pumping.

The grout shall be injected from the lowest point of the drill hole (by tremie methods) until clean, pure grout flows from the top of the micropile. The tremie grout may be pumped through grout tubes or drill rods. Subsequent to tremie grouting, all grouting operations associated with, for example, extraction of drill casing and pressure grouting, must ensure complete continuity of the grout column. The use of compressed air to directly pressurize the fluid grout is not permissible. The grout pressures and grout takes shall be controlled to prevent excessive heave in cohesive soils or fracturing of soil or rock formations. The entire pile shall be grouted to the design cut-off level.

Upon completion of grouting, the grout tube may remain in the hole, but it shall be filled with grout. Grout tubes shall be installed prior to the tremie grouting.

The Contractor shall perform grouting in a way to minimize grout loss to joints in rock and cavities. The Contractor shall be responsible for any overrun of grout beyond the theoretical micropile volume and take it into consideration in their bid. In case the grout does not return to the top of casing after 120 percent of theoretical grout volume for this pile has been consumed, the Contractor may let the grout set and redrill and regROUT the micropile. However, it shall be the Contractor's responsibility to deal with the potential grout loss issue.

Grout within the micropiles shall be allowed to attain the minimum design strength prior to being loaded. No load test shall be performed before the specified grout strength has been reached.

If the Contractor uses a post-grouting system, all relevant details including grouting pressure, volume, location and mix design, shall be submitted for Engineer approval.

(D) PILE SPLICES

Casing sections shall be joined by manufactured thread joints constructed to develop at least the required compressive, tensile, and/or bending structural strength used in the micropile design. Threaded pipe casing joints shall be located at least two casing diameters (OD) from a splice in any reinforcing bar.

Reinforcing steel shall be spliced using approved couplers from the reinforcing steel manufacturer and shall develop the ultimate tensile strength of the bars without evidence of any failure.

Lengths of casing and reinforcing steel to be spliced shall be secured in proper alignments and in such a manner that no eccentricity between the axes of the two lengths spliced or angle between them results.

(E) GROUT PLACEMENT AND CASING REMOVAL

Provide quality control of the mix by monitoring grout quality. Measure grout consistency by determining grout density per API Recommended Practice (RP) 13B-1 by the Baroid Mud Balance Test at a frequency, of at least one test per micropile, and provide the information to the inspector.

The Engineer will perform quality assurance of the mix design. Place grout by means of a tremie pipe from the bottom of the pile upward. Record the initial volume of grout required to fill the hole. Record grouting pressure and volume of grout being pumped into the pile during pressure grouting. Upon completion, maintain the grout level at or above the pile cut off elevation until the grout has set.

Locate the grout pressure and volume measuring gages at the pile installation site so that they are accessible and legible to the inspector.

(F) CONSTRUCTION TOLERANCES

Install the piles so that the center of each micropile does not vary from the plan location by more than 3 inches. Do not allow the micropile to vary from the vertical or established batter by more than 1/4 inch per foot, as measured above ground.

Cut off the top of the pile at the elevation indicated in the Contract Documents.

(G) PILE ACCEPTANCE CRITERIA

Piles will not be accepted for payment unless all the following criteria are satisfied:

1. Pile meets the following construction tolerance criteria:
  - a. Centerline of piling shall not be more than 3 inches from indicated plan location.
  - b. Pile-hole alignment shall be within 1 percent of design alignment.
  - c. Top elevation of pile shall be within 1 inch of the design vertical elevation.
  - d. Centerline of core reinforcement shall not be more than 3/4 inch from centerline of piling.
2. Pile was installed in accordance with the approved submittal.
3. Pile is not damaged.
4. Pile was installed using the same method, grout volumes, and pressures as the accepted test pile, if applicable.

(H) UNACCEPTABLE PILES

Unacceptable piles are piles which do not meet the acceptance criteria identified in the subsection above.

Submit to the Engineer a written plan of remedial action, for approval by the Engineer, showing how to correct the problem and prevent its reoccurrence. Repair, augment, or replace the unacceptable pile in accordance with the approved remedial plan at no additional cost to the City.

(I) QUALITY ASSURANCE

The Contractor shall be fully experienced in all aspects of micropile design and construction, and shall furnish all necessary equipment, materials, skilled labor, and supervision to carry out the contract. The Contractor shall have successfully completed at least three projects in the previous 5 years of similar scope and size. The Contractor shall have successfully installed a minimum of 100 micropiles in similar sites, of similar capacity to those required in the plans and specifications. The Contractor shall also provide resumes of key personnel who will be present on site (and will be materially involved) and who each have at least 3 years of relevant experience. These personnel shall include as a minimum a superintendent and a driller. The Engineer may suspend the Work if the Contractor uses non-approved personnel. If work is suspended, the Contractor shall be fully liable for all resulting costs and no adjustment in contract time will result from the suspension.

Grout shall be tested as follows:

1. Each set of grout samples shall consist of three 2-inch cube samples.
2. During test pile installation, prepare and test minimum one set of samples from grout used for each test pile. Perform one 3-day, 7-day, and one 28-day unconfined compressive strength tests in accordance with ASTM C780 Annex 6.

3. During production pile installation, prepare and test a minimum of one set of samples from each batch of grout used during production pile installation, but no less than one set per day. Perform one 7-day and one 28-day unconfined compressive strength tests per ASTM C780 Annex. The remaining sample shall be tested at 56-day if 28-day strength does not meet specifications.
4. Test results shall be submitted to the Engineer within 3 days from the finish the grout strength test. If the grout strength of a particular micropile is less than the specified strength, the Engineer may require the Contractor to prove the design capacity of the specific micropile by performing additional proof load test or to install additional micropile to replace the specific micropile with inadequate grout strength at no additional cost to the City.

(J) WELDING

All welded connections shall be performed by in accordance with AWS D1.1. These requirements do not apply to minor welding that does not carry structural load, such as cutting teeth and tacking on bearing plates.

(K) PILE LOAD TESTING

Follow the pile load testing requirements and locations specified on the Contract Drawings.

The proposed locations of the test piles are indicated on the Contract Drawings. Static compression pile load tests shall be performed on those test piles in accordance with ASTM D1143 following New York City Building Code, and as indicated on the Contract Drawings. Piles shall be tested to a load 200% of the allowable compression pile capacity provided on the Contract Drawings, using the Standard Procedure.

Static tension pile load tests shall be performed on those test piles in accordance with ASTM D3689 following New York City Building Code, and as indicated on the Contract Drawings. Piles shall be tested to a load 200% of the allowable compression pile capacity provided on the Contract Drawings, using the Standard Procedure.

The Contractor shall retain the services of a New York State Licensed Professional Engineer to perform load tests on the micropiles at the locations shown in the Contract Documents.

A test report, in accordance with ASTM D1143, shall be submitted for each compression pile load test. A test report, in accordance with ASTM D3689, shall be submitted for each tension pile load test.

(L) VIBRATION MONITORING

Follow the vibration monitoring requirements specified on the Contract Drawings, and stated herein.

Where installing micropiles adjacent to critical structures, generated vibrations shall be monitored at the critical structures. Detected vibration levels at the monitored structures shall not exceed a peak particle velocity level greater than 0.5 in./sec.

**551.993.06 MEASUREMENT.**

The quantity of micropiles to be measured for payment shall be the linear feet, measured to the nearest half foot, installed to the satisfaction of the Engineer. No payment or allowance will be made for micropiles installed beyond the limits specified.

Payment for static compression and tension pile load testing shall be per test performed. Static compression pile load testing shall include test set up, conducting the testing, and developing a report for the Engineer's review for each pile tested.

**551.993.07 PRICE TO COVER.**

The contract unit price for micropiles shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish, and install in full compliance with the requirements of the specifications and drawings. The cost of vibration monitoring, exploratory test pits to locate utilities, any loss of grout, and the removal of any obstructions that may interfere with the installation of the micropiles to the specified elevations will be included in the unit price. The contract unit price for pile load testing, both compression and tension, shall be per test performed and reported on, and cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to complete the tests in full compliance with the requirements of the specifications.

*Payment will be made under:*

Item No.	Item	Pay Unit

**END OF SECTION**

## SECTION ESCR-552 – STEEL SHEET PILING

### 552.01 INTENT.

This section describes steel sheet piling for use in the flood protection, cut-off wall, and combi-wall structures.

### 552.02 DESCRIPTION.

Steel sheet piling, under this section, shall refer to all permanent steel sheet piling used for the floodwall, floodgate foundations, and cut-off wall.

### 552.03 MATERIALS.

- (A) All sheet piles and king piles shall be delivered in single pieces. The interlocks of sheet piling and king piles shall be free-sliding, provide a swing angle suitable for the intended installation, but not more than 5 degrees when interlocked, and maintain continuous interlocking when installed. Sheet piling and king piles shall be sections of the dimensions shown on the Contract documents. Sheet piling and king piles shall be provided with standard pulling holes. The outboard face of sheet piling and king piles shall be fully coated in the shop per requirements of these Specification, and touched up in the field as required prior to, during and after driving.

The Contract Documents refer to AZ steel sheet pile sections manufactured by Nucor Skyline. The steel sheet pile sections listed below the respective AZ-section(s) shall be considered equivalent to the AZ-section:

AZ 20-700N (Nucor Skyline)

- ZZ 20-700 (JD Fields)
- PZC 25 (LB Foster)
- Or approved equal.

AZ 26-700N (Nucor Skyline)

- ZZ 26-700 (JD Fields)
- PZC 28 (LB Foster)
- Or approved equal.

AZ 38-700N (Nucor Skyline)

- ZZ 38-700 (JD Fields)
- PZC 38CP (LB Foster)
- Or approved equal.

AZ 46-700N (Nucor Skyline)

- ZZ 46-700 (JD Fields)
- SLC 46-700 (Meever USA)
- Or approved equal.

NZ 19 (Nucor Skyline)

- ZZ 19-700 (JD Fields)
- PZC 19 (LB Foster)

- Or approved equal.

Any changes to other elements of the design that may result from the use of these equivalent sections shall be at no additional cost to the City.

- (B) Steel sheet piling for the buried inland floodwall and deadman (excluding I-wall) shall be ASTM A572, Grade 50.
- (C) Steel sheet piling (AZ-46-700N or equivalent) for the I-wall floodwall shall be ASTM A572, Grade 60.
- (D) Steel sheet piling for the cut-off wall and combi-wall shall be ASTM A572, Grade 60.
- (E) Pipe piles for the combi-wall must be ASTM A252 Grade 3 Modified with  $F_y = 50\text{ksi}$ .
- (F) Tie rods for the cut-off wall anchoring system shall be ASTM 615, 75 ksi threaded bar hot-dip galvanized in accordance with ASTM A153.
- (G) Steel bearing plate, articulating couplers, and turnbuckles for the tie rods shall be galvanized and provided by the same manufacturer as the tie rod.
- (H) Coating for the steel sheet piling must be in accordance with specification Section ESCR-559 Protective Coating for Waterfront Structures.
- (I) Interlock sealant, where specified on the drawings, shall be a coal-tar resistant sealant suitable for sealing against water and applied in the factory. Interlock sealant shall be approved by the Engineer and the NYSDEC.

#### 552.04 SUBMITTALS

- (A) PRODUCT DATA

##### Equipment Descriptions

Complete descriptions of sheet piling driving equipment including hammers, extractors, protection caps, and other installation appurtenances shall be submitted for approval prior to commencement of work.

##### Protective Coating Systems

Manufacturer's specifications, recommended installation procedures and equipment, Materials Safety Data Sheets (MSDS) and other pertinent data needed to prove compliance with the specified requirements.

Tools for mixing and application, as approved by the manufacturer of the coating system supplier.

Manufacturer's instruction for field touch-up of damaged coating.

##### Interlock Sealant

Manufacturer's specifications, recommended installation procedures and equipment, Materials Safety Data Sheets (MSDS) and other pertinent data needed to prove compliance with the specified requirements.

- (B) SHOP DRAWINGS

Drawings for sheet piling shall show complete piling dimensions and details, driving sequence, and location of installed piling. Detail drawings shall include details and dimensions of templates and other temporary guide structures for

installing piling, as well as all appurtenances and temporary supports for the tie rods. Detail drawings shall provide details of the method of handling piling to prevent permanent deformation, overstress, and damage to coatings and piling interlocks.

(C) DESIGN DATA

Submit welding procedures (PQR / WPS) for approval.

(D) CERTIFICATES

- Welder's Qualifications (WPQ): Certificate stating that all coating materials and procedures meet or exceed the specified requirements of this Section.
- Field Test Results for Coating
- Material Mill Certificates

(E) RECORDS

Driving Records

Records of the sheet piling driving operations shall be submitted no later than 7 days after driving is completed. These records shall provide a system of identification which shows the disposition of approved piling in the work, driving equipment performance data, piling penetration rate data, piling dimensions, and top and bottom elevations of installed piling.

Record Drawings

Provide in AutoCAD format with location and tip elevations.

Pulling and Redriving

Provide records of all sheet piles that have been pulled or redriven.

(F) Contractor's Work Plan

Contractor shall submit a detailed work plan for driving all piles to Engineer for approval. It shall include procedures, equipment and personnel to be used, schedule and sequencing, and a general narrative of the proposed work and plan.

(G) Engineer's Reports

The Contractor shall submit the proposed driving hammer(s) and a report prepared by a New York State licensed Professional Engineer, including WEAP analysis, that shows the hammer is adequate to install the piles and will not damage the piles during driving.

**552.05 METHODS.**

(A) SITE PREPARATION

Protect existing structures, including overhead and buried utility lines, during installation of sheet piles. Contractor shall perform exploratory test pits in the area of the proposed sheet pile installation to first expose any buried utilities prior to any sheet pile installation at no additional cost to the City.

The Contractor shall follow the requirements in Con Ed Specification CE-SI-1080 Guidelines for Protecting Existing Underground Transmission Electric Facilities from Nearby Construction Activities for any sheet pile installation adjacent to Con Ed electric facilities.

(B) PILE DRIVING EQUIPMENT (NON-PRESS-IN METHOD)

Where a press-in method of installation is not specified, the sheet piles shall be installed using an approved driving head designed to properly fit a pair of piles. Avoid damage to the top of the piles during driving.

Use an approved impact or vibratory pile hammer of sufficient size to drive the sheet piles to the tip elevation(s) shown on the Contract Drawings without causing stresses due to driving in excess of 90 percent of the yield strength ( $F_y$ ) of the pile material, verified based on Wave Equation Analyses (WEAP Analyses) performed by the Contractor.

(C) PILE DRIVING EQUIPMENT (PRESS-IN METHOD)

Where specified on the drawings, the steel sheet piles shall be hydraulically pressed-in and extracted utilizing a non-vibratory, non-percussive hydraulic press-in methodology.

The hydraulic press-in equipment shall not produce more than 70dB of noise at a distance of 25 feet from the equipment while in operation. During pile installation, the hydraulic press-in equipment shall not produce any measurable vibration at the ground surface at a distance of 15 feet.

(D) WELDING AND SPLICING

Perform welding in accordance with requirements for shielded metal arc welding of AWS D1.1 for buildings and other structures.

Reinforce pile tips if and as shown on the Contract Drawings.

Splicing of sheet piles is only permitted where there is limited headroom for the pile-installation equipment, such as under the FDR Drive viaduct, or as directed by the Engineer. All pile splices shall be full penetration butt welds with cover plates and shall develop the full strength of the sheet pile. An approved jig or alignment device shall be used to maintain the required straightness of the sheet pile. All splices shall be non-destructively tested by an AWS Certified Welding Inspector (CWI) using both VT and UT for the 100 percent of the weld length.

All protective coating must be repaired after welding is completed.

(E) WELDING OF HEADED SHEAR STUDS ON SHEET PILES

Headed shear studs shall be welded to the sheet piles at the locations indicated on the Contract Drawings, and as directed by the Engineer. The studs shall be installed on site, following sheet pile installation. The sheet piles shall not be coated in the immediate area surrounding the shear studs, or the coating shall be removed prior to stud installation.

The headed shear studs shall be of the size indicated on the Contract Drawings. They shall not be coated. They shall be Nelson Type H4L or S3L, or approved equal, flux filled, welded as shown on the Drawings. Studs shall be from cold drawn steel Grades C-1010 through C-1020, per ASTM A108, and shall be welded per the manufacturer's recommendations. The minimum ultimate tensile strength shall be 60 ksi, and the minimum yield strength shall be 50 ksi.

(F) COATING OF PILES

Piles shall be coated in accordance with Section ESCR-559 – Protective Coating for Waterfront Structures to the extents specified on the Contract Drawings.

(G) ALIGNMENT OF PILING

Contractor shall furnish necessary surveying services for establishing sheet piling locations. Any sheet piles driven more than 2 in. from the location indicated on the Contract Drawings will not be acceptable.

Sheet piling shall be driven plumb. For permanent work, deviation from the plumb position of more than one-eighth inch per foot shall be cause for rejection.

Contractor shall provide suitable guide structures to ensure that piles and driving equipment are properly aligned during driving. Guide structures shall be equipped with suitable devices to avoid damaging protecting coatings of pilings.

If, at any time, the piling is found to be out of plumb in the plane of the wall, the Contractor shall provide tapered piles or take other corrective measures to ensure plumbness of the succeeding.

(H) PILE DRIVING

Use an approved guide frame or template to set sheet piles in proper position and alignment and to provide adequate lateral support to maintain vertical alignment during driving. Where field conditions require, use two levels of guide wales to maintain vertical alignment during driving.

Properly set and "shake out" steel sheet piles prior to driving. Place a pair of sheets within their interlocks; then lower them as far as possible. If the sheets bind or hang up in their interlocks before bearing on the ground, pick up adjacent sheets in pairs and shake out as required, until the sheets ride smoothly within their interlocks and simultaneously bear on the ground.

Top of sheet pile shall be normal to the driving force.

Drive sheet piles to the tip elevation(s) shown on the Contract Drawings. Drive sheet piles in segments to assure final sheet pile location are installed in the intended locations.

Drive sheet piles in such a manner as to prevent piles from leaning in the direction of driving and to provide a continuous closure of sheet piles, where closure is required. Where possible, drive sheet piling with the ball end leading. If an open socket is leading, provide a bolt or similar object in the bottom of the interlock to keep interlock free of soil material.

At the completion of the driving operation on a pile, verify that the pile is undamaged, free of defects and in compliance with the requirements of this Section.

Cut piles off at cut-off elevation as shown on the Contract Drawings as soon as practical after driving.

Obstructions encountered during driving shall be removed or the Contractor may penetrate the obstruction by pre-drilling, pre-augering, spudding or other means.

No jetting will be permitted without specific approval of the Engineer.

(I) ROCK SOCKETS

Rock sockets for the combi-wall king piles shall be installed as shown on the Contract Drawings.

#### Pipe Pile Installation

The Contractor shall choose such means as necessary to seal the pipe piles onto or into the rock. The Contractor may use impact, vibratory, or drilling methods, or any combination of these, as the Contractor deems necessary, to produce the finished pipe pile as shown on the Drawings. Blasting is prohibited, and no means shall be employed which disturb existing construction.

The socket shall be cut into the rock, and the bottom of the socket shall be level so that horizontal bearing is achieved. The diameter and depth of the socket shall be shown on the Contract Drawings. The diameter of the socket specified shall be maintained the entire length of the socket. The Engineer may direct the Contractor to cut the socket deeper than specified, if in the Engineer's opinion, this becomes necessary.

#### Concrete Grout

Concrete/grout 28-day compressive strength shall be as shown on the Contract Drawings.

Concrete/grout shall be tremied or pumped in a continuous operation. If the placement is interrupted, special procedures may be required prior to resumption of the pour, as directed by the Engineer.

Concrete/grout may be placed underwater by pumping, or by the tremie method.

The bottom of the socket shall be sounded and the depth determined immediately before concrete placement. Not more than ½-inch of soil residue shall be permitted at the bottom of the socket.

If the soil or any other material persists in entering the drilled socket, the socket may be grouted, the grout allowed to harden, and the socket re-drilled.

The tremie pipe or grout pipe shall extend to within six (6) in. of the bottom of the socket. The pipe shall remain a minimum of six (6) ft below the top of the concrete at all times after attaining that depth.

The tremie operation shall continue until a minimum of one-third of a cubic yard of concrete is pumped over the top of the required concrete top.

#### (J) CORRECTIONS OF DEFICIENCIES

Notify the Engineer immediately in writing of the failure of any sheet pile to meet any requirement of this Section. Such written notification shall include all information required for the evaluation of remedial measures.

Perform remedial work at no additional cost to the City and in accordance with both the applicable Unit Price provisions, if any, and the modified design and details, if any, all as approved by the Engineer, except for sheet piles which do not comply with the requirements of this Section due to encountering during driving any underground obstruction consisting of a boulder or piece of manufactured or construction material as shown by the Contractor, and as determined by the Engineer on the basis of all field information.

#### (K) PRE-DRILLING

Pre-drilling or pre-augering for installation of pipe piles or sheet piles shall be performed to clear obstructions and remove portions of existing historic structures to allow for installation of sheet piles and combi-walls to the specified tip elevation as shown on the Contract Drawings.

#### Waterfront Cut-off Wall (Combi-Wall)

Where indicated in the Contract Drawings, the Contractor shall drill through obstructions, including those caused by the timber piles of the existing waterfront retaining structure to allow for installation of the proposed sheet pile and combi-wall elements. The Contractor shall choose such means as necessary to clear obstruction of existing timber batter pile(s) to allow for installation of proposed cut-off wall. The Contractor may use impact, vibratory, or drilling methods, or any combination of these, as the Contractor deems necessary, to advance the pipe piles to the specified tip elevation as indicated on the Drawings.

Prior to commencement of pile installation, the Contractor and the Engineer must mutually agree on the pre-drilling.

#### Floodwall Foundation (Sheet Pile)

As indicated in the Contract Drawings, historic bulkhead structures may be located below the alignment of the proposed floodwall within East River Park. Where installation of proposed sheet pile foundations requires, the Contractor shall remove portions of the existing structure through pre-drilling. The Contractor shall choose such means as necessary to remove the existing timber cribbing within East River Park along the proposed floodwall alignment to allow for installation of the proposed sheet pile foundations. The Contractor may use impact, vibratory, or drilling methods, or any combination of these, as the Contractor deems necessary, to allow for the advancement of the sheet piles to the specified tip elevation as indicated on the Drawings. The Contractor shall create a clearing with a minimum width of 30 in. through the existing cribbing. The Contractor shall fill the pre-drilled area with pea gravel, to be approved by the Engineer, prior to installation of the sheet piles. For work areas adjacent to or within the FDR Drive roadway, the Contractor's proposed methodology for pre-drilling shall accommodate requirements for work periods and roadway closures/openings as dictated by NYCDOT OCMC.

### **552.06 MEASUREMENT.**

The quantity of steel sheet piling to be measured for payment shall be the number of square feet, measured to the nearest square foot, installed to the satisfaction of the Engineer. The horizontal length will be measured along the centerline of the sheeting wall. The vertical height shall be the sheetpile length measured from the final cut-off elevation to sheetpile tip elevation. No payment or allowance will be made for steel sheet piling installed beyond the limits specified.

The quantity of combi-wall to be measured for payment shall be the number of square feet, measured to the nearest square foot, installed to the satisfaction of the Engineer. The horizontal length will be measured along a projection of the sheeting on a plane parallel to and midway between the front and rear face of the combi-wall. No payment or allowance will be made for steel sheet piling installed beyond the limits specified.

The quantity of steel sheet piling and combi-wall installed in predrilled locations to be measured for payment shall be the number of square feet, measured to the nearest square foot, of drilling performed to clear obstructions for installation of the element. Predrilling quantities shall be measured as the vertical length of pile or sheet pile along which drilling is required for advancement of the pile or sheet pile by the horizontal length of the pile or sheet pile. No payment or allowance will be made for predrilling which does not meet the agreed upon criteria between the Contractor and the Engineer.

The quantity of tie rod to be measured for payment shall be the number of linear feet, measured to the nearest tenth of a foot, installed to the satisfaction of the Engineer. The quantity of tie rod shall include any articulated couplers, nuts, bearing plates, turnbuckles, temporary supports, and other hardware required to install the tie rods. No payment of allowance will be made for steel sheet piling installed placed beyond the limits specified.

The quantity of rock socket to be measured for payment shall be the number of rock sockets installed to the satisfaction of the Engineer. The rock socket shall include all drilling, removal of materials within the pile, cleaning, installation of anchors, temporary supports, concrete/grout fill, and other hardware required to install the rock sockets. No payment of allowance will be made for steel sheet piling installed placed beyond the limits specified.

#### **552.07 PRICE TO COVER.**

The contract unit price for steel sheet piling shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish, coatings (where specified), and install in full compliance with the requirements of the specifications and drawings. The cost to perform exploratory test pits to locate buried utilities prior to sheet pile installation and remove any obstructions that may interfere with the installation of the sheet piling to the specified elevations will be included in the unit price.

The contract unit price for tie rods shall cover the cost of all labor, materials, articulating couplers, turnbuckles, plant, equipment, insurance, samples, and incidentals required to furnish, galvanize, touch-up, and install in full compliance with the requirements of the specifications and drawings. The unit price for tie rods shall include any articulated couplers, nuts, bearing plates, turnbuckles, temporary supports, and other hardware required to install the tie rods.

The contract unit price for combi-wall shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish, coatings and interlock sealant (where specified), and install in full compliance with the requirements of the specifications and drawings. The cost to perform any investigations to locate buried utilities or potential obstructions prior to combi-wall installation and the removal of any obstructions that may interfere with the installation of the combi-wall to the specified elevations will be included in the unit price.

The contract unit price for rock sockets shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish and install in full compliance with the requirements of the specifications and drawings.

**END OF SECTION**

**SECTION ESCR-557 – PRECAST CONCRETE SLAB UNITS****557.01 INTENT.**

This section describes the casting, furnishing, and installation of the precast concrete slab units for use in the esplanade.

**557.02 DESCRIPTION.**

The precast concrete slab units, under this section, shall refer to the precast non-prestressed slab units on the esplanade as shown on the Contract Drawings.

**557.03 MATERIALS.**

- (F) The material and fabrication requirements of §704-03 of the NYSDOT Standard Specifications shall apply.
- (G) All steel reinforcing shall be epoxy coated or galvanized in accordance with the material requirements of §704-03 of the NYSDOT Standard Specifications.
- (H) Concrete shall have a minimum compressive strength of 5,000 psi and include a corrosion inhibitor following the requirements of §711-13 of the NYSDOT Standard Specifications. The corrosion inhibitor shall be used in conjunction with the coated or galvanized reinforcing.

**557.04 INSTALLATION.**

- (D) The Contractor shall use installation equipment which is not bent, twisted, warped or damaged in any way. All wire ropes for cranes of lifting bars shall be of full sections and shall not be bent, kinked, twisted, torn or stretched. The lifting capacity of each lifting device shall be clearly marked.
- (E) Prior to erection, and again after installation, precast members shall be checked for damage, such as cracking, spalling, and honeycombing. As directed by the Engineer, precast members that do not meet the surface finish requirements specified herein shall be repaired, or removed and replaced with new precast members.
- (F) Precast members shall be erected after the concrete has attained the specified compressive strength, unless otherwise approved by the Engineer. Erect in accordance with the approved shop drawings, PCI MNL-116 and PCI MNL-120 (Chapter 8), for tolerances. Brace precast members, unless design calculations submitted with the shop drawings indicate bracing is not required. Follow the manufacturer's recommendations for maximum construction loads. Place precast members level; plumb, square, and true. Align member ends.

**557.05 SURFACE FINISH.**

- (I) Precast members containing hairline cracks which are visible and are less than 0.02 inches in width, may be accepted, except that cracks larger than 0.005 inches in width for surfaces exposed to the weather shall be repaired. Precast members which contain cracks greater than 0.02 inch in width shall be approved by the Engineer, prior to being repaired. Any precast member that is structurally impaired or contains honeycombed section deep enough to expose reinforcing shall be rejected.
- (J) On unformed surfaces, provide a floated finish on formed surfaces. Follow PCI MNL-116 (Appendix A- Commentary), Chapter 3, for grades of surface finishes.

On exposed surfaces, provide a standard grade surface finish. The combined area of acceptable defective areas shall not exceed 0.2 percent of the exposed to view surface area, and the patches shall be indistinguishable from the surrounding surfaces when dry.

**557.06 MEASUREMENT.**

The quantity to be paid for under this work shall be the number of square yard of plan area of precast concrete slab units installed. Plan area is defined as the area bounded by the outer edges of each precast unit. No deductions will be made for chamfers, shear keys, or notch cuts. Space between the units shall not be included in any measurement.

**557.07 PRICE TO COVER.**

The contract unit price for precast concrete units shall cover the cost of all labor, materials, plant, equipment, insurance, samples, testing, and incidentals required to furnish and install the precast concrete units as shown on the Contract Drawings, in full compliance with the requirements of the specifications. Damaged units which cannot be satisfactorily repaired or which do not meet dimensional and camber tolerances shall be replaced by the Contractor at no cost to the City.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-557.44	PRECAST CONCRETE SLAB UNITS	S.Y.

**END OF SECTION**

## SECTION ESCR-559 – PROTECTIVE COATING FOR WATERFRONT STRUCTURES

### 559.01 INTENT.

Protective coating for use on the esplanade, floodwall, and floodgate foundation sheet piles and piles.

### 559.02 DESCRIPTION.

Protective coating for use on the esplanade and flood protection system shall be a two-part coal tar epoxy polyamide coating system suitable for the waterfront environment.

### 559.03 MATERIALS.

#### (A) COATING

Coal Tar Epoxy Polyamide coating system shall comply with SSPC-PAINT16 and shall be a two-part 4:1 system conforming to SSPC-PS11.01

### 559.04 SUBMITTALS.

#### (A) PRODUCT DATA

1. Materials list of items proposed to be provided under this Section.
2. Manufacturer's specifications, recommended installation procedures and equipment, Materials Safety Data Sheets (MSDS) and other pertinent data needed to prove compliance with the specified requirements.
3. Tools for mixing and application, as approved by the manufacturer of the coating system supplier.
4. Manufacturer's instruction for field touch-up of damaged coating.

#### (B) CERTIFICATES

1. Field Test Results.

### 559.05 METHODS.

#### (A) GENERAL

Coating work shall only commence when ambient and curing temperatures are within limits of the coating manufacturer's recommendations and at least 5 degrees F above dew point temperature.

Ensure proper identification after packages are opened and all manufacturer safety recommendations are followed.

At time of delivery all products shall be dry, sealed in their original packages and containers, free of mud, oil, and any other materials or contaminants that may adversely affect quality.

#### (B) SURFACE PREPARATION

Prepare steel surfaces for coating applications in accordance with SSPC-SP10/NACE No. 2, or as otherwise recommended by manufacturer.

#### (C) PROPORTIONING OF COAL TAR EPOXY-POLYAMIDE SYSTEM

Coal tar epoxy-polyamide consists of a two-component system. Component A contains a refined coal tar pitch, polyamide resin, and a polyamine promoter to accelerate curing rate. Component B is an epoxy resin. Mix both components in a ratio of 4 parts of Component A to 1 part of Component B by volume. When thinning is allowed and is necessary for proper application, use xylene or the

coating manufacturer's recommended thinner, to a maximum of 1/2 gallon to a 5-gallon batch.

Power-stir components to a smooth, uniform consistency. Stir coating periodically during induction period. Follow coating manufacturer's requirements for induction time and pot life of mixed batches.

(D) COATING APPLICATION

Coatings shall be shop applied. Apply primer coating to dry surfaces not more than 4 hours after near-white blast cleaning. Apply coats so that finished surfaces are free from runs, sags, brush marks and variations in color.

Unless otherwise specified by manufacturer's recommendations, do not allow drying time between coats to exceed 72 hours. Under conditions of direct sunlight or elevated ambient temperatures of 90 degrees F or greater, limit intercoat drying period to a maximum of 24 hours.

Repair detected coating holidays, thin areas, exposed areas, and areas damaged during welding procedures prior to or during installation by surface treatment and application of additional coating or by manufacturer's recommendations. Allow a period of at least 72 hours to pass following final coat before placing in immersion service.

Apply the first coat to yield a dry film thickness of 8 to 10 mils. Apply the second coat so that the total dry film thickness of the two coats is between 16 and 20 mils. Measure using a magnetic thickness gage.

Coating shall be applied to the following steel elements to the extents described below, unless otherwise noted:

Floodwall and Floodgate Foundations

- Coat full length of steel pipe pile and sheet piles
- For steel sheet piles, both faces shall be coated.
- For steel pipe piles, only the outside exposed face shall be coated.

Esplanade Cut-off Wall

- Coat waterside face of the cut-off wall from top of wall down to 15 ft below the mudline
- Coat landside face of the cut-off wall from top of wall down to 5 ft below the bottom of concrete pile cap

Deadman

- No coating

Embayment and Esplanade Pipe Piles

- Coat from top of pile to 15 ft below the mudline

(E) FIELD TOUCH-UP

Touch-up areas of coating damage for all sheet piles and pipe piles with coal tar epoxy. Use same color as original coating. Follow manufacturer's instructions.

(F) FIELD TESTS

Conduct testing in the presence of the Engineer.

Holiday Testing

1. Prior to installation, test for holidays in total coating system.

2. Use a low-voltage holiday detector of less than 90 volts in accordance with manufacturer's recommendations.
3. After repair of holidays of surface treatment and application of additional coating or by manufacturer's recommendation, retest with low voltage holiday detector.

Dry Film Thickness

1. After repair of holidays, measure dry film thickness using a magnetic dry film thickness gage in accordance with ASTM D1186 and ASTM E376.
2. Re-measure after an additional coat is applied.
3. Continue to apply additional coats until minimum thickness requirements are met.

**559.06 MEASUREMENT AND PAYMENT.**

No separate payment will be made for complying with the requirements of this Section.

**END OF SECTION**

**SECTION ESCR-564 – STRUCTURAL STEEL****564.01 INTENT.**

This section describes structural steel for use in the esplanade cut-off wall and flood protection systems.

**564.02 DESCRIPTION.**

Structural steel, under this section, shall refer to all permanent structural steel members and hardware used in the esplanade and flood protection systems, including utility crossings.

**564.03 MATERIALS.**

- (A) Structural steel shapes and plates shall be ASTM A36, unless otherwise shown on the Contract Drawings.
- (B) Bolts, nuts and washers shall conform to the provisions of ASTM A325, A563, & F436, respectively.
- (C) Structural steel and hardware specified to be coated shall be coated in accordance with specification Section ESCR-559 – Protective Coating for Waterfront Structures.
- (D) Structural steel and hardware specified to be galvanized shall be galvanized in accordance with ASTM A123 Zinc (Hot-Dip Galvanized) Coating on Iron and Steel Products.

**564.04 SUBMITTALS**

- (A) PRODUCT DATA
  - 1. Materials list of items proposed to be provided under this Section.
  - 2. Manufacturer's specifications, recommended installation procedures and equipment and other pertinent data needed to prove compliance with the specified requirements.
  - 3. Manufacturers' catalogs indicating pull-out and shear strengths of all inserts.
- (B) SHOP DRAWINGS
  - 1. Fabrication and erection drawings, including welds. Drawings shall be executed in conformance with recommendations and requirements contained in the AISC Publication: DETAILING FOR STEEL CONSTRUCTION.
- (C) CERTIFICATES
  - 1. Submit certificate stating that all materials and procedures meet or exceed the specified requirements of this Section.
  - 2. Mill certificates certifying chemical and physical properties of all steel furnished.
- (D) REPORTS AND RECORDS
  - 1. Inspection and Test Reports
  - 2. Welding Qualification Records
  - 3. Welding Procedures

**564.05 METHODS.**

- (A) All structural steel work, including, but not limited to fabrication inspection, transportation, and erection shall be performed in accordance with the provisions of the AISC Manual of Steel Construction and Code of Standard Practice For Steel Buildings and Bridges.
- (B) **INSPECTION OF BOLTED CONNECTIONS AND WELDS.**  
The Contractor shall provide all labor and equipment necessary for the performance of inspection of bolt tightness during structural steel fabrication and erection.  
Welds shall be inspected in accordance with AWS D1.1.
- (C) **QUALIFICATION TEST FOR WELDERS, WELDING PROCEDURES AND ELECTRODE AND FLUX COMBINATIONS.**  
The Contractor shall provide tests and certifications required to qualify welders, welding procedures and electrode and flux combinations in accordance with AWS D1.1.
- (D) **RADIOGRAPHIC INSPECTION.**  
Where shown on the Contract Drawings, the Contractor shall provide radiographic inspection and of preparation for radiography, together with the cost of providing access and of furnishing adequate facilities for the review of radiographs in the shop or field.
- (E) **ULTRASONIC INSPECTION.**  
Ultrasonic inspection (UT) shall be performed on all full penetration welds in accordance with AWS D1.1. Any UT inspection work to be done on the job site will be performed by the City's designated representative. The Contractor shall perform any required preparation and furnish access to the weld joints to be inspected.
- (F) **MAGNETIC PARTICLE INSPECTION.**  
The Contractor shall provide magnetic particle inspection when specified or required by the inspector to verify limits of defects discovered during visual inspection.
- (G) **REPAIR OF DEFECTS IN WELDS AND BASE METAL.**  
The Contractor shall repair defects found by visual inspection or nondestructive tests at no additional cost to the City.
- (H) **STRAIGHTENING BENT MATERIAL AND CORRECTING CAMBER DEFICIENCIES.**  
The Contractor shall perform all corrective work required to straighten bent material and correct camber deficiencies, when permitted, at no additional cost to the City.
- (I) **FIELD REPAIR, REAMING AND DRIFTING OF HOLES.**  
Oversize reaming beyond the hole size shown on the shop drawings is not acceptable. The use of reamers to make up connections instead of drifting will not be allowed. Flame enlarging of holes will not be allowed. The Contractor shall

provide all work permitted for the correction of unacceptable holes, including the installation of larger bolts, at no additional cost to the City.

#### Repair for Galvanized Steel

Contractor shall be required to repair damaged areas of galvanized zinc coating. Damage may result from wet storage (white rust), welding or cutting (flame), or from excessive rough handling during shipping or erection. In general, only field repairs will be allowed. Shop repairs shall only be permitted when the total area of damage on any single piece is less than 2% of the coated surface or 10 000 mm, whichever is less. Any coated piece on which the total area of damage exceeds these amounts in the shop shall be rejected.

Materials for field repair shall be selected from NYSDOT's Approved List of Galvanized Repair Materials. Zinc solders shall be zinc-cadmium and zinc-tin-lead alloys supplied in stick or paste form, and that liquidize for application at temperature ranges of from 270 to 275P OPC and 230 to 260P OPC, respectively. Zinc paints shall contain not less than 65% zinc dust (by weight) in the dried paint film and shall meet current standards for the emission of volatile organic compounds. Detailed requirements for the approval of galvanized repair materials are available from the NYSDOT Materials Bureau.

Corrosion deposits shall be removed in a manner satisfactory to the Engineer prior to incorporation of the material in the work. After removal of these deposits, the coating shall have a uniform appearance free from uncoated spots, lumps, blisters, gritty areas, acid, flux and black spots. Materials with these defects will be rejected and shall be immediately removed from the worksite. Acceptable material shall be provided to replace rejected material at no additional expense.

Damaged areas of loose and deteriorated galvanized zinc coating shall be cleaned by power sanding, power grinding, or abrasive blast cleaning to bright metal. If zinc solder is used for repairs the cleaned area shall be preheated in accordance with the manufacturer's instructions for use. The heated surface shall then be rubbed with a repair stick to evenly distribute a layer of zinc alloy, or if zinc paste is used it shall be spread evenly using a spatula or similar tool. Zinc solder shall be deposited in a uniform layer at a minimum dry film thickness of 75 µm. If zinc paint is used for repairs it shall be applied in accordance with the manufacturer's instructions for use, using a brush or by spray methods. Zinc paint shall be applied in such quantity as to produce a minimum dry film thickness of 75 µm.

#### (J) FIELD SPLICES.

Field splice locations and details are shown in the Contract Drawings. If the Contractor wishes to change the location of the splice(s), the Contractor shall submit a request to the Engineer for approval.

#### **564.06 MEASUREMENT.**

The quantity of structural steel to be measured for payment shall be the weight of steel, measured to the nearest pound, installed to the satisfaction of the Engineer. Steel density used to compute the weight of steel for payment shall be 490 lbs/cubic feet.

The weight of steel as shown on the approved shop drawings, shall include permanent bolts and welds in the structure as erected. The weight of all required bolts, nuts, washers, and all required welds will be estimated by adding 3% to the steel weight estimate, making no allowance for waste, and included in the weight for which payment will be made.

The weight of all erection materials including but not limited to bolts, pilot and driving nuts, temporary protective coatings, and all boxes, crates or other containers used for packing, together with sills, struts, and rods used for supporting members during transportation, will be excluded from the measurement for payment.

**564.07 PRICE TO COVER.**

The contract unit price for structural steel shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish, and install in full compliance with the requirements of the specifications and drawings.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-564	STRUCTURAL STEEL (UNCOATED)	LBS.
ESCR-564.CT	STRUCTURAL STEEL (COATED)	LBS.
ESCR-564.G	STRUCTURAL STEEL (GALVANIZED)	LBS.

**END OF SECTION**

## SECTION ESCR-567 – ESPLANADE JOINT SYSTEM

### 567.01 INTENT.

This section describes the joint system used on the esplanade structure.

### 567.02 DESCRIPTION.

The work shall consist of fabricating, furnishing, and installing a joint system at the locations indicated on the Contract Drawings.

### 567.03 MATERIALS.

- (A) Structural steel angles and plates shall be ASTM A36.
- (B) Steel bolts, nuts, and washers shall be ASTM A325.
- (C) Structural shapes and plates shall be galvanized in accordance with ASTM A123.
- (D) Steel hardware shall be galvanized in accordance with ASTM A153.
- (E) Concrete headers as indicated in the Contract Drawings shall be in full compliance with the requirements in Section ESCR-4.06 and paid under Item No. ESCR-4.06 HP ES.

### 567.04 SUBMITTALS.

- (A) Shop Drawings

Drawings for the joint system shall show complete member dimensions and details, installation sequence, and location of installed joint.

### 567.05 METHODS.

Joints shall be installed as shown on the Contract Drawings.

### 567.06 MEASUREMENT.

The quantity of joints to be measured for payment shall be the number of linear feet, measured to the nearest tenth a foot (edge to edge of the joint as shown on the plans) furnished and installed in accordance with the plans and specifications, and to the satisfaction of the Engineer. No payment or allowance will be made for joints placed beyond the limits specified or for the concrete that the joint will be embedded in.

### 567.07 PRICE TO COVER.

The contract unit price shall cover the cost of all labor, materials, plant, equipment, insurance, samples, and incidentals required to furnish and install the joint, in full compliance with the requirements of the specifications, to furnish such samples for testing and to provide such testing equipment, laboratory space and facilities as may be required. Damaged joints shall be satisfactorily repaired or replaced by the Contractor at no cost to the City.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-567.LG	LONGITUDINAL EXPANSION JOINT BETWEEN THE ESPLANADE AND CUT-OFF WALL	L.F.
ESCR-567.PC	TRANSVERSE EXPANSION JOINT AT PILE CAPS BETWEEN THE ESPLANADE SPANS	L.F.

**END OF SECTION**

## SECTION ESCR-9230 – SLEEVING AND SEALING FOR ELECTRICAL CONDUITS

### 9230.1 DESCRIPTION.

This section describes the furnishing, delivering and installing of conduit-to-wall and utility crossing penetration seals including PVC sleeves and anchor/water stop plates for electrical conduits.

### 9230.2 MATERIALS.

All conduit-to-wall and utility crossing penetration seals including PVC sleeves and anchor/water stop plates shall be in accordance with Con Ed Drawing EO-9230-15 titled "Sleeve Details and Method of Sealing H.P. Cable Pipe".

### 9230.3 CONSTRUCTION METHODS.

All conduit-to-wall and utility crossing penetration seals including PVC sleeves and anchor/water stop plates shall be installed in accordance with Con Ed Drawing EO-9230-15 titled "Sleeve Details and Method of Sealing H.P. Cable Pipe".

### 9230.4 MEASUREMENT.

The quantity of conduit-to-wall and utility crossing penetration seals including PVC sleeves and anchor/water stop plates measured for payment shall be the number of each size conduit-to-wall or utility crossing penetration seal including PVC sleeve and anchor/water stop plate furnished, delivered and installed by the Contractor.

### 9230.5 PAYMENT.

The contract price for sleeves and sealing of electrical conduits shall be the unit price bid per each conduit-to-wall or utility crossing penetration seal including PVC sleeve and anchor/water stop plate furnished, delivered and installed. The unit cost shall cover the cost of all labor, equipment, materials, plant, samples, tests and insurance required and necessary to furnish, deliver and install the penetration seals including PVC sleeves and anchor/water stop plates in the manner specified herein and as directed by the Engineer.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-9230	FURNISHING, DELIVERING AND INSTALLING CON-ED PIPE TO WALL PENETRATION SEAL, INCLUDING SLEEVE AND ANCHOR/WATER STOP PLATE	EACH

**END OF SECTION**

## SECTION HW-914 – ALLOWANCE FOR (WAYFINDING) TOTEMS

### HW-914.1. DESCRIPTION.

Under this item, the Contractor shall be required to pay to the New York City Department of Transportation (NYCDOT) TOTEM sign Contractor for furnishing and installing new (WAYFINDING) TOTEMS.

### HW-914.2. MATERIALS.

(Not applicable)

### HW-914.3. CONSTRUCTION DETAILS.

The NYCDOT TOTEMS sign Contractor shall only install (WAYFINDING) TOTEMS signs once the foundation including paving tray and steel foundation plate has been installed by the Contractor. The Contractor shall pick up, deliver to the project site and install the paving tray and steel foundation plate in accordance with plans, specifications and as directed by the Engineer. All costs for pick up, deliver to the project site and installation of the paving tray and steel foundation plate shall be deemed to be included in all scheduled items for foundation work pertinent to (Wayfinding) TOTEMS signs.

### HW-914.4. METHOD OF MEASUREMENT.

The fixed price lump sum shown in the Bid Schedule for this item shall be included in the total bid price; however, actual payment to the Contractor will be based on the actual invoices submitted by the NYCDOT TOTEM sign Contractor.

It is agreed that all work shall be based on the actual number of (Wayfinding) TOTEM SIGNS that are installed by the NYCDOT TOTEM sign contractor to the satisfaction of the Engineer.

### HW-914.5. BASIS OF PAYMENT.

The fixed sum shown in the proposal for the (Wayfinding) TOTEMS sign shall be considered the price bid for this item. The fixed sum is not to be altered in any manner by the bidder. Should the amount shown be altered, the new figures will be disregarded and the original price will be used to determine the total amount bid for the contract.

The fixed sum payment made under this item shall be equal to the sum of all invoices submitted by the NYCDOT TOTEM sign Contractor as proof of work performed for this item, as approved by the Engineer.

The total estimated cost of this item is the "fixed sum" amount shown for this item in the Bid Schedule and shall not be varied in the bid. The "fixed sum" amount is included in the bid solely to ensure that sufficient monies will be available to pay the Contractor for this work, which may be more or less than the fixed sum amount.

The unit price shall cover the cost of all labor, materials, equipment, insurance, and incidentals necessary to complete the work under this section in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

Payment will be made under:

Item No.	Item	Pay Unit
HW-914	ALLOWANCE FOR (WAYFINDING) TOTEMS	F.S.

**SECTION 8.52 FP – STEEL FOUNDATION PLATE**  
**(NOT A PAY ITEM)**

**8.52FP.1. INTENT.** This section describes the furnishing and installation of the Foundation Plate.

**8.52FP.2. DESCRIPTION.** The Steel Foundation Plate shall be embedded in the poured concrete footing to the nominal dimensions as indicated on the contract drawings and specifications.

**8.52FP.3. MATERIAL.** Steel Foundation Plates shall comply with the requirements of the NYC Department of Transportation (DOT) Standard Highway Specifications **Section 2.35, Structural Steel** and shall be galvanized in accordance with **Section 2.34.**

**8.52FP.4. SUBMITTALS.** Shop drawings of each steel plate showing bolt locations shall be provided by the Contractor in accordance with the requirements of **Section 1.06.13** of the NYC DOT Standard Highway Specifications, for review and approval prior to fabrication.

**8.52FP.5. NOT USED.**

**8.52FP.6. MEASUREMENT.** Payment will be based on the computed weight of metal as shown on the approved shop drawings, and shall include, but not be limited to, permanent bolts and welds in the structure as erected.

Not to be included in the measurement is the weight of all erection materials including but not limited to bolts, pilot and driving nuts, temporary protective coatings, and all boxes, crates or other containers used for packing, together with sills, struts, and rods used for supporting members during transportation.

The weight of all required bolt heads, nuts and washers will be estimated, making no allowance for waste, and included in the weight for which payment will be made. The mass of all required welds will be estimated and included in the mass for which payment will be made.

**8.52FP.7. BASIS OF PAYMENT.** No additional payment will be made for compliance with the provisions of this section.

**SECTION 8.52 PT – PAVING TRAY  
(NOT A PAY ITEM)**

**8.52PT.1. INTENT.** This section describes the furnishing of the ground level paving tray.

**8.52PT.2. DESCRIPTION.** Fabricated steel plate frame, angle and flat textured cover plate assembly, configured and to nominal dimensions as indicated on the contract drawings and specifications.

**8.52PT.3. SUBMITTALS.** All submittals shall be provided by the Contractor in accordance with the requirements of the NYC Department of Transportation's Standard Highway Specifications, General Conditions, **Section 1.06.13**.

- (A) Shop Drawings: Erection and fabrication drawings for all totem components and accessories. Show plans and elevations at not less than 1/4 inch to 1'-0" scale, and details at not less than 1-1/2 inch to 1'-0" scale.
- (B) Product Data: Manufacturer's printed specifications and installation instructions for each type of metal framing and accessory, including data required to show compliance with the Drawings and Specifications.

**8.52PT.4. MATERIALS.**

- (A) Steel plate & Side Brackets:
  - a. Material & Finish: Grade 304 Stainless Steel, Mill finish.
  - b. Thickness: 1/4"
  - c. Side Brackets" As required, to be agreed with the Engineer prior to fabrication
    - 1. Edges: All edges to be polished and rounded off
    - 2. Joints: Plate sections to be butt jointed
    - 3. Installed level: To be aligned flush with poured concrete sidewalk
- (B) Cover Plate:
  - a. Material & Finish: Grade 304 Stainless Steel, Textured 'Durbar' plate.
  - b. Thickness: 1/4"
  - c. Edges: All edges to be polished and rounded off
  - d. Finished installed level: To be aligned flush with poured concrete sidewalk
  - e. Mounting Screws:
    - 1. Exposed to sidewalk: To be stainless steel with tamper proof torx' head or approved equivalent
    - 2. Beneath Sidewalk: To be stainless steel socket head
- (C) Temporary Cover Plate Mounting Brackets:
  - a. Material & Finish: Grade 304 Stainless Steel with mill finish.
  - b. Nominal Thickness: As required by Contractor to safely support imposed sidewalk live loads.
  - c. Bolt Fixings: To be stainless steel, sized and configured to support imposed sidewalk live loads.

**8.52PT.5. METHOD.**

- (A) Fabrication:
  - a. Plates cut and seam welded directly to each other
  - b. Side brackets spot welded directly to plates.
  - c. Provide all necessary Jigs for placement of paving trays relative to Totem foundation plates, provided a minimum of 6 jigs per Totem type.

**8.52PT.6. MEASUREMENT.** The quantity to be measured for payment shall be the number of new paving trays, of each size and type listed below, actually installed to the satisfaction of the Engineer.

Type	Item	Length	Width
A	Paving Tray (Pathway Totem)	1'-7 ¼"	8 ½"
B	Paving Tray (Area Totem)	2-11 ¼"	8 ½"
C	Paving Tray (Neighborhood Totem)	4'-3 ¼"	8 ½"

**8.52PT.7. BASIS OF PAYMENT.** No additional payment will be made for compliance with the provisions of this section.

## SECTION 8.52 WSF – WAYFINDING SIGN FOOTING

### 8.52 WSF.1. INTENT.

Under this section, the Contractor must furnish concrete footing for the wayfinding sign and all necessary incidentals in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

### 8.52 WSF.2 MATERIALS.

(A) Saw cut must be done in accordance with **Section 6.55** and price must be deemed included in the price of this item.

(B) Excavation must be done in accordance with **Section 6.02** and its **Item No. 6.02 AAN** and price must be deemed included in the price of this item. Special care excavation must be done in accordance with **Section 8.02** and **Item No. 8.02 A** and must be paid accordingly under its respective pay item number in the BID SCHEDULE.

(C) Concrete must meet with the requirements of **Section 3.05, Concrete**, and be of the class, type and mixing specified and will be done in accordance with **Section 4.06**; price must be deemed included in the price of this item. Subbase material must be of the type, grade, size number and nominal size specified and must be done in accordance with **Section 6.67**; Type MATERIAL B, price must be deemed included in the price for this for this item.

(D) Concrete reinforcement must comply with the requirements of the following sections:

Steel Bars--**Section 2.23**. Kind of reinforcement, size and placement must be as specified and as shown on Contract Drawings. Reinforcement must be installed in accordance with the requirements of **Section 4.14** and price is deemed included in the price of this item.

(E) Joint Sealer and pre-molded joint filler as shown on Contract Drawings must comply with the requirements of **Section 2.22** and **Section 2.15** respectively type as specified and price is deemed included in the price of this item.

(F) Anchor Bolt ASTM A240, Grade 304, ½" dia., to be drilled and installed with epoxy filler as shown on Contract Drawings or as directed by the Engineer.

(G) Galvanized Steel Footing Plate to be installed as per Contract Drawings and **Section 8.52 FP**, cost of installation is deemed included in the price of this item. Furnishing of this plate must be made under **Section 8.52**.

Paving tray and temporary cover plate to be installed as per drawing and **Section 8.52 PT**, cost of installation is deemed included in the price of this item. Furnishing paving tray and temporary cover plate must be made under **Section 8.52**.

Galvanized rigid metal conduit, where required, must be in accordance with Chapter 5 of NYCDOT Specifications for the installation of conduit, duct and bends (November 2013) or HDPE pipe, schedule 40, in accordance with **Subsection C5.2.1**, page 63 of NYCDOT specifications for traffic signals and its systems (November 2013); as directed by the Engineer and as shown in the drawings.

Plastic Filter fabric must be done in accordance with **Section 6.68** and price must be deemed included in the price of this item.

### 8.52 WSF.3. DESIGN AND CONSTRUCTION OF FORMS

Forms must accurately conform to the shape, lines and dimensions of the footing for which they are required, be substantial and sufficiently tight to prevent leakage of mortar, and have,

unless otherwise specified by the Engineer, moldings or chamfer strips at angles. They must be of adequate strength and be braced or tied together with approved ties and spacers, to maintain position and shape, and to insure the safety of workmen and passersby, be clean and free from sawdust, chips, dirt, ice and other objectionable materials. Forms must present smooth, true surfaces to the concrete placed against them, having temporary openings where necessary, to facilitate cleaning and inspection immediately before concrete is deposited. Forms must be coated with non-staining oil before the reinforcement is placed, or be wetted except in freezing weather.

#### **8.52 WSF.4. MEASUREMENT.**

The quantity measured for payment shall be the number of footings of type specified, installed in accordance with the Contract Drawings, the specifications and to the satisfaction of the Engineer.

#### **8.52 WSF.5 BASIS OF PAYMENT.**

The contract price for each wayfinding sign footing of the type specified must cover the cost of labor, materials, equipment, insurance, and incidentals required to construct respective wayfinding footings, including but not limited to, the furnishing and incorporation of all concrete; reinforcement; curing; finishing; samples; testing equipment and facilities for testing; all, in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

The cost of all items referenced in this Section, with the exception of Items 4.13 AAS and 8.02 A, must be deemed included in the contract price of wayfinding sign footings of type specified.

*Payment will be made under:*

Item No.	Item	Pay Unit
8.52 WSF-A	WAYFINDING SIGN FOOTING TYPE A	EACH
8.52 WSF-B	WAYFINDING SIGN FOOTING TYPE B	EACH
8.52 WSF-C	WAYFINDING SIGN FOOTING TYPE C	EACH
8.52 WSF-D	WAYFINDING SIGN FOOTING TYPE D	EACH

**SECTION 7.07 B - FURNISH AND INSTALL NEW STEEL BOLLARDS**

**DESCRIPTION:** Under this section, the Contractor shall furnish all labor, material, plant, equipment, and incidentals necessary to furnish and install bollards in accordance with the plans, the specifications, and the directions of the Engineer.

**MATERIAL:** Steel pipe for bollards shall be 6" nominal in diameter having a 0.188" wall thickness, 66" long and shall comply with the requirements of ASTM designation A120 for hot-dipped galvanized steel pipe, except that the pipes shall be untested for water pressure. Prior to galvanizing, welded seams shall be ground smooth or otherwise dressed and not readily readable on casual inspection or otherwise objectionable to the Engineer.

Concrete for foundation and fill shall be Class B-32, Type IIA; cement - Type II Portland; sand - Type IA; coarse aggregate Type 1, Grade B, or Type 2, Size No. 57; and an approved air-entraining agent shall be added at the time that concrete is mixed. Concrete, cement and aggregate shall comply with the requirements of Section 3.05 of the Standard Highway Specifications.

Primer coat for galvanized surfaces shall be zinc dust-zinc oxide, conforming to Federal Specifications TT-P 641G.

Finish coat above grade for bollards shall be safety yellow in color and shall conform to Federal Specification TT-P-37C.

All other materials shall be as approved by the Engineer.

**METHODS:** Bollards shall be shop fabricated from hot-dipped galvanized steel pipes. After bollards have been fabricated, painted and filled with concrete, they shall be set in-place in a concrete collar at the locations shown on the plans.

After fabrication, all exterior metal surfaces of the bollards shall be shop painted. Prior to painting, the galvanized bollards shall be thoroughly cleaned with a solvent such as mineral spirits or turpentine, to remove all dirt, grease and foreign matter, and then pre-treated with a "wash-coat". The "wash-coat" shall be of a type conforming to the requirements of Military Specification MIL-P-15328b or c, or an approved equal standard. Pre-treatment may be applied by any method, as approved by the Engineer. After the pre-treatment has dried, the bollards shall be prime painted and then finished painted as follows:

Above grade the bollards shall be painted with two shop coats of finish paint.

Below grade the bollards and foundation sleeve shall be coated with a black asphalt paint as approved by the Engineer.

Handling, shipping and erecting of painted steel bollards shall not be performed until coatings are thoroughly dry. Special care shall be exercised to avoid abrasion, staining, or other damage to the painted surface.

Stacking and storing of painted bollards in the shop, in transit, and at the job site shall be done using softeners and timbers to keep individual members free from contact with the ground and with each other. Also, bollards shall be protected from soiling by adjacent fabrication or construction operations.

The Contractor shall excavate required depth necessary to install the bollard in a 18" diameter, 36" deep concrete collar. Steel pipe shall be shimmed and leveled as necessary and set 30" within the concrete collar such that when bollards are set in-place they will be vertical, in plumb, and at equal elevations in their final position. Concrete collars shall be finished to match the

proposed new adjacent surface with a 1" wash. Then backfill around concrete collars to the subgrade of proposed sidewalk. Steel pipe shall be filled with concrete and a rounded concrete dome on top of the pipe, approximately 2" above the pipe, shall be formed.

New sidewalk around bollards shall be furnished and placed under the appropriate sidewalk item.

Touchup after erection shall consist of smoothing all abraded areas and building back each coat damaged to achieve the initial condition. Surface areas that have been abraded to bare metal shall be cleaned and then painted in proper recoating intervals.

**SHOP DRAWINGS:** Shop drawings shall be submitted by the Contractor to the Engineer for approval prior to fabrication and installation.

**MEASUREMENT:** The quantity to be measured for payment shall be the number of bollards actually installed to the satisfaction of the Engineer.

**PRICE TO COVER:** The contract price bid per each steel bollard furnished and installed shall cover the cost of all labor, material, plant, equipment, and incidentals necessary to complete the work including, but not limited to, fabrication, painting of bollards, sand and concrete fill and collars, all excavation and backfilling, and shop drawings, all in accordance with the plans, the specifications, and the directions of the Engineer.

*Payment will be made under:*

Item No.	Description	Pay Unit
7.07 B	FURNISH AND INSTALL NEW STEEL BOLLARDS	EACH

## **SPECIAL FLOODGATE SPECIFICATIONS**

---

### **CONTRACT SANDRESM1**

The specifications in the FLOODGATE-Pages cover the procurement, fabrication, and construction of the roller gates and swing gates, including all foundations, concrete work and metal fabrication and associated works as well as the quick-change moveable concrete barrier.

The FLOODGATE-Pages supplement the specifications shown on the Specifications and Standards of New York City sheet at the beginning of this Volume 3, which apply to the work except as modified in these Contract Documents.

## SECTION ESCR 50 – FABRICATED STEEL FLOODGATES

### 50.1 INTENT.

This specification covers the requirements for furnishing all plant, equipment, labor, and materials for fabricating, assembling, delivering, and installing closure gates in accordance with these specifications and applicable drawings.

### 50.2 DESCRIPTION.

#### 50.2.1 SWING GATE

This type of closure gate for flood protection constitutes a fabricated metal panel which sits on a concrete slab mounted hinge on one end and is connected with a hinge at the top on the same end. The other cantilevered end is free to move as the gates pivot around the axis through the hinges. During non-flood condition, the gate is usually kept swung open. The free end of the gate is usually supported with a hydraulic jack and is latched to a storage monolith (wall), usually featuring a vertical concrete column. At the wake of the flood, the hydraulic jack or screw is taken off; the gate is swung closed and is latched with the gate monolith, preventing any movement. The gate is pressed against the monolith. This causes a continuous rubber seal, running along two vertical edges and also horizontally along the bottom of the gate, to be engaged producing a watertight seal that blocks any water intrusion through the gate.

#### 50.2.2 ROLLER GATE

Roller type flood gate consists of a fabricated metal panel that sits on two rows of wheels running on tracks. The gate is pushed on one side during normal operating conditions opening up the monolith for access. In the wake of a flooding event, the roller gate panel is pushed towards the opening using winches. Once in place, the gate panel is latched to the concrete column on either end. A continuously running rubber seal, located on two vertical edges and along the horizontal bottom part of the gate, is pressed on the concrete monolith forming a watertight barrier.

### **50.4 MATERIALS.**

#### 50.4.1 METALS

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum alloy, and other metal materials used for fabrication shall conform to the requirements shown and specified herein.

#### 50.4.1 STRUCTURAL STEEL

Structural steel shapes shall conform to ASTM A572/A572M, Grade 50. Structural steel plates shall conform to ASTM A36/A36M.

#### 50.4.2 SELF-LUBRICATING BEARINGS

Self-lubricating bearings shall conform to ASTM B823, Type II. The bearings shall be impregnated with a turbine grade lubricant containing oxidation and rust inhibitors and a polar anti-wear additive.

#### 50.4.3 BRONZE CASTINGS

Bronze castings shall conform to ASTM B22/B22M, Copper Alloy UNS No. C91300.

#### 50.4.4 STAINLESS STEEL PLATE, SHEET, STRIP, BAR AND SHAPE

Stainless steel plate, sheet, and strip shall conform to ASTM A240/A240M, UNS S 30400. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

Stainless Steel Bar and Shape shall conform to ASTM A564 TYPE 630 Condition H100, and ASTM A276/A276M as shown in the drawings.

#### 50.4.5 RUBBER SEALS

Rubber seals shall be fluorocarbon (Teflon) clad rubber seals of the mold type only and shall be compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

Physical Test	Test Value	Test Method Specification
Tensile Strength	2500 psi (min.)	ASTM D412
Elongation at Break	450 percent (min.)	ASTM D412
300 percent Modulus	900 psi (min.)	ASTM D412
Durometer Hardness (Shore Type A)	60 to 70	ASTM D2240
Water Absorption	5 percent by weight (max.)	ASTM D471
Compression Set	30 percent (max.)	ASTM D395
Tensile Strength (after aging 48 hrs.)	80 percent of tensile strength (min.)	ASTM D572

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 plus or minus 1/4 hours. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M1 (M1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree C and the duration of immersion shall be 166 hours.

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be 0.060 inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following minimum physical properties:

Tensile strength	2,000 psi
Elongation	250 percent

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

#### 50.4.6 BOLTS, NUTS AND WASHERS

All bolts shall be high-strength bolts unless noted otherwise on the Drawings. High-strength bolts, nuts, and washers shall conform to ASTM A325, Type 1, hot-dip galvanized or ASTM A490, Type 1. Bolts 1/2 inch and larger shall have heavy hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts. Nuts shall be ASTM A563, type to match bolt type and finish. Hardened steel flat and beveled washers shall be ASTM F436, type to match bolt finish.

#### 50.4.7 SCREWS

Screws shall be of the type indicated.

#### 50.4.8 SHACKLES AND TURNBUCKLES

Shackles and turnbuckles shall be of forged steel conforming to ASTM A668/A668M, zinc coated. Turnbuckles shall be end-threaded right and left hand and shall be of the size shown.

#### 50.4.9 SCREW JACKS

Screw jacks shall have a 30,000 lb rated capacity and shall conform to the details shown.

#### 50.4.10 WINCHES

Winches shall be 15,000 lb marine winches with 4.0-inch drum as specified in plans. Each winch shall be equipped with 75 foot of 1/2 inch diameter wire cable suitable for exterior exposure.

#### 50.4.11 RAILS

Rail segments shall conform to 100 lb American Railway Engineering Association (A.R.E.A) rails.

#### 50.4.12 WIRE ROPES

Wire rope shall conform to FS RR-W-410, Type III, Class 1, Construction 6 by 6 desk lashing ropes, improved plow steel, fiber core, as shown.

#### 50.4.13 WHEELS

Wheels shall be short hub or long hub, rigid type, heavy duty steel casters fabricated from steel castings conforming to ASTM A148/A148M. Wheel shall be of the size and load capacity shown and shall be provided with lubrication fittings, roller bearings and removable axle. Wheel treads shall be machined-finished to conform with the indicated rail. Unless otherwise specified or shown, axles for wheels shall be of stainless-steel bars conforming to ASTM A276/A276M, UNS S30400.

#### 50.4.14 PADLOCKS AND HASPS

Padlocks shall conform to CID A-A-59486C, Type II. Padlocks shall be keyed alike and provided with two keys. Hasps shall be of wrought steel and sized to accommodate padlocks.

#### 50.4.15 ELASTOMERIC BEARING PADS

Elastomeric bearing pads shall conform to the requirements of NYSDOT Specification Section 716-11, Steel Laminated Elastomeric Bridge Bearings.

### 50.5 METHODS.

#### 50.5.1 QUALITY ASSURANCE

- (a) Qualification of welders and welding operators – Prior to welding, submit certification for each welder stating the type of welding and positions qualified for, the code and procedure qualified under, date qualified, and the firm and individual certifying the qualification tests. If the qualification date of the welder or welding operator is more than 6 months old, accompany the welding operator's qualification certificate with a current certificate by the welder attesting to the fact that the welder has been engaged in welding since the date

of certification, with no break in welding service greater than 6 months. Conform to all requirements specified in AWS D1.1/D1.1M or BPVC SEC IX.

#### 50.5.2 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items conforming to the requirements specified herein. Unload materials and equipment delivered to the site in the presence of the Engineer. Verify the condition and quantity of the items delivered by the Engineer and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify the Engineer of such in writing within 24 hours after delivery.

- (a) Rubber Seals – Store rubber seals in a place which permits free circulation of air, maintains a temperature of 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

#### 50.5.3 SEQUENCING AND SCHEDULING

Submit a sequencing and scheduling plan, approved before the work is commenced, which illustrates that work affecting roadways has been coordinated with New York State DOT and New York City DOT. Include in the plan schedules, lists of labor or materials to be provided the affected agency, and any other aspects of the work that may impact on the operations of these entities as specified in the Contract requirements. The protection plan shall clearly demonstrate how all public or private roads, streets, or highways will be kept open to traffic at all times during the construction period, except as required to complete the Work and as shown on the NYCDOT OCMC traffic stipulations. The sequencing and scheduling plan must comply with all other Contract requirements such as warning signs, flagmen, permits, and debris removal.

#### 50.5.4 FABRICATION

- (a) Detail Drawings – Prior to performing any fabrication submit detailed shop drawings to the Engineer for approval. Submit detail drawings for metalwork and machine work, prior to fabrication, include within the detail drawings catalog cuts, templates, fabrication and assembly details and type, grade and class of material as appropriate. All temporary and tack welds shall be identified on the shop drawings. Each member shall be identified following the numbering scheme shown on the drawings. A table shall be provided containing a list of all members and a reference to each material certificate and test report that applies to that member. Shop drawings shall identify weld procedures and NDT required for each weld. Any and all splices shall be included in the shop drawings and clouded for approval. Indicate methods of protecting the work during shipping, storage, field assembly, and installation. Submit detail drawings of closure gates and appurtenant items, including fabrication drawings, etched pattern layout drawings, shop assembly drawings, delivery drawings, and field installation drawings.
  - (1) Fabrication Drawings – Fabrication drawings shall show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.
  - (2) Etched Pattern Layout Drawings – Layout drawings shall show complete layout of etched pattern and graphics. Drawings to include etching profile and dimensions. Layouts to be coordinated with skin

plate sizes and pattern offsets at seams, welds, latches, seals, and related elements as shown on the drawings.

- (3) Shop Assembly Drawings – Shop assembly drawings shall provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.
  - (4) Delivery Drawings – Delivery drawings shall provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.
  - (5) Field Installation Drawings – Field installation drawings shall provide a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; and methods for installing other appurtenant items.
- (b) Structural Fabrication – Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown. Splices shall occur only where shown. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation.

Material must be straight before being laid off or worked. Perform straightening, if necessary, by methods that will not impair the metal. Sharp kinks or bends are cause for rejection of the material. Material with welds will not be accepted except where welding is definitely specified, indicated or otherwise approved. Make bends using approved dies, press brakes or bending rolls. Where heating is required, take precautions to avoid overheating the metal and allow it to cool in a manner that will not impair the original properties of the metal. Proposed flame cutting of material is subject to approval and must be indicated on detail drawings. Shearing must be accurate, and all portions of the work neatly finished. Make corners square and true unless otherwise shown. Fillet re-entrant cuts to a minimum radius of 3/4 inch unless otherwise approved. Provide finished members free of twists, bends and open joints. Tighten bolts, nuts and screws.

- (1) Dimensional Tolerances for Structural Work – Measure dimensions using an approved calibrated steel tape of approximately the same temperature as the material being measured. The overall dimensions of an assembled structural unit must be within the tolerances indicated on the drawings or as specified in the particular section of these specifications for the item of work. Where tolerances are not specified in other sections of these specifications

or shown, an allowable variation of 1/32 inch is permissible in the overall length of component members with both ends milled; component members without milled ends must not deviate from the dimensions shown by more than 1/16 inch for members 30 feet or less in length, and by more than 1/8 inch for members over 30 feet in length.

- (2) Structural Steel Fabrication – Structural steel may be cut by mechanically guided or hand-guided torches when approved by the Engineer, provided an accurate profile with a surface that is smooth and free from cracks and notches is obtained. Prepare surfaces and edges in accordance with AWS D1.1/D1.1M,
  - (3) Prequalification of WPSs Clause - Where structural steel is not to be welded, chipping or grinding will not be required except as necessary to remove slag and sharp edges of mechanically guided or hand-guided cuts not exposed to view. Chip, grind or machine to sound metal hand-guided cuts which are to be exposed or visible.
- (c) Welding – Welds shall be in accordance with AWS D1.1/D1.1M, and of the type shown and approved detail drawings. Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.
- (1) Welding Procedures for Structural Steel – Use prequalified welding procedures for structural steel as described in AWS D1.1/D1.1M, Prequalification of WPSs Clause or qualify by tests as prescribed in AWS D1.1/D1.1M, Qualification Clause. For welding procedures qualified by tests, the coupon welding and specimen testing will be witnessed and the test report document signed by the Engineer. Approval of any welding procedure does not relieve the Contractor of the responsibility for producing a finished structure meeting all requirements of these specifications. The Contractor will be directed or authorized to make any changes in previously approved welding procedures that are deemed necessary or desirable by the Engineer. Submit a complete schedule of welding procedures for each steel structure to be welded prior to commencing fabrication. Provide the schedule in conformance with the requirements specified in the provisions of AWS D1.1/D1.1M. Provide within the schedule detailed procedure specifications and tables or diagrams showing the procedures to be used for each required joint. Include in the welding procedures filler metal, preheat, interpass temperature and stress-relief heat treatment requirements. Clearly identify each welding procedure as being prequalified or required to be qualified by tests. Show types and locations of welds designated or in the specifications to receive nondestructive testing in the welding procedures.
  - (2) Welding Process – Perform welding of structural steel by an electric arc welding process using a method which conforms to the applicable provisions of AWS D1.1/D1.1M. Minimize residual stresses, distortion and shrinkage from welding.

- (3) Filler Metal – Provide the electrode, electrode-flux combination and grade of filler metal conforming to the appropriate AWS specification for the base metal and welding process being used or be as shown where a specific choice of AWS specification allowable is required. Submit filler metal product data. Include the AWS designation of the electrodes to be used in the schedule of welding procedures. Use only low hydrogen electrodes for manual shielded metal-arc welding regardless of the thickness of the steel. Use a controlled temperature storage oven at the job site as prescribed by AWS D1.1/D1.1M, Fabrication Clause No 5 to maintain low moisture of low hydrogen electrodes.
- (4) Preheat and Interpass Temperature – Perform preheating as required by AWS D1.1/D1.1M, Fabrication Clause or as otherwise specified except that the temperature of the base metal must be at least 70 degrees F. Slowly and uniformly preheat the joint area by approved means to the prescribed temperature, held at that temperature until the welding is completed and then permitted to cool slowly in still air.
- (5) Stress-Relief Heat Treatment – Where stress relief heat treatment is specified or shown, perform in accordance with the requirements of AWS D1.1/D1.1M, Fabrication Clause unless otherwise authorized or directed.
- (6) Workmanship – Perform welding workmanship in accordance with AWS D1.1/D1.1M, Fabrication Clause and other applicable requirements of these specifications.
- (7) Preparation of Base Metal – Prior to welding inspect surfaces to be welded to ensure compliance with AWS D1.1/D1.1M, Fabrication Clause.
- (8) Temporary Welds – Make temporary welds, required for fabrication and erection, under the controlled conditions prescribed for permanent work. Make temporary welds using low-hydrogen welding electrodes and by welders qualified for permanent work as specified in these specifications. Conduct preheating for temporary welds as required by AWS D1.1/D1.1M for permanent welds except that the minimum temperature must be 120 degrees F in any case. In making temporary welds, do not strike arcs in other than weld locations. Remove each temporary weld and grind flush with adjacent surfaces after serving its purpose.
- (9) Tack Welds – Tack welds that are to be incorporated into the permanent work are to exhibit the same quality requirements as the permanent welds; clean and thoroughly fuse them with permanent welds. Perform preheating as specified above for temporary welds. Provide cascaded ends on multiple-pass tack welds. Remove defective tack welds before permanent welding.
- (10) Weld Access Holes. Weld access holes (corner copes to prevent intersecting welds) shall be provided as shown on the shop drawings. If intersecting out-of-plane welds is encountered, the

fabricator shall notify the Engineer for the approval of additional weld access hole additions in such locations. Payment for the addition of weld access holes not shown on plans will be the Contractor's responsibility. Unless shown on the drawings, welds will be required to wrap the ends of weld access holes.

- (11) Weld Backing Removal. Unless otherwise indicated, all weld backing material shall be removed from welded joints prior to testing. All weld backing material that cannot be removed shall be identified on the shop drawings.
- (12) Weld Backing Material Other Than Steel. All weld backing material, other than steel, shall be qualified by testing and shall be included in submitted PQR/WPS. Variation from approved weld backing material will not be permitted and will require the development and testing a new weld procedure which addresses the change in backing material.
- (13) Welding of Steel Studs – Welding of steel studs must conform to the requirements of AWS D1.1/D1.1M, Stud Welding Clause, except as otherwise specified for the procedures for welding steel studs to structural steel, including mechanical, workmanship, technique, stud application qualification, production quality control and fabrication and verification inspection procedures.
- (14) Application Qualification for Steel Studs – As a condition of approval of the stud application process, submit certified test reports and certification that the studs conform to the requirements of AWS D1.1/D1.1M, Stud Welding Clause, certified results of the stud manufacturer's stud base qualification test, and certified results of the stud application qualification test as required by AWS D1.1/D1.1M, Stud Welding Clause, prior to commencing fabrication, except as otherwise specified.
- (15) Production Control – Production control of stud welding must conform to the requirements of AWS D1.1/D1.1M, Stud Welding Clause, except as otherwise specified for quality control for production welding of studs. Weld studs on which pre-production testing is to be performed must be in the same general position as required on production studs (flat, vertical, overhead or sloping). If the reduction of the length of studs becomes less than normal as they are welded, stop welding immediately and do not resume until the cause has been corrected.
- (16) Weldments – Portions of the structure include thick weldments where locked in thermal stresses may make final dimensions unstable. The Contractor is required to sequence the work and thermally stress relieve subassemblies of thick weldments such that final machining achieves stable specified dimensions and tolerances.
- (17) Seal Welds – Seal welds are required as shown to maintain water tightness of weld joints and to prevent corrosion. All welds

shall be seal welds unless noted otherwise. All seal welds shall be shown and made as indicated on the shop drawings. Seal welds, without a specific size shown, shall be made the minimum size fillet weld as required in AWS D1.1/D1.1M. In addition, seal welds may require weld wrapping around reentrant corners that is specifically prohibited in AWS D1.1/D1.1M.

- (d) Bolted Connections – Provide bolts, nuts and washers of the type specified or indicated. Equip all nuts with washers except for high strength bolts. Use beveled washers where bearing faces have a slope of more than 1:20 with respect to a plane normal to the bolt axis. Where the use of high strength bolts is specified or indicated, conform the materials, workmanship and installation to the applicable provisions of ASTM F3125/F3125M. Install High Strength Bolts ASTM F3125/F3125M Grade A325 or Grade A490 in accordance with the requirements of RCSC S348. All High Strength Bolted Connections are fully pretensioned to the minimum pretension as specified in RCSC S348. Follow the pre-installation verification procedures outlined in RCSC S348. All other bolted connections are snug tight in accordance with RCSC S348.
- (1) Accurately locate bolt holes, smooth, perpendicular to the member and cylindrical.
  - (2) Drill or subdrill holes for regular bolts and ream in the shop and not more than 1/16 inch larger than the diameter of the bolt.
  - (3) Match-ream or drill holes for fitted bolts in the shop. Remove burrs resulting from reaming. Keep bolt threads entirely outside of the holes. The body diameter of bolts must have tolerances as recommended by ASME B4.1 for the class of fit specified. Place fitted bolts in reamed holes by selective assembly to provide an LN-2 fit.
  - (4) Holes for high strength bolts must not have diameters more than 1/16 inch larger than bolt diameters. If the thickness of the material is not greater than the diameter of the bolts, the holes may be punched. If the thickness of the material is greater than the diameter of the bolts the holes may be drilled full size or subpunched or subdrilled at least 1/8 inch smaller than the diameter of the bolts and then reamed to full size. Poor matching of holes will be cause for rejection. Drifting occurring during assembly cannot distort the metal or enlarge the holes. Reaming to a larger diameter of the next standard size bolt will be allowed for slight mismatching.
- (e) Machine Work – Tolerances, allowances and gauges for metal fits between plain, non-threaded, cylindrical parts conform to ASME B4.1 for the class of fit shown or required unless otherwise shown on approved detail drawings. Tolerances for machine-finished surfaces designated by non-decimal dimensions must be within 1/64 inch. Sufficient machining stock must be provided on placing pads to ensure true surfaces of solid material. Provide finished contact or bearing surfaces true and exact to secure full contact. Polish journal surfaces and finish all surfaces with sufficient smoothness and accuracy to ensure proper operation when assembled. Accurately machine parts entering any machine and all like parts be interchangeable except that parts assembled together for drilling or reaming of holes or machining will not

be required to be interchangeable with like parts. Accurately locate all drilled bolt holes.

- (1) Unfinished Surfaces – Lay out all work to secure proper matching of adjoining unfinished surfaces unless otherwise directed. Where there is a large discrepancy between adjoining unfinished surfaces chip and grind smooth or machine to secure proper alignment. Unfinished surfaces must be true to the lines and dimensions shown and be chipped or ground free of all projections and rough spots. Fill in depressions or holes not affecting the strength or usefulness of the parts in an approved manner.
  - (2) Pin Holes – Pin holes are to be bored true to gauges, smooth, straight and at right angles to the axis of the member. Do the boring after the member is securely fastened in position.
  - (3) Shafting – Turn or grind shafting with hot-rolled or cold-rolled steel, as required, unless otherwise specified or authorized. Provide fillets where changes in section occur. Cold-finished shafting may be used where keyseating is the only machine work required.
  - (4) Bearings – Bearings may be lined with bronze unless otherwise specified or shown. Where the bearing pressure is in excess of 200 psi, line bearings with bronze. Pressures on lined bearings must not exceed psi of projected area unless otherwise required or authorized. Anti-friction bearings of approved types and of sizes not less than those recommended by the bearing manufacturer for the duty intended will be permitted subject to approval. Properly align all bearings provided with a suitable means of lubrication. Install anti-friction bearings as required to provide for retention of the lubricant and to exclude dirt and grit.
- (f) Etched Pattern – Exposed faces of gate skin plates to receive custom etched pattern as shown on the approved detail drawings. Etching to produce a smooth and continuous profile; gaps or skips in profile to be limited to 1/8" maximum. Profile to be at the width and depth indicated on the drawings; however, no etching to be more than 1/16" deep maximum.
- (g) Miscellaneous Provisions – Apply zinc coatings in a manner and of a thickness and quality conforming to ASTM A123/A123M. Where zinc coatings are destroyed by cutting, welding or other causes regalvanize the affected areas. Regalvanize coatings 2 ounces or heavier with a suitable low-melting zinc base alloy similar to the recommendations of the American Hot-Dip Galvanizers Association to the thickness and quality specified for the original zinc coating. Repair coatings less than 2 ounces with cold galvanizing in accordance with ASTM A780/A780M.
- (h) Drain holes – Locate drain holes as shown on the drawings, unless otherwise noted. Drain holes shall be drilled. Flame cutting of holes will not be permitted.
- (i) Fabrications – Submit samples approved prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified

and its location recorded. Fabrications shall conform to the following requirements.

- (1) Gate Leaf – Gate leaf shall be of welded structural steel fabrication. Gate leaf shall be provided complete with hinge assemblies, pintle assembly, wheel assemblies, gate hooks, seal assemblies, and other appurtenant components as specified and shown. Proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of gate leaf shall not vary from the nominal dimension by more than 1/4 inch. The surfaces of framing elements to skin plates are to be welded shall not vary from a true plane by more than 1/4 inch. The diagonal dimensions across the corners of both faces of the gate leaf shall not differ from the calculated dimensions based on gate dimensions shown in the drawings by more than 1/2 inch. Splices in skin plates shall be located only where shown. Etched pattern on skin plates to be appear continuous across plate splices; individual etched profiles of the pattern to be aligned within 1/8" across skin plate splices. In addition to welds specifically indicated for nondestructive testing, other welds as chosen by the Engineer in the girders, verticals and skin plate of the gate leaf shall receive nondestructive testing at the Contractor's expense following the guidelines specified in Section 50.5.5(d)(8).
- (2) Hinge Assembly –Materials for the hinge assembly shall follow the schedule shown in the plan. In addition to welds specifically indicated for nondestructive testing, 50 percent of the welds in the hinge assembly and the welds connecting the hinge assembly to the gate framing shall receive nondestructive testing utilizing Ultrasonic Testing. After all welding is completed, the hinge assembly shall be stress-relieved by heat-treating. Stress-relieving shall be performed prior to machining.
- (3) Rolling Gate Wheel Assembly – Rolling gate wheel assembly shall be provided complete with cast steel wheels as specified herein and fittings, couplings and hoses for lubrication of wheels. Fittings shall be 1/4 inch threaded-pipe fitting. Couplings shall be 1/4-inch stainless steel half coupling. Hoses shall be 1/4 inch inside diameter, double-braided stainless steel flexible hoses. Couplings and hoses shall have a pressure rating of 3,000 psi.
- (4) Seal Assembly – Seal assembly shall consist of rubber seals, steel retainer and spacer bars, retractable plate, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded

corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45-degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Steel retainer bars shall be field-spliced only where shown. Field welding of the steel retainer bar shall be ground flush.

- (5) Miscellaneous Embedded Metals – Wall armor, shear anchors, protection and seal plates and shapes, and other miscellaneous embedded metals shall be of structural steel or corrosion-resisting steel conforming with the details specified herein and shown.
- (j) Shop Assembly – Gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. Shop assembly and disassembly work shall be performed in the presence of the Engineer unless waived in writing. The presence of the Engineer will not relieve the Contractor of any responsibility under this contract.

#### 50.5.5 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

- (a) General – Perform material tests and analyses certified by an approved laboratory to demonstrate that materials are in conformity with the specifications. These tests and analyses must be performed and certified at the Contractor's expense, and are in addition to the standard manufacturer's material test reports. Perform tests, inspections, and verifications conforming to the requirements of the particular sections of these specifications for the respective items of work unless otherwise specified or authorized. Conduct tests in the presence of the Engineer if so required. Furnish specimens and samples for additional independent tests and analyses upon request by the Engineer. Properly label specimens and samples and prepare for shipment. Submit certified test reports for material tests performed by the Contractor as well as manufacturers' material test reports with all materials delivered to the site.
- (b) Nondestructive Testing – When doubt exists as to the soundness of any material part, such part may be subjected to any form of nondestructive testing determined by the Engineer. This may include Ultrasonic (UT), Magnetic Particle Testing (MT), Radiographic Testing (RT) or any other test that will thoroughly investigate the part in question. The cost of such investigation will be borne by the Department if the part is found to be sound and by the Contractor if the part is found to be defective. Any defects will be cause for rejection; replace and retest rejected parts at the Contractor's expense.
- (c) Tests of Machinery and Structural Units – The details for tests of machinery and structural units must conform to the requirements of the particular sections

of these specifications covering these items. Assemble each complete machinery and structural unit and test them in the shop, in the presence of the Engineer, unless otherwise directed. Waiving of tests does not relieve the Contractor of responsibility for any fault in operation, workmanship or material that occurs before the completion of the contract or guarantee. After being installed at the site, operate each complete machinery or structural unit through a sufficient number of complete cycles to demonstrate to the satisfaction of the Engineer that it meets the specified operational requirements in all respects.

(d) Inspection of Structural Steel Welding – Nondestructive testing of designated welds will be required. Supplemental examination of any joint or coupon cut from any location in any joint may also be required. Selection of welds to be tested shall be as agreed upon between the Engineer and Contractor. The Contractor's Certified Welding Inspector (CWI) shall be present whenever welding is performed. The CWI shall perform inspection, as necessary, prior to assembly, during assembly, during welding, and after welding. CWI shall perform inspection as required in AWS D1.1/D1.1M.

- (1) Visual Examination – All visual inspection shall be conducted in accordance with AWS D1.1/D1.1M, by a CWI. Document this inspection in the Visual Weld Inspection Log. Submit certificates indicating that CWI meet the requirements of AWS QC1.
- (2) Nondestructive Testing – Perform as designated or described in the sections of these specifications, the nondestructive testing of shop and field welds covering the particular items of work. Record final nondestructive testing results in the Weld Inspection Log which identifies final NDT inspection of all welds requiring inspection and submit the log.
- (3) Testing Agency – The nondestructive testing of welds and the evaluation of tests as to the acceptability of the welds must be performed by a testing agency adequately equipped and competent to perform such services or by the Contractor using suitable equipment and qualified personnel. All personnel performing nondestructive testing shall be certified Level I or II in the method of NDT being utilized in accordance with AWS D1.1/D1.1M. Level I inspectors must have direct supervision of a Level II inspector. Submit certification for nondestructive testing personnel prior to all testing. In either case, written approval of the examination procedures is required, and performance of the examination tests must be done in the presence of the Engineer. The evaluation of tests is subject to the approval and all records become the property of the Department.
- (4) Radiographic Testing (RT) – Radiographic examination is required on the major shop and field welds as per AWS D1.5/D1.5M. See Section 50.5.5(d)(8) for items that shall be subjected to RT. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests.

- (5) Ultrasonic Testing (UT) – Examine, evaluate and report ultrasonic testing of welds in conformance to the requirements of AWS D1.1/D1.1M, Inspection Clause, for statically loaded connections. Provide ultrasonic equipment capable of making a permanent record of the test indications. Make a record of each weld tested.
- (6) Magnetic Particle Inspection Conform magnetic particle inspection of welds to the applicable provisions of ASTM E709.
- (7) Dye Penetrant Inspection – Perform dye penetrant inspection of welds conforming to the applicable provisions of ASTM E165/E165M.
- (8) Welds to be Subject to Nondestructive Testing – 100% of all welds shall be subjected to visual inspection. All welds connecting the Fracture Critical Member (FCM), including all girders, shall be considered Fracture Critical Weld (FCW) and shall be subjected to Radiographic Testing (RT). 50% of the welds including FCW on the hinge assembly shall be subjected to UT. In addition, test 25% of all other Complete Joint Penetration (CJP) welds using RT. Randomly test 50% of all PJP and fillet welds other than FCW using UT as per Table 6.2 of AWS D1.1/D1.1M.
- (9) Test Coupons – The Department reserves the right to require the Contractor to remove coupons from completed work when doubt as to soundness cannot be resolved by nondestructive testing. When coupons are removed from any part of a structure, repair the members cut in a neat manner with joints of the proper type to develop the full strength of the members. Peen repaired joints as approved or directed to relieve residual stress. The expense for removing and testing coupons, repairing cut members and the nondestructive testing of repairs is borne by the Department if the work is not found to be defective or the Contractor if the work is found to be defective.
- (10) Supplemental Examination – When the soundness of any weld is suspected of being deficient due to faulty welding or stresses that might occur during shipment or erection, the Department reserves the right to perform nondestructive supplemental examinations before final acceptance. The cost of such inspection will be borne by the Department. If welds are found to be defective, the Contractor shall repair the defective work and bear the cost of the inspection.
- (11) Welding Repair Plan – Repair defective welds in accordance with AWS D1.1/D1.1M, Fabrication Clause. Remove defective weld metal to sound metal by use of grinding, air carbon-arc or oxygen gouging. Thoroughly clean surfaces before welding. Retest welds that have been repaired by the same methods used in the original inspection. Except for the repair of members cut to remove test coupons and found to have acceptable welds costs of repairs and retesting will be borne by the Contractor. Submit welding repair plans for steel, prior to making repairs.

(12) Inspection and Testing of Steel Stud Welding – Perform fabrication and verification inspection and testing of steel stud welding conforming to the requirements of AWS D1.1/D1.1M, Welding Clause except as otherwise specified. The Engineer will serve as the verification inspector. Bend or torque test one stud in every 100, including studs that do not show a full 360 degree weld flash, have been repaired by welding or whose reduction in length due to welding is less than normal as required by AWS D1.1/D1.1M, Stud Welding Clause. If any of these studs fail, bend or torque test two additional studs. If either of the two additional studs fails, all of the studs represented by the tests will be rejected. Studs that crack under testing in the weld, base metal or shank will be rejected and replaced by the Contractor at no additional cost.

(e) Testing of Rubber Seals – The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 1-inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<b>Thickness of Fluorocarbon Film</b>	<b>Machine Method at 50 mm<sup>2</sup> inches per minute</b>	<b>Deadweight Method</b>
0.060 inch	30 pounds per inch width	30 pounds per inch width
0.030 inch	30 pounds per inch width	30 pounds per inch width

#### 50.5.6 INSTALLATION

Gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Before assembly and installation, all bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant. All components to be field-welded shall be in correct alignment before welding is commenced.

(a) General – Thoroughly clean all parts to be installed. Remove packing compounds, rust, dirt, grit and other foreign matter. Clean holes and grooves for lubrication. Examine enclosed chambers or passages to make sure that they are free from damaging materials. Where units or items are shipped as assemblies they will be inspected prior to installation. Disassembly, cleaning and lubrication will not be required except where necessary to place the assembly in a clean and properly lubricated condition. Do not use pipe wrenches, cold chisels or other tools likely to cause damage to the surfaces of rods, nuts or other parts used for assembling and tightening parts. Tighten bolts and screws firmly and uniformly but take care not to overstress the threads. When a half nut is used for locking a full nut place the half nut first followed by the full nut. Apply the half nut snug tight before applying full torque on the full nut. Lubricate threads of all bolts except high strength bolts, nuts and screws

with an appropriate lubricant before assembly. Coat threads of corrosion-resisting steel bolts and nuts with an approved antigalling compound. Driving bolts or keys will not be permitted.

- (b)
- (1) Alignment and Setting – Accurately align each machinery or structural unit by the use of steel shims or other approved methods so that no binding in any moving parts or distortion of any member occurs before it is fastened in place. The alignment of all parts with respect to each other must be true within the respective tolerances required. Set true machines to the elevations shown.
  - (2) Blocking and Wedges – Remove all blocking and wedges used during installation for the support of parts to be grouted in foundations before final grouting unless otherwise directed. Blocking and wedges left in the foundations with approval must be of steel or iron.
- (c) Embedded Metals – Corner protection angles, sill angles, seal plates, frames, pedestals, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.
- (d) Lower Hinge Assembly – Base anchors for the lower hinge assembly shall be embedded in the first pour concrete. Base plate shall be attached to base anchors, set to the final position, and epoxy fill shall be placed in the void behind the base plates and allowed to reach the strength as shown and the approved field installation drawings. After the gate leaf is set in place, the hinge assembly shall be adjusted to provide for continuous contact between the sealing surfaces over the full height and length of the gate leaf. Allowances shall be made for the seals which shall not be attached until painting operations are completed. Second pour concrete shall be placed after final adjustments are completed.
- (e) Gate Leaf – Gate leaf components not assembled in the shop shall be assembled in the field as required for installation. Lower hinge assembly bearings shall be coated with grease prior to setting the gate leaf in place. All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the top hinge assembly installed, the gate leaf shall be plumbed and brought into correct position.
- (f) Diagonals – Gate leaf diagonals shall be attached to the gate leaf after the leaf is set in place. Submit diagonal prestressing records immediately after completion of the prestressing operations. Diagonals shall be prestressed before the final adjustment of the hinge assemblies are made. Diagonal

prestressing shall be as specified herein and as shown and the prestressing plan developed by the Contractor. The prestressing plan shall be submitted to the Engineer for approval. The plan for prestressing the diagonals shall describe the method of prestressing including the materials, connections, rigging, anchorages, and measuring equipment including strain gauges. The strain gauges shall be removed after the prestressing operation and touch up painting shall be applied. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<b>Stress Data Table</b>					
Gate Leaf Location:				Date:	
	1	2	3	4	5
Diagonal	Strain Gauge Initial	Strain Gauge Final	E (in.)	D (in.)	d(in.)
1. Initial strain gauge readings shall be made after slack is removed.					
2. Final strain gauge readings shall be made after prestressing is complete.					
3. E is the total elongation over the full length of the diagonal, computed from the strain gauge readings.					
4. D is the initial deflection (sag) of the leaf prior to prestressing.					
5. d is the final deflection (sag) of the leaf measured after completion of the prestress operation; it is the deflection at the bottom of the cantilever end when final strain gauge readings are taken.					

- (g) Top Hinge Assembly – After the gate leaf has been set in place, the top hinge assembly shall be installed and adjusted so that the center of the hinge pin is in vertical alignment with the center of the pintle. When the top hinge pin is inserted, the gate leaf shall swing horizontally throughout its range of movement. Any required final adjustments to the top hinge assembly shall be made after the gate leaf diagonals have been prestressed. The second pour concrete shall be made after final adjustments are completed.
- (h) Painting – Painting of the gates shall follow NYSDOT Standard Specification Section 708-01, Structural Steel Paints Class 1. Exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces shall be painted as specified below
- (1) Blast to near white metal (SSPC-SP 10).
  - (2) Prime with one coat of three component, metallic, zinc rich, epoxy primer.

- (3) Coat with two (2) coats of low VOC, high solids, high build epoxy intermediate coat.
  - (4) Finish with one coat of low VOC, high build, semi-gloss urethane finish.
  - (5) Gate colors to be NYC DOT Bridges Standard Colors: Gates 1-17 to be Munsel Gray FS 26173; Gate 18 to be the similar color as George Washington Bridge. Gate numbering shall follow table as shown on plan sheet FG001.
- (i) Seal Assemblies – Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gates, a suitable lubricant as prescribed by the seal manufacturer shall be applied to the rubber seal rubbing plates to protect the rubber.
  - (j) Final Adjustment of Swing Gates – Swing gates have been designed with multiple degrees of adjustment. The pintle assembly has been designed to allow additional thrust washers to allow vertical adjustment. Shim packs have been specified to allow adjustment normal to the concrete abutment surface. Slotted holes have been provided in all seal angles to facilitate minor adjustments normal to the seal surfaces. The bearing blocks of each gate, attached to the horizontal girders, shall be in contact with the vertical face of the concrete abutment or embedded plates. If not in contact, the bearing blocks shall have a gap no larger than 1/32" measured by a feeler gauge between the bearing block and mating surface. Should the gap between the bearing blocks and mating surface exceed 1/32", the Contractor shall notify the Engineer. After all adjustments have been made, the seals of each gate shall be leak tested as specified herein.
  - (k) Testing of Seal – There shall be no inadvertent leakage paths around the seals. The intent of this specification is that the bulb of the J-bulb seal shall be in contact with the seal plate over the entire length when the gate is in the closed position. With the gate in the closed position, the spray from a hose shall be directed along every horizontal and vertical inch of the seal at the contact point between seal bulb and seal plate. The nozzle of the hose may be directed toward either side of the seal but shall be no more than 12 inches from the contact point between seal and seal plate. The spray shall be as nearly perpendicular to the seal as access permits. The flow of water from the hose shall be no less than 8 gallons per minute and the water pressure in the hose just upstream of the nozzle shall be no less than 40 psi, as measured by a calibrated gauge. If leakage occurs at any point along the seal, the gap between the rubber seal and seal plate shall be measured by means of feeler gauges while the water is not running. A maximum gap of 1/16 inch over not more than 12 inches will be accepted.

#### 50.5.7 PROTECTION OF FINISHED WORK

- (a) Machined Surfaces – Thoroughly clean foreign matter off machined surfaces. Protect all finished surfaces. Oil and wrap unassembled pins and bolts with moisture resistant paper or protect them by other approved means. After applying primer wash finished surfaces of ferrous metals to be in bolted

contact, with an approved rust inhibitor and coat them with an approved rust resisting compound for temporary protection during fabrication, shipping and storage periods. Paint finished surfaces of metals which will be exposed after installation, except corrosion resisting steel or nonferrous metals.

- (b) Lubrication After Assembly – After assembly fill all lubricating systems with the appropriate lubricant and apply additional lubricant at intervals as required to maintain the equipment in satisfactory condition until acceptance of the work.

#### 50.5.8 ACCEPTANCE TRIAL OPERATION

After completion of the gate installation, the Engineer will examine the gates for conformance with the contract requirements. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements and the standard of Painting and corrosion protection. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position to demonstrate that all parts are functioning properly. The number of error-free gate opening-closing operations, acceptable to the Engineer's satisfaction, shall follow the guidelines below.

- (a) Swing Gates – Operate at least once using normal gate operating sequence and at least once using the alternative operating procedure. Refer to gate Operation & Maintenance (O&M) manual for details of operating procedures.
- (b) Roller Gates – Operate at least once using normal gate operating sequence and at least once utilizing each of the two alternative operating procedures. Refer to gate O&M manual for details of operating procedures.

The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening, which shall be verified using a spray test. Required repairs or replacements to correct defects, shall be made at no additional cost to the Department. Repeat the trial operation after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

#### 50.6 MEASUREMENT & PAYMENT.

Payment will be made at the lump sum price bid for each fabricated steel floodgate.

#### 50.7 PRICE TO COVER.

Payment will constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for the installation of fabricated steel floodgates as specified and as shown in the drawings.

*Payment will be made under:*

Item No.	Item	Pay Unit
ESCR-50.A.1	FURNISH AND INSTALL FABRICATED STEEL FLOODGATE (VEHICULAR ROLLER TYPE)	L.S.
ESCR-50.A.2	FURNISH AND INSTALL FABRICATED STEEL FLOODGATE (VEHICULAR SWING TYPE)	L.S.
ESCR-50.K.1	FURNISH AND INSTALL FABRICATED STEEL FLOODGATE (VEHICULAR SWING TYPE)	L.S.
ESCR-50.K.2	FURNISH AND INSTALL FABRICATED STEEL FLOODGATE (VEHICULAR SWING TYPE)	L.S.
ESCR-50.K.5	FURNISH AND INSTALL FABRICATED STEEL FLOODGATE (VEHICULAR ROLLER TYPE)	L.S.
ESCR-50.K.6	FURNISH AND INSTALL FABRICATED STEEL FLOODGATE (VEHICULAR SWING TYPE)	L.S.

**END OF SECTION**

**SECTION 619.3610 – QUICK-CHANGE MOVEABLE CONCRETE BARRIER TRANSFER VEHICLE (QMCBTV) - LEASE & MAINTAIN**

**619.3610.1. INTENT.** This section describes leasing and maintenance of Quick-change Moveable Concrete Traffic Barrier Transfer Vehicle (Vehicle) For the purposes of this section, leasing of the vehicle refers to procuring the Vehicle and covers leasing, renting, and the use of a Contractor-owned Vehicle.

**619.3610.2. DESCRIPTION.** This item shall consist of procuring a Quick-change Moveable Concrete Traffic Barrier Transfer Vehicle which meets the requirements noted herein, from Lindsay Transportation Solutions (LTS); 180 River Road, Rio Vista, CA 94571; (888) 800-3691; [www.barriersystemsinc.com](http://www.barriersystemsinc.com) or approved equal. The item shall also include maintaining the Vehicle, and training Vehicle operators.

**619.3610.3. MATERIALS.** The Vehicle shall be on the project site and in good working condition. The Vehicle is capable of performing the following functions:

1. Lateral transfer of continuous lengths of Quick-change Moveable Concrete Barrier (QMCB) from 4 feet to 18 feet;
2. Maintaining a forward speed of at least 5 miles per hour while making lateral transfer moves of the QMCB.
3. The Vehicle is equipped with a Capstan Drive and an engine block heater.

**619.3610.4. METHODS.** The Contractor is responsible for obtaining or entering into an agreement to procure the Vehicle within 30 days upon notification by the Engineer.

1. General:  
The Vehicle designated for use under this item will be used on FDR Drive to facilitate a work zone protection for the limits specified on contract drawings, including lateral movement of QMCB, during the work hours specified in contract documents and approved by Engineer. Each work shift, the Vehicle will be used twice, first to deploy the QMCB prior to work hours, and then to relocate the QMCB back to its stored position.
2. Maintenance:  
The Vehicle shall be stored, when not in use, in an approved storage area. The Contractor shall be required to perform all maintenance operations recommended by the manufacturer of the Vehicle.

The Vehicle shall be kept in good repair at all times. The Contractor shall expedite repairs necessitated by malfunction of or damage to the Vehicle. Maintenance shall include the periodic cleaning of the Vehicle along with the repair of damage to the protective coating of the Vehicle.

The Contractor shall have on hand at all times sufficient spare parts.

**619.3610.5. PRICE TO COVER.** The cost, including labor, materials and equipment needed to complete the work and keep the Vehicle in a functional state must be included in the price bid for Item 6.70, Maintenance and Protection of Traffic.

**END OF SECTION**

**SECTION 619.3614 – QUICK-CHANGE MOVEABLE CONCRETE BARRIER (QMCB) –  
PURCHASE OR LEASE & MAINTAIN**

**619.3614.1. INTENT.** This section describes purchasing or leasing, maintaining, and deployment of Quick-change Moveable Concrete Barrier (QMCB)

**619.3614.2. DESCRIPTION.** Under this work the Contractor shall purchase or lease, maintain, load, unload, transport, and store the QMCB, including any Quick-Lock Variable Length Barrier (QVLB), as indicated on the contract drawings or as ordered by the Engineer.

**619.3614.3. MATERIALS.** The Barrier is a patented product and shall be obtained from Lindsay Transportation Solutions, (180 River Road, Rio Vista, CA 94571; Phone 888-800-3691; [www.barriersystemsinc.com](http://www.barriersystemsinc.com)) or approved equal.

**619.3614.4. METHODS.** Barriers will be manufactured by either the wet cast or dry cast methods. Minimum concrete 28-day compressive strength shall be 4 ksi. All surface voids or rock pockets shall be repaired.

The QMCB, when installed in accordance with the manufacturer's instructions, shall be able to resist the impact of vehicles in accordance with the National Cooperative Highway Research Program Report 350 (NCHRP 350) Test Level 3.

The maximum outside dimensions of the QVLB shall not exceed the outside dimensions of the standard Quick-change Moveable Concrete Barrier. The minimum outside cross sectional dimensions of the QVLB inner shell shall not be less than the QMCB dimensions by more than 1 inch at any location. The hinges utilized on the QVLB shall be similar to the hinges used on the remainder of the system. The longitudinal strength of the QVLB under impact shall be consistent with the strength of the standard Quick-change Moveable Concrete Barrier.

The QMCB and QVLB shall be loaded, unloaded and transported to the site as per the Manufacturer's instructions.

**619.3614.5. PRICE TO COVER.** The cost, including labor, materials and equipment needed to complete the work must be included in the price bid for Item 6.70, Maintenance and Protection of Traffic.

**END OF SECTION**

## SECTION 619.37 – QUICK-CHANGE MOVEABLE CONCRETE BARRIER (QMCB) – OPERATION

**619.37.1. INTENT.** This section describes lateral movement of Quick-change Moveable Concrete Barrier (QMCB)

**619.37.2. DESCRIPTION.** Under this work, the Contractor shall furnish, assemble the run, maintain, and remove Quick-change Moveable Concrete Barriers, at the locations and schedules specified in the contract documents, including the lateral movement of the QMCB from the stored position to the construction activity position and from the construction activity position to the stored position as shown on the plans or as ordered by the Engineer. The cost of providing the operators for the Moveable Barrier Transfer Machine shall be included under this item.

**619.37.3. MATERIALS.** The Quick-change moveable barriers shall be manufactured by Barrier Systems, Inc. (180 River Road, Rio Vista, CA 94571; Phone 888-800-3691; [www.barriersystemsinc.com](http://www.barriersystemsinc.com)) or approved equal. The maximum deflection at NCHRP 350 Test Level 3 shall be 28 inches or less. The barrier segments shall be 32 inches high and 18 inches wide at the base. Each barrier segment shall have a six (6) inch wide, continuous yellow painted stripe applied to the lower six (6) inches of barrier face, prior to installation. The stripe shall be applied along the lower six (6) inches of each exposed face for the full length of the barrier segment. The stripe shall be reflectorized meeting the requirements of **Section 6.44** of the Standard Specifications. The moveable barriers shall be fully compatible with the moveable barrier transfer machine.

**619.37.4. METHODS.** The contractor shall install and move the barriers in accordance with the manufacturer's instructions to locations and schedules as shown in the Contract Documents. Where specified on the Plans, the permanent traffic barriers shall be removed and replaced with deployed QMCB prior to start of work zone operations.

Prior to set-up, the Contractor shall provide the following to the Engineer for approval:

1. Manufacturer's certification that the Barriers are NCHRP 350 approved and meets Test Level 3 conditions.
2. Shop drawings and weight of the barrier pieces.
3. Installation and maintenance details.

The Engineer will inspect the barrier following installation, after each impact, and periodically throughout the duration of the work. Any barrier segment having damage or defect that will adversely affect the performance of the barrier shall be repaired or replaced, within 24 hours, by the Contractor at no additional cost to the City.

Prior to each lateral movement of the QMCB, the Contractor shall give the Engineer ample notice as to when such movement will begin. Minimum movement for payment is 10 feet and anything less than this shall be considered as an incidental movement and shall be included under the price bid for this item. Incidental movement of the barrier to achieve proper alignment or to realign barrier sections disturbed by traffic shall also be included in the price bid.

Once contract work requiring the Quick-change Moveable Barriers is completed, the contractor shall promptly remove the barriers from the work site.

**619.37.5. PRICE TO COVER.** The cost, including labor, materials and equipment needed to complete the work must be included in the price bid for Item 6.70, Maintenance and Protection of Traffic.

**END OF SECTION**

**SECTION ESCR 6.25 GS - GREENWAY REROUTING SIGNS****SECTION ESCR 6.25 GSX – REMOVE GREENWAY REROUTING SIGNS**

**ESCR 6.25.1. DESCRIPTION.** The work shall consist of the fabrication, furnishing, installation, and maintenance of temporary Greenway detour signs required to properly stage the work and maintain bicycle traffic. The work shall include the furnishing of signs, and sign posts, including all accessories; installation of signs and sign posts, including footings, at locations specified on the Contract Plans and as directed by the Engineer; and the maintenance, removal and disposal of temporary detour signs.

**ESCR 6.25.2. MATERIALS.** All materials and the details of fabrication and assembly shall be as shown on the Contract Drawings, outlined in the Special Provisions, and in accordance with the applicable standards of the New York City Department of Transportation, Division of Traffic Operations or the National Manual on Uniform Traffic Control Devices for Streets and Highways (National MUTCD), 2009 or latest Edition, where applicable, the following requirements, and as approved by the Engineer.

(A) Sign shall be made of flat unpainted Aluminum, Alloy 6061-T6 or approved equivalent, of the thickness 0.025”.

No painted signs will be permitted and all orange reflective sheeting applied to rigid substrates shall be one of the following listed fluorescent orange reflective sheeting materials or an approved equal:

Scotchlite Durable Fluorescent Diamond Grade Sheeting 3924 F/G Orange as manufactured by the 3M Company, Traffic Control Materials Division. Diamond shaped signs shall use 3924F reflective sheeting. Square or rectangular shaped signs shall use 3924G reflective sheeting.

Stimsonite Florescent Orange High-Performance Grade Retroreflective Sheeting No. 4380.

Approved reflective sheeting shall be installed in accordance with the manufacturer's written instructions, and to the satisfaction and approval of the Engineer.

(B) Posts shall be of the steel rail type, furnished with a baked green alkyd resin, without anchor plates and shall be rolled from material meeting the requirements of ASTM Designation A 499.

(C) Concrete for footings shall be Class B-32, Type IIA; cement - Type II Portland; sand - Type 1A; coarse aggregate Type 1, Grade B, or Type 2, Size No. 57; and an approved air-entraining agent shall be added at the time that concrete is mixed. Concrete, cement and aggregate shall comply with the requirements of Section 3.05.

(D) All other unspecified materials shall be approved by the Engineer.

**ESCR 6.25.3. METHODS.****(A) SIGNS**

All greenway rerouting signs used during the construction period are to be furnished by the Contractor, as required. The Contractor shall install these signs where indicated on the plans and as directed by the Engineer, and, when no longer required, shall remove these signs and dispose.

**(B) INSTALLATION OF SIGNS**

The erection of a sign shall include all work necessary to secure the sign to the sign post, including the furnishing and installation of clamps, brackets, and all necessary appurtenances and the attachment of the sign in the prescribed location and alignment, as indicated on the Contract Drawings. The erection of the signs shall comply with the applicable details of Drawing Nos. SD-225A, SD-225B and SD-225F of the Division of Traffic Operations, and the directions of the Engineer.

All signs shall be erected plumb and facing in the proper direction and angle as directed by the Engineer. The use of wire, twine or other similar temporary measures to fasten the signs to the post will not be permitted.

The back of each sign shall be clearly labeled with the Contractor's Company Logo, the Agency Name (NYCDDC) and the Contract Number, each from 1-1/2 to 2 inches in height, as approved by the Engineer.

**(C) SIGN POSTS**

All sign posts of the steel rail type furnished shall be of a uniform, modified, flanged channel section such that the area of contact between the post and the sign is symmetrical with the vertical axis of sign and posts.

The minimum dimensions of posts shall be as follows:

Width of Flange Face	Width of Back	Depth from Face of Flange to Back
3-1/2"	1-7/8"	1-3/4"

The minimum weight of each post before holes are punched shall be 3.0 pounds per foot. There may be a weight tolerance of plus or minus 5%.

The length shall be 12'- 0" with a tolerance of plus or minus one inch.

All posts shall be punched with 3/8" diameter holes on the centerline spaced at 1" centers beginning 1" from top of post for the entire length.

The finished posts shall be machine straightened and have a smooth uniform finish free from cracks, flaws, injurious seams, laps, blisters, ragged, sharp and imperfect edges, or other defects affecting strength, durability, or appearance. Bolt holes of the diameter specified shall be accurately spaced vertically and centered horizontally, so that the holes will register for back to back application. All holes and sheared ends shall be free from burrs.

All posts shall be painted with a weather-resistant, rust-inhibitive, high-quality, dark green enamel, which shall produce hard, mar-resistant coating, free from paint cracks, blisters or other defects.

Before painting, all posts shall be thoroughly cleaned of all dirt, rust, loose scale, oil or grease. The quality of the paint and prior preparation shall be such that when the finished post is struck a light blow with a sharp tool, the paint shall not crack or chip, and if scratched with a knife, shall not powder. The minimum thickness of the dry film enamel shall be one mil. It shall pass a standard 100 hour salt spray test (20% solution by spray or fog at 70 degrees). Painting shall be the final process after fabrication and punching has been completed.

#### (D) INSTALLATION OF SIGN POSTS

1. General. The work to be done shall be the installation of sign posts of the steel rail type only. The posts shall be installed in existing sidewalk, or earth. The work shall include excavation, backfilling, the restoration of the sidewalk, and the placement of concrete footing for the posts.

2. Installation Method. The installation of steel rail type sign posts shall be done in accordance with the details shown on the appropriate Division of Traffic Operations Standard Drawings Nos. SG-104, SG-105, SG-104B, or SG-105B. The Contractor may elect to set the sign post in concrete foundation as shown on the Standard Drawings, as modified by the Engineer.

3. Concrete Footing for Posts. The Contractor shall cut a neat hole in the sidewalk or earth, and excavate to the required depth, then pour the concrete and install the sign post in the fresh concrete, as shown on the D.T.O Standard Drawings. Where the sidewalk is made of brick paver, the concrete footings shall be poured prior to installation of the brick paver sidewalk. The concrete mix and placement shall meet the requirements of Section 3.05 and 4.06 respectively. The exposed surface shall be troweled to a neat, smooth finish, sloped to provide drainage away from the post.

The Contractor shall dispose of all unused fill and other materials, leaving the site in a clean and neat condition. The Contractor must also restore sidewalk areas which have been disturbed, in a neat and workmanlike manner, to the satisfaction of the Engineer.

To protect the restored sidewalk areas from mutilation, the Contractor shall use a temporary protective disc of cardboard, of sheetmetal, or other satisfactory method, and remove same when concrete is cured as determined by the Engineer.

#### (E) REMOVAL OF SIGNS

The removal of a sign shall include all work necessary to detach the sign from the sign post, including disassembling of clamps, brackets, and all appurtenances, and cutting and removal of the sign post to a minimum one (1) inch below the surface. The work shall also include restoration of sidewalk areas which have been disturbed to the satisfaction of the Engineer. Removed sign panels, attachment assemblies and sign posts shall become a property of the Contractor.

**ESCR 6.25.4. PRICE TO COVER.** The cost, including labor, materials, plant, equipment, and incidentals necessary to install the post on sidewalk or earth, to excavate and backfill for footing, to place the concrete footing, remove the temporary signs, and to restore all disturbed areas, shall be included under Item 6.70 Maintenance and Protection of Traffic.

**END OF SECTION****SECTION 6.34 T – TEMPORARY CHAIN LINK FENCE AND GATE****6.34T.1. DESCRIPTION**

Under this section, the Contractor must furnish, erect, maintain, and remove, when directed, each type of Temporary Chain Link Fence and Gate as shown on the Contract Drawings and directed by the Engineer.

**6.34T.2. MATERIALS AND METHODS**

All materials and methods shall be as specified in Section 6.34 of the Standard Highway Specifications, with the following modifications and additions:

Temporary Chain Link Fence and Gate to be furnished under Item Section 6.34 ACT, shall consist of chain link fence fabric, top and bottom tension wires, gates, posts to be embedded in the pavement, and all necessary incidental in accordance with the Contract Drawings and the directions of the Engineer.

Temporary Chain Link Fence to be furnished under Item 6.34 ACTP, shall consist of chain link fence fabric, top and bottom rails for mounting a decorative mesh (to be furnished under another item), gates, posts with steel plate footings, sand bags to hold fence in place, and all necessary incidental in accordance with the Contract Drawings and the directions of the Engineer.

When directed by the Engineer, the Contractor must remove and dispose of the temporary chain link fence to the satisfaction of the Engineer. The Contractor must then fill any holes left in the pavement with compacted clean sand to grade.

**6.34T.3. PRICE TO COVER**

The cost, including labor, materials and equipment needed to complete the work of this Section must be included in the price bid for Item 6.70, Maintenance and Protection of Traffic.

No separate payment will be made for Items 6.34 ACT, 6.34 ACTP, 6.34 BCT, 6.34 ADT, and 6.34 BDT; the costs must be included in the price bid for Item 6.70, Maintenance and Protection of Traffic.

**END OF SECTION**

## SECTION 9.06 HW - ALLOWANCE FOR DECORATIVE MESH FABRIC

### 9.06 HW.1. DESCRIPTION.

Under this section, the Contractor will be paid to furnish and install panels of breathable mesh fabric upon which art work is printed in a maximum of four (4) colors, as directed by the Engineer. Each panel must be mounted on the construction barrier identified by the Engineer, typically Temporary Chain Link Fence (Item No. 6.34 ACTP), Fencing (Item No. 70.31), or metal Pedestrian Barricade identified by the Engineer (Item No. 7.36), unless an alternate method of mounting the panels is proposed by the Contractor and approved by the Engineer.

At the completion of the work the panels must be uninstalled and delivered to the Engineer, unless otherwise directed. Panels must remain the property of the City, unless otherwise directed.

### 9.06 HW.2. MATERIALS

- A. Artwork. Contractor must engage the services of an Artist selected by the City. The Artist, in consultation with the Engineer and DDC's Public Art Unit must develop the artwork.
- B. Mesh Fabric Panels. Fabric must be a breathable mesh fabric, with metal grommets installed at a one (1) foot maximum spacing around the perimeter of the fabric. Fabric panels must have sufficient air vent slits (u-cuts) to prevent overturning of the fence or barricade that it is mounted to. Slits must be approximately 6" wide semi-circles, spaced no further than 2' on center, staggered vertically. Slit edges to be electrically cauterized to prevent fraying. Slit and grommet locations must be shown on the shop drawings.
- C. Submittals. Contractor must submit to the Engineer for approval, in consultation with DDC's Public Art Unit:
  - Final Artwork package (provided by the Artist) for printing panels;
  - Shop Drawings for each panel, showing artwork, grommets, and air vent slits;
  - Samples and catalog cuts for fabric panel material;
  - Name and qualifications of printing company that will prepare the panels.

### 9.06 HW.3 PRICE TO COVER

The lump sum payment made under this item must be equal to the sum total of all invoices submitted by the Contractor, as approved by the Engineer, for design of artwork, furnishing and installing decorative mesh fabric materials, to the satisfaction of the Engineer, plus an allowance of 12% overhead and 10% profit.

The total estimated cost of this item is the "fixed sum" amount shown for this item in the Bid Schedule and must not be varied in the bid. No guarantee is given that the actual lump sum cost for this item will in fact be the "fixed sum" amount. The "fixed sum" amount is included in the bid solely to ensure that sufficient monies will be available to

pay the Contractor for this work, which may be more or less than the fixed amount. This "fixed sum" amount must be included with the other amounts bid by the Contractor for all the other items under this contract.

The unit price must cover the cost of all labor, materials, equipment, insurance, and incidentals necessary to complete the work under this section in accordance with the drawings, the specifications and the directions of the Engineer.

*Payment will be made under:*

Item No.	Item	Pay Unit

## SECTION 564.02010211 – BRIDGE HANGER ASSEMBLIES

### DESCRIPTION

This work shall include fabricating, transporting and erecting bridge hanger assemblies as shown on the plans and in accordance with the provisions of the Contract Documents. Each hanger assembly shall include the one structural strand and the associated sockets, threaded anchor rods, pins, nuts, washers, pivot plates, pin caps and appurtenances, and all field adjustments to hanger tension and roadway profile grade required or ordered. Within 7 days of Notice to Proceed, the Contractor must notify the Engineer of the sources of proposed materials. The manufacturer/contractor shall contact the Engineer to request inspection as required by the New York State Steel Construction Manual (SCM). No work shall commence prior to distribution of approved drawings as per section 202.5 of the Steel Construction Manual. For assemblies manufactured under this specification, inspection and rescheduling issues should be requested 5 working days prior to the commencement of work. Fabrication done without approved drawings or City inspection will be rejected. The Contractor's attention is drawn to the requirement of the PROJECT DESCRIPTION section, in Volume 3 of this Contract, for the use of NYSDOT materials such as the SCM.

### MATERIALS

The materials for this work and fabrication shall be in strict conformance with the SCM, and the following sections of the NYSDOT Standard Specifications:

Paint as specified	708
High Strength Bolts, Nuts, and Washers	715-14
Painting Procedures	740
Painting Galvanizing Surfaces	740-03

All specified Galvanized items shall meet the requirements of (ASTM A 153), and minimum thickness shall be 4 mils.

**A. *Structural Strand:*** The structural strand shall be an arrangement of wires laid helically around a center wire to produce a symmetrical cross-section. The structural strand shall meet the requirements of ASTM A586 and shall be provided with a Class A weight zinc-coated inner wires and Class C weight zinc-coated outer wires. The structural strands shall be pre-stretched under a tension not to exceed 55% of the breaking strength. After pre-stretching, the minimum Modulus of Elasticity, E, shall be as per ASTM A586.

The manufacturer's quality procedures plan and manual shall be subject to approval by the Engineer.

Certified copies of the results of the tests conducted by the manufacturer shall be furnished to the Engineer in accordance with the requirements of NYSDOT §715-01, Structural Steel.

Size of structural strand shall be as indicated on the design drawings.

**B. *Cast Sockets and Socket Pins:*** The cast sockets and socket pins shall be supplied by the Contractor. The sockets and pins shall be designed to develop the minimum required ultimate strength of the structural strand without suffering stresses beyond the yield point of the socket steel or measurable creep of the zinc filler under load. Open strand socket castings shall be cast steel conforming to the requirements of 715-02 of the NYSDOT Standard Specifications except that the material shall be (ASTM A 148, Grade 105-85) with Supplementary

Requirement S9. One specimen per heat shall be Charpy V-notch (CVN) impact tested with the documented results submitted to the Engineer minimum CVN value shall be 15 ft-lbs @-40° F. Socket pin material shall at a minimum meet the requirements of (A 668) Class F and may be machined from forged stock. Galvanizing shall meet the requirements of (ASTM A 153) with a minimum thickness of 4 mils. All socket pins shall be furnished with a recessed hexagonal nut and stainless steel cotter pin. Any material alterations or substitutions must be approved by the Engineer prior to fabrication.

The manufacturer's quality procedures plan and manual shall be subject to approval by the Engineer.

Certified copies of the results of the tests conducted by the manufacturer shall be furnished to the Engineer in accordance with the requirements of NYSDOT §715-01, Structural Steel.

- C. *Pivot Pins:*** Pins material shall at a minimum meet the requirements of (A 668) Class F Galvanized, and the galvanizing shall meet the requirements of (ASTM A 153) with a minimum thickness of 4 mils. Any material alterations or substitutions must be approved by the Engineer prior to fabrication. Pivot pins shall be furnished by the socket supplier.

Certified copies of the results of the tests conducted by the manufacturer shall be furnished to the Engineer in accordance with the requirements of NYSDOT §715-01, Structural Steel.

- D. *Pivot Plates, Washer Plates, Pin Caps and Socket Spacers:*** Plates, spacers and pin caps shall conform to ASTM A709, Grade 50 galvanized, and the galvanizing shall meet the requirements of (ASTM A 153) with a minimum thickness of 4 mils. Pivot plates and pin caps shall be furnished by the socket supplier.

- E. *Neoprene Spacers:*** Neoprene spacers shall be furnished to the dimensions shown on the plans and shall conform to §728-03 of the NYSDOT Standard Specifications.

## **CONSTRUCTION DETAILS**

This work, including fabrication, transportation, and erection shall be in accordance with the provisions of the SCM. Shop drawings shall be prepared, approved, and distributed in accordance with the requirements of the SCM.

### **A. Testing of Strand Wire:**

Prior to fabrication, the zinc-coated steel wire used in the manufacture of the structural strand shall be tested, in the presence of the Engineer or authorized representative, for physical properties in accordance with paragraph 5 of ASTM A 586 and the following:

1. The test for tensile strength shall be made on samples of not less than 10 percent of the coils of any lot of zinc-coated wire. If tests of any of these coils fail to meet the requirements, the Engineer may require that all coils of such lot be tested and shall reject all individual coils which do not meet the requirements for tensile strength.
2. The test for stress at 0.7 percent extension shall be made on samples of not less than 10 percent of the coils of any lot of zinc-coated wire. If tests of any of these coils fail to meet the requirements, the Engineer may require that all coils of such lot be tested and shall reject all individual coils which do not meet the requirements for stress.
3. Tests for zinc coating (weight and adherence) shall be made on samples of not less than 5 percent of the coils of any lot of zinc-coated wire. If tests of any of these coils fail to meet the requirements, the Engineer may require that all coils of such lot be tested. Unless at least 80 percent of the coils pass the test, the entire lot shall be rejected. Any coil failing to meet the requirements shall be rejected.

**B. Fabrication of Structural Strand:**

The strand shall be manufactured to meet or exceed the strength requirements specified herein. Documentation of compliance with these requirements and the make-up of the wires in the strand shall be submitted to the Engineer.

1. The strand shall be manufactured on machines of sufficient size to ensure good workmanship and shall be fabricated in the greatest length possible. Once the manufacture of the strand has been started, no changes shall be made as to the grade of wire, construction or lay of the strand, or other factors that would affect the uniformity of the finished product. Straightening of bent wires shall not be permitted. Any kinked or damaged strands shall be rejected.
2. All strands shall be pre-stretched by stressing each strand with a load equal to 55 percent of the breaking strength in straight tension. The load shall be maintained and/or repeated until the strand reaches a stable condition and shows a well-defined and uniform elastic stretch and recovery under stressing.
3. The modulus of elasticity of each pre-stretched length of strand shall be determined in accordance with ASTM A 586. This information shall be submitted to the Engineer.
4. The strand shall be measured in the shop for the various hanger lengths while under tension equal to one-half of the full dead load as shown on the plans and cut for use in the hangers. When cutting the strand an allowance shall be made for obtaining test specimens for strand and socket testing as specified in subsection C, Testing of Structural Strand.
5. At the time the strands are measured, a continuous paint stripe shall be made on one side of the strand for its entire length to assure correct alignment of the strands during erection.
6. Strand identification marks shall be provided in order to facilitate erection. Each strand shall have a legible waterproof tag firmly attached to it giving the fabricated length and the location where it is to be installed on the bridge.
7. Strands shall be properly coiled or rolled on reels in such a manner so that no permanent deformation of wires in the strand will occur. Strands shall be stored in a well-protected location. Handling, transporting and storing of strands shall be in accordance with the AISI Wire Rope User's Manual. Any strands or sockets damaged by handling, transporting or storing shall be replaced by the Contractor at no cost to the City.

**C. Testing of Structural Strand:**

From each pre-stretched length of the strand, one piece not less than (100") long shall be cut and tested, in the presence of the Engineer, to demonstrate the strength of the strand and sockets as specified in paragraph 9 of ASTM A 586. The ends of the test pieces shall be socketed with sockets selected at random from those that are to be used in filling the order. The material and method of socketing shall be the same for both the test pieces and the production strand. Sockets shall be attached to the jaws of the testing machine in such a manner that stresses in the socket will reproduce those expected when the socket is installed in the bridge (i.e. pins at the lower socket and anchor rods at the upper socket). Positive means shall be provided to assure that the strand does not twist after pre-stretching and that the upper and lower sockets are kept free from rotating with respect to each other. The first six test pieces and any others directed by the Engineer shall be stressed to destruction in a suitable testing machine. All pieces shall be tested to not less than the minimum specified breaking strength. The sockets in every instance shall be of sufficient strength to produce failure in the strand material. If, after six or more tests of pre-stretched strands have been made, the Engineer finds that the strength and elasticity have sufficient uniformity, the

Engineer may direct that the testing be reduced to two pieces, one from each end of each manufactured length of strand instead of one from each pre-stretched length. The sockets used for these tests shall not be used in the bridge.

1. If a socket should break during the strand testing specified above, two additional sockets shall be selected and attached to strand and the test repeated. This testing shall continue until the Engineer is satisfied with the socket reliability, at which point the lot shall be accepted. If 10 percent or more of all the sockets tested break at a load less than the specified minimum breaking strength, the entire lot shall be rejected and new ones, of greater resistance, shall be furnished.

#### **D. Socket Finishing:**

Sockets shall be neatly finished to the exact dimensions shown on the approved shop drawings. Each socket shall be visually examined for defects. Defects judged to be unacceptable by the Engineer shall be repaired to the satisfaction of the Engineer, or the socket shall be replaced by a new casting. The Engineer shall be the sole judge as to the reparability of a socket. To determine the type and amount of repair, where repairs are required, the Contractor shall perform such additional non-destructive tests at each unacceptable defect as the Engineer may consider necessary. Such tests may be radiograph, ultrasonic, magnetic particle, or liquid penetrant as the Engineer may direct or approve and shall be at the sole expense of the Contractor. Weld preparation shall be examined by magnetic particle or liquid penetrant methods in accordance with (ASTM A 781, S5). Repaired areas shall be retested using magnetic particle or liquid penetrant methods as directed or approved. At the Engineer's option, large repairs may require heat treatment in accordance with (ASTM A 148) requirements. The Engineer shall be the sole judge as to the suitability of a repaired socket.

1. Socket manufacturer shall supply each strand socket drawing along with calculations for each socket. Only cast strand sockets designed for strand shall be supplied.
2. Socket manufacturer and steel fabricator shall review each other's drawings ensuring that all pin and jaw dimensions meet. It is suggested that the socket manufacturer supply one each type cast open strand socket pin to steel fabricator for final fabrication.
3. Holes for socket pins shall be line-bored to final dimensions.
4. After fabrication, it shall be demonstrated that the nuts, when turned by hand, move freely on the threads of the anchor rods for the Type 6 anchor sockets.

#### **E. Socket Installation:**

The sockets shall be attached to the strands in accordance with the procedures submitted to the Engineer prior to socketing.

1. Sockets shall be attached to the structural strand at 20% of the minimum breaking strength of each diameter strand.
2. The wires of a strand, after being splayed in preparation for socketing, shall be cleaned of grease and other impurities by a carefully controlled process that will assure no harm is done to the wire galvanizing coating. After socketing, the strand wires adjacent to the socket shall be relubricated.
3. The basket of the socket shall be preheated to expel moisture and to prevent the molten zinc from congealing before it has completely filled the narrow lower end of the basket. Strands shall be rejected if the socketing procedure results in bare wires within the socket.
4. The zinc used to attach the sockets to the strand shall comply with ASTM B 6, High Grade,

or better. The molten zinc shall be placed at the lowest practical temperature, usually within the range of 496°C (925°F) to 524°C (975°F) and never over 538°C (1000°F), so as to minimize the effect of heat on the strands. The zinc temperature at the time of pouring shall be recorded for each socket and submitted to the Engineer. Filling of the socket with molten zinc shall be performed in one continuous operation.

5. Care shall be taken to ensure socket and strand alignment and that the lengths of the hanger after socketing are correct. A tabulation of shop-measured lengths of each hanger shall be submitted to the Engineer for use in erecting the hangers.

**F. Pivot Plates, Pivot Pins, and Pin Caps:**

Fabrication of pivot plates, pins, and pin caps shall conform to §564-3 of the NYSDOT Standard Specifications. Pivot plates and pin caps shall be galvanized, and the galvanizing shall meet the requirements of (ASTM A 153) with a minimum thickness of 4 mils.

**G. Delivery to Job Site:**

The hanger assemblies shall be inspected and approved for shipping by the Engineer. The hanger assemblies shall be transported to the job site in a manner such that no permanent deformation of the bridge strand wires occurs. Any bridge hanger assembly damaged by handling, transporting or storing, shall be replaced by the Contractor at no cost to the City.

**H. Hanger Erection:**

**Subcontractor Qualifications**

Hanger installation, stressing, and adjustments shall be supervised by the hanger supplier. The hanger supplier must have a representative on site full time during all such operations. The representative shall have previous experience with strand-by-strand installation of hangers/stay cables of similar or larger size on at least two other projects within the previous five years.

The Contractor shall submit qualification for all subcontractors and supervisors and a quality procedures manual to the Engineer for review.

Hangers shall be erected with sockets in the same relative position to each other as existed when strands were measured and with paint stripe in a straight line. Extreme care shall be taken to prevent twisting of the strands during erection and field adjustments to hanger tension and roadway profile grade in accordance with the following:

1. Field adjustments to hanger tension and roadway profile grade shall be made underfloor system framing dead load and again under full dead load. Each strand shall be tensioned to one-half of the hanger force shown on the plans. Strands shall be tensioned simultaneously at each panel point on each side of the bridge using calibrated jacks in accordance with the approved jacking procedure.
2. The Contractor shall submit a written hanger installation procedure to the Engineer for approval. The Contractor shall submit to the Engineer the complete method of erecting and tensioning the hanger assemblies in accordance with Section 204 of SCM.

**I. Painting**

All ferrous metal surfaces, other than stainless steel and hot dipped galvanized surfaces of the hanger cable system, shall be painted with approved paint system.

Finish coat color shall be the color of the arch span. Bearing plates, guide pipes, and tower deviation pipes shall be galvanized in accordance with ASTM M 111M (ASTM A123M), Standard Specification for Zinc (Hot-Dip Galvanized) Coating on Iron and Steel Products, six

kilograms per square meter.

#### **J. Handling**

The Contractor shall develop procedures to assure that hanger cable components will not be damaged during handling.

Hangers shall be protected from corrosives, heat, abrasion and other harmful effects throughout the fabrication and installation.

Spreader bars and slings or other appropriate devices shall be used to handle all cables. The minimum bending radius for all such cables during handling shall be 25 times the diameter of the cable sheath. Slings or similar devices shall be positioned on the cable to carry both the anchor and adjacent cable in a tangent position, preventing bending of the cable at the anchor. Slings and spreader devices shall be padded to prevent damage to the cable sheath.

All damage to hangers or components thereof shall be evaluated by the Engineer and remedied prior to installation of the cable. Damaged strand shall be replaced. Damage to non-load carrying components shall be repaired to the Engineer's satisfaction prior to the installation of the hangers. Repair procedures shall be submitted for review and approval prior to the commencement of work.

#### **K. Working Drawings**

All working drawings shall be in accordance with the provisions of section 2 of the SCM.

##### 1) Shop Drawings

The contractor shall prepare and submit shop drawings in accordance with Section 202. Shop Drawings in the SCM. The Contractor shall submit copies of the detailed shop drawings to the Engineer for approval.

##### 2) Erection Drawings

The contractor shall prepare and submit erection drawings in accordance with Section 204. Erection Drawings in the SCM.

The Contractor shall submit drawings illustrating fully their proposed method of hanger erection and installation. It is intended that the hangers are prefabricated and installed as one system. Erection drawings shall show details of all lifting and handling devices, and attachments to the hangers: the sequence of erection, location, and capacities of lifting equipment as well as the location of lifting points on the hangers, and weights of the hangers.

The plan and drawings shall be complete in detail for all anticipated phases and conditions during hanger installation. Design calculations, sealed by a Professional Engineer registered in the State of New York, shall be submitted by the Contractor to the Engineer for approval which will demonstrate compliance with the PTI Recommendations and these specifications.

#### **L. Certificate of Compliance:**

The Contractor shall submit records of all tests results and Certificates of Compliance to the Engineer indicating that all materials, testing and fabrication of the hanger assemblies and dampening devices meet the requirements specified herein.

#### **METHOD OF MEASUREMENT**

Payment will be made at the lump sum price bid.

**BASIS OF PAYMENT**

The price bid shall include the cost of testing, fabricating, transporting and installing bridge hanger assemblies as shown on the plans, and all field adjustments to hanger tension and roadway profile grade required or ordered.

**A. Progress Payments – Lump Sum:**

These shall be calculated by multiplying the lump sum price bid less 20% by the ratio which represents the bridge hanger assemblies erected during the payment period in question less any partial payments made for the hanger assemblies erected. The ratio will be computed by dividing number of the erected bridge hanger assemblies by the Total Quantity of bridge hanger assemblies. The remaining 20% will be paid upon final adjustment and acceptance of all hangers as specified under Construction Details §H, Hanger Erection (refer to NYSDOT §109-03).

Progress Payment Formula:

$$\text{Progress Payment Amount} = ((\text{LS Price Bid} - 20\%) \times (x/y)) - z$$

x – No. of Hangers Assemblies Installed/payment period

y – Total no. of Hanger Assemblies

z – Partial payment (if any) made on x Hanger Assemblies Installed in the payment period

If the Contractor elects, partial payments may be made per NYCDOT Standard Highway Specifications Section 1.06.35. Partial payment for material shall be deducted prior to making progress payments as stated above.

Payment Will be made under:

<b>Item Number</b>	<b>ITEM</b>	<b>Pay Unit</b>
564.02010211	Bridge Hanger Assemblies	Lump Sum

**END OF SECTION**

## SECTION 572.0002NN01 – METALIZING

### **DESCRIPTION**

This work shall consist of furnishing all materials and equipment necessary and to apply metalizing in accordance with the contract documents and as directed by the Engineer.

### **Qualification of Metalizing Contractor**

The metalizing contractor performing the work shall document previous experience in providing surface preparation for metalizing and metalizing application services in the shop and field, with a minimum history of three (3) successfully completed projects of similar complexity. The contractor shall be certified per the requirements of SSPC-QP 3.

The contractor shall submit experience and qualification records of all personnel performing the work.

### **Qualification of Thermal Spray Technicians and Personnel**

The thermal spray technicians shall be qualified in accordance with ANSI/AWS C2.16 with a minimum passing adhesion of 700 psi, and must hold a certificate of satisfactory completion of training from the equipment manufacturer. The equipment used for qualification shall be equivalent to that used in production.

Each metalizing shift shall have at least one metalizing supervisor, meeting the thermal spray technician requirements, and who will additionally have a minimum of three years documented satisfactory metalizing experience on similar projects.

An SSPC certified Quality Control Supervisor shall be on the thermal spray company's staff and shall provide a Quality Control Plan to the Engineer prior to the onset of work. The Quality Control Supervisor shall meet the requirements of Thermal Spray Supervisor as per SSPC-QP 6. Additionally, the Quality Control Supervisor shall have a minimum of five (5) years experience with satisfactory performance in abrasive blast cleaning of steel surfaces according to SSPC-SP 10 and shall have performed similar duties on two successful metalizing projects.

### **Codes and Standards**

The provisions set forth in the latest issue of the following codes and standards shall apply unless otherwise indicated in the contract documents:

ASTM B 833, Standard Specification for Zinc Wire for Thermal Spraying (Metalizing).

ASTM C 633, Test Method for Adhesive/Cohesive Strength of Flame Sprayed Coatings.

ASTM D 4285, Method for Indicating Oil or Water in Compressed Air.

ASTM D 4417, Test Method for Field Measurement of Surface Profile of Blasted Steel.

NACE Standard RP0287, Field Measurement of Surface Profile of Abrasive Blast Cleaned Steel Surfaces Using a Replica Tape.

ASTM D 4541, Test Method for Pull-Off Strength of Coating Using Portable Adhesion Testers.

ASTM E1920, Standard Guide for Metallographic Preparation of Thermal Sprayed Coatings.

ASTM E2109, Standard Test Methods for Determining Area Percentage Porosity in Thermal Sprayed Coatings.

ANSI/AWS C2.16, Guide for Thermal-Spray Operator Qualification

ANSI/AWS C2.18, Guide for the Protection of Steel with Thermal Spray Coatings of Aluminum, Zinc, and Their Alloys and Composites.

SSPC-CS 23.00/AWS C2.23M/NACE No. 12, Specification for the Application of Thermal Spray Coatings (Metalizing) of Aluminum, Zinc, and their Alloys and Composites for the Corrosion Protection of Steel.

SSPC Publication, the Inspection of Coatings and Linings: A Handbook of Basic Practice for Inspectors, Owners, and Specifiers.

SSPC-AB 1, Mineral and Slag Abrasives.

SSPC-AB 2, Specification for Cleanliness of Recycled Ferrous Metallic Abrasives.

SSPC-AB 3, Ferrous Metallic Abrasives.

SSPC-PA 1, Shop, Field, and Maintenance Painting of Steel.

SSPC-PA 2, Measurement of Dry Coating Thickness with Magnetic Gages.

SSPC-QP 3, Standard Procedure for Evaluating Qualifications of Shop Painting Applicators

SSPC-QP 6, Standard Procedure for Evaluating the Qualifications of Contractors Who Apply Thermal Spray (Metalizing) for Corrosion Protection of Steel and Concrete Structures

SSPC-SP 1, Solvent Cleaning

SSPC-SP 10/NACE No. 2, Near-White Blast Cleaning.

SSPC-SP 11, Power Tool Cleaning to Bare Metal

SSPC-VIS 1, Guide and Reference Photographs for Steel Surfaces Prepared by Dry Abrasive Blast Cleaning.

### **Quality Control Plan**

Prior to the start of work, the Contractor's QC Supervisor shall provide a written quality control plan and submit it to the Engineer for approval. The plan shall include the procedure to be followed and equipment to be used for all processes outlined herein, including surface preparation and metalizing and seal coat application. The plan shall include a method of adhesion testing, thickness measuring, bend test protocol, testing frequency, and MSDS sheets for material utilized on the project. The plan shall outline the quality assurance procedures and any safety precautions that must be followed by workers and inspectors. No work shall commence until the Engineer has approved the plan.

### **Job Reference Standard (JRS)**

A job site pass/fail Job Reference Standard (JRS), representative of the work to be performed, shall be prepared by the metalizing applicator. The JRS will be used to evaluate the suitability of the application process. The JRS shall be made on a steel plate approximately 18 in. x 18 in. x 0.25 in. and shall be made with the actual equipment, materials, and process parameters and procedures (surface preparation, metalizing, sealing, and testing) that shall be used for the contracted work. The JRS shall be made in similar environmental conditions as the work to be performed. Thickness measurements and adhesion tests shall be performed on the JRS per this specification. The JRS will be deemed unsatisfactory if any of the measurements or test results is less than the values indicated herein.

Metallographic testing shall be performed, in accordance with ASTM E1920 and ASTM E2109, on a JRS meeting the requirements of this section. Porosity of the metalized coating shall be less than 10% with less than 5% air inclusions in the film, and shall be fully bonded to the substrate with no air pockets between the coating and substrate. There shall be no interconnected porosity to the substrate for the contract specified thickness, intended technique of application, number of passes, and thickness applied per pass.

For steel assemblies exhibiting acute angles between structural members to be metalized in the shop after assembly, a similarly scaled steel, blasted mockup must be put together emulating the angles encountered. This mockup shall be metalized by the coating applicator, disassembled and adhesion testing shall be performed on the metalizing in the acute angle, per these specifications. If the mockup fails the adhesion test, the applicator shall change the application technique and/or adjust equipment to obtain proper adhesion results, thickness measurements and appearance requirements in acute angles.

### **Job Control Record**

The Contractor shall keep a Job Control Record (JCR), detailing the essential job information and the in-process quality control checkpoints required by this standard. The JCR shall include information on safety precautions, and the equipment, parameters, and procedures for surface preparation, thermal spraying, and sealing. Failure to perform production work in a manner consistent with the JCR guidelines will be cause for rejection.

## **MATERIALS**

### **A. METALIZING**

Certified alloy wire is required, and shall be composed of 85% zinc and 15% aluminum by weight. Wire shall meet the requirements of ASTM B-833 Standard Specification for Zinc and Zinc Alloy Wire for Thermal Spraying (Metalizing) for the Corrosion Protection of Steel. The Contractor shall submit a certificate with results of testing for chemical analysis to the Engineer, for each lot of wire used on the job. The Contractor shall obtain written certification from the manufacturer of the alloy and will provide the certifications for each lot of wire a minimum of five business days prior to commencement of metalizing.

The metalizing 85/15 alloy shall have a minimum tensile bond of 700 psi.

### **B. ABRASIVE FOR BLAST CLEANING**

Blast media shall be angular steel grit, angular aluminum oxide, or angular crushed slag, evaluated per SSPC-AB 3 for new abrasive material, and shall be capable of producing an angular anchor tooth profile. If abrasive material is to be recycled, the abrasive material shall be evaluated prior to each reuse per the requirements of SSPC-AB 2. Use of silica sand, steel shot, or any other abrasives that result in a round surface profile is prohibited.

### **C. SEALER**

Sealer shall be UV resistant and be a urethane or epoxy polyamide penetrating sealer, type as recommended by the supplier for use on metalized surfaces. The sealer shall be VOC compliant for use in New York State. Sealer shall be of such viscosity to penetrate pores in metalized coating.

### **D. PAINT**

Paint shall be a two-coat system with an polyamide epoxy primer and an aliphatic urethane, suitable for exterior use. The paints shall have a VOC level below 340 g/L or 2.8 lb/gal, shall

be produced by the same manufacturer, and the prime and top coat shall be compatible. The primer shall be specifically formulated for use over metalized surfaces.

## **E. SUBMITTALS**

The metalizing applicator shall submit the detailed procedures for surface preparation, metalizing application, and application of sealer coat, conforming to these specifications. The procedures shall detail the equipment, application process, in-process quality control, and Job Control Record to be used for the contract work. The information shall include:

1. Detailed procedures for surface preparation, thermal spraying, seal coating, and the in-process quality control checkpoints.
2. Equipment (surface preparation, thermal spraying, seal coating, and the in-process quality control) to be used and for which the detailed procedures apply.
3. Product Data and MSDS sheets for sealer.
4. Blasting media, thermal spray feedstock materials, and seal coat product.
5. Job Reference Standard.
6. Job Reference Standard test results report.
7. Job Control Record.
8. Repair of defective coatings per ANSI/AWS C2.18.
9. Certification of Class B slip coefficient and creep resistance. The certification shall include the written test results, including the thickness range required to meet the certification. Certification of Class B slip and creep resistance is not required for metalized to metalized faying surfaces meeting the requirements of this specification.

This information shall be submitted at least 10 work days prior to the schedule start of the Job Reference Standard (JRS).

## **CONSTRUCTION DETAILS**

### **A. SURFACE PREPARATION**

Prior to blast cleaning, steel surfaces shall be Solvent Cleaned in accordance with SSPC-SP 1, Solvent Cleaning, to remove all visible oil, grease, dirt, salt, and other contaminants. Then, all surfaces to be metalized shall be cleaned to SSPC-SP 10, Near-White Blast Cleaning, standards. All cleaning and coating shall be performed at the same facility. Surface finish and cleanliness shall be confirmed according to SSPC-VIS 1 standards. In the event of a dispute, the written SSPC SP-10 standard will take precedence.

Unacceptably hard surfaces, as defined by section 602 of the NYSDOT Steel Construction Manual, shall be removed by grinding, machining, or approved heat treating procedures, prior to abrasive blasting.

The substrate shall have an angular anchor tooth profile of 3 to 5 mils. Surface Profile measurements shall be made using X-course profile tape and a micrometer, as outlined in ASTM D4417. "Standard Test Methods for Field Measurement of Surface Profile of Blast Cleaned Steel/NACE Standard RP0287, Field Measurement of Surface Profile of Abrasive Blast Cleaned Steel Surfaces Using a Replica Tape." Spot measurements shall be made approximately every 2000 ft<sup>2</sup> for automated blasting or 200 ft<sup>2</sup> for manual blasting. Take

three measurements for each spot in an area approximately 1.5 in<sup>2</sup>. Average the measurements and record in the Job Control Record.

Compressed air shall be free of oil and water and shall meet ASTM D4285, method for Indicating Oil or Water in Compressed Air. Utilize a compressed air system capable of delivery at the nozzle of 125 cfm at 120 psi. To minimize any contamination, use an oil/water separator on the airline. 120 psi of compressed air maintains the proper atomization of the molten wire producing the optimum spray pattern.

## **B. SYSTEM REQUIREMENTS**

Only spooled metalizing wire, which is properly drawn, spooled and packaged, shall be used.

The metalizing equipment shall be set up, calibrated, and operated according to the manufacturer's instructions and technical manuals or the metalizing applicator's refinement thereto and as validated by the Job Reference Standard.

Spray parameters shall be set for spraying the specified thermal spray material and, at a minimum, be validated with the bend test. A bend test shall be satisfactorily performed at the beginning of crew and shift change.

A copy of the spray parameters used shall be attached to the Job Control Record.

## **C. SUBSTRATE CONDITION**

The steel surface temperature shall be at least 5°F above the dew-point.

For flame spraying, preheat the initial starting area to a minimum of 250°F to prevent condensation of moisture in the flame onto the substrate. Validate preheating and non-preheating requirements with a tensile bond measurement and a bend test.

Time between the completion of the final anchor-tooth blasting (or final brush blasting) and the completion of the thermal spraying shall be no greater than six hours for steel substrates. In high-humidity and damp environments, shorter holding periods shall be used. If rust bloom or a degraded coating appears at any time within the six-hour window, the procedure outlined in Section F, Surface or Coating Degradation shall be followed.

### **Extension of Time of Application**

In low-humidity environments or in enclosed spaces using industrial dehumidification equipment, it will be possible to retard the oxidation of the steel and hold the surface finish for more than six hours. The metalizing applicator, with the approval of the Engineer, can validate a holding period greater than six hours by determining the acceptable temperature-humidity envelope for the work enclosure by spraying and analyzing bend coupons and tensile-bond coupons.

A 1-mil to 2-mil flash coat of the metalizing may be applied within six hours of completing surface preparation to extend the holding period for up to four further hours beyond the complete application of the flash coat. The final metalizing thickness, however, shall be applied within four hours of the completion of the application of the flash coat provided the metalizing can be maintained free of contamination.

Validate the use of the flash TSC holding period with a tensile-bond measurement and a bend test.

- Clean and abrasive blast a representative job area and three bend-test coupons.

- Apply a flash metalizing to the representative job area and the three bend coupons.
- Wait the delay period in representative environmental conditions and apply the final metalizing thickness.
- Perform adhesion test and bend test on coupons.
- Flash metalizing and holding period are acceptable if the tensile bond and the bend test are satisfactory.

#### **D. METALIZING**

The applied 85/15 alloy metalizing thickness shall be a minimum of 12 mils, with a tolerance of - 0 and + 4 mils. For each coated component, the applied thickness shall be measured using a SSPC PA2 type 2 fixed probe gauge properly calibrated per certified coating thickness calibration standards, and measurements shall be recorded in the Job Control Report (JCR). Use a measurement line to measure the peaks and valleys of the metalizing, taking the average value of five readings along a line at 1.0 in. intervals. For complex geometries and geometric transitions, use a measurement spot approximately 1.5 square inches, and do not measure the peaks and valleys of the metalized coating. Record all measurements in the JCR. If upon inspection, and prior to sealer application, the metalizing thickness is less than the above stated requirements, the applicator shall apply additional metalizing to meet the thickness requirements.

No coating shall be applied unless the following conditions are met:

- The receiving surface shall be clean and absolutely dry.
- The surface temperature and ambient air temperature are as recommended by the coating equipment's manufacturer, except in no case shall coating work be performed when surface and ambient air temperatures are less than 40°F.
- The receiving surface temperature shall be at least 5°F above the dew point.
- The relative humidity shall not exceed 85%.

All coating applied in violation of these conditions shall be completely removed, and the affected surface cleaned and recoated in accordance with the stated requirements at no additional cost to the City.

Any staining that does occur shall be removed in a manner that does not cause damage to the seal or metalized coatings, at no cost to the City.

Surface Roughness: Surface roughness of the metalized coating shall be less than 4 mils in order to avoid unfilled valleys and low areas in the film.

#### **E. SEALER**

Sealer shall be applied and cured according to the paint manufacturer's instructions for use with metalizing, or as directed by the Engineer.

The seal coat shall be thin enough to penetrate into the body of the metalizing and seal the interconnected surface porosity. Typically the seal coat is applied at a spreading rate resulting in a theoretical 1.5 mil dry-film thickness.

Sealer shall be applied as soon as possible after thermal spraying, but shall be applied within eight hours after application of metalizing. If a sealer cannot be applied within eight hours, it shall be verified that the metalizing (a) has not been contaminated by visual inspection (10x), and (b) is dust-free (10x) using the clear cellophane tape test per ISO

8502-3 before applying the sealer.

If moisture is present or suspected in the pores of the metalizing, the steel shall be heated to 250°F to remove the moisture prior to seal coat application. When possible, the steel shall be heated from the reverse side of the metalizing to minimize oxidation and contamination of the metalizing prior to sealing.

During application of the seal coat, it shall be visually validated that there was complete coverage of all intended areas. Companion steel coupons positioned near the metalizing shall receive a seal coat as well. The wet and dry film thicknesses of the seal coat on these companion coupons shall be used to verify that the correct thickness of seal coat is being applied to the metalizing. Measurements shall be recorded in the JCR.

The sealer shall not be applied to faying surfaces prior to assembly. Faying surfaces of all bolted connections shall be masked prior to application of the seal coat. Touch-up field sealant shall be applied after assembly of the connection.

#### **F. SURFACE OR COATING DEGRADATION**

If rust bloom, blistering or a degraded coating appears at any time during the application of the metalizing, the following procedure applies:

1. Stop spraying.
2. Mark off the satisfactorily sprayed area.
3. Call the Thermal Spray Inspector/Foreman to observe and evaluate the error.
4. Report the deficiency to the Engineer and record the deficiency.
5. Repair the unsatisfactory area by removing the degraded metalizing, re-blast to a minimum near-white metal finish (SSPC-SP 10 standard), and returning to the specified anchor tooth profile depth.
6. Recoat the blasted area as per this specification.
7. Record the actions taken to resume the job in the JCR.

#### **G. FIELD REPAIRS**

The only field work allowed to be done under this item is touch-up work after all steel erection and all concrete placement has been completed. All areas requiring field repairs shall be clearly marked. All the requirements of this specification shall apply to field coating material with the following modifications:

1. All dirt, grease and other foreign matter shall be removed in accordance with SSPC-SP 1, Solvent Cleaning. Clean the damaged area of all loose and cracked coating by power tool to bare metal in accordance with SSPC-SP 11, Power Tool Cleaning to Bare Metal.
2. Roughen the damaged area and the surrounding 2 inches to produce a suitable anchor for the coating. All repaired areas shall be tested for proper anchor tooth profile in accordance with ASTM D4417 and as per this specification.
3. All damage to the coating system shall be corrected by the contractor in accordance with the requirements of this specification and to the satisfaction of the Engineer at no additional cost to the City.
4. The overlap of thermal spray edges shall be tested for proper adhesion at each repair location in accordance with this specification.

#### **H. ADHESION TEST**

Random adhesion testing shall be performed for each coated component, utilizing self

aligning portable pull-off adhesion testing equipment, in accordance with ASTM D 4541 standards. The minimum tensile bond value shall be 700 psi.

Use adhesive recommended by the instrument manufacturer, or equivalent. Attach adhesive manufacturer's instructions to the job control record.

One portable tensile-bond measurement shall be made every 500 ft<sup>2</sup>. If the tensile bond is less than the contract specification, additional tensile bond measurements shall be made to identify the limits or boundaries of the degraded metalizing. The degree of added testing that is necessitated by coating deficiencies will be solely determined by the Engineer, and shall be performed at no added cost to the City. Any degraded metalizing shall be removed and reapplied as per Section F, Surface or Coating Degradation. The tensile force shall be measured to 700 psi. The tensile force shall then be reduced and the tensile fixture removed without damaging the metalizing.

#### **I. BEND TEST**

Conduct a bend test at the beginning of each work shift or crew change:

1. Use carbon steel coupons of approximate dimensions 2 in. x 4 in. to 8 in. x 0.050 in.
2. Surface preparation according to contract specification.
3. Spray 12-mil to 15-mil thick metalizing in crossing passes, laying down approximately 3 to 4 mils for each pass.
4. Bend coupons 180° around a 0.5-in. diameter mandrel.
  - a. Bend test passes if there is no cracking or only minor cracks with no spalling or lifting (by a knife blade) from the substrate.
  - b. Bend test fails if the coating cracks with lifting (by a knife blade) from the substrate.

Bend test shall be performed on coupons without sealant coats.

#### **J. WEATHER CONSIDERATIONS:**

Thermal spraying in low-temperature environments (below freezing):

Substrate shall meet the surface temperature and holding period specified in Section C, Substrate Condition. No moisture or condensation is permissible on the surface during surface preparation and thermal spraying.

Qualify metalizing period with a tensile-bond measurement and a bend test. Meet the tensile bond and metallographic requirements specified herein.

#### **BASIS OF PAYMENT**

The cost of furnishing all labor, materials, and equipment necessary to satisfactorily complete the work must be included in the price bid for items 564.0501 and 564.0502.

END OF SECTION

**SECTION 619.70040011 - PROTECTIVE SAFETY SHIELDING OVER HIGHWAY****DESCRIPTION**

This work shall consist of furnishing protective safety shields at the locations specified in the plan.

**MATERIALS****Structural:**

- 1) Structural steel shall conform to the requirements of Section 564 *Structural Steel*.

**Timber and Lumber:**

- Timber and Lumber shall conform to the requirements of Section 594 *Timber and Lumber*
- Stress graded timber and lumber shall conform to the requirements of §712-14 *Stress Graded Timber and Lumber*.

**CONSTRUCTION DETAILS**

The Contractor shall be responsible for the shield design. Calculations, drawings, details and installation procedure of the shield shall be prepared by a licensed Professional Engineer. A minimum of 90 work days prior to installation, the contractor shall submit design details to the participating railroad and the Engineer for approval.

The Contractor shall construct shields to the limits shown on the plans, in accordance with the horizontal and vertical clearance and design loads specified in the railroad or highway notes on the plans or in the contract documents.

The Contractor shall remove the protective safety shielding once the shielding is no longer needed. **METHOD OF MEASUREMENT**

The quantity of safety shields to be measured for payment will be in square feet measured to the nearest whole square foot, from the limits shown on the plans.

**BASIS OF PAYMENT:**

The unit price bid per square foot shall include the cost of furnishing all labor, equipment and materials necessary to complete the work. Progress payments will be made as follows: 90% of the unit price bid for initial installation during construction and 10% of the unit price bid for final removal, at each location or construction stage.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>619.70040011</b>	<b>Protective Safety Shield Over Highway</b>	<b>SF</b>

## SECTION NYC-180002 – METAL ARCHITECTURAL MESH

### **DESCRIPTION**

This work shall consist of furnishing and installing tensioned metal architectural mesh as shown on Contract Drawings, and as directed by the Engineer. Each tensioned mesh panel shall be fastened with the associated connection plates, bolts, nuts, washers, stiffeners, structural steel assemblies and appurtenances, and all field adjustments to mesh tension.

### **MATERIALS**

**Architectural Mesh Tension System:** Large-scale, rigid open weave mesh.

- a. Mesh
  - i. Mesh Basis of Design Pattern: Cambridge Tartan (1" x 1" Mesh)
  - ii. Material: Stainless Steel.
  - iii. Maximum Width: 120 inches.
  - iv. Weight: 1.00 lb/sq. ft.
  - v. Open Area: 77 percent.
  - vi. Mesh Type: Rigid.
- b. Attachment System: Flat bar/Clevis
  - i. Material: Stainless Steel
  - ii. Mesh panel ends are clasped between flat bars with holes punched through bars. Clevises are mounted at the holes and used for tensioning the mesh panels.
- c. **Structural Steel:** All channels, plates, and angles shall conform to ASTM A709, Grade 50.
- d. **Fasteners:** High strength bolts shall be manufactured in accordance with the sizes designated on the Contract Plans, the geometric specifications included in ANSI B18.2.6 and material specification ASTM F3125 Grade A325. All high strength bolts shall be hot-dipped galvanized in accordance with ASTM A153 Class C. Nuts and Washers shall be manufactured in accordance with ASTM A563 and ASTM F436, respectively. All Nuts and Washers shall be hot-dipped galvanized in accordance with ASTM A153 Class C.

### **CONSTRUCTION DETAILS**

**Product Construction:** Manufacturers include:

- a. Cambridge Architectural, Cambridge Inc, [www.cambridgearchitectural.com](http://www.cambridgearchitectural.com), Tel: (866) 806-2385.
- b. Ametco Manufacturing Corporation, [ametco.com](http://ametco.com), Tel: (800) 321-7042.
- c. McNichols and Gage Architectural Products, <http://www.mcnichols.com/>, Tel (877)-884-4653.
- d. Or as approved by the Engineer.

**Examination:**

- a. Do not begin installation until anchor studs and base plate have been properly prepared to receive the products of this section.
- b. Verify dimensions, tolerances, and method of attachment with other work on-site.
- c. If anchor bolt and base plate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

**Cleaning and Preparation:**

- a. Clean surfaces thoroughly prior to installation.

- b. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

**Fabrication:**

- a. Make architectural mesh panels square in accordance with approved Shop Drawings.
- b. Fabrication compatible attachment system to satisfy structural and performance requirements.
- c. All fabrication and welding must meet the requirements of the New York State Steel Construction Manual (SCM).

**Engineering services:**

- a. Manufacturer to provide on-site assistance during mock-up installation as well as initial stage of project installation.
- b. Manufacturer to provide PE stamped calculations prepared by a Professional Engineer Licensed in the State of New York. Calculations must be provided to satisfy the following design criteria:
  - i. Mesh must limit deflection of fabric at mid-span to a max of 3" in 80 mile per hour winds, 3 seconds gust. Vertical post spacing may be adjusted to limit deflections.
  - ii. Fence mesh tension shall be limited to to 150 plf unloaded.
  - iii. Fence mesh tension shall be limited to to 300 plf loaded.

**Submittals:**

- a. Calculations.
- b. The Contractor shall submit Shop Drawings for approval prior to beginning the work and shall not begin work until all approvals are granted.
- c. Mesh Panel: Manufacturer's data sheets on each product to be used, including:
  - i. Preparation instructions and recommendations.
  - ii. Storage and handling requirements and recommendations.
  - iii. Installation methods.
- d. Submit Shop Drawings indicating the following:
  - i. Mesh series and pattern name.
  - ii. Panel sizes.
  - iii. Panel thickness.
  - iv. Installation details.
  - v. Vertical member locations.
  - vi. Provisions for reinforcement and anchoring.
- e. Verification Samples: For each finish product specified, two samples, minimum size 6 inches square, representing actual product, color, and patterns.

**Coordination:**

- a. Coordinate fabrication of metal mesh with fabrication of work on or in which the panels will be installed.
- b. Providing final size measurements to manufacturer in time to avoid delay in the construction schedule.

**Installation:**

- a. Install in accordance with manufacturer's instructions.
- b. Provide suitable means of permanent, positively connected anchorage acceptable to the engineer such as dowels, bar anchors, expansion bolts and shields, and toggles. Clipped anchors which could vibrate loose over time will not be acceptable.
- c. Anchor supports securely with allowance for necessary thermal movement and structural

- support.
- d. Erect metalwork square, plumb, straight, and true, accurately fitted, with tight joints and intersections.
  - e. Do not install component parts that are observed to be defective, including warped, bowed, dented, abraded and broken members.
  - f. Do not cut, trim, weld or braze component parts during erection in manner that would damage finish, decrease strength, or result in visual imperfection or failure in performance. Return component parts that require alteration to shop for re-fabrication, if possible, or for replacement with new parts.
  - g. Separate dissimilar metals and use gasketed fasteners, isolation shim, or isolation tape where needed to eliminate possibility of corrosive or electrolytic action between metals.

**Quality Assurance:**

- a. Manufacturer shall be a firm with engineering, manufacturing, and delivery capacity required for project. Manufacturer shall have successfully completed at least five (5) projects within the past 3 years of similar size, complexity, and utilizing similar systems.

**Protection:**

- a. Protect installed products until completion of project.
- b. Touch-up, repair or replace damaged products before Substantial Completion.

**Delivery, Storage, and Handling:**

- a. Store products in manufacturer's unopened packaging until ready for installation.
- b. Store products wrapped or otherwise protected and under clean and dry storage conditions until required for installation.
- c. Should any field condition or installation issue arise which results in excessive movement of the mesh or incompatibility with the bridge system, provide field and engineering support to promptly remedy the issue to the satisfaction of the Engineer.

**Warranty:**

- a. Provide 5 year from Substantial Completion joint Contractor/ Manufacturer warranty against defects and ensuring mesh performs as intended without excessive movement or failure of any components. Contractor shall repair or replace any conditions due to defective design and manufacture noted by the Engineer within the warranty period at no cost to the City of New York.

**METHOD OF MEASUREMENT**

This work will be measured on a lump sum basis.

**BASIS OF PAYMENT**

The lump sum price bid shall include the cost of furnishing all labor, materials, structural anchorage, installation of anchorage, and equipment necessary to satisfactorily complete the work.

**Payment will be made under:**

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>
NYC-180002	Metal Architectural Mesh	Lump Sum

**END OF SECTION**

## **Section ESCR 570 – Concrete Deterrent Furniture**

### **ESCR 570.01 INTENT**

Provide concrete deterrent furniture in accordance with the requirements of the Contract Documents.

### **ESCR 570.02 DESCRIPTION**

The work shall consist of constructing, furnishing and placing concrete deterrent furniture. Preparation for work shall include coordinated submittals, samples, visual and performance testing mock-ups, and installations as specified herein. Fabrication and installation of concrete deterrent furniture assemblies shall include coatings, embedments, trim, and reinforcement.

### **ESCR 570.03 REFERENCES**

General: Comply with the applicable provisions and recommendations of the referenced standards except as modified by governing codes and by the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.

- A) American Concrete Institute (ACI)
  - a. ACI 301: "Specifications for Structural Concrete for Buildings".
  - b. ACI 318: "Building Code Requirements for Reinforced Concrete".
  - c. ACI 315: "Details and Detailing of Concrete Reinforcement".
  - d. ACI 211.1: "Standard Practice for Selecting Proportions for Normal and Heavy Weight Concrete".
  - e. ACI 304: "Guide for Measuring, Mixing, Transporting and Placing Concrete".
  - f. ACI 347 "Guide to Formwork for Concrete".
- B) American Welding Society (AWS)
  - a. AWS D1.1: "Structural Welding Code - Steel".
  - b. AWS D1.4: "Structural Welding Code - Reinforcing Steel".
- C) Precast/Prestressed Concrete Institute
  - a. PCI MNL 117: "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products".
  - b. PCI MNL 121: "Manual for Structural Design of Architectural Precast Concrete".
  - c. PCI MNL 122: "Architectural Precast Concrete".
- D) Concrete Reinforcing Steel Institute (CRSI)
  - a. CRSI: "Manual of Standard Practice
  - b. CRSI-WCRSI "Placing Reinforcing Bars".

### **ESCR 570.04 MATERIALS**

#### **A) CONCRETE MATERIALS**

Cement, aggregate, water, admixtures, etc. shall comply with Section ESCR 3.05 – Concrete. Fabricator has the following two concrete options:

### Option 1 – Precast Concrete Materials

Concrete: Steel-reinforced, 5000 PSI minimum 28-day compressive strength, air-entrained (ASTM C260):

Match Engineer's sample for color, texture and finish.

Reinforcing Steel: ASTM A615, grade 60 unless otherwise specified and galvanized.

Welded Wire Fabric: ASTM 185, Grade 65, galvanized.

### Option 2 – Ultra High Performance Concrete (UHPC) Materials

Ultra High Performance Concrete:

1. Ultra High Performance Aggregate (UHPA) with PVA fibers.
2. Mechanical Properties at 28 days:
  - a. 16,000 psi compressive
  - b. 1,400 psi flexural
  - c. 6,500 ksi Young's modulus (E)
  - d. 1000 psi direct tension
3. Reinforcement: Stainless Steel fibers.
4. Match Engineer's sample for color, texture and finish.

## B) FORMWORK

Provide forms that are non-reactive with concrete and produce required finish surfaces with materials specified. Accurately construct forms, fluid-tight, and of sufficient strength to withstand pressures due to concrete placing operations and temperature changes. Maintain formwork to provide concrete deterrent furniture units of shapes, finishes, and dimensions indicated on contract drawings.

Formwork materials:

1. Resin-impregnated plywood.
2. Non-staining metal fasteners.
3. High density urethane.

Form release agent shall be colorless, non-staining and having no deleterious effects on concrete surfaces. Coating shall be compatible with form surface allowing minimal surface voids. Coating shall be compatible with final anti-graffiti coating.

## C) METAL MATERIALS

Metal work to be incorporated in to the furniture which will be exposed to view, shall consist of metal materials which are smooth and free of surface blemishes. Do not use materials which have stains and discolorations.

Surface Flatness and Edges: For exposed work provide materials which have been cold-rolled, cold-finished, cold-drawn, extruded, stretcher leveled, machine cut and otherwise produced to the highest commercial standard for flatness with edges and corners sharp and true to angle or curvature as required.

All exposed metal materials shall be Stainless Steel, AISI Type 316 with No. 4 finish.

1. Plate and Sheet: ASTM A666, Stretcher level sheets.
2. Bar Stock: ASTM A276.

## D) FINISHES

Custom concrete finish, as indicated on drawings and matching approved samples and mock-up.

E) ANTI-GRAFFITI COATING

Concrete Anti-Graffiti Coating at exterior face (public side): Provide non-sacrificial, water borne, breathable, non-yellowing, UV stable, VOC compliant, anti-graffiti coating and shall comply with NYSDOT specification item number 559.90010011.

**ESCR 570.05 MANUFACTURER**

Fabricators: Subject to compliance with requirements, fabricators offering products that may be incorporated into the Work include, but are not limited to, the following:

1. QCP, Norco, CA. - (347)931-3142
2. Southside Precast Products, Buffalo, NY - (716) 825-9300
3. David Kucera, Inc., Gardiner, NY - (845) 255-1044
4. Jersey Precast, Trenton, NJ - (609) 587-6068
5. Blakeslee Prestress Inc. Branford, CT – (203)-481-5306

Fabricator must submit a sample piece representative of at least one of the types of precast products on the project or provide the location of a recently finished product that is publicly accessible for approval to be pre-approved. Approval is at the sole discretion of the Engineer

**ESCR 570.06 FABRICATION**

A) General:

The Fabricator shall provide the concrete mix and structural design required to meet the requirements for precast concrete furniture as follows or as approved by the Engineer:

1. Fabricate the work of this section to the sizes and shapes indicated on the contract drawings and as indicated on the approved shop drawings.
2. Each unit shall weight between 2200 to 3000 lbs. in order to be lifted and transported using a standard size forklift and be maneuverable within a 15 foot wide space.
3. Provide color and finishes as indicated on the drawings and to match Engineer's samples.
4. Make exposed edges and chamfers sharp, straight and consistent. Provide flat surfaces to true planes.
5. Place and secure in the forms all anchors, clips, inserts, bolts lifting devices, shear ties and other embedded devices required, to ensure that embedments remain in position indicated on the shop drawings or specified. Provide air bleed holes for embedded items as necessary to ensure voids or honeycombs do not form.
6. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units.
7. Provide all openings, recesses or block-outs required.
8. Provide temperature and shrinkage reinforcement in accordance with ACI 318.
9. Reinforce precast units to resist handling, and transportation stresses.
10. Place reinforcement to maintain at least 3/4-inch minimum cover
11. Minor patching in plant is acceptable, provided structural integrity and appearance is not impaired.

- B) Curing:
1. Form-cure the work for a minimum of 24 hours.
  2. Wet cure for not less than 6 days after being removed from forms
  3. Following curing period, allow units to air-dry for not less than an additional 7 days before being loaded for delivery.
- C) Casting Tolerances:
- Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished unit complies with the following product tolerances:
1. Length and width of precast units shall not vary more than 1/8 in. Thickness of units to vary not more than 1/8 in. Units 'out of square' more than 6 linear ft. 1/8 in. per 1/4 in. total are not acceptable.
  2. Inserts: Plus or minus 1/2 inch.
  3. Handling Devices: Plus or minus 1 inch.
  4. Reinforcing Steel and Welded Wire Fabric: Plus or minus 1/4 inch where position has structural implications or affects concrete cover; otherwise, plus or minus 1/2 inch.

#### **ESCR 570.07 SUBMITTALS**

- A) Product Data: Submit for Engineer's approval manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work.
1. Form Release Agent: Furnish data stating that the product will not stain the concrete surfaces and will not adversely affect the bond of subsequently applied finishes.
- B) Engineering Calculations : Submit for Engineer's approval
- C) Concrete Design Mixes: Submit for Engineer's approval all design mixes and strength tests to be used.
- D) Material Certification: Signed by the manufacturer certifying that each of the following items complies with requirements: concrete materials, reinforcing materials, admixtures and water-absorption test reports.
- E) Shop Drawings: Submit for Engineer's approval shop drawings for the fabrication and installation of the Work. Prepare details at an approved scale indicating profiles, cross-sections, dimensions, and arrangement of units; details of units, inserts, and openings, reinforcing for each unit, fabrication tolerances, method of installation and lifting devices necessary for handling and installation.
- F) Samples: Submit for Engineer's approval. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor.
1. Submit three (3) 18 in. x 18 in. x full product thickness samples prior to fabrication of units or construction of mock-up, using same design mix as proposed for the finished work. On back of samples, record mix design, types and locations of

aggregates, and type and method of finish. Sample acceptance will be for color, appearance and configuration of aggregate, aggregate distribution and depth of exposure only.

- a. Match sample on file in the Engineer's office.
2. Anti-Graffiti Coatings: Coat half of each sample with the specified anti-graffiti coating.

#### **ESCR 570.08 QUALITY ASSURANCE**

- A) The precast concrete furniture producer shall be a plant-certified by either the National Precast Concrete Association (NPCA) or The Precast/ Prestressed Concrete Institute (PCI).
- B) Single Source Responsibility:
  1. Single Source Responsibility: Obtain concrete deterrent furniture from one source of a single manufacturer. Obtain accessory products used in conjunction with concrete deterrent furniture from sources acceptable to the concrete deterrent furniture manufacturer, and as specified. The concrete deterrent furniture manufacturer shall furnish evidence that the specified materials have been manufactured by the same source and successfully utilized on a yearly basis for a minimum of 5 years on projects of a similar scope to that shown and specified for this Project.
  2. Single Source Responsibility Anti-Graffiti Coating: Obtain anti-graffiti coating from one source of a single manufacturer for the entire project. Obtain accessory products used in conjunction with anti-graffiti coating from the anti-graffiti coating manufacturer or from sources acceptable to the manufacturer. The manufacturer shall furnish evidence that the specified materials have been manufactured by the same source and successfully utilized on a yearly basis for a minimum of 5 years .
- C) Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D) Qualified Applicator: The contractor or subcontractor performing the anti-graffiti coating of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work. In addition, the contractor or subcontractor must be approved, or certified, or authorized by the manufacturer, and must be eligible to receive the manufacturer's warranty.
- E) Mock-Up(s):
  1. Build one (1) full sized unit as mock-up, as detailed on contract documents. The Work of this mock-up shall be constructed based on approval of workmanship, construction, texture, and colors of the approved sample.
  2. Clean mock-ups with materials and techniques intended for use on the Project.
  3. Apply "anti-graffiti" coating to mockup entire exterior face. Demonstrate "anti-graffiti" qualities by utilizing 5 standard graffiti marking mediums and removing graffiti.
  4. Obtain acceptance of visual qualities of mock-up before proceeding with the final work.
- F) Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review

methods and sequence of construction, special details and conditions, standard of work, testing and quality control requirements, job organization and other pertinent topics related to the Work.

#### **ESCR 570.09 DELIVERY, STORAGE AND HANDLING**

- A) Packing, Shipping, Handling, and Unloading: Deliver materials, other than bulk materials to Project site in manufacturer's unopened containers, bundles, pallets or other standard packaging devices; fully identified with name, type, grade, color and size.
- B) Storage and Protection: Store on platforms off the ground, in a dry location and protect from weather, soiling and damage. Store aggregates where grading and other required characteristics can be maintained and contamination avoided. Store accessories including metal items to prevent corrosion and accumulation of dirt and oil.
- C) Metal Materials: Do not use metal reinforcing, ties, or other components which are coated with loose rust or other deleterious matter that will reduce or destroy bond with mortar and grout.

#### **ESCR 570.10 PROJECT/SITE CONDITIONS**

- A) Installation Requirements
  - 1. Cold Weather Conditions: Do not install work when the temperature is below 40 deg. F. unless provisions for heating and drying the materials and protecting the completed work. Do not build upon frozen work. Do not lay units having a film of water or frost on their surfaces.
  - 2. Hot Weather Conditions: Do not install work when the temperature is above 100 deg. F. or 90 deg. F with a wind velocity greater than 8 mph.
- B) "Anti-Graffiti" Coating Application Conditions: Maintain ambient temperature above 40 degrees F during and 24 hours after installation. Do not proceed with application on materials if ice or frost is covering the substrate. Do not proceed with application if ambient temperature of surface exceeds 100 degree F. Do not proceed with the application of materials in rainy conditions or if heavy rain is anticipated with 4 hours after application.

#### **ESCR 570.11 WARRANTIES**

- A) Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - Special Warranty, Anti-Graffiti Coating: Provide a manufacturer's labor and material performance warranty, for a period for two (2) years stating that the anti-graffiti coating will be free of defects related to workmanship or material deficiency. Defective areas, (where anti-graffiti coating effectiveness does not meet the specified limits in the opinion of the City of New York) shall be retreated by the system manufacturer. Upon notification of defects, within the warranty period, reseal areas at the convenience of the City of New York.

#### **ESCR 570.12 METHODS**

- A) GENERAL: Prepare and install the work of this Section, including components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra

precautions or provisions to ensure satisfactory performance of the Work.

- B) **EXAMINATION: Verification of Conditions:** Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected. Examine construction to verify acceptable conditions prior to installation.
- C) **INSTALLATION: Surface Preparation:** Clean surfaces before installation to remove dirt, dust, debris, loose material and other foreign matter detrimental to proper bonding.  
**Lay Out of Units:** Lay out units in advance for accuracy and as indicated on drawings.
- D) **ANTI-GRAFFITI COATING APPLICATION**
1. **Manufacturer's Technical Representative:** At the start of the installation and periodically as work progresses provide the services of the anti-graffiti manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.
  2. **Surface Preparation:** Concrete surfaces to receive coating shall be cleaned of dirt, oil, graffiti, grease, laitance, and other contaminants. All other surfaces shall be cleaned by mid-pressure water (1500 psi). Pressure wash all surfaces scheduled to receive anti-graffiti coating unless manufacturer recommends other acceptable method of cleaning. Remove dirt, dust and materials that will interfere with the proper and effective application of the anti-graffiti coating. Check the compatibility of all coatings and other material contiguous to or scheduled to be used with the anti-graffiti coating.
  3. **Application**
    - a) Anti-graffiti coating shall be applied as per manufacturer's written application instructions and recommendations. Apply as a minimum 2 full coats (depending on porosity of CMU) allowing first coat to dry as per manufacturer's requirements.
    - b) Apply at temperature and weather conditions recommended by the manufacture or written in this specification. Surface residue shall be brushed out thoroughly until they completely penetrate into the surface. Protect treated areas from rain and other surface water for a period of not less than four hours after application.
- E) **TESTING AND INSPECTION PROGRAM:** Testing and inspection will be performed, at any time during the progress of the Work, by an independent testing agency per the Contract. Allow access at any time to the manufacturer's plant as required by the City, Engineer and Engineer's representatives to inspect Work.
- F) **ADJUSTING:** Remove and replace defective materials; correct defective workmanship; leave work clean.
- G) **CLEANING: Removal of Excess Materials:** Execute work in as clean a manner as possible, removing excess materials.
- H) **PROTECTION:** Precast units shall remain in a protective cover, approved by the Engineer, until the completion of the entire project or as directed by the Engineer.

### **ESCR 570.13 MEASUREMENT**

The quantity to be measured for payment shall be the number of each concrete deterrent furniture unit actually manufactured and installed to the satisfaction of the Engineer.

**ESCR 570.14 PRICE TO COVER**

The unit price bid for each Concrete Deterrent Furniture shall cover the cost of furnishing all labor, materials, equipment, insurance and incidentals required to manufacture, deliver and install concrete deterrent furniture, complete, and shall include, but not be limited to, the design ing furnishing and incorporating of all concrete; reinforcement; curing; finishing; samples; coatings; testing equipment; all in accordance with the contract drawings, the specifications and the direction of the Engineer.

Payment will be made under:

Item No.	Item	Pay Unit
ESCR 570	CONCRETE DETERRENT FURNITURE	EA

**END OF SECTION**

**SECTION 832 – SPECIFICATION FOR LEAD PAINT REMOVAL FROM BRIDGES****PART 1.0 GENERAL****1.01 PURPOSE**

- A. This Specification sets out the requirements for worker protection, containment system design and use, environmental protection, and waste disposal during the removal and disposal of coatings containing lead and other toxic metals from bridges. The purpose is to assure that the public, workers, and the environment are properly protected from potential exposure to toxic metals in these coatings during paint removal operations. All provisions associated with containment also apply to the removal of coatings that do not contain toxic metals.
- B. The Contractor is responsible and liable for the remediation of all damages caused by the Work, and any required cleanup or repair activities.

**1.02 GENERAL**

- A. The Contractor is responsible for compliance with all personal monitoring required under OSHA regulations, and is required to maintain:
  - 1. A full-time competent person at the project site to observe and monitor work activities, and to oversee the implementation of the Worker Protection Plan, Environmental Protection Plan, Hazardous Waste Treatment and Disposal, and Containment performance. The competent person shall be authorized to take prompt corrective measures to rectify any observed problems with the control over emissions, protection of workers, and management of the waste streams. The competent person shall be independent of all other responsibilities on the project and shall not serve in a worker or supervisory capacity. The competent person shall not be assigned any other responsibilities or work assignments which prevent him/her from continuously fulfilling the responsibilities of a competent person. The competent person must be on the job site whenever lead, or other hazardous metals, is disturbed. A back-up competent person shall be designated in the event that the full-time competent person is absent from the job site. The competent person must be SSPC C-3 and C-5 trained and have OSHA 40-hour HAZWOPER certification plus annual 8 hour refresher training. Qualifications of the competent person are presented in Appendix A.
  - 2. A Certified Industrial Hygienist (CIH) to oversee the development of Worker Protection Plans and to conduct monthly site visits to confirm that the Work is being performed in accordance with the contract requirements. Qualifications of the CIH are presented in Appendix A.
- B. The Engineer will be employing an environmental consultant to monitor the paint removal operations and ensure compliance with Contract specifications and applicable regulations. The Contractor shall coordinate project activities with the environmental consultant and initiate any action that is necessary to correct specification violations identified by the environmental consultant. The environmental consultant has the authority to halt any operation involving the generation, handling, or disposal of project waste and debris if the operation violates the requirements of this specification, even if the competent person or CIH/IH did

not observe the violation. In the event of a conflict between the observations of the environmental consultant and the Contractor, the findings of the environmental consultant shall prevail. The presence or activities of the environmental consultant do not relieve the Contractor of the responsibility to fully comply with all aspects of this Section.

- C. Project submittal requirements are itemized in Appendix A. Terms and definitions are provided in Appendix B.

### **1.03 CONTRACTOR QUALIFICATIONS**

- A. Unless otherwise specified in the Special Provisions, the painting Contractor or subcontractor that is directly performing the field cleaning and painting work shall possess SSPC-QP1 and QP2 Category A certification when a ventilated, negative pressure containment is used, and Category A or B certification for surface preparation methods that do not require a ventilated, negative pressure containment. Certifications shall be in place at the time of bid and throughout the duration of the project.

### **1.04 COMMUNITY NOTIFICATION**

- A. For projects involving abrasive blast cleaning, the Contractor shall be responsible for Community Notification. Community Notification shall consist of developing and assembling a community Notification Package and distributing the Package to the affected community through mailing to the community boards, council members, borough president, and members of the New York State Legislature. The Community Notification package shall consist of the NYCDOT brochures and project-specific flyer, both to be printed by the Contractor. The affected community shall be notified of planned abrasive blasting activities as well as other removal activities requiring MPT plans (lane closures/diversions) 30 days in advance. The development and distribution of the Package must be coordinated with the Engineer.
- B. NYCDOT Brochures contain information on lead and its effect; various sources of lead; deleading operations specific to bridge projects; precautions to eliminate or minimize exposure undertaken by both the City and the community; and in case of a large release, steps that the City will implement to minimize community exposure (emergency response plan).
- C. The Contractor will be responsible for developing project-specific flyers providing information (multi-language versions, if necessary) on the nature of the removal work, the time period of the work and its duration, and contact names and telephone numbers. The flyers shall be approved by the Engineer prior to distribution. The contractor will be responsible for posting the information around the perimeter of the job site.

### **1.05 REGULATORY COMPLIANCE**

- A. Comply with the requirements of this Section and all applicable Federal, State, and City laws, codes, and regulations, including, but not limited to the regulations of the United States Environmental Protection Agency (USEPA) and Occupational Safety and Health Administration (OSHA), New York State Department of Environmental Conservation (DEC), New York State Department of Health (NYS DOH), New York State Department of Labor (NYS DOL), and the New York City Department of

Environmental Protection (NYC DEP). Codes, Rules and Regulations of the State of New York (NYCRR) are administered by the NYS Department of Environmental Conservation, Albany, NY. EPA regulations are administered by the US Environmental Protection Agency, Region 2, NY, NY.

- B. Identification of the items in this specification that are of specific interest to the Engineer in no way relieves the Contractor of the responsibility to comply with all applicable legal requirements. Moreover, compliance with Contract specifications does not relieve the Contractor of the obligation to comply with other applicable requirements. Contractor is required to comply with the Final Environmental Impact Statement (FEIS). If a Federal, State, or City regulation is more restrictive than any of the requirements of this Section, the more restrictive requirements shall apply.

## 1.06 REFERENCE STANDARDS

- A. **Latest Edition** - the latest edition of the following acts, regulations, guides, and standards form a part of this Specification. In the event of a conflict, comply with the most restrictive requirements, including any new or revised regulations or codes that may take effect after the contract is awarded. Maintain at the jobsite, a copy of all applicable reference standards.
- B. **American Association of State Highway and Transportation Officials (AASHTO)**
1. Standard Specifications for Highway Bridges
  2. Manual for Maintenance Inspection of Bridges
- C. **ASTM International (ASTM)**
1. ASTM E90, Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements
- D. **American Industrial Hygiene Association (AIHA)**
1. Environmental Lead Laboratory Accreditation Program (ELLAP) - paint, soil, air, dust
  2. Industrial Hygiene Accredited Laboratories (IHLAP) – metals
- E. **Code of Federal Regulations (CFR)**
1. 29 CFR 1910, Occupational Safety and Health Regulations for General Industry
  2. 29 CFR 1910.20, Access to Employee Exposure and Medical Records
  3. 29 CFR 1910.132, General Requirements for Personal Protective Equipment
  4. 29 CFR 1910.133, Eye and Face Protection
  5. 29 CFR 1910.134, Respiratory Protection
  6. 29 CFR 1910.147, The Control of Hazardous Energy (Lockout/Tagout)
  7. 29 CFR 1910.333, Selection and Use of Work Practices
  8. 29 CFR 1910.1000, Air Contaminants
  9. 29 CFR 1910.1200, Hazard Communication
  10. 29 CFR 1926, Occupational Safety and Health Regulations for the Construction Industry
  11. 29 CFR 1926.16, Rules of Construction
  12. 29 CFR 1926.20, General Safety and Health Provisions
  13. 29 CFR 1926.21, Safety Training and Education
  14. 29 CFR 1926.24, Fire Protection and Prevention

15. 29 CFR 1926.28, Personal Protective Equipment
16. 29 CFR 1926.32, Definition of Competent Person
17. 29 CFR 1926.51, Sanitation
18. 29 CFR 1926.52, Noise Exposure
19. 29 CFR 1926.55, Gases, Vapors, Fumes, Dusts, and Mists
20. 29 CFR 1926.57, Ventilation
21. 29 CFR 1926.59, Hazard Communication
22. 29 CFR 1926.62, Lead
23. 29 CFR 1926.101, Hearing Protection
24. 29 CFR 1926.104, Safety Belts, Lifelines, and Lanyards

**M. Suppliers (Equipment and Material Manufacturers) Published Instructions**

**1.07 SUBMITTALS** – See Appendix A.

**PART 2.0 PRODUCTS**

**2.01 CONTAINMENT MATERIALS AND EQUIPMENT**

- A. Supply all materials needed to contain paint removal debris in accordance with the requirements of this Specification and Construction Details. This may include, but is not limited to, ground covers, rigging, scaffolding, planking, containment materials, tarpaulins, dust collection and ventilation equipment, HEPA vacuums, water booms, boats with skimmers, and all other containment materials that may be needed.
- B. Flame retardant containment materials are to be used. Tarps and other sheet materials must pass the requirements contained in NFPA 701, Test Method 2.
- C. Use low sulfur fuels (less than 15ppm sulfur content) for all non-road combustion engines that are 50 HP or greater (e.g., generators, dust collection equipment, etc.) in accordance with Title 15, Chapter 14 Rules.
- D. Properly maintain all equipment in accordance with the NYC Noise Control Code and Citywide Construction Noise Mitigation. Applicable regulations and compliance information may be found on the NYCDEP's website. For example, the NYCDEP has provided a list of "Construction Noise Control Products and Vendor Guidance Sheets".
- E. Supply the Engineer with one (1) portable light meter with a scale of 9 to 200+ foot-candles. The meter will be returned to the Contractor upon completion of the Work.
- F. Supply the Engineer with one (1) portable sound level meter for ensuring compliance with NYCDEP Noise Code. Sound level meter shall be equipped with data logging and have the capability to calculate L10 and L90 in both A and C scales at slow and fast response.
- G. Do not use any materials until they have been accepted by the Engineer.

**2.02 MONITORING AND TESTING EQUIPMENT**

- A. **High Volume Ambient Air Monitoring Equipment**
  1. Provide, and maintain in good operating condition, all equipment necessary for the monitoring of airborne emissions in accordance with the provisions of this specification. If site conditions do not permit permanent installation for the duration of the project, install and remove the equipment each day at the times and locations requested by the environmental consultant. The equipment will be calibrated and used by the environmental consultant. Equipment requirements include:
    - a) High volume air monitoring equipment approved for sampling in accordance with 40 CFR 50, Appendix B, equipped with collection

heads for total suspended particulate (TSP). Provide mass flow or volumetric flow controlled units, equipped with a flow event recorder and an adequate supply of flow charts. Provide look up tables for the volumetric controlled units. Verify that the monitors are properly maintained in accordance with the manufacturers' instructions. The environmental consultant will provide the filters.

- b) An ample supply of parts or spare units in order to provide fully operational TSP monitors on the project site. Unless otherwise directed by the Environmental Engineering Unit, provide at least four (4) monitors each day for each work area that involves dust creating activities.
- c) One variable resistance calibration kit with a current (within 1 year) calibration certificate and two (2) slack-tube water manometers (15-0-15 inches), or calibrated digital manometers (0 to 50 or 100 in. WC).
- d) All equipment (e.g., generators, power cords, fuel, etc.) needed to simultaneously operate the monitors. The monitors will be sited by the environmental consultant adjacent to the bridge or at distances away from the bridge approximately equal to three times the bridge height. Provide enough support equipment to accommodate this entire range of monitor placement.
- e) Security and/or secure overnight storage of the equipment (e.g., in jobsite trailers maintained by the Contractor). Note that if the paint removal work is being conducted during evening hours, professional, armed security personnel may be needed since the monitors cannot be placed into secure storage during these times.

**B. Worker Exposure and Regulated Area Monitoring Equipment**

- 1. Supply the instrumentation needed for the monitoring of construction and consulting personnel exposure, and regulated area exposures. Provide all equipment needed for its operation (e.g., batteries, chargers, primary calibration source (soap bubble meter), secondary calibration source (rotameters), cassettes, etc.).
- 2. Provide all necessary air monitoring cassettes and filter paper for exposure monitoring. Utilize appropriate air sampling cassettes and filter paper for monitoring exposure to lead and other toxic metals.

**2.03 EMERGENCY RESPONSE EQUIPMENT**

- A. Provide all personal protective equipment and emergency response equipment needed for the Project as outlined in the Contractor's Emergency Response Plan. Emergency response kits must be in place at all locations where petroleum or chemical products are being utilized.
- B. Contractor shall provide spill kits ready for immediate use in case of a spill at release points. The spill kits are to be equipped to respond to oil and chemical spills, have all materials inside of the spill kits, and marked to be easily identifiable.
- C. Provide inspected, operable, and charged fire extinguishers where the contractor designates at areas where petroleum and flammable products are to be stored. The fire extinguishers are to be visible in case they are needed and stored in such

a manner that access to them is unobstructed.

- D. Contractor shall assure that all pressure release mechanisms are in the open position so as to prevent storage containers from becoming over pressurized and explode.
- E. Contractor shall obtain all the required FDNY permits when storing petroleum, chemical, hazardous, and flammable materials/liquids so in case of a fire or need to contact and have the FDNY come on site, FDNY knows what type of materials are stored on site.

#### **2.04 PERSONAL PROTECTIVE EQUIPMENT AND HYGIENE FACILITIES**

- A. At each site, provide all personal protective clothing and equipment (PPE) needed to protect Contractor workers, City employees and City representatives (REI Consultants and environmental consultant), from project hazards. Repair or replace PPE as required to assure that it continues to provide its intended purpose. The Contractor is responsible for proper cleaning and disposal of all PPE.
- B. Provide climate-controlled decontamination facilities.
  - 1. Supply the number of facilities as dictated by 29 CFR 1926.51, site conditions, the Contractor's sequence of operations, and as approved by the Contractor's CIH and Engineer.
  - 2. Provide facilities which contain a "clean" area where workers can remove and store their street clothing when they arrive on site; a shower room with hot and cold running water, soap and clean towels; and a "dirty" area where workers can remove their work clothing at the end of their work shift. The "clean" area and the "dirty" area shall each have a separate entrance.
- C. Provide all potable water required for drinking and hygiene purposes.

#### **2.05 WASTE CONTAINERS**

- A. **Hazardous Waste**
  - 1. Provide USDOT-approved drums, tanks, roll-offs, or other containers of the appropriate size and type in accordance with 49 CFR 173, 178, and 179 (that are suitable for any hazardous waste (liquid and solid) generated on the project. Use containers that are resistant to rust and corrosion (painted, if constructed of steel), that have tight fitting and locking lids or covers, and which are water resistant and leak proof. All containers must be in new condition, be free of any contamination and have no damage. Drums and/or barrels shall be stored on pallets or similar dunnage so that the bottom is not in contact with the ground and is capable of being inspected for leakage and corrosion. Cover the ground underneath the waste with a tarpaulin. Liquid wastes are to be stored inside a secondary containment of sufficient volume to hold the contents of the entire liquid waste in the storage area if a spill were to occur. All hazardous waste must be stored on City property.
  - 2. Assure that the dry volume capacity of the containers, in cubic yards, is clearly marked on all containers, and that they are labeled as required by applicable Federal, State and City regulatory requirements.
- B. **Construction Waste** - Provide all containers for non-hazardous construction waste. Use containers that are free of loose debris when brought on-site. Non-hazardous waste must be segregated from the storage of hazardous or regulated

wastes.

- C. **Spent Solvents** - Provide appropriate containers for spent solvents. Spent solvents shall be managed as hazardous waste unless laboratory analysis indicates otherwise. Containers shall be corrosion resistant and non-reactive to the solvents. Review solvent MSDS/SDS to ensure compatibility with container materials and storage requirements. Containers shall be labeled in accordance with all applicable Federal, State, and City regulations and stored on City property at least 50 feet from the City property boundary. Store spent solvents in secondary containment. Protect the containers from sources of heat, ignition, and any other conditions which could cause the contents to expand, catch fire, or the containers to explode.

## 2.06 CLEANLINESS OF MATERIALS AND EQUIPMENT

- A. Provide equipment and materials that are free of loose dust and debris when brought onto the bridge site. This includes, but is not limited to, containment and ventilation equipment, scaffolding, planking, metal sheeting, suspended platform materials, personal protective equipment, waste storage containers, trailers, and paint removal and abrasive recycling equipment.
- B. Clean the materials and equipment and assure that they are free of loose dust and debris at the end of each shift and upon removal from the Work site. Use HEPA vacuums and/or wet wipe with an approved cleaning solution. Verify proper cleanliness by wiping a cloth across the surface. If dust or debris is dislodged, additional cleaning is required before transporting the materials or equipment off site (See Section 3.06). Settled dust (lead) sampling (wipe sampling) may be performed by the environmental consultant in order to verify cleanliness of all equipment and materials. An acceptance criteria of <400 µg/sq ft will be used. All filters in equipment, including but not limited to, dust collectors, recycling units, and HEPA vacuums, must be removed and replaced prior to equipment leaving the project site.

## PART 3.0 - EXECUTION

### 3.01 WORKER PROTECTION

- A. **General**
1. Conduct the Work in strict accordance with Federal OSHA, State, and City regulations governing worker protection. Develop a comprehensive Worker Protection Plan addressing the protection of the health and safety of workers from jobsite hazards, including but not limited to fall protection, confined space (if applicable), lock out/tag out, hearing and eye protection, and exposure to hazardous materials or conditions. Note: If Sections 831 and 832 are specified for the work, the requirements of both Sections can be combined into a single Worker Protection Plan.
  2. When disturbing paints, institute engineering and work practice controls to reduce worker exposures to lead and other toxic metals to as low as feasible. Work practices that disturb paints consist of, but are not limited to, paint removal activities, cutting, grinding, removal of concrete encasement, hot work, and power washing. Present the proposed engineering and work practice controls in the Worker Protection Plan for Engineer review.

3. Employ the services of a Certified Industrial Hygienist (CIH) to develop the Worker Protection Plan and review all exposure monitoring and medical surveillance results. The CIH shall also provide general oversight of the work either directly or with the assistance of an Industrial Hygienist (IH). The CIH is also required to conduct a monthly site visit and issue a monthly summary report of activities and monitoring results. See Appendix A for the qualifications of the CIH and IH, and an itemization of the monthly CIH reporting requirements.
4. In addition to the CIH, assign a competent person to the Work site. See Appendix A for the qualifications of the competent person. Have the competent person inspect the Work site on a daily basis for compliance with the requirements of this Section and the approved Worker Protection Plan and prepare a daily report or daily log of observations made. Maintain the information at the project site and make it available to the Engineer or environmental consultant for review at any time. The competent person shall have no other responsibilities on the project. The competent person cannot serve as a supervisor, foreman or production worker on the project.
5. Note that all worker protection requirements apply to Contractor and Subcontractor personnel working for the Contractor.
6. The requirements identified in this Section 3.01 regarding exposure to toxic metals are based on 29 CFR 1926.62, but the Contractor must protect the employees from exposure to any of the other toxic metals or materials which may be present in the paint and/or abrasive, as applicable, in addition to lead.

**B. Pigeon Droppings/Histoplasmosis**

1. In addition to controlling exposures to lead and other toxic metals, take special precautions when working in areas where pigeons have nested.
2. Develop and implement a worker protection plan under the direction of the CIH, for the inspection and removal of pigeon droppings in accordance with NYSDOT Safety Bulletin SB-94-4 (copy attached) in Appendix C. Note: If Sections 831 and 832 are specified for the work, only a single Histoplasmosis plan is required.
3. At a minimum, use disposable gloves, whole body protective clothing and a respirator while inspecting or removing the debris, followed by thorough washing of hands, face, and forearms before eating, drinking, or smoking. Provide respiratory protection appropriate to the level of exposure for all workers. Verify that all workers involved in cleaning activities involving exposure to pigeon droppings have medical clearance to utilize personal protective equipment such as respiratory protection and have been fit tested.
4. Remove and properly dispose all pigeon droppings located within containment enclosures.

**C. Worker Protection Plan**

1. Develop a written Worker Protection Plan under the direction of a CIH to establish and implement practices and procedures for protecting the health and safety of employees from Project hazards in accordance with

applicable OSHA requirements.

2. The Worker Protection Plan must include provisions for the protection of workers from toxic metals or materials when exposures to lead or other toxic metals or materials are above the OSHA Action Level. Note that while this specification addresses the protection of employees exposed to lead and other toxic metals, the Worker Protection Plan must address the protection of workers from all Project hazards. Requirements for the content of the Worker Protection Plan are presented in Appendix A.
3. Revise and update the program at least annually during the portion(s) of the project which involve the disturbance of toxic metals. Verify that the CIH signs off on all updates and revisions. If the review does not result in an update or revision, have the CIH acknowledge in writing that the review was made.
4. Establish methods for complying with this specification and any OSHA standards published for the toxic metals present in the paint (e.g., 29 CFR 1926.62 for lead, 29 CFR 1926.1126 for hexavalent chromium, 29 CFR 1926.1127 for cadmium, and 29 CFR 1926.1118 for inorganic arsenic). Toxic metals and materials may also be present in the paint for which OSHA has not developed a comprehensive health and safety standard. In these cases, include statements that appropriate measures will be taken to assure that the workers will not be exposed above the Permissible Exposure Limit (PEL) or Threshold Limit Value (TLV) as identified in 29 CFR 1926.55.
5. Identify the methods of compliance that will be used to reduce worker exposures to toxic metals and materials. Rely on respiratory protection only after feasible engineering and work practice controls have been first implemented to reduce airborne exposures.

**D. Exposure Monitoring/Initial Assessment**

1. Conduct initial personal exposure monitoring unless objective data is available to prove that exposures from a given activity cannot exceed the Action Level for lead or other metals contained in the coating. Provide the objective data to the Engineer in writing, signed by the CIH. Rely upon this data in lieu of monitoring only upon acceptance by the Engineer or Environmental Consultant.
2. Collect representative personal air samples at the beginning of the lead exposure work (at project start-up) to determine employee exposures to lead and other toxic metals that might be present in the coating. Tasks resulting in the potential exposure to toxic metals include, but are not limited to, paint removal activities, installation of lead paste in cables, work site cleanup, containment movement, hot work, and debris handling operations.
3. Collect full shift (at least 7 hours) air samples for workers in each job classification in each exposure area, and when requested, collect samples on the Engineer and the Engineer's representatives (REI's or environmental consultant personnel). Provide the Engineer and representatives with the results of their analysis within the same five-day notification period required for the employees.

4. When lead is present, provide personal protective equipment for workers during the initial monitoring. Anticipate exposure levels as dictated by 29 CFR 1926.62 and as specified below. A few activities in addition to those identified by OSHA are included. Use the same level of protection when other toxic metals are found in the coating, unless OSHA has developed a comprehensive health standard for that metal (e.g., cadmium, hexavalent chromium, and inorganic arsenic). In those cases, implement the protection requirements of the standard specific to that metal.
  - a) Assume an exposure of up to 10 times the PEL ( $500 \mu\text{g}/\text{m}^3$  for an 8-hour shift): Manual demolition of structures containing lead-containing coatings or paint (e.g., dry wall), manual scraping, manual sanding, heat gun applications, power tool cleaning with dust collection systems, and spray painting with lead paint. Although not identified in 29 CFR 1926.62, include chemical stripping, water washing, centrifugal wheel blasting, and the operation of abrasive grit recovery equipment in this category.
  - b) Assume an exposure of up to 50 times the PEL ( $2,500 \mu\text{g}/\text{m}^3$  for an 8-hour shift): Using lead-containing mortar, lead burning, or conducting the following activities where lead-containing coatings or paint are present: rivet busting, power tool cleaning without dust collection systems, cleanup activities where dry expendable abrasives are used, and the movement and removal of abrasive blasting enclosures. Although not identified in 29 CFR 1926.62, include vacuum blasting, water jetting, and wet abrasive blasting removal of paint in this category.
  - c) Assume an exposure in excess of  $2,500 \mu\text{g}/\text{m}^3$ : Activities involving lead containing coatings or paint on structures disturbed by abrasive blasting, welding, cutting, and torch burning.
  - d) During any of the above activities, provide appropriate respiratory protection, personal protective clothing and equipment, change areas and washing facilities, showers, blood lead and zinc protoporphyrin monitoring, and employee training. Maintain the protection as specified above until the test results are received; then modify the protection measures as necessary.
  - e) If inorganic arsenic, cadmium or hexavalent chromium is present in the coating, provide personal protective equipment that prevents contact with the skin or eyes and washing facilities capable of removing these metals from the skin.
5. Collect and analyze all air samples according to the appropriate NIOSH method, or equivalent, for the metal of concern (e.g., Method 7082 for lead, Method 7048 for cadmium, Method 7600 for hexavalent chromium, and Method 7900 for inorganic arsenic). Note that monitoring for hexavalent chromium requires the use of a PVC filter. Only use laboratories that meet the qualification requirements established under Appendix A, and which have been approved by the Engineer.
6. Conduct periodic exposure monitoring of Contractor workers and City Agents and provide written employee notifications within five days of receipt of results in strict accordance with the applicable OSHA standard

for the metal of concern (e.g., 29 CFR 1926.62 for lead). At a minimum, this requires monitoring at project start up, and after any changes in work practices are made which could have an effect on airborne exposures. If there is no OSHA comprehensive health standard for the detected metal, conduct the monitoring and employee notification based on the requirements of OSHA 29 CFR 1926.62. Provide the Engineer with the results of any subsequent employee monitoring in the monthly CIH report.

7. Maintain an accurate record of all air monitoring. The record should include at least the following information; date of sampling; sampling location; operation that is being monitored; number, duration and results of samples taken; type of personal protective equipment; name, identification number, and job classification of employees represented by the monitoring.

#### **E. Action Level**

1. The Action Level for lead is 30  $\mu\text{g}/\text{m}^3$  as an eight (8) hour Time Weighted Average (TWA), the Action Level for cadmium is 2.5  $\mu\text{g}/\text{m}^3$  as an 8 hour TWA, the Action Level for hexavalent chromium is 2.5  $\mu\text{g}/\text{m}^3$  as an 8 hour TWA, and the Action Level for inorganic arsenic is 5  $\mu\text{g}/\text{m}^3$  as an 8 hour TWA. For other metals that are found in the coating, and for which no Action Level exists, establish the Action Level at 1/2 of the PEL. If a PEL does not exist, establish the Action Level at 1/2 of the Threshold Limit Value (TLV) found in Appendix A of 29 CFR 1926.55 (e.g., if the TLV is 5  $\mu\text{g}/\text{m}^3$ , establish the Action Level at 2.5 $\mu\text{g}/\text{m}^3$ ).
2. If airborne exposures to toxic metals are detected, but are below the Action Level, provide the worker training required by the OSHA standard for the respective metal, and hand wash facilities.
3. If airborne exposures to toxic metals are at or above the Action Level, invoke the following protective measures, as required by the OSHA standard for the respective metal:
  - a) Written Worker Protection Plan
  - b) Exposure Monitoring
  - c) Housekeeping
  - d) Employee Medical Surveillance and Medical Removal Protection
  - e) Employee Information and Training
  - f) Signs and Regulated Areas
  - g) Recordkeeping

#### **F. Permissible Exposure Limit (PEL) and Threshold Limit Value (TLV)**

1. The PEL for airborne lead exposure is 50  $\mu\text{g}/\text{m}^3$  as an 8 hour TWA. The PEL for cadmium is 5  $\mu\text{g}/\text{m}^3$  as an 8 hour TWA, the PEL for hexavalent chromium is 5  $\mu\text{g}/\text{m}^3$  as an 8 hour TWA, and the PEL for inorganic arsenic is 10  $\mu\text{g}/\text{m}^3$  as an 8 hour TWA. The PEL/TLVs for other metals can be found in 29 CFR 1926.55.
2. In the event that extended work shifts are allowed, use the following formula to adjust the PEL: Adjusted PEL = 8 hr. PEL x (8  $\square$  hours worked in a day). The PEL may only be reduced; never increased.
3. In addition to complying with the requirements identified when exceeding the Action Level, invoke the following protective measures when the

airborne exposure to a toxic metal found in the coating exceeds the PEL or TLV:

- a) Engineering and Work Practice Controls
- b) Respiratory Protection
- c) Protective Clothing and Equipment
- d) Hygiene Facilities and Practices

#### **G. Respiratory Protection**

1. After feasible engineering controls and work practices have been implemented, use respiratory protection if necessary to maintain employees' exposures to lead and other toxic metals below the PEL or TLV. Require the use of respirators for all employees, inspectors, observers, or other personnel who enter areas where airborne exposures exceed or are expected to exceed the PEL or TLV, or when entering regulated areas.
2. Develop a written Respiratory Protection Program in compliance with 29 CFR 1910.134 including commitments to provide any necessary pulmonary function tests or medical examinations. When lead is present, include the provisions of 29 CFR 1926.62 in the program. When cadmium is present, include 29 CFR 1926.1127. When hexavalent chromium is present, include 29 CFR 1926.1126. When inorganic arsenic is present, include 29 CFR 1926.1118. Address the selection, use, maintenance and inspection of respirators, and qualifications for respirator users.
3. Treat used respirator cartridges as hazardous waste.

#### **H. Protective Clothing and Equipment**

1. Provide protective clothing and equipment and ensure they are worn by all employees during the initial assessment and for any employee whose exposures exceed the PEL or TLV.
2. When inorganic arsenic, cadmium and/or hexavalent chromium is present in the coating, provide protective clothing for the skin and eyes regardless of the airborne exposures.
3. Do not allow workers to wear street clothing beneath protective clothing in any areas where exposures to toxic metals exceed the PEL or TLV. This includes personal shoes unless they are fully protected by shoe covers or left on the job site until thoroughly decontaminated.
4. Clean or replace the protective clothing as required by the appropriate OSHA standard for the toxic metal that is present. In the case of lead, clean or replace the clothing weekly if the airborne exposure levels are less than 200  $\mu\text{g}/\text{m}^3$  as an 8-hour TWA, or daily if the exposure levels are greater than or equal to 200  $\mu\text{g}/\text{m}^3$ . In the case of inorganic arsenic, the threshold for daily versus weekly cleaning is 100  $\mu\text{g}/\text{m}^3$ . In the case of cadmium, clean clothing shall be provided as often as necessary to maintain its effectiveness but no longer than one week. In the case of hexavalent chromium, clean, launder, repair and replace all protective clothing and equipment as needed to maintain its effectiveness. Do not use disposable clothing for any longer than one day and replace the clothing more frequently if it becomes torn or damaged.
5. Do not remove or clean the clothing by any means that reintroduces the

toxic metals into the ambient air, or onto an employee's body, such as brushing, shaking, or blowing. Use HEPA vacuums for employee cleaning prior to removing protective clothing.

6. Store the used clothing in labeled, sealed containers.
  - a) Containers shall have the following label if clothing was exposed to lead: "DANGER: CLOTHING AND EQUIPMENT CONTAMINATED WITH LEAD. MAY DAMAGE FERTILITY OR THE UNBORN CHILD. CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM. DO NOT EAT, DRINK OR SMOKE WHEN HANDLING. DO NOT REMOVE DUST BY BLOWING OR SHAKING. DISPOSE OF LEAD CONTAMINATED WASHWATER IN ACCORDANCE WITH APPLICABLE LOCAL, STATE, OR FEDERAL REGULATIONS."
  - b) Containers shall have the following label if clothing was exposed to arsenic: "DANGER: CONTAMINATED WITH INORGANIC ARSENIC. MAY CAUSE CANCER. DO NOT REMOVE DUST BY BLOWING OR SHAKING. DISPOSE OF INORGANIC CONTAMINATED WASHWATER IN ACCORDANCE WITH APPLICABLE LOCAL, STATE, OR FEDERAL REGULATIONS."
  - c) Containers shall have the following label if clothing was exposed to cadmium: "DANGER: CONTAINS CADMIUM. MAY CAUSE CANCER. CAUSES DAMAGE TO LUNGS AND KIDNEYS. AVOID CREATING DUST."
  - d) Containers for clothing exposed to hexavalent chromium shall be labeled in accordance with the Hazard Communications standard (29 CFR 1910.1200).
  - e) If the clothing is going to be disposed, either declare the waste as hazardous, or test the waste and apply hazardous waste labels as appropriate based on the results.
7. If the clothing is washed on site, provide containers for the collection and retention of the water after filtration. Comply with the specific testing and disposal requirements in Section 3.05.H.4.
- I. **Housekeeping** – Conduct housekeeping and project cleanup as specified in Section 3.06. The project site, including but not limited to, staging areas, work site, regulated areas and project boundaries, must be properly maintained and free of rubbish and trash throughout the duration of the project.
- J. **Personal Hygiene Facilities and Equipment**
  1. Provide clean lavatory and hand washing facilities in accordance with OSHA sanitation standard 29 CFR 1926.51. Locate the hand washing facilities outside of the regulated area, but in close proximity to the paint removal operation, in an area that is convenient for washing prior to drinking, eating or smoking.
  2. Provide showers when exposures exceed the PEL or TLV. Confirm that all employees whose exposures exceed the PEL or TLV shower, including hair, prior to leaving the project site. Clean the decontamination facilities daily during use.

3. Filter and containerize all hygiene water. Comply with the specific testing and disposal requirements in Section 3.05.H.4.
4. Prohibit eating, drinking, smoking, chewing of food or tobacco products, or the application of cosmetics any time that hexavalent chromium is present, in any area where the exposure to any toxic metal exceeds the PEL or TLV, or within regulated areas. Confirm that workers thoroughly wash hands and face prior to undertaking any of these activities.
5. Provide clean lunch and break areas for use by all employees and maintain airborne concentrations in these areas below the Action Level for all toxic metals.
6. Provide clean change area(s) for employees whose exposures exceed the PEL or TLV, or where protective clothing is required. Equip the change area(s) with separate storage facilities for street clothing that are adequately segregated to prevent cross-contamination from work clothing. Assure that employees do not leave the project site wearing any clothing that was worn while performing activities where exposures exceeded the PEL or TLV.

**K. Medical Surveillance and Medical Removal Protection**

1. Provide all employees with initial and periodic medical surveillance as required by the published OSHA health and safety standards for the metal of concern, except that the frequency of blood testing in the case of lead is increased. Conduct blood lead and zinc protoporphyrin (ZPP) sampling and analysis prior to exposure to lead and at monthly intervals thereafter. In addition, conduct exit blood tests for each worker within five working days upon completion of his/her Project activities that involve exposure to lead. Exit blood test shall be offered to the departing employee in writing. Conduct the exit tests even if the departure of the employee occurs prior to the completion of the Contractor's work on the project, and at any time that project activities involving lead exposure will be halted for 30 days or more (e.g., winter shut down).
2. Verify that all medical tests are completed by, or conducted under the supervision of, a physician or other licensed health care professional (PLHCP). Verify that the blood analysis is conducted by laboratories which meet the qualification requirements established in Appendix A, and which have been accepted by the Engineer. Provide the specialized medical surveillance and X-rays required by 29 CFR 1926.1118 for employees exposed to inorganic arsenic.
3. Workers with initial blood lead levels of 40 micrograms per deciliter ( $\mu\text{g}/\text{dl}$ ) are not permitted on the project for any work activities involving exposure to lead.
4. Provide for intervention by the CIH/IH if a blood lead level  $>25 \mu\text{g}/\text{dl}$  occurs for two or more workers, or there is an increase of  $10 \mu\text{g}/\text{dl}$  or more between consecutive tests for any individual worker. Intervention consists of an on-site investigation by the CIH/IH, implementation of corrective action, and notification of the Engineer in the following monthly report.
5. Provide for the temporary removal of employees from exposures above the Action Level for the metal of concern when the blood analysis indicates that

unacceptable results are occurring (e.g., 50 µg/dl or above in the case of blood lead). Protect employees' benefits during any period of medical removal and conduct all tests required by the OSHA standard for the metal of concern during the removal period. In the case of lead, return workers to exposures above the PEL only after two consecutive blood tests taken at least two weeks apart are below 40µg/dl.

6. Provide medical removal protection to workers as required by the OSHA inorganic arsenic, cadmium, and hexavalent chromium standard if workers are exposed to these metals.
7. When inorganic arsenic, cadmium and/or hexavalent chromium is present, provide medical surveillance as required by the appropriate OSHA standard at the time frequency required by that standard. Verify that all examinations are performed by, or under the direct supervision of, a licensed physician.
8. Provide all exam information and test results to the employees in writing within five days of receipt. Provide the Engineer with a letter report within 10 calendar days after the completion of each month signed by the CIH that summarizes all examination and biological monitoring results.
9. For employees who are offered an examination and biological monitoring but choose not to participate or fail to respond, the Contractor shall provide documentation that the examination and monitoring were offered. This shall be in the form of a written declination signed by the employee or, for employees who are no longer on the payroll, a registered letter to the employee's last known address.

**L. Employee Training and Information**

1. Provide initial and annual refresher training for all employees who will be exposed to toxic metals above the respective Action Levels on any one day in a 12-month period. Include all of the elements of training that are required by the appropriate OSHA standard. If an OSHA standard for the metal does not exist, use the training requirements of 29 CFR 1926.62 as the basis of the training program highlighting the differences as appropriate for the other metals of concern.
2. When other contractors or employers are present at the site, notify them of the nature of the hazards of the work such as lead, noise, and solvent vapors. Advise them of the need to remain out of exposure areas, the warning signs and labeling system in effect, and the potential need for them to take measures to protect their employees in accordance with the applicable OSHA regulations. Notify the Engineer if other contractors are working in regulated areas.

**M. Signs** – As specified in section 3.02, post warning signs around areas or activities that might generate airborne emissions of toxic metals in excess of the Action Levels. Signs are to be in accordance with 29 CFR 1926.200. Access to this regulated area is only allowed by authorized people who have received specific training, undergone initial medical surveillance, have on the proper personal protective equipment and who have on the appropriate respiratory protection as required by the OSHA standards for the toxic metals present.

**N. Parking Areas** - Worker vehicles are not permitted in the regulated areas or within

100 feet of the containment enclosures.

**O. Recordkeeping**

1. Retain all records related to training, medical examinations, blood analysis, exposure monitoring, respirator fit testing, inspections by a competent person, and other related project documentation on file at the project site.
2. Provide the Engineer with letter reports signed by the CIH which summarize all examination results that are indicative of worker exposures to (or which demonstrate proper protection from) toxic metals. In the case of lead, summarize the blood lead and ZPP results, indicate any observed trends, and identify worker intervention or removal provisions that were invoked based on the results. Provide summary reports of the test results prior to worker exposures to Project activities, periodic surveillance results, and results upon completion of site activities. Provide the Engineer with an original signed copy of each report within 10 calendar days after the end of each month.
3. The Contractor is responsible for retaining all exposure monitoring records for 30 years and employee medical records for the duration of employment plus 30 years.

**3.02 ESTABLISHMENT OF REGULATED AREAS**

- A. Establish zones (regulated areas) around project locations or activities that might generate airborne emissions of lead, cadmium, hexavalent chromium, inorganic arsenic, or other toxic metal in excess of the Action Level (e.g., paint removal and cleanup locations, dust collector staging areas, waste storage areas, etc.).
- B. Use ropes, ribbons, tape, warning signs, or other visible means to define the areas. Prohibit entrance into the regulated areas by unprotected or untrained personnel to ensure that they are not exposed to toxic metals from project activities.
- C. Unless objective data is available for establishing the regulated areas, and the data is provided in writing, signed by the CIH and is accepted by the Engineer, conduct instrument monitoring in accordance with SSPC-TU7, Method C (Occupational Monitoring of Area Emissions of Hazardous and Toxic Substances), to verify the adequacy of the regulated areas. Use a minimum of two low flow pumps at each regulated area location (e.g., one pump upwind and one pump downwind). Unless otherwise directed by the Engineer, until the monitoring results are available to establish the perimeter of the regulated area, initially establish the boundary a minimum of 15 feet away from any equipment or operations that might generate airborne emissions of toxic metals.
- D. Conduct the monitoring according to NIOSH Method 7082, or equivalent method for the other metals of concern, at the pre-established boundaries of the regulated area(s). The Contractor, at their discretion, can decide to perform a total chromium analysis off the cellulose ester filter used to collect samples for inorganic arsenic, cadmium and lead analysis. If the total chromium content is below detectable limits, then a hexavalent chromium analysis will not be required. Collect the samples throughout an entire work shift upon full commencement of the paint removal activities (at project-start-up).
- E. If the monitoring confirms that project emissions at the initial boundary do not exceed

the Action Level as an eight-hour TWA, establish the boundary at that location. Unless directed otherwise by the Engineer, all boundaries must be a minimum of 15 feet away from equipment or operations that might generate airborne emissions of toxic metals.

- F. If the monitoring shows that the emissions exceed the Action Level, modify and improve work practices and containment to provide better controls over the emissions, or reestablish the boundary at a different location if allowed by the Engineer. Repeat the monitoring in either case.
- G. After the boundaries have been established through instrument monitoring, additional monitoring is not required unless directed by the Engineer or environmental consultant if suspect visible emissions occur, or there are changes to the work practices or equipment being used within the regulated areas. In these cases, conduct additional monitoring as directed.
- H. Verify that the exposure cassettes are only analyzed by laboratories which meet the qualification requirements established under Appendix A, and which have been approved by the Engineer. The laboratory must provide the results to the Contractor within three days of the field sampling. Provide the test results to the Engineer verbally within one day of receipt, and in writing within five working days thereafter.
- I. Post caution signs at the entryways around each regulated area. If there is no regulation for the metal of concern, use the legend for the CAUTION sign as found in 29 CFR 1926.62 as the format, and insert the name(s) of the other toxic metals and their major health effects. Sign requirements for lead, cadmium, and inorganic arsenic are as follows:

DANGER  
LEAD WORK AREA  
MAY DAMAGE FERTILITY OR THE UNBORN CHILD  
CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM  
DO NOT EAT, DRINK, OR SMOKE IN THIS AREA

DANGER,  
CADMIUM  
MAY CAUSE CANCER  
CAUSES DAMAGE TO LUNGS AND KIDNEYS  
WEAR RESPIRATORY PROTECTION IN THIS AREA  
AUTHORIZED PERSONNEL ONLY

DANGER  
INORGANIC ARSENIC  
MAY CAUSE CANCER  
DO NOT EAT, DRINK OR SMOKE  
WEAR RESPIRATORY PROTECTION IN THIS AREA  
AUTHORIZED PERSONNEL ONLY

DANGER  
HEXAVALENT CHROMIUM  
CHROMIUM (VI) OR Cr(VI)  
CANCER HAZARD  
CAN DAMAGE SKIN, EYES, NASAL PASSAGES AND LUNGS  
AUTHORIZED PERSONNEL ONLY  
RESPIRATORS MAY BE REQUIRED IN THIS AREA

- J. Use signs that are a minimum of 8 1/2 inches by 11 inches in size with black block lettering on a white, yellow, or orange background. Do not use caution ribbons as a substitute for signs.
- K. Verify that all workers who enter the regulated area have had the proper training, blood analysis and medical examinations, and are wearing the required protective clothing and equipment. Prohibit eating, drinking, smoking, and chewing of food or tobacco products in any area where the exposures exceed the Action Level or where hexavalent chromium may be present.

### 3.03 CONTROL AND MONITORING OF RELEASES TO AIR, SOIL AND WATER

#### A. General

1. Conduct all activities so that spills or releases to the soil, water, sediment, or sewers do not occur. Comply with all applicable federal, state and local regulations for the protection of soils, groundwater and surface waters.
2. Have the competent person inspect the Work site on a daily basis for compliance with the requirements of this Section and the approved Environmental Protection Plan and prepare a daily report or daily log of observations made. Maintain the information at the project site and make it available to the Engineer or environmental consultant for review at any time.
3. Initiate immediate corrective action, including the replacement of materials or equipment, or adjustments to work activities as necessary, to correct unacceptable emissions or releases. All equipment and vehicles must be repaired or replaced to prevent leaks to the environment.
4. Spill prevention and control measures must be implemented for vehicles and equipment that utilize diesel fuel, gasoline or other petroleum products. Any spills of petroleum products to the environment must be reported to the NYSDEC Spill Hotline: 1-800-457-7362 and the National Response Center: 1-800-424-8802. Any spills to a storm drain, sewer system, wetland, body of water or waterway must be reported to the National Response Center and the Engineer.
5. Provide secondary containment when storing bulk petroleum or chemicals at the project site. Secondary containment shall be large enough to hold the volume of the container being stored within the secondary containment system.

#### B. Visible Emissions and Releases

1. Clean the work area of all visible pre-existing construction material, rubbish, garbage existing paint chips, and paint removal debris (i.e. spent abrasive, rust, paint chips, etc.) prior to installing the containment over any

land mass. Areas to be cleaned include the City's right-of-way and adjacent areas as directed by the Engineer. The presence of new paint chips or surface preparation debris in these areas will be cause to examine the containment and work practices, and to correct all observed deficiencies. Upon completion of the project verify that the same locations and all staging areas are free of construction and paint removal debris.

2. When working over water, install water booms beneath and around the work area as appropriate and/or use boats with skimmers to control and collect unanticipated escapes of debris (see Section 3.04 M).
3. Have the competent person conduct observations of visible emissions and releases on an ongoing daily basis when dust-producing activities are underway, such as paint removal, cleanup, waste handling, and containment dismantling or relocation. Conduct these assessments in accordance with and SSPC-TU7, Method A (Visible Emissions Observations). These assessments are in addition to those performed by the environmental consultant.
4. Visible emissions in excess of SSPC-TU7, Level B are unacceptable. This involves emissions of a cumulative duration of greater than 1 percent of the workday, or greater than 36 seconds in an hour, or 9 seconds in any 15-minute observation period.
5. Releases or spills of dust and debris which have become deposited on surrounding property, structures, equipment or vehicles, and bodies of water are unacceptable. If unacceptable visible emissions or releases are observed, whether by the Contractor, Engineer or the environmental consultant:
  - a) Immediately shut down the emission-producing operations and cleanup visible deposits of debris on the unprotected ground, on the soil, in the water, around storm sewers or drains, or in areas where rain water could carry the debris into storm sewers or drains. Pick up debris by hand and by HEPA vacuuming.
  - b) Change work practices, modify the containment, or take other appropriate corrective action as needed and as agreed upon by the environmental consultant, to prevent similar releases from occurring in the future.
  - c) Do not resume the emission-producing operations until the Engineer or environmental consultant has given permission to resume these operations.
6. In the event of a conflict between the observations of the environmental consultant and the Contractor, the findings of the environmental consultant shall prevail.
7. Maintain written documentation of the results of the observations in a log book or other report form available to the Engineer or environmental consultant for review. Verbally report problems to the Engineer or environmental consultant on the same day they are observed.

**C. High Volume Ambient Air Monitoring**

1. The environmental consultant, on behalf of the Engineer, will utilize the high volume ambient air monitoring equipment provided by the Contractor. The purpose of the consultant monitoring is to confirm that unacceptable TSP-lead emissions are not generated during paint removal, containment cleaning operations, containment dismantling and other emission-producing activities that involve the disturbance of paint and lead-paint debris/wastes/dust. Unless otherwise directed by the Environmental Engineering Unit, a minimum of four TSP high volume air monitors are required for each work area that involves dust creating activities.
2. Do not conduct any work involving the disturbance or cleanup of lead paint debris or move the containment unless the monitors are in place and operating.
3. Position the monitors at the locations and times as designated by the environmental consultant:
  - a) Monitor siting will take into consideration the proximity of the work to sensitive receptors, and the general surrounding environment. The locations are likely to change as the work progresses across the bridge.
  - b) Review the monitor siting plan proposed by the environmental consultant and confirm that the plan can be maintained per the contract requirements. Notify the Engineer if modifications to the monitoring plan are requested. The modifications shall be approved prior to beginning the applicable dust producing operations.
  - c) Move and set up the equipment in the designated locations. Put all monitors into position at the designated locations and ensure that they are fully operational at least 30 minutes before the commencement of dust producing operations in order to allow enough time for the environmental consultant to install filters and make any necessary adjustments to the equipment.
  - d) Allow the monitors to remain operational for a minimum of 30 minutes after the completion of daily operations.
4. At the completion of each day's monitoring activities pick-up, transport and store monitors and associated equipment for the next use. If the monitors are to remain in position, provide for the necessary level of security.
5. Initiate the following action based on the TSP-lead results:
  - a) The background concentration is established at  $0.1\mu\text{g}/\text{m}^3$ .
  - b) If TSP-lead levels, measured over 8 hours, are greater than  $4.5\mu\text{g}/\text{m}^3$  minus 2 times the background concentration of  $0.1\mu\text{g}/\text{m}^3$  on one day of dust-producing operations, assess all field operations undertaken on that day and initiate appropriate corrective action.
  - c) If TSP-lead levels, measured over 8 hours, are greater than  $4.5\mu\text{g}/\text{m}^3$  minus 2 times the background concentration of  $0.1\mu\text{g}/\text{m}^3$  at the same location on two days of dust-producing operations, suspend all dust-producing operations pending a full assessment

and corrective action.

- d) If the results of the monitoring are unacceptable, undertake the necessary corrective action within 24 hours of receipt of the results. Corrective action may include modifications to the paint removal or containment systems and work practices. Do not resume the emission-producing operations until the Engineer or environmental consultant has given permission to resume these operations.

**D. Real Time Particulate Monitoring**

1. The environmental consultant will conduct real time monitoring around the containment (e.g., seams and entryways) each day using a real-time aerosol monitor such as a Data Ram or hand-held Mini Ram. The monitoring is being conducted to evaluate the containment seams and entryways for particulate emissions that represent instantaneous increases over background of three times or more. Background values will be established by taking readings in the same or similar locations while no operations are underway.
2. If unacceptable particulate releases are reported by the environmental consultant, in addition to cleaning the debris, change work practices, modify the containment, or take other appropriate corrective action as needed to prevent similar releases from occurring in the future. Do not resume the emission-producing operations until the Engineer or environmental consultant has given permission to resume these operations.

**E. Sensitive Natural Resources**

1. Sensitive natural resource areas may be located around the project. A sensitive natural resource includes any area capable of providing habitat for plant and animal species or capable of functioning to support environmental systems and maintain the City's environmental balance, such as bays, inlets, and wetlands. These areas also include all federal and state parkland, wetlands, tidal zones or other regulated natural areas. If the project is located in a natural resource area, develop a site-specific habitat protection plan to address the steps that will be taken to protect these ecologically sensitive areas from damage. Note: If Sections 831 and 832 are specified for the work, only a single sensitive natural resources protection plan is required.

**F. Endangered, Threatened, and Protected Species**

1. Peregrine falcons, barn owls, red-tailed hawks, or other birds that are protected by federal and/or state law may be nesting or present on the bridge at the commencement of the Work or may build nests or be present on the bridge as the Work proceeds. (Barn owl and red-tailed hawk nests are generally occupied from the beginning of April until the end of July, with eggs laid in April. Peregrine falcon nests are generally occupied from March to July.) If birds or their nests are present, notify the Engineer about the location of the birds and/or nests and identify the species (if known). Do not disturb the birds or their nests without first obtaining approval from the Engineer of a site-specific plan and all applicable permits and licenses required by state and, if applicable, federal law.

Note: If Sections 831 and 832 are specified for the work, only a single endangered/protected species plan is required.

2. Peregrine falcons are listed as an endangered species under New York State Law, 6 NYCRR § 182.5(a), and they are also protected birds under New York State Law. See N.Y. Environmental Conservation Law §§ 11-0103(5)(b). Barn owls and red-tailed hawks are also protected birds under New York State Law, see id., but they are not endangered or threatened species. None of these species are currently listed as endangered or threatened species under the federal Endangered Species Act.
3. N.Y. Environmental Conservation Law § 11-0505(5) prohibits any person from destroying a nest of a protected bird without a permit from the N.Y. Department of Environmental Conservation. Therefore, prior to destroying a nest of a peregrine falcon, barn owl, red-tailed hawk, or other protected bird, Contractor must obtain a permit.
4. N.Y. Environmental Conservation Law § 11-0535(2) prohibits the “taking” of any endangered species without a license from the N.Y. Department of Environmental Conservation. “Taking” includes “disturbing,” among other activities. N.Y. Environmental Conservation Law § 11-0103(13) (“Taking” and “take” include “pursuing, shooting, hunting, killing, capturing, trapping, snaring and netting”). Therefore, prior to taking (including disturbing) a peregrine falcon that may be present on the bridge, Contractor must obtain a license.

### **3.04 CONTAINMENT SYSTEMS**

#### **A. General**

1. Use a containment system that maintains the work area free of emissions of dust and debris in accordance with all provisions of this Specification.
2. Install and use a containment system for the project based on the paint removal methods that will be utilized.
3. Provide the containment system in compliance with SSPC Guide 6 guidelines and the requirements of this Specification as well as the FEIS.
4. The containment enclosing the active work area must meet all specification requirements for the entire enclosed area. The entire containment is considered to be the active work area and the specified negative pressure and airflow must be maintained throughout the entire cross-section of the containment enclosure (airflow cannot be directed or channeled within the containment enclosure by the use of barriers, partitions, baffle tarps, or other devices). Containment cannot be divided up into smaller sections with dust and debris being released into adjacent sections that do not have air flow or negative pressure. If the containment is divided into smaller sections, the smaller section must also meet the class of containment as presented in Section 3.04.F.
5. Have the competent person inspect the performance of the containment on a daily basis for compliance with this Section and the approved containment submittals and prepare a daily report or daily log of observations made. Maintain the information at the project site and make it available to the Engineer or environmental consultant for review at any

time.

6. All materials utilized in containment construction shall be fire-retardant. All materials shall possess a fire rating in accordance with all applicable federal, local and state agency, as well as passing U.L and NFPA test standards. With the submittals, provide proof that the materials are fire retardant.

**B. Noise**

1. Comply with the New York City Noise Control Code and Citywide Construction Noise Mitigation requirements.
2. Develop and post on site a Construction Noise Mitigation Plan that defines the steps taken to comply with the standard. Address noise mitigation measures in the plan, including but not limited to:
  - a) the use of noise reduction devices on equipment
  - b) installation of noise barriers around blast cleaning operations or lining the containment with noise resistant material meeting sound transmission class (STC) 30 or greater per ASTM E90
  - c) control of after-hours noise to 80 dBA maximum
  - d) noise mitigation training.
3. If construction activities will be performed outside of normal hours of operation (7AM to 6PM on weekdays), obtain special permits authorizing this activity and prepare an Alternative Noise Mitigation Plan for submission to and approval by the NYCDEP. Provide a copy of the permit to the Engineer prior to commencing any operations outside of normal hours.

**C. Containment Drawings and Submittals**

1. Provide containment drawings, calculations, and assumptions, including ventilation criteria as detailed in Appendix A, signed and sealed by a New York State licensed Professional Engineer. Do not conduct any work until the drawings, calculations, and containment submittals have been reviewed and accepted by the Engineer.
2. The containment drawings must include calculations for pressure losses, dust collector capacity, make-up air openings and airflow.
3. Provide catalog cut sheets, fan curves and equipment operating parameters for the dust collectors and filters.
4. Provide design details regarding containments withstanding high winds during storm events when wind speeds are equal to or greater than 40mph.
5. Provide detailed procedure of the steps to be taken should the wind speed exceed the designed maximum wind speed for the containment.

**D. Certification of Containment Installation**

1. After each containment enclosure is installed, have the New York State licensed Professional Engineer responsible for the containment design, or a designee employed by the same firm and working under the direction of the design engineer, conduct a site inspection to verify that the containment system has been assembled as shown on the approved, signed and sealed

drawings. Have the design engineer submit a letter to the Engineer attesting to the above. The Engineer must receive the letter before any paint removal work within the containment can begin.

2. If the containment is not installed in accordance with the design drawings, reinstall the containment, or issue supplemental calculations for the new design for Engineer review and acceptance in accordance with the original submittal requirements. Field changes will only be acceptable after submission and acceptance of supplemental calculations or design drawings.
3. Provide the services of the structural engineer responsible for the design of the containment when requested by the Engineer.

**E. Containment Flooring System and Additional Collectors**

1. If the floor or ground beneath the structure being prepared serves as the base of the containment:
  - a) Cover it with air and dust impenetrable materials such as tarpaulins.
  - b) Prior to the installation of the containment floor, ensure that the work area has been cleaned of all rubbish, paint chips, garbage and debris and properly disposed. Do not remove any trees, bushes or shrubs.
  - c) As required, install a rigid material such as plywood over or under the ground tarpaulin in order to prevent any rips, tears or other penetrations from occurring in the ground tarpaulin. Maintain the materials throughout the project to avoid discharging debris through rips, tears, or breaks in the coverings.
2. If a suspended or elevated platform is constructed to serve as the base of the containment:
  - a) Flexible platforms shall not be used over water bodies, vehicular traffic and pedestrian walkways.
  - b) Cover rigid platform materials (e.g., plywood, metal, etc.) with multiple layers of flexible materials as necessary to create an air and dust impenetrable enclosure. For platforms over water bodies, vehicular traffic, railroads and pedestrian walkways, the use of at least one (1) layer of continuous rubber type membrane is mandatory.
  - c) Cover flexible platform materials, such as those composed of a chain-link wire fencing with multiple layers of flexible materials to create an air and dust impenetrable enclosure. The flexible materials consist of a first layer of rubber-type membrane and a second layer of tarpaulin-type material.
  - d) Seal all holes and gaps at cable, hanger, or vertical pick-up intersections with the platform.
  - e) Verify that the platform and its components are designed and constructed to support at least four times its maximum intended load without failure plus a safety factor, with wire cables capable of supporting at least six times their maximum intended load without

failure plus a safety factor. Provide all load calculations for design of the suspended platform systems. Strictly follow all applicable OSHA regulations regarding scaffolding and fall protection systems.

- f) Provide ground covers around and beneath the containment area to capture inadvertent spills or leaks of debris. Extend the covers a minimum of 10 feet beyond the area covered by the containment. Increase this distance based on the height of the work above the ground as directed by the Engineer. Remove debris from the covers continuously and at the end of a work shift, or as directed by the Engineer.
3. Note the requirements in Section 3.06 C for the daily cleaning of the floor and for overall cleaning of the containment prior to moving or dismantling the enclosure.
- F. **Containment Requirements for Removal Methods** – The minimum containment system requirements per SSPC Guide 6 for the various method(s) of paint removal are as follows:
1. Dry Abrasive Blast Cleaning – Class 1A
  2. Vacuum Blast Cleaning – Class 4A
  3. Wet Abrasive Blast Cleaning – Class 1W
  4. Water Jetting – Class 2W
  5. Power Tool Cleaning without Vacuum Shrouds – Class 1P
  6. Power Tool Cleaning with Vacuum Shrouds – Class 3P
  7. Hand Tool Cleaning – Class 3P
  8. Chemical Stripping with Hand Removal – Class 3C
  9. Chemical Stripping with Wet Removal – Class 2C
- G. **Containment and Ventilation System Components** – The basic components that make up containment systems are defined below. The components are combined in Table 1 and in accordance with the requirements of SSPC Guide 6 to establish the requirements for each method of removal.
1. **Rigidity of Containment Materials:** Rigid containment materials consist of single panels, interlocking panels or modular fabrications constructed of plywood, aluminum, rigid metal, plastic, fiberglass, composites, or similar materials. Flexible materials consist of screens, tarps, drapes, plastic sheeting, or similar materials. Containment materials must be fire retardant, and new and unused when delivered to the project site. Maintain stored materials in a new condition until used in containment construction. Containment materials that become torn, ripped, or otherwise damaged during use, or show evidence of wear that may affect their ability to control emissions shall not be used for the construction of containment enclosures or in any other manner on the project.
  2. **Permeability of Containment Materials:** The containment materials are identified as air impenetrable if they are impervious to dust or wind such as provided by rigid panels, coated solid tarps, or plastic sheeting. Air

penetrable materials include tightly woven, but not coated, tarps, and materials that are formed or woven to allow airflow, but can retain some airborne particles. Water impermeable materials are those that are capable of containing and controlling water when wet methods of preparation are used. Chemical resistant materials are those resistant to the specific chemical and solvent stripping solutions.

3. **Support Structure:** Rigid support structures consist of scaffolding and framing to which the containment materials are affixed to minimize movement of the containment cocoon. Flexible support structures are comprised of cables, chains, or similar systems to which the containment materials are affixed. Minimal support structures involve the cables or connections necessary to attach the material to the structure being prepared and/or to the ground.
4. **Containment Joints:** Fully sealed joints require that mating surfaces between the containment materials and the structure being prepared are completely sealed. Sealing measures include tape, caulk, stitching, clamps, overlapping seams (when using flexible materials) or other similar material capable of forming a continuous, impenetrable or impermeable seal. Partially sealed joints involve the mating of the materials to one another and to the structure being prepared with concern for the structural soundness of the joint, but without consideration for creating a continuous, impenetrable or impermeable seal.
5. **Entryway:** An airlock entryway involves a minimum of one stage that is fully sealed to the containment and which is maintained under negative pressure using the ventilation system of the containment. Resealable door entryways involve the use of flexible or rigid doors capable of being repeatedly opened and resealed. Sealing methods include the use of zippers, clamps, or similar fasteners. The use of clamps to create "resealable doors" is not permitted. Overlapping door tarpaulin entryways consist of minimum two or three overlapping door tarpaulins. Open seam entryways involve entrance into the containment through any open seam.
6. **Mechanical Ventilation:** The requirement for mechanical ventilation is to ensure that adequate air movement is achieved to reduce worker exposure to toxic metals to as low as feasible, and to enhance visibility. Design the system with proper exhaust ports or plenums, adequately sized ductwork, adequately sized discharge fans and air cleaning devices (dust collectors) and properly sized and distributed make-up air points. A minimum cross-draft airflow of 100 feet per minute (30 meters/min) or a down-draft airflow of 60 feet per minute (18 meters/minute) are required during all activities that disturb lead paint or debris within the containment. These activities include, but are not limited to, abrasive blasting, blow down, waste removal, cleaning of the containment and cleaning of surfaces in the containment. Increase these minimum airflows as required if unacceptable visibility occurs. Verify through instrument monitoring that air flows meet or exceed design values initially and at least weekly thereafter. Number and locations of air velocity measuring points shall be agreed upon with the Environmental Consultant. Document air flow measurements.

Natural ventilation does not require the use of mechanical equipment for moving dust and debris through the work area. It relies on natural air flow patterns, if any, through the containment.

7. **Negative Pressure:** If negative pressure is specified, verify its performance through pressure gage instrument monitoring to achieve a minimum of 0.03 in. (0.08 cm) water column (W.C.) relative to ambient conditions during all activities that disturb lead paint, debris, grit or other lead-contaminated materials. This shall include, but not be limited to, abrasive blasting, containment cleaning, vacuuming, and blowdown within containment. In addition, verify through visual assessments for the concave appearance of the containment enclosure.
8. **Exhaust Ventilation:** When mechanical ventilation systems are used, provide filtration of the exhaust air, otherwise airborne particulate from the containment will be exhausted directly into the surrounding air. Provide a filter that is at least 99.9% efficient in removing a mono-dispersed aerosol at 0.5 micrometers in diameter. For other requirements related to exhaust ventilation design and use requirements, see SSPC-Guide 16 and 3.04.G.6, Mechanical Ventilation and 3.04.G.7, Negative Pressure, described above.

#### H. **Maintenance of Existing Lighting Systems, Surveillance Cameras, and Containment Lighting Requirements**

1. Maintain as fully operational throughout the project, all existing navigation and anti-collision lighting systems that are attached to the structure. If existing lighting will be concealed, install temporary lighting of equal or better magnitude. Provide the lighting plan to the Engineer for approval in advance.
2. Make all efforts to maintain existing aerial, roadway, and parking lot lighting, or provide suitable substitutions as approved by the Engineer.
3. Do not obstruct surveillance cameras view without prior approval. The Contractor will be responsible for temporary relocation and reinstallation of security cameras as directed by the Engineer.
4. In accordance with SSPC-Guide 12, maintain light intensity inside containment, by natural or artificial means, at a minimum of 20 foot-candles (215 lux) on the surface throughout surface preparation and painting activities. Maintain a minimum of 50 foot-candles (538 lux) at the surface for inspection activities. Provide auxiliary lighting as necessary. Use explosion-proof lighting.
5. Increase lighting intensity when measurements by any involved party indicate that there is insufficient lighting for either surface preparation, painting, or inspection.

#### I. **Lockout/Tagout of Existing Electrical Systems**

1. Develop, implement and maintain a Lockout/Tagout plan.
2. De-energize and lockout/tagout existing electrical systems located inside containment enclosures and in other work areas as appropriate.
3. Perform all lockout/tagout in accordance with 29 CFR 1910.147 and

1910.333.

4. Coordinate all lockout/tagout activities with the Engineer and the utilities.
5. Include lockout/tagout in the worker protection plan. If Sections 831 and 832 are specified for the work, only a single Lockout/Tagout plan is required.

**J. Fire Protection and Prevention, and Emergency Response**

1. Coordinate all lockout/tagout activities with the Engineer and the utilities.
2. Develop, implement, and maintain a site-specific Fire Protection and Prevention Plan meeting at a minimum the requirements of 29 CFR 1926.24 and 29 CFR 1926.150.
3. Control all sources of ignition throughout the period of construction and comply at a minimum with the requirements of 29 CFR 1926.151.
4. Store and handle all flammable and combustible in a safe manner and in compliance with the requirements of 29 CFR 1926.152 at a minimum.
5. Develop, implement and maintain a site-specific Emergency Response Plan in accordance with the requirements of 29 CFR 1926.65(q) at a minimum.
6. If Sections 831 and 832 are specified for the work, only a single Fire Protection/Prevention and Emergency Response plan is required

**K. Electrical Safety**

1. Develop, implement and maintain a written site-specific Electrical Safety plan ensuring control of electrical hazards due to installations, safety-related work practices, maintenance and environmental considerations, and/or use of special equipment as outlined in 29 CFR 1926.400 and 29 CFR 1926.403.
2. Implement all applicable provisions of 29 CFR 1926 Subpart K as necessary based upon the hazards present on the jobsite.
3. If Sections 831 and 832 are specified for the work, only a single Electrical Safety plan is required.
4. Provide training, hazard assessment and proper personal protective equipment if workers are going to come into contact with high voltage power when working on the City site as specified in NFPA 70E regarding arc flashing.

**L. Protection of Drainage Systems**

1. Protect storm sewers and drains from the entrance of debris from project activities. Keep all drainage systems clean and operational throughout the entire project. At the end of each shift, remove all visible debris from the protective devices or from areas where rain water could carry the debris into drains or storm sewers. Conduct more frequent cleaning as directed by the Engineer.
2. Identify the methods that will be used to route run-off from the existing deck drains through the containment enclosure. Do not close any bridge deck drains without the explicit approval of the Engineer.

**M. Work Over/On Water - Containment Restrictions**

1. When working over or near water, install a shield, suspended platform or other engineering control meeting the requirements of Section 3.04.E.2 to prevent discharge of any debris or materials into the waterway. Use water booms to contain inadvertent spills or releases of dust and debris unless prohibited by navigation lanes or ineffective due to high water flow. In these cases, have a boat available with a skimmer to collect fugitive materials. Remove all project-related dust and debris from the surface of the water or from sediment at the end of each shift at a minimum. Conduct more frequent cleaning, if directed by the Engineer.
2. Provide the Engineer and the appropriate authorities (e.g., Coast Guard) with the distance that the containment will extend below the bottom of the bridge (e.g., below the bottom chord) when operating in the navigation channel. Clearance reduction shall be approved by Coast Guard.
3. Unless otherwise directed by the Engineer or the appropriate authorities, design the containment to allow it to be moved out of the navigation channel within 24 hours of notification that ships needing additional clearance require passage.
4. Provide the Engineer and the appropriate authorities with a 24-hour telephone number and contacts for discussions regarding the containment system.

**N. Inclement Weather**

1. When threatening weather conditions exist or are forecast for the New York City Metropolitan Area, such as sustained winds of 30 mph (48 kilometers/hour) or gusts of 40 mph (64 kilometers/hour) that could cause the release of waste material to the surrounding environment, stop all work activities and immediately cleanup waste materials within the containment. The work area and project site must be secured of all loose materials and equipment.
2. Develop and submit to the Engineer for acceptance, an Emergency Demobilization Procedure for the securing of equipment and materials, and the removal of necessary containment materials in the event of, or the forecast of, inclement weather for the New York City Metropolitan Area. Inclement weather includes, but is not limited to, sustained wind speeds of 40 mph (64 kilometers/hour), gusts greater than 40 mph (64 kilometers/hour), wind speeds greater than the containment design (if less than 40 mph (64 kilometers/hour)) and heavy snow/ice storms that will place unacceptable loads on the containment structure. Initiate the Emergency Demobilization Procedure under, or the forecast of, inclement weather conditions or as directed by the Engineer. Note that if the containment design mandates Emergency Demobilization at wind speeds less than the above, initiate demobilization at the lower speeds. The Contractor is responsible for maintaining containment integrity even if predicted adverse weather events occur during off hours, weekends and/or holidays.

### 3.05 WASTE CLASSIFICATION, HANDLING, AND DISPOSAL

#### A. General

1. The Contractor and the City are co-generators of the hazardous waste. The Engineer will provide the EPA identification number, but the Contractor is solely responsible for the aspects of waste management as defined in this Section.
2. Work under this Section consists of accumulating, packaging, labeling, loading, transporting, treating, and disposing of hazardous paint removal waste, hazardous wastes, hazardous and non-hazardous soils, solvents, liquid wastes, non-hazardous construction debris, and waste water used for cleaning and washing the bridge, decontamination of personnel and equipment prior to removal from the Work site.
3. For purposes of this Section, paint removal waste is defined as removed paint particles, rust and other foreign matter combined with the material used to remove the paint. This also includes used abrasive grit material, recyclable or otherwise. The City has declared all paint removal waste as hazardous, even if sampling and analysis indicate that hazardous thresholds are not exceeded. Note that the existing coatings may contain toxic metals in addition to lead.
4. Recover all waste products generated during cleaning and painting work, including but not limited to rags, tape, and paint cans. Manage as non-hazardous /construction waste as described in 3.05 H.2 unless the items are contaminated with paint, thinners and petroleum products, or if paint cans contain more than one inch of material. If the items are contaminated with paint, thinners and petroleum products, or contain more than one inch of material, handle them as a flammable hazardous waste.
5. The competent person shall inspect the waste handling and storage areas on a daily basis for compliance with this Section and the approved Waste Management Plan and prepare a daily report or daily log of observations made. Maintain the information at the project site and make it available to the Engineer or environmental consultant for review at any time.

#### B. Items Provided by the Contractor

1. Waste sampling, testing, and classification.
2. Waste packaging, handling, and secure storage.
3. Labeling of containers.
4. Procuring all necessary waste permits and licenses.
5. Arranging for the transportation and disposal of hazardous waste.
6. Arranging for the transportation and disposal of non-hazardous waste.

#### C. Waste Sampling

1. All paint removal waste streams are declared hazardous but collect a minimum of four representative samples of each paint removal waste stream to identify the specific composition.
2. Collect a minimum of 1/2 pound of waste per sample, or approximately 8 oz

per sample in the case of wastewater. Collect the wastewater sample only after the water has been filtered as specified later in this Section.

3. Collect the samples under the observation of the environmental consultant.
4. Collect the samples in accordance with EPA solid waste test methods SW-846, "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods." Use a random sampling technique to collect representative samples. Obtain samples as close to the point of generation as possible, i.e., from the floor of containment, except that debris from blasting with recyclable abrasives shall be taken from the abrasive recycling equipment.
5. Complete the initial sampling of each waste stream prior to, or immediately upon filling the first container, but do not allow waste to accumulate for longer than 30 days before sampling. After the representative samples are collected, send them immediately to the approved and NYS accredited laboratory for analysis.
6. Unless otherwise directed by the Engineer or required by State regulations or the waste recycling or disposal facility, once each waste stream is sampled, tested, and classified, additional sampling and analysis are not required for subsequent shipments unless the waste stream changes.

#### **D. Waste Testing**

1. Only use laboratories which meet the qualification requirements of Appendix A, and which have been approved by the Engineer.
2. Direct the laboratory to test the solid waste in accordance with 40 CFR 261, Appendix II, Method 1311 Toxicity Characteristic Leaching Procedure (TCLP).
3. Analyze one sample from each waste stream by TCLP for all eight (8) RCRA metals, and other hazardous characteristics (e.g., corrosivity, reactivity, toxicity, and ignitability) as required by the regulations. Conduct any additional tests required by the disposal facility. When chemical strippers are used, test all liquids and sludge. Include pH to determine corrosivity. Test chemical waste products for ignitability and corrosivity.
4. Retain the other samples for possible further analysis.
5. After filtration, test the wastewater for lead and any other analytical parameters required for disposal characterization by the POTW, discharge permit or disposal facility. Comply with disposal requirements in 3.05.H.4.

#### **E. Waste Classification**

##### **1. Hazardous Waste Classification**

- a) All paint removal waste streams are classified as hazardous. Other waste streams are classified as hazardous if results from TCLP analysis indicate any one of the following eight metals in concentrations at or above limits established in 40 CFR 261:

Arsenic -	5.0 mg/L
Barium -	100.0 mg/L
Cadmium -	1.0 mg/L
Chromium -	5.0 mg/L

Lead -	5.0 mg/L
Mercury -	0.2 mg/L
Selenium -	1.0 mg/L
Silver -	5.0 mg/L

- b) The above list includes only those elements typically associated with paints. Take into account and test for other substances that may be present which can cause debris to be classified as hazardous waste as defined in 40 CFR 261 (e.g., pH  $\leq$  2.0 or  $\geq$  12.5 resulting in corrosivity, or the characteristics of reactivity or ignitability).
- c) The City requires that paint removal waste, including waste that is generated through the use of steel abrasives and used steel abrasives, be handled, transported, and disposed of as hazardous waste, regardless of the TCLP test results.
- d) Typical paint removal waste contains less than 2% by weight of organic material. The Contractor is specifically forewarned that disposal facilities perform spot tests and may refuse to accept wastes in excess of 2% organic content. Waste contaminated in this manner (e.g., with solvent waste) will be the Contractor's responsibility. All penalties and costs associated with the refusal of a disposal facility to accept waste not meeting its requirements will be borne by the Contractor.
- e) Ensure that all waste characterization testing required by the disposal facility is included in waste classification sampling and testing. The Contractor shall classify waste via any additional sampling and testing required by the selected disposal facility.

## 2. **Non-Hazardous Waste Classification**

- a) A waste stream is classified as non-hazardous if the TCLP analysis indicates that the waste stream contains toxic metals or hazardous substances below the thresholds identified above which would classify it as hazardous, and it does not exhibit other characteristics of hazardous wastes.
- b) The City has classified paint removal waste as hazardous regardless of the test results.

## 3. **Laboratory Report**

- a) Have the laboratory send the original test report directly to the Engineer no later than five (5) calendar days after the representative samples are submitted for testing, with a copy being sent by facsimile or email to the Engineer on the same day the original report is sent.
- b) Include the following minimum information in each report: Identity of the waste stream(s) analyzed, the number of samples collected and tested, dates of sampling and testing, laboratory test procedures utilized, the names and signatures of the individuals collecting the samples and conducting the laboratory tests, an interpretation of the test results, and chain-of-custody forms.

**F. Waste Handling, Site Transportation and Spill Containment**

1. Comply with 40 CFR 262, State and City regulations for the on-site handling, packaging, and storage of all waste generated by the project.
2. Sequence the waste collection operations and identify storage locations in order to minimize the amount of container movement required throughout the course of the project. The Engineer must approve all waste storage locations. All hazardous waste must be stored on City property.
3. Provide secure waste storage areas (e.g., within a separate locked fenced-in area or other secure enclosure) to prevent access by the public or vandals and placard the storage area in accordance with applicable regulations. Store the waste on a level surface. Any fencing used for the storage area must be a minimum of eight feet high. All hazardous waste storage areas must be in compliance with the RCRA Contingency Plan as prepared by the contractor.
4. Do not place hazardous waste on the unprotected ground (e.g., cover the ground with impermeable tarpaulins). Provide protection from the elements (e.g., rain and snow) and adequate shielding to prevent dispersion of the waste by wind or rain. Use pallets to keep the hazardous waste drums off of the ground. Store drums containing liquid wastes (e.g., wastewater and spent solvents) on drip pads. Clean the drip pads on a periodic basis, as necessary. Install secondary containment controls around all hazardous waste containers.
5. Store non-hazardous waste separately from hazardous waste. Do not co-mix hazardous waste with non-hazardous waste. Do not mix different types of hazardous waste together unless specifically approved by the Engineer and the disposal facility.
6. Arrange containers in the storage area for easy accessibility. Drums should be stored in rows of two with hazardous waste labels facing outward for inspection. Do not pile drums over two high.
7. At the end of each working day at a minimum, collect and store the waste in drums or containers such that no waste is left exposed overnight. Cover all containers immediately upon filling and confirm that all lids are closed except when filling. Verify that all labels remain intact. Hazardous waste must be transported from the points of generation to the secure storage area within a closed vehicle (i.e. box truck). Transportation of hazardous waste via fork-lift, pick-up truck, flat bed or other similar type vehicles is not permitted. Hazardous waste can only be transported on the project site and not to an off-site storage area or staging yard. Hazardous waste can only be transported through New York City streets by a properly NYSDEC licensed and permitted waste transporter to the TSDF in accordance with applicable regulations.
8. Maintain all containers in good operating condition with all lids and closing mechanisms intact and operational to prevent the escape of debris by wind, spilling of the contents, or access by unauthorized personnel. Drums must have lids and rings in place. Drums stationed at the dust collectors, recyclers or other equipment must have drum lids in place and connected to the discharge nozzles of the equipment through the flanged opening on

the drum lid. All hazardous waste and debris from paint removal operations must be stored in rigid containers. The use of fabric or plastic-type bags to collect hazardous waste, non-characterized waste or other regulated waste is prohibited. The connecting of fabric or plastic bags to discharge nozzles of equipment is prohibited.

9. Provide adequate shielding and protection of the surrounding area when transferring and/or conveying hazardous waste from one container to another to prevent dispersion or spills. Hazardous waste can only be transferred within a regulated, controlled and contained area. Immediately cleanup spilled debris and return it to the storage containers. Use methods such as HEPA vacuuming that will prevent airborne dispersion of the material. Revise labels as necessary at the time of transferring and/or conveying hazardous waste from one container to another.
10. Do not fill any container or roll-off in excess of the capacity marked on the container.
11. Have the competent person, on a daily basis, inspect the drums or containers for corrosion, applicable and legible labels, proper covers, ground protection, and leaks, and record the results of all the inspections in a log book. Conduct additional inspections before containers are moved.
12. Verify that all waste is transported to the appropriate recycling or disposal facility within forty-five (45) calendar days after waste is generated, or two weeks following demobilization of the site, whichever occurs first. Failure to comply with the aforementioned deadlines may result in the actions described under Basis of Payment.
13. Improper waste storage is cause for immediate suspension of the Work by the Engineer until appropriate corrective action is completed.
14. Train all personnel in the proper handling of hazardous waste at the Work site in accordance with 40 CFR 265.16 and 6 NYCRR 373. Include procedures in the Waste Handling Plan that will be followed in the event of a release or spill when handling the waste, including containment of the spill, notification of the Engineer, collection and containerizing of the waste, and a review of work practices and implementation of necessary changes to prevent a reoccurrence. Maintain all training records on-site. Workers responsible for handling hazardous wastes must have a current OSHA 24-hour HAZWOPER certification plus 8 hours of annual refresher training.

**G. Labeling of Containers**

1. Immediately label all containers of hazardous waste in accordance with 40 CFR 262, and 49 CFR 171-179. Complete missing information upon receipt of the testing results. Include the following minimum information:
  - a) Hazardous Waste. Federal law prohibits improper disposal. If found, contact the nearest police, or public safety authority, or the U.S. Environmental Protection Agency.
  - b) Proper DOT Shipping Name (e.g., RQ Hazardous Waste Solid, N.O.S. 9, NA 3077, PG III)
  - c) Manifest Document No (when manifest is prepared; prior to shipping)

- d) Generator Name, Address, EPA ID No, and Contract No. ‘
  - e) Date of Accumulation (accumulation date commences when hazardous waste is first placed into the container)
  - f) EPA Waste No (e.g., Arsenic - D0004, Cadmium - D0006, Chromium - D0007, Lead - D008)
  - g) Apply DOT identification labels based on DOT hazard class in accordance with 49 CFR 172.
2. Enter the above information using permanent marking material, printed in English, and displayed on a background of contrasting color unobscured by other labels or attachments. Locate labeling away from other markings that could substantially reduce its effectiveness.
  3. Complete the labeling, marking, and placarding activities under the observation of the environmental consultant prior to storing or transporting any container or roll-off.

#### H. **Waste Transportation and Disposal**

##### 1. **Hazardous Waste**

- a) Procure all necessary waste permits or licenses that are required by State or City regulations.
- b) Prepare the Uniform Hazardous Waste Manifest for each shipment, including the LDR (Land Disposal Restriction) certification, which will be attached to the manifest. The Generator Owner shall be NYCDDC OEGS Unit. The Engineer will sign the Generator’s Certification on the manifest and maintain copies of the original manifest and signed copies upon completion of disposal. All original manifests must be submitted to the Engineer.
- c) Arrange for the transportation of all hazardous waste by a licensed transporter in accordance with 40 CFR 263, 49 CFR 171-179, and State and City regulations. Verify that all waste is completely covered before departing project site.
- d) The hazardous waste transporter is not permitted to stop enroute after the pick-up of hazardous materials from the construction site.
- e) Arrange for the recycling or disposal of all hazardous waste in accordance with 40 CFR 264, 40 CFR 268, and state regulations. Verify that only licensed recycling or Treatment, Storage, and Disposal (TSD) facilities are used.
- f) Should any problems arise that would preclude the selected facility from accepting the waste, immediately notify the Engineer in writing of such situation. Identify and provide information on an alternate TSD that is properly licensed and acceptable to the Engineer and arrange for disposal at such facility after having obtained written approval from the Engineer.
- g) Provide a certification for each manifested shipment that the waste was accepted by the recycling or disposal facility, and properly treated and disposed. Comply with all of the manifesting,

certification, and reporting requirements for hazardous waste in accordance with 40 CFR 262, 40 CFR 268 and State regulations, including certificates of final disposal for each shipment.

- h) If the signed manifest is not received from the disposal facility within thirty-five (35) days, initiate tracking by contacting the transporter and TSD to determine the status of the shipment. If the signed manifest is not received from the disposal facility within forty-five (45) days of shipment, as directed by the Engineer, initiate the EPA Exception Report in accordance with 40 CFR 262.42, and take all steps necessary to locate the manifest and waste.

## 2. **Non-Hazardous Municipal/Construction Waste**

- a) Procure all necessary waste permits or licenses that are required by State or City regulations.
- b) Properly transport and dispose of all non-hazardous municipal/construction waste.
- c) Verify that waste is completely covered before departing the project site.
- d) If toxic metals or hazardous substances were detected during the laboratory testing, notify the disposal facility that such metals or materials are present in the waste.
- e) Lead coated scrap steel shipped off site for recycling must be properly wrapped and protected during transport to prevent paint chips discharging from the truck into the environment. Provide a letter from the recycling facility acknowledging the receipt of lead coated steel from the specific City project site, and that they do accept lead-painted steel for recycling.
- f) Non-hazardous, lead-containing soil can either be disposed at an appropriately permitted waste landfill or soil recycler depending upon the disposal facility requirements for acceptance.

## 3. **Special Waste Requirements for Recycled Steel Grit**

- When recycled steel abrasives are used, collect, handle, store, and transport the recycled steel abrasives as hazardous waste. All waste generated from the recycled steel abrasives, including used recyclable steel abrasives, must also be treated as hazardous waste. Do not transport used abrasive materials from/to other project sites unless approved by the Engineer.
- Manage the hazardous waste as per 3.05 F, G, and H.

## 4. **Waste Water Handling and Disposal**

- a) Collect, test and dispose all waste water used for the bridge cleaning, clean up activities, hygiene purposes and laundering of clothing if done on site in accordance with Federal, State and Local regulations. Note that payment for the hygiene and laundering water is included under decontamination facilities for worker protection.

- b) Filter visible paint chips and particulate from the water prior to placing it into the containers. Prior to disposal, test the water for total toxic metals and provide ample filtration (e.g., through a multi-stage filtration system ending in 5 microns or better if needed) until the water is not classified as hazardous. If the filtered waste water does not meet the requirements for nonhazardous waste classification, handle and dispose of it as a hazardous waste in accordance with Federal, State and Local regulations.
- c) Make disposal arrangements with the local publicly owned treatment works (POTW), Sanitation Company, or other appropriate permitted facility. Provide the Engineer with documentation signed by an official of the facility stating that the facility will accept the waste, and that the levels of any lead or other metals remaining in the water are acceptable. If the facility allows the filtered water to be placed into the sanitary sewer system, include such authorization in the letter. Provide a copy of the NYCDEP Discharge Permit for any discharge into the NYC sewer system. Waste water discharged to the New York City sewer system must be below the discharge standards established by the NYCDEP.

### **3.06 CLEANING AND CLEARANCE OF MATERIALS, EQUIPMENT, AND SURROUNDING SURFACES**

#### **A. General**

1. Have the competent person inspect the Work site on a daily basis for compliance with the requirements of this Section and the approved Environmental Protection Plan and prepare a daily report or daily log of observations made. Maintain the information at the project site and make it available to the Engineer or environmental consultant for review at any time.

#### **B. Daily Cleaning of Work Site**

1. Cleanup paint chips, dust, materials, staining from steel abrasives and paint removal debris from the unprotected ground, the soil, on or in the water or sediment, from surfaces of all equipment, around storm sewers or drains, or in areas where rain water could carry the debris into storm sewers or drains. When cleaning pavement surfaces take special care to remove all waste material so as to prevent it from being redistributed into the air by traffic.
2. Cleanup the debris at least once each shift or more frequently if directed by the Engineer or environmental consultant. Note that the cleanup of loose debris by the end of the work shift is mandatory.
3. Conduct the cleaning by manually removing paint chips, washing and wiping, and/or HEPA vacuuming. Sweeping of paint chips, lead paint removal debris, dust is not permitted.
4. Have the competent person document the results of the daily cleaning in a report or log.

**C. Cleaning of Containment**

1. When abrasive blast cleaning is employed, remove abrasive/paint debris from the containment floor in order to prevent waste build up. Acceptable methods include the use of automatic waste conveyance systems or HEPA vacuums. If such ongoing methods of removal are not employed, conduct waste removal at a minimum of every two hours, or continuously, while abrasive blast cleaning is underway, to remove accumulations of waste, or as directed by the Engineer. Remove all abrasive/paint waste at the end of each shift, or before a prolonged work stoppage, such as for weather interruptions, or as directed by the Engineer.
2. When methods of paint removal other than abrasive blast cleaning are employed, conduct cleaning of the waste from within containment at the end of each shift, or before a prolonged work stoppage, such as for weather interruptions, or as directed by the Engineer.
3. Prior to moving the containment enclosure, clean the inside surfaces of the enclosure (walls, floors, ceiling, etc.) of dust and other spent material by vacuuming. The competent person shall conduct a visual inspection to verify that the surfaces are free of loose debris, dust, paint removal waste, grit, etc. prior to moving and document the results in the daily log or report. All scaffolding, platforms, floor sheathing must be inspected for cleanness prior to dismantling of containment tarps. Mechanical air ventilation must be maintained during all cleaning operations and must remain operational until the tarps are dismantled from the containments.
4. Prior to dismantling the containment, clean the inside surfaces to the extent that dust or debris is not dislodged when wiping a cloth across the surface. The competent person shall conduct the inspection and document the results in the daily log or report. Do not dismantle the containment closure until the Engineer has accepted the quality of cleaning.

**D. Cleaning of Contractor Equipment and Materials**

1. Prior to removing equipment or reusable materials from the project site, remove all loose dust and debris from the surfaces to the satisfaction of the Engineer or environmental consultant.
2. Conduct the cleaning by manually removing paint chips, washing and wiping, and/or HEPA vacuuming.
3. Ductwork – Remove all accumulation of loosely held dust or debris from ductwork exterior by thoroughly vacuuming (using wet- or dry-powered HEPA vacuums), followed by wet washing as necessary. Clean the interior surface of ductwork using a low-pressure wash or air in conjunction with a system designed to capture dust washings, waste water and debris. After all visible, loose dust has been removed from inside the ductwork, seal the ends of each segment of duct using a minimum of double-wrapped, 6-mil polyethylene sheeting. Prior to transporting off site, the ductwork should be labeled “LEAD-CONTAMINATED.”
4. The competent person shall conduct clearance tests by wiping a cloth across representative surfaces. If dust or debris is dislodged, conduct additional cleaning until the surfaces pass the clearance test. Report the

results of the testing in the daily report or log.

5. The engineer, environmental consultant or authorized representative may collect and analyze wipe samples from equipment to confirm effectiveness of cleaning. An acceptance criterion of <math><400 \mu\text{g}/\text{SF}</math> will be used.
6. All dust collectors and recycling units must have all filters removed and disposed of as hazardous waste during the project as necessary and prior to equipment leaving the project site.

**E. Final Cleaning/Clearance of Surrounding Property and Structures**

1. After all Contractor equipment and materials have been removed, conduct a visual inspection and cleanup of the project site and surrounding property. This includes all areas used by the Contractor (e.g., staging and equipment yards, shower and trailer areas, waste storage, etc.), and all surrounding property, structures, buildings, equipment, and surfaces located within 100 feet in each direction from the outermost face of the bridge structure. If project debris is observed to be present beyond 100 feet from the structure, expand the limits of the inspection and cleanup, as directed by the Engineer.
2. Test the surface layer of bare soil in publicly accessible areas for total lead concentrations. Test any applicable locations that were within the regulated area(s) established for the project and extending 100 feet in any direction from the regulated areas for projects involving abrasive blasting. If the concentration of total lead exceeds 400 ppm, remove the top two inches (not including vegetation) of topsoil and replace with clean soil and/or sod. Background soil samples are not required for comparison. Test the removed soil per Section 3.05.D to determine proper disposal.
3. Remove all lead dust, spent abrasives or other paint removal media, paint chips, solvents, materials of construction, fuel, and other litter from the areas indicated in item 3.06 E.1. Cleanup and remove the debris to the satisfaction of the Engineer or environmental consultant. This includes all visible debris and waste associated with bridge painting activities, even if the paint chips and abrasive waste are a pre-existing condition.
4. Clean the surrounding ground, equipment and other surfaces by manually removing paint chips, wet washing and wiping, and/or HEPA-vacuuming. Sweeping is not permitted. The environmental consultant will be conducting visual cleanliness inspections and wiping a cloth across surfaces to verify that dust has been removed. Wipe sampling may also be performed. Surfaces should have less than 400  $\mu\text{g}$  of lead/SF. Conduct additional cleaning as required, based on the results of these inspections.
5. Clean the surrounding water with the use of approved materials and equipment including but not limited to water booms and/or boats with skimmers, as directed by the Engineer.
6. Properly collect, handle, store, transport and dispose of all material and/or water along with all waste products generated during the Work including but not limited to rags, tape, disposable coveralls, and filters.
7. Prepare a written report presenting the results of the inspections and tests conducted to verify the final cleanliness of the project site, surrounding

property, waterways, equipment, buildings, and structures.

### 3.07 DEMOLITION

#### A. General

1. Demolition and work involving painted metal such as steel, wrought iron and cast iron, is to conform to the requirements of this section. This includes 3.01 – WORKER PROTECTION, 3.02 – ESTABLISHMENT OF REGULATED AREAS, 3.03 – CONTROL AND MONITORING OF RELEASES TO AIR, SOIL AND WATER, 3.04 - CONTAINMENT, 3.05 – WASTE CLASSIFICATION, HANDLING AND DISPOSAL, and 3.06 – CLEANING AND CLEARANCE OF MATERIALS, EQUIPMENT, AND SURROUNDING SURFACES, and as modified by this section.
2. Assume the coating on the metal contains hazardous metal(s) unless otherwise determined by testing. Certify in writing to the Engineer the results of all testing. Provide proof that the coated steel removed from the project was not reused or buried but was sent to a scrap metal recycling facility or properly disposed.
3. This section is intended only for the demolition and preparation prior to repair. It does not include provisions for recoating of the steel.

#### B. Cleaning/Removal

1. Flame Cutting or Burning
  - a) Prior to the start of work, all surfaces that are to be welded, heated, or burned are to be cleaned to removal all contaminants and/or hazardous materials which can be discharged to the environment as a function of subsequent operations.
  - b) The paint is to be removed in its entirety extending a minimum of six inches (15 cm) on both sides of the cut line. Paint is to be removed from all surfaces in the cut area, including the back surface of the member being cut.
  - c) Furnish and erect temporary lighting to illuminate the surfaces being cleaned at a minimum illumination of 30 foot-candles to aid in cleaning operations and inspection if ambient light is insufficient.
  - d) Allowable coating removal methods include chemical stripping, power tool cleaning, water jetting, and abrasive blasting. Containment levels as presented in 3.04.F to match the method of removal are to be used.
2. Saw Cutting, Rivet Busting and Bolt Removal
  - a) Saw cutting is limited to small areas such as when removing handrails, fence posts, pipes less than 6 inches (15 cm) in diameter, and similar items. Saw cutting shall not be used for cutting of large steel members or other large steel items such as decks, diaphragms or other similar items. Either remove the coating prior to saw cutting, or firmly attach duct tape to the surface extending a distance 4 inches (10 cm) to both sides of the saw line. If water is used during saw cutting to cool down cutting blades all water must be collected and properly disposed of after waste characterization testing and

analysis. The tape shall also be collected and disposed of properly.

- b) Coating removal is not required for rivet busting or bolt removal. However, if the coating is not removed, the surfaces must be coated with an encapsulant specifically manufactured for use on lead-based paint. All debris from rivet busting shall be cleaned with a HEPA vacuum. Ensure ground protection or a work platform is in place during rivet busting activities.
- c) Do not use any method that will cause dust to be emitted into the environment to an extent that would expose the worker above the Action Level for any hazardous metal that is present.
- d) Containment is to consist of ground cover, catch basin, catch tarp or the like to contain paint chips, debris and water (if used). Submit the containment plan for approval by the Engineer.

**C. Worker Protection**

- 1. When flame cutting or burning is performed, conduct worker exposure assessment in accordance with Section 3.01.D both for the coating removal step and when flame cutting or burning is performed.
- 2. Perform worker exposure assessment in accordance with Section 3.01.D when saw cutting, rivet busting and bolt removal.

**D. Regulated Areas**

- 1. Establish regulated areas through instrument monitoring as required by Section 3.02. When flame cutting or burning, the instrumental monitoring is to be performed for both the coating removal step and cutting step.

**E. Environmental Control and Monitoring of Releases to Air, Soil, and Water**

- 1. Follow the requirements in Section 3.03. Ambient air monitoring is not required when chemical stripping is performed.

**F. On-Site Handling and Waste Disposal**

- 1. Do not store painted metal components on the ground without protection. Either cover the ground or place in lined containers. Small items such as bolts, rivets and small pieces of steel can be placed in drums.
- 2. Either wrap metal components painted with hazardous materials in 6-mil thick plastic sheeting or place in lined containers for transport.
- 3. Provide the Engineer with a letter from the recycling facility as required in Section 3.05.H.2.e).

**3.08 METHOD OF MEASUREMENT**

- A. **Worker Protection Plan** – The work of developing and implementing the Worker Protection Plan will be measured on a lump sum basis. This includes all medical testing and exposure monitoring sample analysis, and the furnishing, installation, maintenance, relocation, and removal of decontamination facilities. Included in the price is the cost of testing, storing, and disposing all hygiene water.
- B. **Environmental Protection and Project Cleanup** – The work to develop and implement the environmental protection plans; supply and maintain the TSP-lead monitors; conduct visible emissions evaluations; and conduct routine and final

project inspections and cleanup will be measured on a lump sum basis.

- C. **Containment System** – The work to design the containment/ventilation system, prepare all working drawings and submittals, and provide all labor, materials and equipment necessary to install, operate, and remove the containment systems will be measured on a lump sum basis. On single projects where different types of containment are being used (e.g., unique designs for girder spans versus through truss, or one design for power tool work versus blast cleaning), the Contractor may elect to provide a separate lump sum price for each type of containment system being employed.
- D. **Treatment and Disposal of Hazardous Waste, Solvents, Soils, Paint Removal Waste, and Waste Water**
  - 1. This work will be measured on a lump sum basis to include all paint removal waste, hazardous waste, solvents, soils, and waste water (with the exception of hygiene water which is included in item 832 under decontamination facilities in “Worker Protection Plan”) accumulated, packaged, stored, transported, treated, and disposed in accordance with the requirements of this Section.
  - 2. The accumulation, packaging, storage, transportation, and disposal of non-hazardous waste (e.g., construction debris) is addressed in this specification, but it is not measured for payment. The cost for the handling and disposal of this waste is considered to be incidental.
- E. **Community Notification** – The work to develop and distribute pamphlets and participate in community meetings will be measured on a lump sum basis.
- F. **Demolition Cleaning** – The work to perform demolition cleaning will be measured on a lump sum basis.

### 3.09 BASIS OF PAYMENT

- A. **Worker Protection Plan**
  - 1. The lump sum price bid shall include labor costs for the IH and the competent person, and the cost of all materials, personal protective equipment, respirators, other equipment, and fees necessary to complete the Work, including lockout/tagout, fire prevention and protection, electrical safety, etc.
  - 2. All costs related to personal exposure monitoring and medical surveillance, including worker time and transportation for medical testing, the cost of providing results to employees and the Engineer, and the cost for collection of exposure monitoring samples, shall be included in the lump sum price. No payments shall be made for additional medical tests or laboratory analysis required due to an increase in the blood lead level of any employee(s) above the OSHA threshold of 40 µg/dl.
  - 3. The lump sum price shall also include the cost of ground rental and utility as necessary to furnish and install (clean, maintain, relocate and remove) the decontamination facilities as necessary to complete the Work. Cost of handling, testing and disposal of hygiene water also included in the Lump sum price.
  - 4. Progress payments for the development and installation of the Worker

Protection Plan will be computed in accordance with the following schedule:

- a) 15% of the lump sum price will be paid when work entailing a potential for lead exposure has begun, the work is in compliance with the Worker Protection Plan as determined by the Engineer, and the following items (if required) have been completed:
  - (1) Lead Health and Safety plan is submitted, reviewed and accepted by the Engineer.
  - (2) Certification of completion of lead training for supervisors and employees is provided to the Engineer.
  - (3) Certification of completion of respirator training and documentation of respirator fit testing for all employees who will wear respirators is provided to the Engineer.
  - (4) Documentation of purchase or mobilization of all required respirators and Personal Protective Equipment (PPE) is provided to the Engineer.
  - (5) Documentation of purchase or mobilization of decontamination facilities is provided to the Engineer.
  - (6) Documentation of initial medical testing and a summary of the results is provided to employees and the Engineer.
  - (7) Documentation of initial exposure monitoring and a summary of the results are provided to employees and the Engineer.
  - (8) Warning signs are posted in exposure areas.
- b) 75% of the lump sum price will be paid based on the percentage of the work completed.
- c) 10% of the lump sum price will be paid when the exit medical exams have been offered as required and results provided to employees and the Engineer, the final monthly report has been received, all work which entails a potential for lead exposure has been demobilized, and all equipment associated with such operations has been removed from the project site.

**C. Environmental Protection and Project Cleanup**

- 1. The lump sum price bid shall include the cost for developing and implementing the environmental protection plans; supplying, setting up and maintaining the TSP-lead monitors including power, monitoring visible emissions, taking corrective actions as required, and conducting routine and final project inspections and cleanup.
- 2. 15% of the lump sum price will be paid when the work is in compliance with the Environmental Protection and Project Cleanup Plan as determined by the Engineer, and the following items (if required) have been completed:
  - a) Contractor's written procedure for assessment of visible emissions and releases is provided to the Engineer.
  - b) Documentation of purchase, rental, or mobilization of the TSP-lead high volume ambient air monitoring equipment and the submittal of the written description of the maintenance and security measures for them.

- c) Documentation of preconstruction evaluations of ground, soil, equipment, structures and other surfaces is provided to the Engineer.
  - d) Documentation of the preconstruction evaluations of the water and sediment beneath and around the project site is provided to the Engineer.
  - e) Establishment of Regulated areas and approval by the Engineer.
3. 75% of the lump sum price will be paid based on the percentage of work completed.
  4. 10% of the lump sum price will be paid after final project cleanup is completed to the satisfaction of the Engineer.

**D. Containment Systems**

1. The lump sum price bid shall include the cost for preparing the containment/ventilation system design, working drawings, and all labor, materials and equipment necessary to install, operate, and remove the containment systems. As directed by the Pay Items, provide a separate price for various types of containment design used on unique sections of the bridge (e.g., girder approaches versus through truss), or for unique methods of paint removal (containment for power tool cleaning versus abrasive blast cleaning).
2. All Work shall be done in a manner satisfactory to the Engineer. Payment for the assessment and cleanup of emissions and releases, and final project cleanup, are addressed above in the Environmental Protection and Project Cleanup item.
3. Progress payments will be made. They will be based upon percentage of completion. The percentage of the total containment cost(s) represented by each section of the bridge (e.g., each span) will be established in advance, and the lump sum price(s) divided accordingly. 60% of the amount will be paid after containment system is ready for surface preparation and accepted by the Engineer.
4. 40% of the amount will be paid after containment is removed from the structure.

**E. Treatment and Disposal of Hazardous Waste, Solvents, Soils, Paint Removal Waste and Waste Water**

1. The lump sum price for the treatment and disposal of paint removal waste, hazardous soil, solvents, etc., and waste water used for cleaning the bridge and equipment shall include the cost of all labor, materials, equipment, sampling, testing, and fees necessary to complete the Work. The cost for the handling, testing, and disposal of hygiene water is included in the Section 832 under Item cost for the decontamination facilities.
2. The lump sum price shall also include the following fees which are the responsibility of the Contractor:
  - a) Special Assessment on Generation, Treatment or Disposal of Hazardous Waste in New York State. The Contractor shall

complete the quarterly form (TP-550) which is available on the NYS Taxation and Finance web page: [https://www.tax.ny.gov/pdf/current\\_forms/haz/tp550\\_fill\\_in.pdf](https://www.tax.ny.gov/pdf/current_forms/haz/tp550_fill_in.pdf).

- b) The contractor shall pay the fee to the NYS Department of Taxation and Finance on a quarterly basis within 20 days after the end of each quarter. The fee will be based on actual tons of hazardous waste per quarter. The Contractor shall be responsible for all interest and penalties associated with late or non-payment of taxes.
  - c) Hazardous Waste Fee (Generator Fee) – The Contractor shall pay the fee to New York State Department of Environmental Conservation on an annual basis (once a year). The fee is based on the amount of hazardous waste generated per year. The Contractor shall be responsible for all interest and penalties associated with late or non-payment of fees.
  - d) Hazardous Waste Regulatory Surcharge Fee – The Contractor shall pay the fee to the New York State Department of Environmental Conservation on an annual basis (once a year). The fee is based on the amount of hazardous waste generated per year. The Contractor shall be responsible for all interest and penalties associated with late or non-payment of fees.
  - e) The Contractor shall contact the NYS Department of Taxation and Finance and NYS Department of Environmental Conservation for proper procedures and forms for payment.
3. If the City is fined or penalized as a result of the Contractor's performance or lack thereof on this item, in addition to other remedies the City may possess, said fine or penalty will be deducted from the Contractor's payments on this item.
4. Progress payments will be made as follows:
- a) 10% will be paid after the following documents are submitted, reviewed and accepted by the Engineer:
    - 1. Waste Handling, Storage, and Disposal;
    - 2. Hazardous Waste Transportation;
    - 3. Hazardous Waste Disposal;
    - 4. Waste Water Disposal Information;
    - 5. Non-Hazardous Waste Transportation and Disposal information.
  - b) 80% of BID amount will be divided by the scheduled number of months. Payment for the month will be made only after signed manifests from the disposal facility are received by the Engineer for the hazardous waste picked-up from the project site in this month.  
  
Example: 4 pick-ups were made in the month of March. Signed manifests for 3 pick-ups were received by the Engineer. No payment for March will be processed until 4<sup>th</sup> signed manifest is received.
  - c) 10% will be paid after all hazardous waste storage areas are cleaned-up and accepted by the Engineer and all weight tickets have been received by the Engineer.

F. **Community Notification** – Payment will be made on a lump sum basis to cover the cost of furnishing all labor and materials to develop and distribute pamphlets and participate in community meetings as directed by the Engineer.

G. **Pay Items** – Payment will be made under the following items:

<b>Item No</b>	<b>Item</b>	<b>Pay Unit</b>
832.10	Worker Protection	Lump Sum
832.20	Environmental Protection and Project Cleanup (for each Structure)	Lump Sum
832.30nnnn	Containment System(s) (for each designated type)	Lump Sum
832.40	Treatment and Disposal of Hazardous Waste, Solvents, Soils, Paint Removal Waste, and Waste Water	Lump Sum
832.50	Community Notification	Lump Sum
832.60	Demolition Cleaning	Lump Sum

**END OF SECTION**

## APPENDIX A – SUBMITTALS

### A.01 GENERAL

- A. This Appendix identifies the plans, programs, and documentation required prior to mobilization on site, at the start of construction, and during the construction phase.

### A.02 PRE-CONSTRUCTION SUBMITTALS

- A. **Submittal Schedule and Engineer Acceptance**
  - 1. Submit the following plans and programs to the Engineer for review and acceptance a minimum of 30 days prior to mobilization at the project site. The Contractor shall not begin any paint removal Work until the Engineer has accepted the submittals.
  - 2. Do not construe Engineer acceptance of the submittals to imply approval of any particular method or sequence for conducting the Work, or for addressing health and safety concerns. Acceptance of the programs does not relieve the Contractor from the responsibility to conduct the Work in strict accordance with the requirements of Federal, State, or City regulations and this specification, or to adequately protect the health and safety of all workers involved in the project and any members of the public who may be affected by the project. The Contractor remains solely responsible for the adequacy and completeness of the programs and work practices, and adherence to them.
- B. **Project Schedule** – Provide the Engineer with an initial estimate of the workdays required to complete each phase of the project (e.g., mobilization, paint removal, paint application, and demobilization). Include the estimated number of workdays each month when lead exposures are anticipated.
- C. **Qualifications, Experience, and Certifications** – Provide written qualification, experience, and certification information for the following:
  - 1. Contractor – Provide proof of SSPC QP-1 and QP-2 certifications.
  - 2. Provide evidence that the laboratories have two certifications. One certification must be from the New York State Environmental Laboratory Approval Program (NYSELAP) in the appropriate category. The second certification must be from either the American Industrial Hygiene Association (AIHA) or Environmental Protection Agency (EPA) in the appropriate category:

MEDIA	CERTIFICATION 1 (mandatory)	CERTIFICATION 2 (One of the following)		
	NYSELAP category	AIHA (IHLAP) category	EPA (NAIHA (LLAP) category	EPA (NLLAP) category
Worker or Regulated Area	Air & Emissions - Lead, Total	Metals	N/A	Air
Hi-volume Air	Air & Emissions - Lead, Total	N/A	N/A	N/A
Paint Chip	Solid and Hazardous Waste - Lead in Paint	N/A	Paint	Paint
Settled Dust	Solid and Hazardous Waste - Lead in Dust Wipes	N/A	Dust	Dust
Soil	Solid and Hazardous Waste - Lead, Total	N/A	Soil	Soil
TCLP	Solid and Hazardous Waste - TCLP	N/A	N/A	N/A

3. A list of NYSELAP certified laboratories can be found at <http://www.wadsworth.org/regulatory/elap/certified-labs>.
4. A list of IHLAP certified laboratories can be found at [http://apps.aiha.org/gms\\_aiha/public/pages/reports/publicScopeView.aspx?ProgramCode=40&Version=2](http://apps.aiha.org/gms_aiha/public/pages/reports/publicScopeView.aspx?ProgramCode=40&Version=2).
5. A list of NLLAP accredited laboratories can be found through <https://www.epa.gov/lead/national-lead-laboratory-accreditation-program-list>.
6. Laboratory for blood lead analysis – Provide the name, address, contact person, and proof that the laboratory conducting the worker blood lead analysis is approved by OSHA and the NYS DOH. A current list of approved labs can be accessed through <https://www.osha.gov/SLTC/bloodlead>.
7. Certified Industrial Hygienist (CIH) – provide the name, experience and qualifications of the CIH who will be reviewing, approving and sealing the site specific Worker Protection Plan and monthly summary reports of activities and monitoring results. The CIH must have current certification by the American Board of Industrial Hygiene.
8. Industrial Hygienist (IH) - provide the name, experience, and qualifications of the IH, if one is used. The IH must meet one of the following qualifications:
  - a) Current certification by the American Board of Industrial Hygiene (Certified Industrial Hygienist - CIH).

- b) A Bachelor's Degree in engineering, chemistry, physics, biological sciences, industrial hygiene, toxicology, the environmental sciences or a related field, and at least three years of documented full-time work as an IH under the supervision of a CIH, including field and sampling experience.
  - c) A Master's Degree in one of the above fields, and at least two years of documented full-time work as an IH under supervision of a CIH, including field and sampling experience.
9. Competent Person, CIH, IH, supervisors, and foremen – Provide proof that the competent person, IH, and all project superintendents and foremen, have successfully completed the SSPC C3, SSPC C5, Competent Person and Supervisor training, with refresher training completed within the last 12 months, as well as an Engineer-approved course that addresses the procedures and documentation specific to the Project. OSHA 40-hour HAZWOPER certification plus 8 hours of annual refresher training is required for the competent person/supervisor responsible for managing or handling hazardous waste. An OSHA 24-hour HAZWOPER certification plus 8 hours of annual refresher training is required for workers who will be handling hazardous waste.

**D. Contractor Chain of Command**

- 1. Submit a listing of key Contractor personnel, including names and relative positions, home addresses, and telephone and pager numbers.
- 2. Include the names and telephone/pager numbers for contact persons who are available on a 24-hour 7 day a week basis in the event of emergencies.

**E. Worker Protection Plan**

- 1. Submit two copies of a written Worker Protection Plan to the Engineer for review and acceptance. The Worker Protection Plan must provide for the protection of Contractor workers from all project hazards including but not limited to fall protection, confined space (if applicable), hearing and eye protection, and exposure to hazardous materials or conditions. If Sections 831 and 832 are specified for the work, only a single worker protection plan is required.
- 2. Include as part of the plan, or in a separate submittal, a binder containing SDS for all materials that will be used on the Project site. If all SDS are not available at the pre-construction stage, provide the SDS before using the product on site.
- 3. Address as part of the Worker Protection Plan, or in a separate document, the personal protective equipment and hygiene practices that will be invoked to protect workers from exposure to pigeon droppings in accordance with NYSDOT Safety Bulletin SB-94-4.
- 4. The Worker Protection Plan must be a project-specific program, prepared under the direction of, and signed by, a Certified Industrial Hygienist (CIH).
- 5. Address worker protection from lead in strict accordance with 29 CFR 1926.62 and the requirements of this Specification, as well as from other toxic metals in the paint (e.g., 29 CFR 1926.1126 for hexavalent chromium, 29 CFR 1926.1127 for cadmium, and 29 CFR 1926.1118 for inorganic

arsenic). When toxic metals are present in the paint for which OSHA has not developed a comprehensive health and safety standard, include provisions to assure that the workers will not be exposed above the Threshold Limit Values (TLVs) established for the metal as identified in 29 CFR 1926.55. In the event of a conflict between the requirements of this specification and an OSHA standard, follow the most restrictive requirement.

6. Address the requirements of 29 CFR 1926.62, this specification, and other applicable Federal or State regulations in the Worker Protection Plan. A Worker Protection Plan is required any time that exposures to lead or other toxic metals exceed the Action Level. These elements of the Worker Protection Plan include, but are not limited to, the following:
  - a) A description of the Contractor's lead health and safety organization, including the responsibilities and qualifications of the CIH, IH and the competent person.
  - b) A description of arrangements for ensuring that subcontractors, if any, will comply with the Worker Protection Plan.
  - c) A description of each activity which will entail a risk for lead exposure.
  - d) Descriptions of the engineering, administrative and work practice controls that will be used to reduce exposure. As required by 29CFR1926.62, all feasible engineering, administrative and work practice controls must be implemented before considering the use of respirators to reduce exposure.
  - e) A respiratory protection program in compliance with 29 CFR 1910.134 including commitments to provide the necessary fit testing, respirator training, and medical evaluations. When lead is present, include the provisions of 29 CFR 1926.62. When hexavalent chromium is present, include 29 CFR 1926.1126. When cadmium is present, include 29 CFR 1926.1127. When inorganic arsenic is present, include 29 CFR 1926.1118. Address the selection, use, maintenance and inspection of respirators, and qualifications for respirator users.
  - f) A description of the Personal Protective equipment (PPE) to be provided and plans for regular laundering or replacement of protective clothing.  
Provide the name, address, and qualifications of the launderer, if one will be used, for the cleaning of reusable clothing. Provide a letter from the laundry indicating that it is permitted to handle clothing contaminated with lead and/or the other toxic metals of concern and that it disposes of wash water in accordance with all local, state and federal regulations.
  - g) A description of the hygiene practices the employees will be required to follow, and the procedures that will be implemented for the proper storage, testing, and disposal of hygiene and laundry wash water. Include a description, floor plan, and proposed number of decontamination facilities and hand wash stations that will be provided.
  - h) A description of the Contractor's medical surveillance and removal program, including plans for notifying employees and the Engineer

- of results. This description shall include the name and address of the clinic(s) where testing will be performed, and of the OSHA-approved laboratory where blood samples will be analyzed.
- i) Plans for worker and supervisor lead training.
  - j) An initial assessment of anticipated exposure level(s), including any relevant historical exposure monitoring data.
  - k) Plans for performing exposure monitoring, and for notifying employees and the Engineer of results.
  - l) Plans for posting warning signs in high exposure areas.
  - m) Plans for regular inspections of the jobsite by the CIH (or IH) and the competent person. The CIH (or IH) shall inspect the site at least monthly and the competent person at least daily.
  - n) Provisions for providing parking area(s) for worker's cars where they will not be exposed to lead.
  - o) Plans for updating the Worker Protection Plan.
  - p) Plans for keeping and maintaining the records and issuing monthly summary reports.
  - q) Include the name of the competent person who will be making daily inspections of project activities to ensure compliance with the program, and the signature of the CIH responsible for the development of the Plan.
7. Verify that any Subcontractors working for the Contractor are included in the program or in a separate program which meets the requirements of this Specification. If Subcontractors are operating under a separate program, include the program with the submittals.
  8. Include statements that the Contractor will provide City employees, City representatives (such as REI Consultants engaged in inspection activities, and employees of the environmental monitoring firm), with the same OSHA related equipment and facilities that are provided to the Contractor and sub-contractor personnel. These include:
    - a) Respiratory protection including cleaning and maintenance, and work areas to wash faces and respirator face piece. Provide both HEPA and organic vapor filters and replacements. City employees or representatives are responsible for assuring that all of their personnel have the necessary medical surveillance, are qualified to wear the respirators, and have been properly fit tested.
    - b) Protective work clothing including laundering or disposal.
    - c) Clean change areas including separated storage facilities for street and work clothes.
    - d) Hand washing facilities per 29 CFR 1926.51.
    - e) Shower facilities per 29 CFR 1926.51.
    - f) Training per 29 CFR 1926.62 (l).
  9. Review the Worker Protection Plan at least annually during the portion(s) of the Project which involve the disturbance of toxic metals. Revise and update as necessary to comply with any newly issued Federal, State or local regulations or revisions to existing regulations. Verify that the CIH/IH signs off on all reviews and revisions.
  10. Submit a letter to the Engineer if it is proposed that objective data, rather

than monitoring, will be used to prove that exposures from a given activity cannot exceed the Action Level for lead or other metals contained in the coating. Provide the objective data in writing, signed by a CIH/IH in strict accordance with the requirements of 29CFR1926.62 (d)(3) and 29 CFR 1926.1126(k)(3). The Contractor can rely upon this data in lieu of monitoring only upon acceptance by the Engineer.

- F. **Environmental Protection Plan** – Submit an Environmental Protection Plan to the Engineer. The plan shall include but not be limited to, the following elements:
1. **Assessment of Visible Emissions and Releases**
    - a) Provide a written program for the observation of visible emissions during Project activities. Note that these inspections by the Contractor are in addition to the observations that will be made by the Engineer or environmental consultant.
    - b) Visual assessments of emissions are required on a continuous basis while dust producing operations are underway. Include the methods of observation and inspection that will be made, and areas or work activities that will be observed.
    - c) Include a statement that the Contractor will shut down operations, adjust work practices, modify containment and take other steps as necessary to comply with the results of the visible emissions assessments as directed by the Engineer or the environmental consultant.
  2. **Establishment of Regulated Areas** - Provide written procedures in accordance with the requirements of Part 3.0 of this Specification for the instrument monitoring of airborne exposures surrounding project activities, and the establishment of visible barriers (regulated areas) to control the access of personnel within the exposure zones.
  3. **Ambient Air Monitoring**
    - a) Provide a written description of the TSP-lead high volume ambient air monitoring equipment the Contractor will provide for the Work. Include a description of the power that will be provided to operate the units. Provide catalog cut sheets for the monitors and power generators (if used).
    - b) Provide a written description of the maintenance and security measures that will be taken to protect the monitoring equipment (i.e., full time guard, removal and reinstallation of the equipment each day, etc.). Describe the provisions made for setting up and removing (or securing) the monitors each day, as stipulated in this Section.
    - c) The environmental consultant will also be conducting real time monitoring (using their own equipment) to evaluate airborne particulate levels at various locations such as the containment seals and entryways.
    - d) Include a statement that the Contractor will shut down operations, adjust work practices, modify containment and take other steps as necessary to comply with the results of the high volume or real time monitoring as directed by the Engineer or the environmental consultant.

4. Evaluations of Ground (Soil), Equipment, Structures and Other Surfaces
    - a) Provide a written program for the visual inspection of the ground, soil, equipment, and other surfaces beneath and around the project site for the presence of project dust and debris. Include the frequency of the inspections, and the inspection procedures that will be followed both during the Work and upon completion of project activities. Note that these inspections by the Contractor are in addition to the observations that will be made by the Engineer or environmental consultant.
  5. Water and Sediment Evaluations
    - a) Provide a written program for the visual inspection of the water and sediment beneath and around the project site for the presence of project dust and debris. Include the frequency of the inspections, and the inspection procedures that will be followed both during the Work and upon completion of project activities. Note that these inspections by the Contractor are in addition to the observations that will be made by the Engineer or environmental consultant.
  6. Cleaning/Clearance Plans
    - a) Provide a written program identifying the procedures, methods, equipment, and materials that will be used to conduct daily and final cleanup of project dust and debris. Include a description of the cleanliness examinations that will be made by the competent person (e.g., both visual examinations and more detailed inspections involving wiping the surfaces as described in Section 3.06). Include provisions for recleaning equipment that fails wipe tests ( $<200 \mu\text{g}/\text{sf}$ ) that may be conducted by the environmental consultant.
    - b) Indicate that these inspections are conducted to assure that the work site and surrounding equipment, property, structures, ground, soil, water, sediment, and other surfaces have been properly cleaned and are free of visible paint chips, blasting material, or other debris in compliance with this Section. Cleaning is required routinely each day and upon completion of all project activities.
    - c) When wet wiping or washing is employed, identify the solutions proposed for cleaning the surfaces and equipment.
  7. Sensitive Natural Resources and Endangered or Protected Species
    - a) Contractor shall submit a site-specific sensitive natural resources and endangered or protected species plan and all applicable permits and licenses required by state and, if applicable, federal law.
    - b) If Sections 831 and 832 are specified for the work, only a single sensitive natural resources/ endangered and protected species plan is required.
- G. Spill Response Plan**
1. Develop and implement a Spill Response Plan to control and cleanup spills or dispersions of deteriorated paint chip material, and/or abrasive blast material.

2. Specifically identify the procedures that will be used to comply with the following steps:
  - a) Containment of the breach.
  - b) Immediate notification of the Engineer and, as directed by the Engineer, other agencies such as the Coast Guard or the New York State Department of Environmental Conservation Spill Bureau.
  - c) Collection and removal of the spilled material followed by washing and wiping and/or HEPA vacuuming of the affected area.
  - d) Visual inspections to confirm complete removal of the material.
  - e) Changes to work practices and/or equipment and material used to prevent a reoccurrence.
  
- H. **Noise** – Provide a Construction Noise Mitigation Plan as per NYCDEP that defines the steps taken to comply with the standard, materials used to control noise, and worker training. Include copies of any required permits for after-hours work. If compliance with the NYCDEP Noise Code and the Construction Noise Mitigation Plan is not possible then prepare an Alternate Noise Mitigation Plan for approval by the NYCDEP. If Sections 831 and 832 are specified for the work, only a single Noise Mitigation Plan is required.
  
- I. **Containment Plans and Drawings** – Provide six (6) complete sets of detailed working drawing(s) of each containment system proposed for use on the structure. The drawings shall be prepared and stamped by a registered, licensed Professional Engineer. No paint removal work is allowed to begin until the drawings have been reviewed and accepted by the Engineer.
  1. Provide plan and elevation views of the containment enclosure in relation to the bridge structure.
  2. A design analysis of the loads on the bridge due to the containment enclosure including: maximum dead and live loads of the enclosure, the workers, blast abrasive, and equipment; maximum allowable load for the floor and working platform; wind loads imposed on the structure by the enclosure; and maximum wind velocity that the containment enclosure is designed to withstand.
  3. If the containment system is supported by the bridge, the working drawing submittal shall include certification by the Professional Engineer that the loads imposed do not cause the overall stress level of any element of the bridge to exceed the Operating Allowable Stresses defined in AASHTO Manual for Maintenance Inspection of Bridges (current edition).
  4. The analysis shall account for all loads on the structure, including the enclosure dead load, worker live load, blast abrasive load, equipment load, wind load, structure dead load, and live load plus the impact. The highway live load used for analysis purposes shall be either a HS20 truck or equivalent lane loading, whichever is greater, unless a different highway live load is shown on the plans.  
  
 Except as noted, the analysis shall use the loadings and design assumptions in the NYSDOT Standard Specifications for Highway Bridges.
  5. Provide all data, calculations, and assumptions used for the design of the containment and ventilation system. Provide air make-up locations, the

location(s) of the exhaust ductwork, and the type and location of dust collector(s) that will be employed. Provide information on airflow velocities through the containment. Provide manufacturer's data sheets, equipment weights, and airflow capacities of the equipment.

6. Provide information on the maximum amount of surface preparation debris, in inches, that the containment can support.
7. Provide a description of the type of containment material(s) used for the walls and ceiling, and the type of flooring system or working platform employed. If a barge or another type of floating platform is used, include details regarding its construction, such as materials and dimensions, how the platform will be tied-off, how the debris will be collected and offloaded, etc.
8. Provide technical data sheets, specification sheets, any other information needed to thoroughly describe the materials proposed for use.
9. Identify the methods by which the containment enclosure will be supported or attached to the bridge (e.g., rollers, clamps). Welding, bolting, or similar connections will not be allowed.
10. Identify the methods that will be used to seal the joints (seams) formed when fabricating the containment enclosure, and the method that will be used to seal the mating joints between the containment enclosure and the bridge structure.
11. Identify the method that will be used to seal the entryway.
12. Provide a description of how the drainage run-off from existing deck drains will be routed through the enclosure.
13. Provide the plans for maintaining the operation of any existing equipment or bridge facilities during the Work (e.g., navigation, anti-collision, aerial, roadway, and parking lot lighting).
14. Provide the type, size, and configuration of auxiliary lighting that will be provided for inside the containment enclosure.
15. Provide information on any temporary heating units proposed for use, fuel to be used and the safety measures to be employed for heater use and fuel storage.
16. Describe the methods that will be used to provide worker access to the enclosure (personal lifts, scaffolds, etc.) and the procedures and equipment that will be used to protect workers from falls.
17. Provide details on how the use of the containment enclosure will be coordinated with the maintenance and protection of traffic.

Encroachments onto roadways, and clearances over waterways and railroads shall be clearly identified. Structures that span a navigable waterway are subject to regulation by the U.S. Coast Guard, and possibly the U.S. Army-Corps of Engineers, the N.Y.S. Thruway Authority – Office of Canals, and the N.Y.S. Dept. of Environmental Conservation.

18. Provide details on how the containment enclosure is assembled and disassembled and moved to a new location on the structure as surface

preparation work progresses. Indicate how the dust collector will be included in the containment enclosure. All other pertinent details relating to the containment enclosure shall be included with the working drawings as notes, or as written narrative.

19. Describe the provisions made for moving the containment out of navigation lanes when working over active waterways.
20. Describe the provisions made for moving or lowering the containment in the event of inclement weather. Provide information on the maximum wind speed the structure can withstand, and at what wind speed the containment must be dismantled.
21. Identify the methods that will be used to verify adequate air flow characteristics and negative pressure within containment.
22. Describe the containment inspection and cleaning procedures that will be undertaken.
23. Include any other information needed to thoroughly describe the containment plan.

**J. Emergency Containment Demobilization Plan**

1. Provide a detailed plan for dropping the containment upon notification of inclement weather, including but not limited to conditions such as sustained wind speeds of 40 mph (64 kilometers/hour), gusts greater than 40 mph (64 kilometers/hour), wind and gusts in excess of the containment design, or heavy snow/ice.
2. Include the methods and procedures that will be followed to assure that:
  - a) all equipment and tools are secured,
  - b) the containment is cleaned of loose dust and debris,
  - c) all containment system roof and wall enclosure elements that could contribute to adding wind load to the bridge structure are removed or lowered (excluding containment framing), and
  - d) snow and ice are removed from the containment routinely, as well as under storm conditions.

**K. Lockout/Tagout Plan**

1. Provide the procedures in accordance with 29 CFR 1910.147 and 1910.333 that will be followed for lockout/tagout of existing electrical utilities within containment or other work areas as appropriate.
2. Include provisions for coordinating lock-out/tag-out activities with the City and the Utilities.
3. If Sections 831 and 832 are specified for the work, only a single lockout/tagout plan is required

**L. Waste Management Plan**

1. **Waste Handling, Storage, and Disposal**
  - a) Provide the procedures that will be followed for the collection of random and representative samples of the waste for sampling and testing, and the testing and analysis procedures that will be used to

- characterize the waste before shipping.
- b) Provide procedures for the site handling, storage, container inspection, packaging, labeling, manifesting, transporting, and disposal of the waste. Include a written containment plan for adequately shielding and protecting the surrounding area when transferring and/or conveying hazardous waste from one container to another to prevent any dispersion or spills.
  - c) Provide a copy of the weekly waste storage area inspection form and an explanation of the procedure that will be used to assure hazardous waste does not remain on-site for more than 45 days.
  - d) Provide a detailed contingency plan that addresses worker training and the notification, containment, cleanup, and reporting that will be undertaken in the event of a spill during the jobsite handling and transportation of the waste.

## 2. **Hazardous Waste Transportation**

- a) Submit evidence that each proposed hazardous waste transporter has a valid 6 NYCRR Part 364 Waste Transporter Permit. Provide a copy of the Certificate of Insurance.
- b) If it is proposed that the transportation pass through other states, provide evidence that the transporter complies with the applicable laws, codes, rules and regulations of the respective states. Provide copies of all licenses and certifications for States through which the transporter will pass.

## 3. **Hazardous Waste Disposal**

- a) Provide the name, address, license or permit number, qualifications, certificate of insurance and contact person of each proposed legally permitted hazardous waste disposal facility that will be used.
- b) Advise each proposed recycling or waste disposal facility that paint removal waste will be generated (e.g., abrasive/paint debris), and identify the metals that the waste will likely contain. Based on that information, request a letter from each facility, stating that the facility can accept this type of waste, is authorized to accept the waste under the laws of the State of residence, has the required capability to treat and dispose of the materials, and will provide or ensure the ultimate disposal method indicated on the Uniform Hazardous Waste Manifest.
- c) Provide the Engineer with the original letter signed by a legally authorized representative of the facility prior to shipping any hazardous waste but within enough time to ensure all wastes are disposed within Contract required time frames. Include a copy of permits or letter of authorization to operate the facility and provide a signed statement from the disposal facility that the waste shipping containers that the Contractor proposes to use are acceptable to the facility.
- d) If recycled steel grit abrasives will be used, the Contractor shall advise the disposal facilities that the paint removal waste must be handled and stabilized as if it tested hazardous, even if the initial TCLP test results are below hazardous thresholds. Provide the

- Engineer with the proposed means of stabilization that will be used by the facility to comply with the requirements of this specification.
- e) If it is proposed that a secondary smelter will be used for the recycling of the hazardous waste, provide evidence that the smelter holds a valid EPA and consignment state approval for the treatment of the hazardous materials present in the waste that will be generated (e.g., D008 in the case of lead-containing waste).

4. **Waste Water Disposal Information**

- a) Submit the name, address, and contact person of the facility that will be accepting the wastewater for disposal. Wastewater under this item is water used for washing and cleaning the bridge and equipment. The handling and disposal of hygiene water is included as part of the decontamination units under the Worker Protection Plan.
- b) The Contractor shall advise the facility of all of the toxic metals and anticipated concentrations that the water will likely contain. Based on that information, request a letter from the proposed facility stating that the facility can accept waste water, is authorized to accept the waste under the laws of the State of residence, and has the required capability to treat and dispose of the waste water. If the facility indicates that the wastewater can be placed into the sanitary sewer system, include such an authorization in the letter. Provide the Engineer with the original letter signed by a legally authorized representative of the facility, including a copy of permits or letter of authorization to operate the facility.

5. **Non-Hazardous Waste Transportation and Disposal Information**

- a) Provide the name, address, license or permit number, qualifications, and contact person of each proposed hauler of non-hazardous waste (note that paint removal waste has been declared hazardous).
- b) Submit the name, address, license or permit number, qualifications, and contact person of each permitted waste landfill that will accept the non-hazardous (construction) waste, and the waste which passes TCLP, but which contains toxic metals.
- c) Provide a letter of intent from the proposed legally permitted landfill operator agreeing to accept waste which passes TCLP, but which contains toxic metals.

**A.03 CONSTRUCTION START UP SUBMITTALS**

- A. **Worker Protection** – Submit the following documentation to the Engineer prior to the initiation of lead exposure-producing operations:
1. Documentation of purchase or mobilization of respirators and personal protective equipment (PPE).
  2. Documentation of purchase, or rental, and mobilization of decontamination facilities before beginning the project.
  3. Certification of completion of lead training for supervisors and employees (including SSPC C3, SSPC C5 and City project-specific requirements, such

as HAZWOPER).

4. Documentation of respirator fit testing for all employees who will wear respirators.
5. Verification that the employees who will potentially be exposed to lead above the Action Level have successfully completed the necessary medical surveillance. For employees who refuse to participate in the medical examinations and biological monitoring, provide written proof signed by the employee, that they were offered, but declined the examinations and monitoring.
6. Documentation that workers have received the lead training required in 29 CFR 1926.62 (I).

**B. Certification of Containment Installation**

1. Prior to working within each unique containment design, submit a letter signed and sealed by the containment design engineer stating that the containment system has been assembled as shown on the approved, signed and sealed drawings. The inspection shall be performed by the design engineer, or a designee employed by the same firm and working under the direction of the design engineer,
2. If the containment is not installed in accordance with the design drawings, and field modifications are made, issue supplemental calculations for the new design for Engineer review and approval in accordance with the original submittal requirements.

**A.04 CONSTRUCTION PHASE SUBMITTALS**

- A. **Competent Person Daily Reports** – Make the competent person’s daily oversight reports or logs available for review by the Engineer or environmental consultant when requested. Include enough information and observations to demonstrate compliance with the specification requirements and the documentation requirements of the following plans:
  1. Compliance with the Worker Protection Plan.
  2. Compliance with Environmental Protection Plan including daily and final project cleanup.
  3. Compliance with the Waste Handling Plan.
  4. Compliance with the Containment submittals.
- B. **Worker Protection** – Submit the following documentation to the Engineer throughout the course of the project:
  1. For all new supervisors and employees who begin Work after the initial project start-up, before the individual begins working on the project, provide certification of completion of lead training (including SSPC C3 and project-specific requirements), respirator fit testing, and verification that they have successfully completed the necessary medical surveillance. For employees who refuse to participate in the medical examinations and biological monitoring, provide written proof signed by the employee, that they were offered, but declined the examinations and monitoring.

2. Worker exposure monitoring results (included in the monthly summary report described below).
3. De-personalized results of all employee medical testing at the end of each month that testing is performed (included in the monthly summary report described below).
4. Documentation of any medical removals within one day of the removal, a description of what triggered them, and the corrective measures taken.
5. Copies of the hygiene water test results (water used for washing, showering, or laundering clothing on site). Tests are to address all of the parameters established by the POTW to confirm the acceptability of the filtration. Provide the Engineer with the test results within five days of receipt and before disposal or discharge of the water.
6. Any revisions or updates to the Worker Protection Plan immediately upon development.
7. Confirmation that the parking lots for worker cars are not in lead-exposure areas.
8. SDS for all new products and materials brought onto the Project site. At the Engineer's discretion, the Contractor may be directed to maintain the SDS at the Project site only, rather than provide a separate copy to the Engineer in addition to the Project site copy.
9. Monthly progress reports - Except where the Contractor can document that employee lead exposure will be below the Action Level, at the end of each month of Work which entails potential lead exposure, submit a report to the Engineer which has been reviewed, signed, and stamped by the CIH/IH. Submit the report within 10 calendar days after the completion of each month. This report shall contain the following elements:
  - a) A summary of the Work entailing potential lead exposure that was completed in the last month including a summary of the observations made by the CIH/IH during the monthly visit and any required intervention activities.
  - b) A statement that, with the exception of any deficiencies noted, the past month's work has been in compliance with the requirements of 29 CFR 1926.62, this specification, and all other applicable Federal and State regulations.
  - c) A description of any interventions or deficiencies noted, along with a summary of the corrective actions taken.
  - d) A summary of the results of any exposure monitoring or medical testing which was completed in the past month. To protect worker privacy, these results shall not include the individual names or Social Security numbers of the workers tested. Instead, workers shall be identified by trade (e.g., ironworker, painter, laborer, etc.) and with an individual control number so that their exposure can be tracked throughout the project.
10. Results of any exposure monitoring conducted on the Engineer and City Agents. Provide the results within the same five day notification period required for Contractor employees.

**C. Visible Emissions and Releases**

1. Record the results of the daily assessments of visible emissions and releases in a log or report form approved by the Engineer. Include the following information at a minimum: Contract number, Contractor's name, Work location, date of observations, activities being performed that day, daily observation results (location and duration of emission), general comments, outline of the visible emission criteria, notation of compliance or noncompliance with the visible emission criteria, notification of Agencies as applicable, corrective actions, and signature block for the observer.
2. Provide the Engineer with an immediate verbal report each time that unacceptable visible emissions or releases are observed.
3. Document all cases where Work has been halted due to visible emissions or releases, the resulting clean up activities performed, the reason or explanation for the emission or release, and the corrective action taken to avoid a reoccurrence. Provide the written report to the Engineer within 48 hours of the occurrence.

**D. Regulated Area Monitoring** – The laboratory must provide the results of regulated area monitoring to the Contractor within three days of the field sampling. Provide the test results to the Engineer verbally within one day of receipt, and in writing within five working days thereafter.

**E. Containment Scaffolding Inspection Log** - Maintain, and make available for review by the Engineer, a daily log of the inspections of scaffolding, platforms, and wire ropes in accordance with the OSHA requirements. Conduct the inspections each shift, and after any occurrence which could affect the structural integrity of the scaffolding or wire suspension ropes.

**F. Air flow and Negative Pressure Measurement Log** - Maintain, and make available for review by the Engineer, a log of air flow and negative pressure measurements.

**G. Temporary Heating Units** - If the use of temporary heating units was not anticipated at the time of the initial submittals, notify the Engineer at least one week in advance of use of heating units. Submit, for approval, information on fuel to be used and the safety measures to be employed for heater use and fuel storage.

**H. Waste Management**

1. **Waste Storage Logs** – Maintain daily waste storage logs and make them available for inspection by the Engineer or environmental consultant.

2. **Waste Analysis Reports**

- a) Direct the laboratory to send the original waste analysis test reports directly to the Engineer, with copies of the results to the Contractor. The reports must be issued no later than five calendar days after the representative samples are submitted for testing, with a copy being sent by facsimile transmission or by email to the Engineer the same day the report is sent.
- b) The reports shall contain at a minimum the following information: the identity of the waste stream(s) analyzed, the sampling method

used to get random and representative samples, the number of samples collected and tested, dates of sampling and testing, laboratory test procedures utilized, the names and signatures of the individuals collecting the samples and conducting the laboratory tests, an interpretation of the test results, and chain-of-custody forms.

3. **Waste Manifests and Disposal Documentation**

a) **Waste Manifest**

(1) The Contractor shall prepare the Uniform Hazardous Waste Manifest for each shipment, including the LDR (Land Disposal Restriction) certification, which will be attached to the manifest. The Engineer will sign the Generator's Certification on the manifest and maintain copies of the original manifest and signed copies upon completion of disposal.

(2) If the signed manifest is not received from the disposal facility within thirty-five (35) days of shipment, as directed by the Engineer, the Contractor shall initiate tracking of the waste by contacting the Transporter and Treatment, Storage and Disposal (TSD). If the completed manifest is not received within forty-five (45) days, the Contractor shall complete the EPA Exception Report in accordance with 40 CFR 262.42,

b) **Disposal Certification** – The Contractor shall provide a certification for each manifested shipment that the waste was accepted by the recycling or disposal facility, and properly treated and disposed of.

I. **Daily and Final Project Cleanup**

1. Maintain a log or report confirming the visual cleanliness of the jobsite each day, the cleanliness of containment prior to movement, and the more detailed testing of cleanliness (wiping with a cloth and inspecting for dislodged material) prior to dismantling, and cleanliness of contractor equipment prior to removal from the project site. Include the results of any wipe samples conducted on equipment by the environmental consultant.
2. Prepare a letter report presenting the results of the inspections conducted to verify the final cleanliness of the project site, surrounding property, waterways, equipment, buildings, and structures. Submit the report to the Engineer within one week of the final inspection.
3. Include a summary of any problems or releases that occurred during the project, and the cleanup and corrective action measures that were taken to resolve the problem.

**END OF SECTION**

## APPENDIX B – TERMS AND DEFINITIONS

1. **The terms and definitions below only apply to Section 832.Action Level** – Employee exposure, without regard to the use of respirators, to an airborne concentration in micrograms per cubic meter of air ( $\mu\text{g}/\text{m}^3$ ) calculated as an eight hour time-weighted average (TWA). The Action Level for lead is  $30 \mu\text{g}/\text{m}^3$ .
2. **Acceptance Criteria** – Minimum standards for the content of programs, plans, procedures, and designs required by this Specification for the performance of the Contract. Acceptance criteria will be the basis for judging the responsiveness of Contractors' programs and will also be used as a basis for suspending work, if necessary.
3. **Agency** – New York City Department of Design and Construction (NYCDDC)
4. **CERCLA** – Comprehensive Environmental Response, Compensation, and Liability Act; commonly called Superfund. Federal laws addressing the cleanup of hazardous waste sites. Amended in 1986 by the Superfund Amendments and Re-Authorization Act (SARA). EPA implementing regulations are contained in 40 CFR 300-373.
5. **CIH** – Certified Industrial Hygienist holding valid certification by the American Board of Industrial Hygiene (ABIH).
6. **Competent Person** – One who is capable of identifying existing and predictable I hazards in the surroundings or working conditions and who has authorization to take prompt corrective measures to eliminate them. The Competent Person is either an employee of the Contractor, or is under contract directly to the Contractor.
7. **Compliance Program** – A document prepared by the Contractor performing the removal of the lead-containing paint giving a detailed description of engineering controls, work practices, and safety precautions that will be adopted for the execution of the work. The Compliance Program is part of the overall Worker Protection Plan in this specification.
8. **Containment System** – A system which minimizes or prevents debris, generated during surface preparation or the removal of lead-containing paint, from entering into the environment, and which facilitates the controlled collection of the debris for disposal. It includes the cover panels, screens, tarpaulins, scaffolds, supports, and shrouds used to enclose entire work areas or the paint removal tools. Containment systems may also employ the use of ground covers or water booms.
9. **Contractor** – The person or corporate body that is party to the contract and bound to execute the work in accordance with the contract.
10. **Discharge** – Accidental or intentional spilling, leaking, pumping, pouring, emitting, emptying, or dumping of hazardous material, waste water or waste into or on any land, water or airspace.
11. **Disposal** – The discharge, deposit, injection, dumping, spilling, leaking or placing of any solid or hazardous waste into or on any land or water, so that no solid waste or hazardous waste, or any constituent thereof, may enter the environment or be emitted into the air or discharged into any waters, including ground waters.
12. **Disposal Facility** – A licensed facility where hazardous and non-hazardous waste is intentionally placed, and in which the waste will remain after closure.
13. **Emission** - A release of material to the air, water, or ground.
14. **Employee Lead Exposure** – Exposure which would occur if the employee were not using

- a respirator.
15. **Engineer** – The designated City employee, or authorized representative, who is responsible for the project including the authority to accept or reject Work on behalf of the Agency.
  16. **Engineering Controls** – The use of technologically feasible controls in the work areas for the purpose of reducing and maintaining employee exposure to lead to or below the PEL or as low as feasible, and for controlling emissions from the work area. Examples of engineering controls are mechanical ventilation for enclosures, or methods which capture the dust at the point of generation such as vacuum blast cleaning.
  17. **Environmental Consultant** – Individual or company employed by the City on a periodic or full time basis to monitor the lead removal project to assure that it is conducted in an environmentally protective manner in accordance with the provisions of this specification and the contract documents.
  18. **EPA** – The U.S. Environment Protection Agency. Regulations are contained in Title 40 of the Code of Federal Regulations (40 CFR).
  19. **EPA Hazardous Waste Number** – The Federal number assigned to each hazardous waste. The number assigned to lead waste is D008.
  20. **Flood Plain** – A flat, low-lying portion of a stream valley subject to inundation during a flood.
  21. **Generator** – Any facility owner, operator or person whose act or process produces hazardous waste or whose act first causes a hazardous waste to become subject to regulation. The City and Contractor are co-generators for the work under this Specification. The City will obtain the EPA ID Number.
  22. **Hazardous Waste**– Waste that is classified as hazardous due to its concentrations of regulated hazardous substances. Wastes may be classified as hazardous based on the characteristics of toxicity, ignitability, corrosivity, and reactivity. Paint debris is typically classified as hazardous waste based on the characteristic of toxicity. This is determined by testing representative samples of the waste using the Toxicity Characteristic Leaching Procedure (TCLP). If the leachate contains any of the eight metals or other substances in concentrations at or above limits established in 40 CFR 261, Identification and Listing of Hazardous Wastes, it is classified as hazardous.
  23. **HEPA** – A high efficiency particulate air filter (HEPA filter) removes from the air 99.97% or more of the aerosols having a diameter of 0.3 microns.
  24. **Ignitability** – A characteristic of waste that causes it to be classified as hazardous. Waste is determined to be ignitable if it is found to be capable of being set afire, or of bursting into flame spontaneously or by interaction with another substance or material, when tested in accordance with 40 CFR 261. Spent solvents and liquid paint waste typically fall into this category.
  25. **Leachate** – The amount of a specific substance (e.g., lead) that is carried off or dissolved out of a material. The amount of leachable lead that classifies paint debris as being hazardous is 5 mg/L (ppm) when tested by TCLP.
  26. **Lead** – Metallic lead, all inorganic lead compounds, and organic lead soaps. The lead pigments used in paints comply with this definition.

27. **µg/m<sup>3</sup>** – Micrograms per cubic meter. Common units for reporting airborne concentrations of lead and other aerosols.
28. **mg/L** – Milligrams per liter. Common units for reporting a concentration of a specific substance in units of mass per volume (e.g., amount of hazardous material contained in paint debris).
29. **SDS** – Safety Data Sheet. Data provided by the manufacturer of a product that identifies the hazardous constituents contained in the product together with precautions that need to be taken during its handling and use.
30. **NAAQS** – National Ambient Air Quality Standards. Federal regulations which establish limits on allowable pollutants in the ambient air. Lead and particulate matter are included. Regulations are found in 40 CFR 50.
31. **NIOSH** – National Institute of Occupational Safety and Health.
32. **OSHA** – Occupational Safety and Health Administration. Standards are contained in Title 29 of the Code of Federal Regulations, Parts 1910 and 1926 (29 CFR 1910 and 29 CFR 1926) are the standards for General Industry and Construction Industry, respectively.
33. **Owner** – New York City
34. **Paint Removal Waste** – Removed paint particles, rust and other contaminants combined with the material (e.g., abrasives) used to remove the paint. The waste stream from the recycling equipment when blasting with recyclable steel grit is also considered a paint removal waste.
35. **Permissible Exposure Limit (PEL)** – Employee exposure, without regard to the use of respirators, to an airborne concentration in micrograms per cubic meter of air (µg/m<sup>3</sup>), calculated as an eight hour time-weighted average (TWA). The PEL for lead is 50 µg/m<sup>3</sup> as an 8 hour TWA. If an employee works for longer than 8 hours in a given day, the PEL is reduced using the following formula:  
  
Adjusted PEL = (PEL x 8) ÷ (hours worked in the day)
36. **PM-10** – Particulate matter of an aerodynamic equivalent diameter of 10 microns or less. PM-10. Term associated with the collection of airborne particulate using high volume ambient air samplers.
37. **POTW** – Publicly Owned Treatment Works (e.g., waste water treatment facility).
38. **PPM** – Parts per million. Common units for reporting low concentration of a specific substance (e.g., amount of hazardous material contained in paint debris). One (1) percent is equal to 10,000 ppm.
39. **RCRA** – Resource Conservation and Recovery Act. RCRA regulations addressing waste handling and disposal and are found in 40 CFR 240 through 280. Hazardous waste regulations are found in 40 CFR 260 through 268.
40. **Regulated Area** – Area established by the Contractor, outside of which the airborne concentrations of lead or other toxic material can reasonably be expected to not exceed the corresponding Action Level.
41. **Representative Sample** – A sample of debris from a pile, drum, or container of debris which can be expected to exhibit the average properties of that pile, drum, or container of debris.

42. **SSPC** – SSPC: The Society for Protective Coatings. An independent, non-profit association of engineers, technical specialists, owners and contractors whose mission is to advance the technology and promote the use of protective coatings to preserve industrial, marine, and commercial structures, components and substrates.
43. **TCLP** – Toxicity Characteristic Leaching Procedure. Laboratory tests conducted on wastes that determine the amount of hazardous materials that leach out into a test solution. The test is intended to simulate the solubility of hazardous material if it was placed in a municipal waste landfill. TCLP testing is defined in 40 CFR 261, Appendix II.
44. **Threshold Limit Value (TLV)** – The time-weighted average concentration for a normal 8-hour workday and a 40-hour workweek, to which nearly all workers may be repeatedly exposed day after day, without adverse effect.
45. **Time Weighted Average (TWA)** – The average concentration of a contaminant in air during a specific time period.
46. **Treatment** – Any method or process designed to change the physical, chemical or biological characteristics or the composition of any hazardous waste so as to render such waste non-hazardous.
47. **Treatment, Storage, and Disposal (TSD) Facility** – The TSD facility is the last phase of the cradle-to-grave concept in handling hazardous waste and is responsible for its proper stabilization and disposal. Requirements are found in 40 CFR 264 and 265.
48. **TSP** – Total Suspended Particulate. Term associated with the collection of airborne particulate using high volume ambient air samplers. TSP particles have a maximum aerodynamic diameter of about 100 micrometers. Filters are typically analyzed for lead.
49. **Waste Stream** – A waste stream represents debris of a similar type, make up, and process. The paint debris from a given structure represents a single waste stream if the coating system and method of removal is constant. The debris represents a different waste stream, if different coating materials or methods of removal are involved. For example, the waste created when using recycled steel grit generates a different waste stream than waste created using an expendable abrasive (e.g., coal slag) even though the paint being removed is the same. The waste stream consists of the abrasive material, removed paint particles and any other materials generated during the paint removal process.
50. **Worker Protection Plan** – Comprehensive plan addressing the steps that will be taken to protect the health and safety of Contractor workers from jobsite hazards.
51. **Ventilation System** – Ventilation systems include both natural ventilation and artificial ventilation (mechanical fans, hoods, and ductwork), to provide air movement across the work area, and dust collectors to clean the air stream prior to discharge to the atmosphere.
52. **Visible Emissions** – Emissions of particulate from the work area that are visible to the unaided eye. EPA methods for assessing visible emissions are found in 40 CFR 60, Appendix A. Method 9 determinations are based on the opacity of the emissions. Method 22 is based on total visible emissions regardless of the opacity.

**END OF SECTION**

## APPENDIX C – NYSDOT SAFETY BULLETIN SB-94-4, HISTOPLASMOSIS

### INTRODUCTION

Employees engaged in a variety of tasks are often required to work in areas where pigeons have nested, usually for long periods. Such conditions are often found in bridge structures and cold storage facilities. This nesting results in a substantial build-up of pigeon droppings, a condition which can be harmful to humans if the material is disturbed and made airborne.

Histoplasmosis is a fungal infection resulting from exposure to pigeon droppings. Infectious material enters the body usually by inhalation into the lungs, but in some cases by ingestion through the mouth into the gastrointestinal tract. Pigeons do not carry the organism that causes Histoplasmosis. Histoplasmosis is caused by a soil organism that requires the moist, nutrient rich environment that large masses of droppings offer. Areas with small amounts of dried droppings pose minimal hazard.

This Safety Bulletin is intended to alert employees of this potential health hazard and establish common sense precautions to minimize exposure.

### PROCEDURES

Prior to work in any area where pigeons nest, a thorough inspection should be made to determine if, and to what extent there is a build-up of material. Inspection itself requires minimum precautions such as the use of personal protective equipment, which may include gloves, rubber boots, rain suit components, goggles and a dust/nuisance respirator. Questions regarding proper equipment for this activity should be directed to the Regional Safety Representative or Employee Safety & Health Section.

If substantial material is found in the immediate work area, cleaning must be performed. Employees engaged in cleaning activity shall wear all of the personal protective equipment specified above. A high powered water hose is an effective means to remove material. If the material is to be scraped away, it must be kept wet during the entire process. Application of a cleaning agent (bleach, for example), before removal may help dissolve the material, and may be applied as a disinfectant upon the affected surfaces after the droppings have been removed. Compressed air shall not be used to remove pigeon droppings because it increases the potential for inhalation and ingestion of airborne particles and the area of potential exposure.

When cleaning has been successfully completed, the personal protective equipment specified above is no longer required. All other personal protective equipment appropriate for the task and/or location shall be used, such as fall protection, hard hat, etc.

Employees engaged in cleaning, or any other activity which involves exposure to pigeon droppings, should observe a high degree of personal hygiene, even if the exposure is casual.

Special care must be taken to wash hands thoroughly before eating or smoking.

*HISTOPLASMOSIS (NYS DOT Code: SB-94-4, Date: 1/21/94), Last Update: April 20, 1999*

Wet Abrasive Blasting <sup>6</sup>	1W	Rigid or Flexible	Air Impermeable & Water Impermeable	Rigid or Flexible	Fully Sealed	Resealable	Mechanical	Required	Required
Abrasive Blast Cleaning <sup>7</sup>	1A	Rigid or Flexible	Air Impenetrable	Rigid or Flexible	Fully Sealed	Airlock or Resealable	Mechanical	Required	Required

<sup>1</sup> This table provides general design criteria only. Other combinations of materials may provide controls over emissions equivalent to those combinations shown above.

<sup>2</sup> The SSPC Classification is based on SSPC Guide 6. Note that for work over water, water booms or boats with skimmers should be employed, where feasible, to contain spills or releases. Debris must be removed daily at a minimum.

- 3 Permeability addresses both air penetrability and water permeability as appropriate. In the case of water or chemical removal methods, the containment materials must be resistant to both chemicals and water. Ground covers should always be impermeable, and of sufficient strength to withstand the impact and weight of the debris and the equipment used for collection and cleanup.
- 4 Ground covers must always be impermeable and of sufficient strength to withstand the weight and impact of the debris and the equipment used for cleaning. When tarpaulins are used, install plywood above or below the tarpaulins as necessary to prevent perforation. If debris escape through the seams, then additional sealing of the seams and joints is required. All containment materials and materials used for sealing must be resistant to both chemicals and water. If unacceptable worker exposures to lead or other toxic metals occurs, incorporate a ventilation system.
- 5 This method applies to high pressure water jetting without abrasives. Ground covers and the lower portions of the containment must be of sufficient strength and integrity to facilitate the collection and holding of the water and debris for proper disposal. Ventilation is not required provided the emissions are controlled as specified in this Section and provided worker exposures are properly controlled. If unacceptable worker exposures to lead or other toxic metals occurs, incorporate a ventilation system into the containment.
- 6 This method applies to any methods which combine water with abrasives. Ground covers and the lower portions of the containment must be of sufficient strength and integrity to facilitate the collection and holding of the water and abrasive/paint debris for proper disposal.
- 7 Ground covers must be of sufficient strength to withstand the impact and weight of the abrasive and the equipment used for cleaning. Ground covers must also extend beyond the containment boundary to capture escaping debris.

## **CONTRACT SANDRESM1**

The specifications in the BUILDINGS-Pages cover furnishing all building components and assemblies, equipment (including lighting, plumbing, HVAC, furnishings and associated works), superintendence, labor, skill, material and all other items necessary for the construction, installation, start-up and testing of the work at the Tennis House Building, Track and Field Building, East 10<sup>th</sup> Comfort Station, Maintenance and Operations (M&O) Area 2 Building, M&O Area 3 Building, M&O Area 1 Canopy, and M&O Area 2 Canopy as part of the East Side Coastal Resiliency Project.

The BUILDINGS-Pages supplement the specifications shown on the Specifications and Standards of New York City sheet at the beginning of this Volume 3, which apply to the work except as modified in these Contract Documents.

**SECTION 01 11 00 – SUMMARY OF WORK****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: This Section specifies a Summary of Work to be performed in accordance with the requirements of the Contract Documents and the items of work shown on the Contract Drawings listed in PART 4 - Appendix attached at the end of this section. The work consists of furnishing all building components and assemblies, equipment, superintendence, labor, skill, material and all other items necessary for the construction, installation, start-up and testing of the work as part of the East Side Coastal Resiliency Project.
1. The work shall include
    - a. Tennis House Building,
    - b. Track and Field Building,
    - c. East 10<sup>th</sup> Comfort Station,
    - d. Maintenance and Operations (M&O) Area 2 Building,
    - e. M&O Area 3 Building,
    - f. M&O Area 1 Canopy, and
    - g. M&O Area 2 Canopy.
- B. This Section Includes:
1. Related Sections.
  2. Location and Description of Work.
  3. Work Included in the Contract.

**1.2 RELATED SECTIONS**

- A. All Contract Documents, including all other specifications sections in this Contract, will apply to this Section.
- B. Specifications sections related to the items of work covered under this Contract are organized into the following Sections:
- C. SPECIAL WORKS SECTIONS cover requirements related to the complete furnishing, construction, installation, startup, and testing of the work. The SPECIAL WORKS SECTIONS include all Sections within these BUILDINGS-Pages.

**1.3 REFERENCES**

- A. Abbreviations / Acronyms: No new references are used in this Section.
- B. Definitions: No new references are used in this Section.
- C. Reference Standards: No new references are used in this Section.

**1.4 WORK INCLUDED IN THE CONTRACT**

- A. Location: The site of the work performed under this Contract takes place within the East Side Coastal Resiliency Project, generally from Montgomery St. in the

south to 24<sup>th</sup> St in the north from the FDR Drive to Avenue C. The full extent of the site and work is shown on the drawings.

- B. Items of Work: The work covered in this and all related sections include, but is not limited to, providing all building components and assemblies, equipment, superintendence, labor, skill, material and all other items necessary for the construction, installation, start-up and testing necessary to complete this work and do all work incidental thereto, all in accordance with the plans and specifications, and as directed by the City.
1. Additionally, included items of work hereunder shall be the installation and testing of equipment used in the operation of the work in accordance with the plans, specifications and standards, and as directed by the City.
- C. Description of Work as follows:
1. Tennis House Building
    - a. The Tennis House Building is an approximately 1,500 SF single story building consisting of Public Restrooms, Tennis and M&O offices, a small Concession space with a sales window, Park Storage, and Mechanical Room. The exterior of the building will be constructed of an insulated CMU block wall system with a multi-colored glazed brick finish. The exterior openings for this project will be stainless steel doors and aluminum frame windows covered by perforated metal panels. The interior finishes of the occupied spaces will be glazed brick wall tiles or painted CMU with painted steel doors and frames. The roof will be an insulated, extensive vegetated fluid- applied roof system. The full extent of the work is as shown on the drawings.
    - b. Mechanical, electrical and plumbing (MEP) work including electric heating, ventilation fans with motorized dampers/louvers, water service and distribution piping, valves, slop sink, winterizable exterior hose bib, floor drains, drainage piping and house trap, electrical panel, lighting fixtures, occupancy sensors, receptacles, GFCI receptacles, conduit, wire, pull/junction boxes, supports, etc. for complete installation with testing, instruction, operations and maintenance manuals and as-built drawings.
    - c. Foundation requirements for the Tennis House Building are as described in the Contract Plans S-600 series.
  2. Track and Field Building
    - a. The Track and Field Building is an approximately 5,400 SF single story building consisting of Public Restrooms, Public Locker Rooms, a Concession space with sales windows, Vendor Storage Room, Track Office with Staff Locker Rooms and Restrooms, Park Storage Rooms, and Mechanical Room. The exterior of the building will be constructed of an insulated CMU block wall system with a multi-colored glazed brick finish. The

exterior openings for this project will be stainless steel doors and aluminum frame windows covered by perforated metal panels. The interior finishes of the occupied spaces will be glazed brick wall tiles or painted CMU with painted steel doors and frames. The roof will be an insulated, extensive vegetated fluid-applied roof system. The full extent of the building is as shown on the drawings.

- b. Mechanical, electrical and plumbing (MEP) work including electric heating, ventilation fans with motorized dampers/louvers, water service and distribution piping, valves, slop sink, winterizable exterior hose bib, floor drains, drainage piping and house trap, electrical panel, lighting fixtures, occupancy sensors, receptacles, GFCI receptacles, conduit, wire, pull/junction boxes, supports, etc. for complete installation with testing, instruction, operations and maintenance manuals and as-built drawings.
  - c. Foundation requirements for the Track and Field Building are as described in the Contract Plans S-500 series.
3. East 10<sup>th</sup> Street Comfort Station
- a. The Comfort Station is an approximately 750 SF single story building consisting of Public Restrooms and a Mechanical Room. The exterior of the building will be constructed of an insulated CMU block wall system with a multi-colored glazed brick finish. The exterior openings for this project will be stainless steel doors and aluminum frame windows covered by perforated metal panels. The interior finish of the Restrooms will be glazed brick wall tiles with painted steel doors and frames. The roof will be an insulated, fluid-applied roof system. The full extent of the building is as shown on the drawings.
  - b. Mechanical, electrical and plumbing (MEP) work including electric heating, ventilation fans with motorized dampers/louvers, water service and distribution piping, valves, slop sink, winterizable exterior hose bib, floor drains, drainage piping and house trap, electrical panel, lighting fixtures, occupancy sensors, receptacles, GFCI receptacles, conduit, wire, pull/junction boxes, supports, etc. for complete installation with testing, instruction, operations and maintenance manuals and as-built drawings.
  - c. Foundation requirements for the E 10<sup>th</sup> Street Comfort Station are as described in the Contract Plans S-700 series.
4. M&O Area 2 Building
- a. The M&O Area 2 Building is an approximately 968 SF single story prefabricated structure as a storage room with a utility sink. The exterior of the building will be constructed of an insulated precast concrete panel with custom form liner pattern. The exterior openings for this project will be stainless steel doors with two motorized garage doors. The roof will be an insulated, fluid-

applied roof system. The full extent of the building is as shown on the drawings.

- b. Mechanical, electrical and plumbing (MEP) work including electric heating, ventilation fans with motorized dampers/louvers, water service and distribution piping, valves, slop sink, winterizable exterior hose bib, floor drains, drainage piping and house trap, electrical panel, lighting fixtures, occupancy sensors, receptacles, GFCI receptacles, conduit, wire, pull/junction boxes, supports, etc. for complete installation with testing, instruction, operations and maintenance manuals and as-built drawings.
- c. Foundation requirements for the M&O Area 2 Building are as described in the Contract Plans S-300 series.

5. M&O Area 3 Building

- a. The M&O Area 3 Building is an approximately 968 SF single story prefabricated structure as a storage room with a slop sink. The exterior of the building will be constructed of an insulated precast concrete panel with custom form liner pattern. The exterior openings for this project will be stainless steel doors with two motorized garage doors. The roof will be an insulated, fluid-applied roof system. The full extent of the building is as shown on the drawings.
- b. Mechanical, electrical and plumbing (MEP) work including electric heating, ventilation fans with motorized dampers/louvers, water service and distribution piping, valves, slop sink, winterizable exterior hose bib, floor drains, drainage piping and house trap, electrical panel, lighting fixtures, occupancy sensors, receptacles, GFCI receptacles, conduit, wire, pull/junction boxes, supports, etc. for complete installation with testing, instruction, operations and maintenance manuals and as-built drawings.
- c. Foundation requirements for the M&O Area 3 Building are as described in the Contract Plans S-400 series.

6. M&O Area 1 Canopy

- a. The M&O Area 1 Canopy is an approximately 840 SF freestanding structure supported by two columns. The structural steel framing is clad with stainless steel panels.
- b. Lighting on/within underside of canopy with associated conduit, wire, pull/junction boxes, supports, etc. for complete installation with testing, instruction and as-built drawings.

7. M&O Area 2 Canopy

- a. The M&O Area 2 Canopy is an approximately 1,560 SF freestanding structure supported by four columns. The structural steel framing is clad with stainless steel panels.
- b. Lighting on/within underside of canopy with associated conduit,

wire, pull/junction boxes, supports, etc. for complete installation with testing, instruction and as-built drawings.

8. M+O Fuel Storage Cabinet

The M+O Fuel Storage Cabinets are pre-fabricated 90 gal capacity (69"Hx43"Wx31"D) 2shelf, self latched 2 door fuel cabinets as indicated on the contract plans.

9. Fencing and gates

- a. M&O Areas 1, 2 and 3 are secured by painted, hot-dipped galvanized slatted fence panels mounted to posts on concrete foundations or retaining walls.
- b. Access points will be equipped with rolling gates or double swing gates. The gates receive slatted panels to match the adjacent fence. The gates are painted, hot-dipped galvanized.

## 1.5 BUILDING PERMITS AND SPECIAL INSPECTIONS

- A. The Contractor shall secure and pay for the building permit and other permits and governmental fees, and licenses necessary for execution and completion of the Work. Reference Article B14, "Special Inspection and Department of Buildings" in the S-Pages for additional requirements.
- B. The Special Inspection requirements as indicated on the General Notes sheet of each project discipline. See General Notes sheets including but are not limited to the following:
  1. Structural General Notes (KSE) – Sheet S-101.00
  2. Structural General Notes (Arcadis) – Sheet S800
  3. Mechanical General Notes (WCA) – Sheet M401

## PART 2 - PRODUCTS

(NOT APPLICABLE)

## PART 3 - EXECUTION

The requirements of this Section apply only to the work covered in these BUILDING-Pages.

### 3.1 GUARANTEES

- (a) **Contractor's Guaranty Obligation:** The Contractor shall promptly repair, replace, restore or rebuild, as the Commissioner may determine, any finished Work in which defects of materials or workmanship may appear or to which damage may occur because of such defects, during the one (1) year period subsequent to the date of Substantial Completion (or use and occupancy in accordance with the Contract), except for the areas of Work set forth below:
- Roofing, Waterproofing, and Joint Sealant Work. For these types of work, the guarantee period shall be (2) two years.
  - Trees and/or Plant Material. For trees and/or plant material furnished and installed, the guarantee period shall be (2) two years. During the guarantee period, the Contractor shall provide all maintenance services set forth in the

Specifications.

- (b) **Guaranty Period:** The obligation of the Contractor, and its Surety under the Performance Bond, is limited to the period(s) of time specified above.
- (c) **Other Provisions Deemed Deleted:** In the event the Specifications and/or the Contract Drawings contain any provisions regarding guaranty requirements, such provisions are deemed deleted and replaced with the guaranty requirements set forth in this Schedule B.

### 3.2 WARRANTIES

Requirements for Warranties are set forth in the following table.

- (a) The term “manufacturer’s warranty” as described in this article encompasses the following terms as indicated in the Specifications: “Manufacturer’s Warranty”, “Manufacturer’s Special Warranty”, “Special Warranty”, “Special Finish Warranty”, “Manufacturer’s Special Warranty for a (product, assembly).
- (b) In the event of any conflict or inconsistency between (1) a warranty requirement set forth in the Specifications and/or the Contract Drawings and (2) a warranty requirement set forth in in the table below, the warranty requirement set forth in the table below will prevail.
- (c) **Contractor’s Obligation to Provide Warranties:** The items of material and/or equipment for which manufacturer warranties are required are listed below. For each item of material and/or equipment listed below, the Contractor shall obtain a written warranty from the manufacturer. Such warranty shall provide that the material or equipment is free from defects for the period set forth below and will be replaced or repaired within such specified period. The Contractor shall deliver all required warranties to the Commissioner.
- (d) **Application:** The obligations under the warranty for the periods specified below shall apply only to the manufacturer of the material or equipment, and not to the Contractor or its Surety; provided, however, the Contractor retains responsibility for obtaining all required warranties from the manufacturers and delivering the same to the Commissioner.
- (e) **Other Provisions:** The warranty requirements set forth in the table below are also included in the Specifications.
  - (1) In the event a warranty requirement set forth in the Specifications is omitted from the table below, such omission from the table below will have no effect and the Contractor’s obligation to provide the manufacturer’s warranty, as set forth in the Specifications, will remain in full force and effect.
  - (2) In the event a warranty requirement for a particular item of material or equipment is omitted from both the table below and the Specifications, and the manufacturer of such item actually provides a warranty, the Contractor shall be obligated to obtain and deliver to the Commissioner the highest level of warranty actually provided by that manufacturer.
  - (3) In the event a warranty requirement is provided for a particular item of material or equipment, and such requirement specifies a warranty period that is longer than that which is actually provided by any of the specified manufacturers, the Contractor shall be obligated to obtain and deliver to

the Commissioner the highest level of warranty actually provided by any of the specified manufacturers, unless otherwise directed in writing by the Commissioner.

- (4) Unless indicated otherwise Warranties are to take effect on the date of Substantial Completion or use prior to completion per Article 16 of the Standard Construction Contract.

Section	Material or Equipment	Warranty Period
211300	Sprinkler System	1 Year
223333	Instantaneous Electric, Domestic Water Heaters	1 Year
233423	HVAC Power Ventilators	1 Year
238113	Air Conditioners	1 Year
260923	Lighting Control Devices	1 Year
262416	Panelboards	1 Year
265119	LED Interior Lighting	1 Year
265300	Exit Light Fixtures	1 Year
284600	Fire Detection and Alarm System	1 Year

## PART 4 – EXECUTION

### 4.1 MEASUREMENT AND PAYMENT

The contractor shall be paid the lump sum price bid for completing all the work required to be done per the contract drawings and specifications, to the satisfaction of the Engineer. For M&O Area 2 Building and M&O Area 3 Building the contractor shall be paid the lump sum price under PK-ESCR 049 M+O Pre-Fabricated Building. For M+O Fuel Storage Cabinet, the contractor shall be paid for EACH cabinet furnished and installed.

For furnishing and installing Steel Slat Double Swing Gate, 8'HT, 35"W, Steel Slat Double Swing Gate, 8'-0"HT, 15'-0"W and Steel Slat Rolling Gate 8'-0"HT, 25"W in accordance with the plans, specifications and direction of the Engineer, the Contractor shall receive the unit bid price.

The quantity of Steel Slat Privacy Fence M&O to be paid for shall be the number of LINEAR FEET furnished and installed in accordance with the plans, specifications and direction of the Engineer.

### 4.2 PAYMENT

The contract price for all items listed below shall cover the cost to provide all labor, material, plant, equipment, insurance and incidentals required for the complete installation. The contract price shall cover all work including but not limited to concrete, reinforcing steel, masonry, metals, wood, plastic and composites, thermal and moisture protection openings, finishes, specialties, equipment, furnishings, special construction, fire suppression, plumbing, heating, ventilation and air conditioning (HVAC), controls, electrical, communications, fire alarm systems all together with necessary incidentals as required in full compliance with the contract documents, the specifications and the direction of the Engineer. The lump sum items shall include cost for all filings, expediting, coordination, fees and compliance with all agencies and utilities service requirements including but not limited to NYC Department of Buildings (DOB), NYC Small Business Services (SBS), NYC Department of Environmental Protection (DEP),

Con-Edison, OSHA, etc. as required. The lump sum process shall cover all work to five feet outside of structures and include flexible utility connections. The lump sum price includes foundation pile work and foundations as shown on the contract plans.

Payment will be made under the following items:

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>
PK-ESCR 049	M+O Pre Fabricated Building	LUMP SUM
PK-ESCR 051	M+O Fuel Storage Cabinet	EA
PK-ESCR 50A	M+O Canopy Structure, Area 1	LUMP SUM
PK-ESCR 50B	M+O Canopy Structure, Area 2	LUMP SUM
PK-ESCR 501	Tennis Building	LUMP SUM
PK-ESCR 502	Track Building	LUMP SUM
PK-ESCR 503	10th Street Comfort Station	LUMP SUM
PK-ESCR 032	Steel Slat Double Swing Gate, 8'HT, 35' W	EA
PK-ESCR 200	Steel Slat Rolling Gate, 8'-0"HT, 25' W	EA
PK-ESCR 905	Steel Slat Double Swing Gate, 8'-0" HT, 15'-0"W	EA
PK-ESCR 947	Steel Slat Privacy Fence M&O	LF

**END OF SECTION**

**SECTION 03 33 00 / ESCR-13 – ARCHITECTURAL CONCRETE TEXTURED FINISHES**

- A. See FLOODWALL-Pages for Section ESCR 13, which applies to the Architectural Concrete Textured Finishes work covered in the BUILDINGS-Pages and the following:
- B. **Mock-up for Formed Concrete Work:** After all samples, product data, and the shop drawings for the Mock-up are approved, construct mock-ups of the architectural concrete textured finish work in a location approved by the Engineer and as described below. Mock-ups and mock-up submissions for the concrete work shall consist of the following:
1. Mock-ups shall be as detailed.
  2. Prepare and submit a “Lessons Learned” report after completion of each mock-up for review and discussion with the Project Team.
  3. Additional mock-ups or partial mock-ups shall be required if the above mock-ups are deficient in producing the quality required for the project.
  4. Mock-ups shall consist of the following:
    - a. Foundation of a size and reinforcement adequate to support the work at the designated location.
      - Scope of Visual Mock-up: Wall section using form liner weave ribbon pattern: full height, and full thickness, and 8-foot-long straight section with form liner seams, and typical joints in the project.
      - Apply anti-graffiti protection coating (ITEM 559.90010011) over Penetrating Type Protective Sealer according to manufacturer’s instruction in an area approved by Engineer.
    - b. Reinforce as in a similar detail on the drawings and add necessary reinforcing and/or supports to maintain stability.
    - c. Use approved form facing materials, reinforcement and accessories and assemble formwork using methods as intended for construction and to achieve the specified requirements.
    - d. Place concrete with methods to be used in construction, including anticipated time delays between placements. Place concrete to achieve the specified requirements.
    - e. Use approved concrete design mixes, inclusive of specified admixtures, for the mock-ups as will be used in the construction of the formed surfaces.
- C. If mock-ups do not meet the specified quality and are not approved, remove and replace in full or in part at no additional cost. Mock-ups shall be located so they will remain throughout construction. Protect mock-up from damage. Remove mock-up only when directed by the Engineer.

**END OF SECTION**

**SECTION 04 20 00 – UNIT MASONRY****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide masonry units, ceramic glazed masonry units, and ceramic glazed thin brick units in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Miscellaneous steel lintels, relieving angles, other support steel and accessories for masonry units are specified in Section 05 50 00 "Metal Fabrications" and installed under this Section.
  - 2. Air vapor barrier as specified in Section 07 27 10 "Air Vapor Barrier".
  - 3. Insulation as specified in Section 07 21 00 "Building Insulation".
  - 4. Sheet metal flashing and trim is specified in Section 07 62 00 "Sheet Metal Flashing and Trim".
  - 5. Sealants and joint fillers are specified in Section 07 92 50 "Joint Sealants".
  - 6. Steel doors, windows and frames is furnished under Section 08 11 00 "Hollow Metal Doors and Frames" and installed under this Section.

**1.2 SYSTEM DESCRIPTION**

- A. Performance Requirements: For information only. Reinforcing bar schedule and locations are shown on the drawings.
  - 1. Load and Deflection Criteria (Interior):
    - a. Construct interior unit masonry walls to withstand a lateral loading of minimum 5 psf positive and negative pressure, except where more stringent requirements are indicated.
  - 2. Load and Deflection Criteria (Exterior):
    - a. Structural requirements shall be as indicated on the Contract Drawings.
  - 3. Freeze-Thaw Criteria:
    - a. For surface-coated brick, include test report for durability of surface appearance after 50 cycles of freezing and thawing according to ASTM C 67 or a list of addresses of buildings in Project's area where proposed brick has been used successfully and with a history of durability.
  - 4. Anti-Graffiti Coating Performance Requirements:
    - a. Solvent: water-borne.
    - b. VOC Content: EPA Method 25 -- less than 25 grams per liter.

- c. Graffiti Removal: ASTM D6578 "Standard Practice for Determination of Graffiti Resistance" Non-sacrificial minimum of Level 3 cleaning
- d. Water Vapor Permeability: ASTM D1652 – minimum 95% breathable.
- e. Surface Appearance: No appreciable difference compared to non-coated surface.
- f. Weathering: 1000 hours in QUV – no change in repellency
- g. Fire Propagation Test: negative
- h. Surface Spread of Flame: Class 1, no spread of flame
- i. Toxic Fume Summation During Combustion: None

### 1.3 REFERENCES

- A. General: Comply with the applicable provisions and recommendations of the referenced standards except as modified by governing codes and by the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Concrete Institute (ACI): ACI 530.1/ASCE 6/TMS 602 "Specifications for Masonry Structures".
  - 2. American Concrete Institute (ACI): ACI 216.1/TMS 216 "Code Requirements for Determining Fire Resistance of Concrete and Masonry Construction Assemblies".
  - 3. National Concrete Masonry Association (NCMA): "TEK" Information Series".
  - 4. American Society for Testing and Materials (ASTM):
    - a. ASTM C1586 "Standard Guide for Quality Assurance of Mortars".
    - b. ASTM D6578 "Standard Practice for Determination of Graffiti Resistance"
  - 5. New York City Building Code.
  - 6. Industrial Fasteners Institute (IFI)
    - a. "Fastener Standards Book".
  - 7. Ceramic Glazed Masonry Institute (CGMI)

### 1.4 SUBMITTALS

- A. Product Data: Submit manufacturer's literature and specifications describing the general properties of each material and accessory to be used in the Work. Provide complete product data for the "anti-graffiti" coating.

- B. Shop Drawings: Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft.-0 in. minimum scale.
1. Submit shop drawings for fabrication, bending and placement of reinforcement bars and details for reinforced masonry. Comply with ACI 315 "Details and Detailing of Concrete Reinforcing". Submit bar schedules, stirrup spacing, bending diagrams for bars and arrangement of masonry reinforcement. Shop drawings shall bear the seal of a Professional Engineer licensed in the State of New York.
  2. Submit shop drawings for corner blocks and other special shapes.
- C. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished Work. Compliance with other requirements is the responsibility of the Contractor.
1. Sample Block: Provide (2) full size samples of each type, color and texture of exposed face blocks.
  2. Provide (2) 12 in. long colored masonry mortar samples of each color and type demonstrating match with block specified.
  3. Provide (2) 24 in. sq. samples of each type precast unit.
  4. Anti-Graffiti Coatings: Coat half of each sample block with the anti-graffiti coating as specified herein.
- D. List of Materials Used in Constructing Mockups: Submit a list of generic product names together with manufacturers, manufacturers' product names, model numbers, lot numbers, batch numbers, source of supply, and other information as required to identify materials used. Include mix proportions for mortar and grout and source of aggregates. Submittal is for information only. Neither receipt of list nor approval of mockup constitutes approval of deviations from the Contract Documents, unless such deviations are specifically approved in writing.
- E. Quality Control Submittals: Submit the following:
1. Test Reports:
    - a. Preconstruction and field test reports for mortar indicating conformance of mortar materials to property specifications of ASTM C270.
    - b. Test reports, per ASTM C780, for mortar mixes required to comply with property specification.
    - c. Preconstruction and field test reports of grout in conformance with ASTM C1019.
    - d. Certified test reports indicating compliance with requirements for the "anti-graffiti" coating. In addition, provide manufacturer's field reports for "anti-graffiti" coating.

2. Certificates:
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
      - 1) Submit concrete masonry unit(s) producer's certificates, from an independent testing laboratory, stating concrete masonry units comply with International Building Code fire resistance rating requirements for two (2) hour or better (as required) referencing full scale fire test reports in conformance with ASTM E119. □
      - 2) Submit producer's certification that the concrete masonry units oven dry density is less than 90 pcf and that the type aggregate utilized in the production of the concrete masonry units are 100% lightweight aggregate. □
    - b. Mill Certificates: Submit steel producer's certificates of mill analysis, tensile and bend tests for reinforcement steel.
  3. Procedures: Submit, for Engineer's information, hot and cold-weather construction procedures evidencing compliance with requirements specified in referenced unit masonry standard ACI 530.1/ASCE 6 "Specifications for Masonry Structures".
- F. Closeout Submittals: Submit the following:
1. Warranties: Special warranties as specified.
  2. Maintenance Data: Two (2) copies of an assembled and bound maintenance manual, describing the materials and procedures to be followed in cleaning and maintaining the "anti-graffiti" coating. Include manufacturer's brochures describing the actual materials used in the work.

## 1.5 QUALITY ASSURANCE

- A. Contractor's Testing Agency Qualifications: An independent testing agency, acceptable to the Engineer, and qualified according to ASTM C1093 to conduct the testing indicated, as documented according to ASTM E548.
- B. Single Source Responsibility:
  1. Single Source Responsibility for CMU: Obtain exposed masonry units from one source of a single manufacturer. Obtain accessory products used in conjunction with masonry units from the Masonry Units manufacturer or from sources acceptable to the

- manufacturer. The manufacturer providing material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
2. Single Source Responsibility Anti-Graffiti Coating: Obtain anti-graffiti coating from one source of a single manufacturer for the entire project. Obtain accessory products used in conjunction with anti-graffiti coating from the anti-graffiti coating manufacturer or from sources acceptable to the manufacturer. The anti-graffiti coating manufacturer must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
1. Concrete masonry units fire resistance ratings shall be determined using either prescriptive details and tables found in IBC Section 720 or calculations found in IBC Section 721. The technical content of these provisions corresponds to the provisions of "Code Requirements for Determining Fire Resistance of Concrete and Masonry Construction Assemblies, ACI 216.1/TMS 216".
  2. Requirements for fire-rated or lateral support conditions are not necessarily fully defined on the Drawings or specified; comply with applicable regulations.
- D. Qualified Applicator: The entity performing the anti-graffiti coating application work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- E. Mock-Up(s):
1. Sample Wall:
    - a. Build sample wall(s) as detailed on contract documents. The Work of this Project shall be constructed on approval of workmanship, joint sizes, construction and control joints, vertical alignment, parapet conditions, window and door head and sills, flashing installation, window/door installation and CMU and mortar colors of the sample wall.
      - 1) An initial 4 ft. x 4 ft. x full depth CMU veneer wall showing CMU (face and backup) and mortar specified shall be constructed before authorization to complete the sample wall.

- b. Clean mock-ups with materials and techniques intended for use on the Project.
  - c. Apply "anti-graffiti" coating to mockup entire exterior face. Demonstrate "anti-graffiti" qualities by utilizing 5 standard graffiti marking mediums and removing graffiti.
  - d. Obtain acceptance of visual qualities of each sample panel before proceeding with the final work.
- F. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review methods and sequence of masonry construction, special masonry details and conditions, standard of work, testing and quality control requirements, job organization and other pertinent topics related to the Work.

## 1.6 DELIVERY, STORAGE AND HANDLING

- A. Packing, Shipping, Handling, and Unloading: Deliver masonry materials, other than bulk materials to Project site in manufacturer's unopened containers, bundles, pallets or other standard packaging devices; fully identified with name, type, grade, color and size.
- B. Storage and Protection: Store on platforms off the ground, in a dry location and protect from weather, soiling and damage. Store aggregates where grading and other required characteristics can be maintained and contamination avoided. Store masonry accessories including metal items to prevent corrosion and accumulation of dirt and oil.
- C. Metal Materials: Do not use metal reinforcing, ties, or other components which are coated with loose rust or other deleterious matter that will reduce or destroy bond with mortar and grout.

## 1.7 PROJECT/SITE CONDITIONS

- A. CMU Installation Requirements
  - 1. Cold Weather Conditions: Do not erect masonry when the temperature is below 40 deg. F. unless provisions for heating and drying the materials and protecting the completed work comply with the requirements specified in Paragraph 2.3.2.2 of ACI 530.1/ASCE 6 "Specifications for Masonry Structures". Do not build upon frozen work. Do not lay masonry units having a film of water or frost on their surfaces.
  - 2. Hot Weather Conditions: Do not erect masonry when the temperature is above 100 deg. F. or 90 deg. F with a wind velocity greater than 8 mph to comply with the requirements specified Paragraph 2.3.2.3 of ACI 530.1/ASCE 6 "Specifications for Masonry Structures".
- B. "Anti-Graffiti" Coating Application Conditions: Maintain ambient temperature above 40 degrees F during and 24 hours after installation. Do not proceed with application on materials if ice or frost is covering the substrate. Do not proceed with application if ambient temperature of surface exceeds 100 degree F. Do not proceed with the application of

materials in rainy conditions or if heavy rain is anticipated within 4 hours after application.

## **PART 2 – PRODUCTS**

### **2.1 MANUFACTURER**

- A. Standard Concrete Unit ( **CMU-01** ) Masonry Manufacturers:
  - 1. Oldcastle/Echelon Masonry shall be the basis of design but is not intended to imply a preference for a specific product.
  - 2. Other manufacturers making equivalent products to be considered may include the following:
    - a. Westbrook Concrete Block.
    - b. A. Jandris & Sons.
    - c. York Building Products.
    - d. Nitterhouse Masonry Products.
    - e. Or approved equal.
- B. Ceramic Glazed Masonry Units ( **BRK-01** ) and Ceramic Glazed Thin Brick Units ( **BRK-02** ) Manufacturers:
  - 1. Elgin Butler Company. No substitutions allowed.

### **2.2 UNIT MASONRY MATERIALS**

- A. Standard Concrete Masonry Units ( **CMU-01** ): ASTM C90, Type I Moisture Controlled Units, modified as follows:
  - 1. Aggregates: Lightweight, 100% expanded shale, clay or slate produced by the rotary kiln method complying with ASTM C331, and graded from No. 4 to 0 to assure constant texture. The blending of screenings or any other deleterious substances which will impair the fire ratings or insulation value of the unit is prohibited.
  - 2. Density: The oven dry density of the concrete masonry unit shall not exceed 90 lbs. per cu. ft.
  - 3. Compressive Strength: Based on net area as follows:
    - a. Minimum compressive strength of one unit: 1700 psi.
    - b. Minimum average compressive strength of three units: 1900 psi.
  - 4. Face Size: Nominal 8 in. x 16 in., unless otherwise shown. Width or thickness as indicated.
    - a. Provide custom fabricated shapes and units as required per project conditions or as indicated on drawings.
  - 5. Curing: Low pressure steam cure at a pressure not to exceed 12 psi. Raise the curing temperature uniformly at not more than 1 deg.

- F. per minute from 80 deg. F. to a finish temperature of 180 deg. F. and allow the masonry units to reach equilibrium, approximately 3-1/2 hours from initial set period. Allow an interval (preset time) ranging from 2 to 5 hours between the forming of the units and the curing process.
6. Linear Shrinkage: Not over 0.065% at delivery when tested in accordance with ASTM C426.
  7. Moisture Content: Not over 30%.
  8. Provide special shapes where indicated and as follows:
    - a. For lintels, corners, jambs, sash, control joints, headers, bonding and other special conditions.
    - b. Provide square edged units for outside corners except as otherwise shown or specified.
  9. Exposed Units: Provide units for exposed construction with fine textured surface, sharp straight arises, and without chips, cracks or other defects on exposed edges or surfaces which would impair appearance. Provide custom fabricated shapes and units as required per the design.
  10. Integral Water-Repellant: Unless otherwise specified, provide manufactured concrete masonry units with integral water repellent for CMU in exterior wall (both face and backup) and other exterior units where exposed.
- B. Ceramic Glazed Masonry Units ( **BRK-01** ): ASTM C-1405, Grade S, Class Exterior, and as follows:
1. Product: Glazed Brick – “Norman 6SSU”. No substitutions allowed.
  2. Color/Gloss: Match approved control samples. Assume nine (9) standard colors and four (4) “Special Order” colors, thirteen (13) total colors.
  3. Pattern: Custom pattern as indicated on drawings.
  4. Fire rating: ASTM C-84 (UL723) requirements and rated zero flame spread, zero smoke developed and zero fuel contribution. Also will not release any toxic or noxious fumes when burned at 2000°F (1093°C).
  5. Nominal Face: 2 ¼ in. height x 11 5/8 in. length, and as indicated on drawings. All dimensions are +/- allowable tolerance.
  6. Nominal Bed Depths: 4 in. thickness bed depth and as indicated on drawings.
  7. Shapes: Furnished as shown on the plans in accordance with manufacturers current standard production. All external corners, sills and jambs shall be square, unless otherwise noted. Lintels and internal corners shall be square, unless otherwise noted. The base course is straight and as shown on the drawings.

8. Provide special shapes where indicated and as follows:
    - a. For lintels, corners, jambs, sash, control joints, headers, bonding and other special conditions.
    - b. Provide square edged units for outside corners except as otherwise shown or specified.
  9. Exposed Units: Provide units for exposed construction with fine textured surface, sharp straight arises, and without chips, cracks or other defects on exposed edges or surfaces which would impair appearance. Provide custom fabricated shapes and units as required per the design.
- C. Ceramic Glazed Thin Brick Units ( **BRK-02** ): ASTM C 1088-13, Type TBS, Grade Exterior, and as follows:
1. Product: Glazed Thin Brick – “EB Thin Brick”. No substitutions allowed.
  2. Color/Gloss: Match approved control sample. Assume nine (9) standard colors and four (4) “Special Order” colors, thirteen (13) total colors.
  3. Pattern: Custom pattern as indicated on drawings.
  4. Ceramic glaze Properties of Finish: ASTM C1405-12, Grade S (Select), Type I, Class Exterior
  5. Fire rating: ASTM C-84 (UL723) requirements and rated zero flame spread, zero smoke developed and zero fuel contribution. Also will not release any toxic or noxious fumes when burned at 2000°F (1093°C).
  6. Nominal Face: 2 ¼ in. height x 11 5/8 in. length, and as indicated on drawings. All dimensions are +/- allowable tolerance.
  7. Nominal Bed Depths: 3/4” thickness bed depth and as indicated on drawings.
  8. Shapes: Furnished as shown on the plans in accordance with manufacturers current standard production. All external corners, sills and jambs shall be square, unless otherwise noted. Lintels and internal corners shall be square, unless otherwise noted. The base course is straight and as shown on the drawings.
  9. Provide special shapes where indicated and as follows:
    - a. For lintels, corners, jambs, sash, control joints, headers, bonding and other special conditions.
    - b. Provide square edged units for outside corners except as otherwise shown or specified.
  10. Exposed Units: Provide units for exposed construction with fine textured surface, sharp straight arises, and without chips, cracks or other defects on exposed edges or surfaces which would impair appearance. Provide custom fabricated shapes and units as required per the design.

### 2.3 MORTAR AND GROUT MATERIALS

- A. Portland Cement: ASTM C150, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce the specified mortar color.
- B. Hydrated Lime: ASTM C207, Type S.
- C. Aggregate for Mortar: ASTM C144, except for joints less than 1/4 in. use aggregate graded with 100% passing the No. 16 sieve. In areas requiring white mortar use natural white sand or ground white stone.
- D. Aggregate for Grout: ASTM C404.
- E. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides of high purity, nonfading and limeproof, compounded for use in mortar mixes; color as specified. Use only pigments with record of satisfactory performance in masonry mortars.
- F. Water: Clear and free of harmful amounts of acid, alkalies, salts, organic materials or other deleterious material which would impair the Work.
- G. Water Repellent Mortar Admixtures: Liquid water-repellent mortar admixture intended for use with concrete masonry units, containing integral water repellent by same manufacturer. Provide one of the following:
  - 1. "Mortar Tite" (Addiment Incorporated).
  - 2. "Dry-Block Mortar Admixture" (Grace Construction Products).
  - 3. "Rheomix Rheopel" (Master Builders, Inc.).
  - 4. Or approved equal.

### 2.4 MASONRY ANCHORS, REINFORCEMENT AND INSERTS

- A. Acceptable manufacturers include Dur-O-Wall Inc., Heckman Building Products, Inc., Hohmann & Barnard, Inc or approved equal.
- B. Anchors and Ties: ASTM A951; Stainless steel, complying with the following requirements:
  - 1. Anchor Bolts: 1/2 in. dia., complying with ASTM F593 for bolts and ASTM F594 for nuts; 12 in. long with a 2 in. turned leg, unless otherwise shown. Provide bolts with stainless steel hex nuts and flat washers.
  - 2. Column and Beam Anchors: As required for masonry support. Provide stainless steel units of profiles and sizes as required for locations shown.
  - 3. Wire Ties: 10 gage, looped at both ends.
  - 4. Wire Mesh Ties: 16 gage, 1/2 in. mesh, 3 in. wide, length as required.
  - 5. Hardware Cloth: 16 gage, 1/2 in. mesh, size as required.
  - 6. Anchor Straps: 1-1/4 in. x 1/8 in. by length required, with ends turned up 2 in.

- C. Horizontal Joint Reinforcement and Wall Tie Assembly: Truss type two piece adjustable eye, fabricated from 3/16 inch diameter stainless steel wire; deformed side rods; smooth cross rods; out to out spacing of side rods not less than 2 in. less than nominal wall dimension. Provide manufacturer's standard or custom fabrications to comply with the specified requirements.
1. Cavity Walls for Seismic Applications: Truss type horizontal joint reinforcement specifically manufactured and tested for seismic applications; fabricated from 3/16 diameter stainless steel wire; sized for the inner wythe masonry construction with loose, adjustable anchors sized for the outer wythe masonry construction and designed for seismic applications. Provide prefabricated tee and corner units.
    - a. "D/A 3700 S Seismic Dur-O Eye" (Dur-O-Wall).
    - b. "Lox-All Adjustable Truss Type #170 with Seismicclip Interlock System" (Hohmann & Barnard, Inc.).
    - c. Series 900 Cavity Hook and Eye with Wire-Bond Clip (WIRE-BOND)
    - d. Or approved equal.
  2. Single Wythe Concrete Masonry Units Walls: One piece stainless steel truss type horizontal joint reinforcement with prefabricated corner and tee units. Sizes as required for walls shown.
    - a. "Dur-O-Wal D/A 3100 Truss" (Dur-O-Wal, Inc.).
    - b. "Single Wythe Wall with #120 Truss Mesh" (Hohmann & Barnard, Inc.).
    - c. "Two Wire System 300" (WIRE-BOND)
    - d. Or approved equal.
  3. Horizontal Wire Reinforcement: 3/16 inch diameter stainless steel wire. Utilize continuous horizontal wire in exterior CMU veneer above and below truss type horizontal joint reinforcement as specified above.
- D. Reinforcement:
1. Rod Reinforcement: 1/4 in. stainless steel pencil rods free from mill scale and loose other deleterious matter.
  2. Deformed Bar Reinforcement: Stainless steel, free from mill scale or other deleterious matter. Provide sizes and spacing as shown.
- E. Reinforcing Bar Positioners: Wire units designed to fit into mortar bed joints spanning masonry unit cells with loops for holding reinforcing bars in center of cells. Units are formed from 0.14 in. steel wire, hot-dip galvanized after fabrication. Provide units with either two loops or four loops as needed for number of bars indicated. Provide one of the following:
1. "D/A 810, D/A 812 or D/A 817" (Dur-O-Wal).

2. "No. 376 Rebar Positioner" (Heckmann Building Products Inc.).
3. "#RB or #RB-Twin Rebar Positioner" (Hohmann & Barnard, Inc.).
4. "O-Ring or Double O-Ring Rebar Positioner" (WIRE-BOND).
5. Or approved equal.

## 2.5 MASONRY ACCESSORY MATERIALS

- A. Expansion and Control Joint Fillers: Provide a system of joint fillers for unit masonry work of sizes and profiles shown. Provide fillers in joints to receive sealant sized to allow space for sealant and back-up materials.
- B. CMU Control Joints: ASTM D2000, Shore A Durometer 60-80. Preformed closed-cell synthetic rubber, size and shape intended for use with concrete masonry sash blocks, unless otherwise shown.
- C. Open Cell Cavity Filler: Polyurethane plastic, open cell sponge material, 10 pores per in.
- D. Metal Flashing Trim: Stainless steel, ASTM A167, Type 304, dead soft fully annealed except where harder temper required for forming or performance; 24 gauge unless otherwise shown, finish No. 2D. Provide factory preformed and crimped edge.
- E. Weather Barrier: Provide air-vapor barrier specified in Section 07 13 00 "Sheet Waterproofing".
- F. Insulation: Provide insulation specified in Section 07 21 00 "Building Insulation".
- G. Weep Holes: Clear PVC tubing; 3/8 in. dia, lengths as required; Provide one of the following:
  1. "AA223 Weep Holes" (AA Wire Products Co.).
  2. "D/A 1005 Weep Hole" (Dur-O-Wal Inc.).
  3. "Plastic Tube Weepholes" (Hohman & Barnard Inc.).
  4. Or approved equal.

## 2.6 ANTI-GRAFFITI COATING

- A. Concrete Masonry Anti-Graffiti Coating for application on exposed face: A non-sacrificial, water borne, breathable, non-yellowing, UV stable, VOC compliant, anti-graffiti coating. Provide NYSDOT item number 559.90010011.

## 2.7 MIXES

- A. General: The total chloride (CL) ion content in the entire mortar or grout mix shall not exceed 0.10% of the weight of cement.
- B. Mortar for Unit Masonry: ASTM C270, Portland Cement-Lime Mortar; Type N for interior work and exterior wall work except use Type S mortar for reinforced unit masonry. Do not use quicklime or masonry cement for mortar.

1. In mortar used for glazed concrete masonry units, sand shall pass a No. 16 sieve.
- C. Pigmented Colored Mortar: For pigmented mortars, use colored Portland cement- lime mix of formulation required to produce color specified. Pigments shall not exceed 10 % of Portland cement by weight for mineral oxides or 2 for carbon black. Provide mortar mixes to match approved sample.
- D. Grout: ASTM C476, Portland Cement Grout; provide individual mixes for fine aggregate grout and coarse aggregate grout as specified.
- E. Measurement and Mixing of Mortar Materials: Comply with ASTM C270 for measuring and mixing of mortar materials and for retempering of mixed mortar. Measure and mix mortar to provide the following properties:
1. Compressive Strength: Minimum 28-day strength as follows:
    - a. Type N: 750 psi.
    - b. Type S for Reinforced Masonry Only: 1800 psi.
  2. Water Retention: 75%, minimum.
  3. Air Content: 12%, maximum.
- F. Measurement and Mixing of Grout Materials: Comply with ASTM C476 for measuring and mixing of grout materials. Control batching procedure to ensure proper volume proportions of grout materials and to achieve a grout slump of 8 to 11 in., and a 28 day minimum compressive strength of 2500 psi in accordance with ASTM C1019.
- G. Measuring Devices: Use accurate measuring devices to mix materials by volume. The use of shovels for measurement is prohibited.
- H. Mixing of Pigmented Colored Mortars: Mix colored mortars separately to prevent contamination from other mortars.
- I. Mixture and Retempering Procedures: Mix only sufficient mortar as required at a given time. Retemper stiffened mortar as required, except discard mortar not utilized within 2 hrs. of initial mixing. Do not retemper colored mortar.

## **2.8 SOURCE QUALITY CONTROL**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. General: Provide and maintain an effective Quality Control program and perform sufficient inspections, surveys and tests of the Work, including those of other trades, to ensure compliance with the Contract Documents. Furnish appropriate facilities, accurately calibrated instruments and testing devices required to perform the quality control operations and with sufficient work forces to cover the construction operations within the actual construction sequences. Coordinate this work with the quality control requirements of other technical Sections of the Specifications and with requirements of the City of New York and governing authorities.

- C. Contractor's Testing: Perform testing in an independent certified testing laboratory. Furnish the laboratory sufficient quantities of specimens to comply with referenced testing standards. Test and furnish test reports for materials specified.
1. Concrete Masonry Unit Testing: After review and approval of samples, test each type, class and grade of concrete masonry unit specified in accordance with ASTM C140. Provide testing specimens from actual production batches. Perform the following tests:
    - a. Compressive strength.
    - b. Absorption.
    - c. Moisture content.
    - d. Weight.
    - e. Dimensions.
  2. Prism Test: Provide a prism test for each type of wall construction indicated. Prism test concrete masonry units to determine the actual  $f'_m$  of the concrete masonry units wall construction. Construct and test concrete masonry units prisms in accordance with ASTM C1314, and to comply with requirements of the NYC Building Department.. Test grouted and hollow concrete masonry units wall specimens. Test concrete masonry units thickness and mortar types intended for use on the Project. Test prisms a minimum of 16 in. in height.
  3. Aggregate Testing: Test aggregate as follows:
    - a. Mortar Aggregate: ASTM C144.
    - b. Grout Aggregate: ASTM C404.
  4. Mortar Testing: Test mortar samples in accordance with ASTM C780 for mortar composition and properties. Test each mortar type and color each week. Prior to commencement of Work, provide preconstruction tests to establish a basis for comparison.
  5. Grout Testing: Test and submit test reports of grout samples in accordance with ASTM C1019. Test grout during construction for each 5000 ft<sup>2</sup>. of wall area or portion thereof. Prior to commencement of Work, provide preconstruction tests to establish a basis for comparison.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and erect the work of this Section, including components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### 3.2 EXAMINATION

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected. Examine rough-in and built-in construction to verify actual locations of piping and other connections prior to installation.

### 3.3 INSTALLATION

- A. Surface Preparation: Clean surfaces scheduled for unit masonry, before installation to remove dirt, dust, debris, loose material and other foreign matter detrimental to proper bonding.
- B. Lay Out of Walls: Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate locating of openings, movement-type joints, returns, and offsets. Avoid the use of less-than-half-size units at corners, jambs, and where possible at other locations.
- C. Lay Out and Maintenance of Plumb: Lay masonry plumb, true to line with level and accurately spaced courses; corners plumb and true; each course breaking joint with the course below, except as may be otherwise indicated or specified. Maintain plumb bond. Comply with tolerances as specified in "References" and the following:
  - 1. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/4 in. in 20 ft., or 1/2 in. maximum.
  - 2. For vertical alignment of exposed head joints, do not vary from plumb by more than 1/4 in. in 10 ft., or 1/2 in., maximum.
  - 3. For conspicuous horizontal lines, such as exposed lintels, sills, parapets, and reveals, do not vary from level by more than 1/4 in., in 20 ft., or 1/2 in. maximum.
  - 4. For exposed bed joints, do not vary from thickness indicated by more than plus or minus 1/8 in., with a maximum thickness limited to 1/2 in. Do not vary from bed-joint thickness of adjacent courses by more than 1/8 in.
  - 5. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 in. Do not vary from adjacent bed-joint and head-joint thicknesses by more than 1/8 in.
- D. Anchor, tie, reinforce and bond masonry at corners and intersections in accordance with the applicable requirements of the NYC Building Department.
- E. Leave openings for equipment to be installed before completion of masonry. After installation of equipment, complete masonry to match construction immediately adjacent to the opening.
- F. Stopping and Resuming Work: In each course, rack back 2-unit length for one-half running bond or 1/3-unit length for one-third running bond;

do not tooth. Clean exposed surfaces of set masonry, wet clay masonry units lightly (if required), and remove loose masonry units and mortar prior to laying fresh masonry.

- G. Condition of Exposed Masonry: No cracked, chipped, broken, discolored, defaced or open celled units will be permitted on exposed masonry. All masonry walls shall be braced for lateral loads until the final connections to the building frame are completed.
- H. Cutting, patching and repairing in connection with masonry work as required to accommodate the work of other trades shall be performed under this Section.
- I. Use of Motor Driven Diamond Saw: Use motor driven diamond saw designed to cut masonry units with clean sharp corners. Cut units as required to provide pattern shown and to fit adjoining work neatly. Use full units without cutting wherever possible. Avoid the use of less than half-size units at corners, jambs and at other locations.
- J. Joints: Tool exposed joints slightly concave unless otherwise shown. Lay masonry unit with uniform joint widths. Tool joints to squeeze mortar back into joints. Tool after mortar has taken its initial set.
- K. Anchors and Ties: Provide anchors and ties where shown and where required to supplement other reinforcement specified and in accordance with the project requirements.
  - 1. Space anchors and ties a maximum of 16 in o.c. horizontally and vertically.
  - 2. Set anchors, with vertical legs, within the core of the masonry wythe and fill core solid with mortar or grout.
  - 3. Provide wire mesh ties, hardware cloth, or expanded lath below core space to retain mortar or grout at embedded anchors.
  - 4. Provide loose anchors at columns, beams and other structural elements as shown and as required to support imposed loads. Install anchors to structural elements to prevent rattle and lateral displacement in any direction.
- L. Flashing and Weep Holes: Install embedded flashing including weep holes if required, in masonry construction at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall as indicated and as specified in Section 07 62 00, "Sheet Metal Flashing and Trim". Ensure that laps in flashing are fully adhered.
  - 1. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing. Adhere flashing to interior face of cavity wall as shown and seal top edge with compatible sealant. Form to flashing lines shown on drawing to where it extends beyond building face. Slice off exposed flashing and seal with sealant.

2. At lintels and shelf angles, extend flashing a minimum of 4 in. into masonry at each end. At heads and sills, extend flashing 4 in. at ends and turn flashing up not less than 2 in. to form a pan. Protect flashing from damage during construction.
  3. Install weep holes in the head joints in exterior wythes of the first and second course (staggered) of masonry immediately above the flashing line.
- M. Installation of Loose Lintels, Relieving Angles and Other Miscellaneous Support Stainless Steel: Install loose lintels, relieving angles and other miscellaneous support stainless steel where shown. Adjust as required to provide square, level, plumb and true openings for attachment and alignment of other work. Grout lintels fully. Provide minimum lintel bearing at each jamb of 4 in. for openings which do not exceed 6 ft. and 8 in. for openings in excess of 6 ft.
1. Fill cores in hollow concrete masonry units with grout 3 courses (24 in.) under bearing plates, beams, lintels, posts, and similar items, unless otherwise shown.
  2. At underside of relieving angles and other miscellaneous support stainless steel where shown or required, provide compressible filler.
- N. Built-In Work: Build in frames, struts, hangers, miscellaneous metal and other items of work furnished under other Sections. Prepare for, build in and protect flashings, reglets, anchors and other similar items occurring in connection with work of this Section. Set and grout loose lintels. Build in anchors, furnishing such as may be required exclusively by reason of work under this Section.
1. Access Doors, Frames and Access Panels: Install access doors, frames and access panels occurring in masonry construction where shown and required for access to mechanical and electrical installations and equipment.
  2. Chases, Slots, Reglets or Openings: Chases, slots, reglets or openings necessary for the proper installation of work of other trades shall be formed as required. Keep chases and reglets free from mortar or other debris.
- O. Pointing: At completion of any portion of work, point holes in joints of exposed masonry surfaces by completely filling with mortar. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance. Prepare joints for sealant application. After pointing has hardened clean the masonry surfaces. Clean masonry in small sections prior to the installation of contiguous work by other trades.

### **3.4 LAYING CONCRETE MASONRY UNITS**

- A. Procedures for Erection of Concrete Masonry Units: Erect concrete masonry units (CMU) where shown. Solidly bed each course in mortar. Butter vertical joints their entire length. Lay concrete unit masonry with units in running bond with vertical joint in each course centered on units in courses above and below. Bond each course at corners and intersections

and bond into or anchor to adjacent construction with metal anchors spaced not over 16 in. o.c. in both directions. Do not use units with less than nominal 4 in. horizontal face dimensions at corners or jambs.

- B. Procedures for Setting Units: Set units with care around frames so as not to bulge the sides or change the position of the frames. Break joints in units set around the tops of door frames so as to minimize the danger of loosening the units due to door jarring. Set units tightly against metal frames and fill voids completely. Build frame anchors into joints. Cut units accurately to fit around pipes, ducts, openings, etc. and fill voids full. Fill jambs and head of hollow metal frames solid with mortar.
- C. Appearance of Work: Line up courses of exposed work throughout to obtain a uniform appearance. Install units at locations where conduits, pipes, etc. are to be enclosed in a manner to produce the regular jointing pattern of the adjacent surfaces. Provide necessary reinforcement for bonding where block units are used. Holes made in exposed units for attachment of handrail brackets and similar items shall be neatly drilled. Provide necessary special jamb, corner, angled corner, irregular and regular angle units where required to obtain smooth, evenly jointed and regular patterns throughout exposed surfaces.
- D. Joint Reinforcement: Place joint reinforcement in horizontal mortar joints on 16 in. centers unless otherwise shown. Make reinforcement continuous except at control joints and expansion joints. Lap reinforcement 6 in. at ends and use prefabricated "T" and "L" sections at corners and intersections to provide continuity. Place reinforcement to obtain min. 5/8 in. mortar cover at side rods. Provide reinforcement in first and second bed joints above lintels and below sills extending 2 ft. beyond jamb openings.
- E. Control Joints: Construct continuous control joints to provide an unbroken vertical separation through the entire thickness of walls, in the manner shown by the details, complying with referenced standards and at locations shown. Locations of control joints not shown shall be approved by the Design Consultant prior to the start of construction. Where locations are not shown, construct control joints throughout the unbroken length of walls as follows:
  - 1. Not to exceed twenty (20) ft. on center in same plane as wall unless otherwise shown.
  - 2. Where joints occur in construction supporting masonry wall.
  - 3. Where masonry abuts dissimilar construction or structural element such as a column.
  - 4. At one jamb for major openings less than 6 ft. in width and at both jambs for wider openings. (Control joints can be omitted if adequate tensile reinforcement, as approved, is placed above and below wall openings.)
  - 5. Where a change occurs in masonry wall height or thickness, and at chases and recesses in the masonry wall.
- F. Concrete Bond Beams and Lintels: Provide concrete bond beams and masonry lintels consisting of specially formed units, with reinforcing bars and Type M mortar fill, wherever shown and wherever openings in

concrete masonry of more than 1 ft. are shown without structural steel or other supporting lintels. Unless otherwise shown provide one bar for each 4 in. thickness of wall, and use bars of a size number not less than the number of feet of opening width. Provide minimum lintel bearing at each jamb of 4 in. for openings which do not exceed 6 ft. and 8 in. for openings in excess of 6 ft. Precast lintels or form lintels in place with adequate temporary support. Cure precast lintels thoroughly before handling and installing.

- G. Miscellaneous Masonry Items: Install structural steel lintels and supports for unit masonry as indicated and as specified in Section 05 50 00, "Metal Fabrications". Build sleeves, frames, or other miscellaneous metal items into masonry, and fill solidly around each built-in item as Work progresses

### 3.5 REINFORCED UNIT MASONRY

- A. Reinforcement Placement:
1. Clean reinforcement of loose rust, mill scale, or other deleterious materials. Do not use reinforcement with kinks or reduced cross-section due to excessive rusting or other causes. Do not use reinforcement with bends other than shown on final shop drawings.
  2. Position reinforcement accurately at spacing shown. Support and secure bars against displacement.
    - a. Provide laps of dimension shown; if not shown, as required by the NYC Building Department.
  3. Anchoring: Anchor masonry work to supporting structure as indicated. At intersection of reinforced masonry walls with non-reinforced masonry, provide anchorage as shown.
- B. Temporary Shoring: Provide temporary shoring as required to support masonry elements; to conform to masonry shapes, lines and dimensions shown.
- C. Installation of Reinforced Concrete Unit Masonry: Lay CMU units with full-face shell mortar beds. Use Type S mortar for reinforced unit masonry. Fill vertical head joints (end joints between units) solidly with mortar from face of unit to a distance behind face equal to not less than the thickness of longitudinal face shells. Solidly bed cross-webs of starting courses in mortar. Maintain head and bed joint widths shown, or if not shown, provide 3/8 in. joints.
- D. Walls:
1. Pattern Bond: Lay CMU wall units in half running bond with vertical joints in each course centered on units in courses above and below, unless otherwise indicated. Bond and interlock each course at corners and intersections. Use special-shaped units where shown, and as required for corners, jambs, sash, control joints, lintels, bond beams and other special conditions.
    - a. Maintain vertical continuity of core or cell cavities, which are to be reinforced and grouted, to provide minimum

clear dimensions indicated and to provide minimum clearance and grout coverage for vertical reinforcement bars. Keep cavities free of mortar. Solidly bed webs in mortar where adjacent to reinforced cores or cells.

2. Where horizontal reinforced beams (bond beams) are shown, use special units or modify regular units to allow for placement of continuous horizontal reinforcement bars. Place small mesh expanded metal lath or wire screening in mortar joints under bond beam courses over cores or cells of non-reinforced vertical cells, or provide units with solid bottoms.
3. Grouting: Install grout in accordance with ACI 530.1/ASCE 6.
  - a. Use "Fine Grout" for filling spaces less than 3 in. in both horizontal directions.
  - b. Use "Course Grout" for filling 3 in. spaces or larger in both horizontal directions.
4. Low-Lift Grouting:
  - a. Provide minimum clear dimension of 2 in. and clear area of 8 in.<sup>2</sup> in vertical cores to be grouted.
  - b. Place vertical reinforcement prior to laying of CMU. Extend above elevation of maximum pour height as required to allow for splicing. Support in position utilizing metal supports, centering clips, spacers, ties or caging devices located near the ends of each bar and at intermediate vertical intervals not exceeding 192 bar diameters nor 10 ft.
  - c. Lay CMU to maximum pour height. Do not exceed 4 ft. height, or if bond beam occurs below 4 ft. height stop pour at course below bond beam.
  - d. Pour grout using container with spout or by chute. Rod or vibrate grout during lacing. Place grout continuously; do not interrupt pouring of grout for more than one hour. Terminate grout pours 1- 1/2 in. below top course of pour except at the finish course. Puddle or agitate grout thoroughly to eliminate voids. Remove masonry displaced by grouting operation and re-lay in alignment with fresh mortar.
  - e. Bond Beams: Stop grout in vertical cells 1-1/2 in. below bond beam course. Place horizontal reinforcement in bond beams; lap at corners and intersections as shown. Place grout in bond beam course before filling vertical cores above bond beam.

### 3.6 CAVITY WALL CONSTRUCTION

- A. General: Construct cavity walls as shown; consisting of an outer wythe of face unit, an air space, cavity insulation, weepholes, fillers, flashings, vapor barrier and an inner wythe of CMU. The outer and inner masonry wythes shall be tied together with horizontal joint reinforcement.

- B. Cavity Space: Care shall be taken to keep the cavity space free from mortar droppings and other deleterious materials. Use wood strips temporarily placed in cavity to collect mortar droppings. As work progresses, remove strips, clean off mortar droppings, and replace in cavity.
- C. Flashing and Weephole Ventilators: At bottom terminations of cavity, install flashing continuously with weepholes. Provide weephole ventilators at bottom of cavity (see requirements under "Flashing and Weep Holes" above), not more than 2 ft. o.c. in the vertical unit joint resting on the horizontal leg of the relieving angle above the flashing.
- D. Open Cell Filler Materials, and End Dams: At the bottom terminations of the cavity and at other flashing locations, install continuous open-cell filler material above flashing for the full width of the cavity and 8 in. vertically within the cavity. Coordinate with the related flashing work specified elsewhere. Provide end dams at flashing terminations, extending the full height of the flashing as described in "Flashing and Weep Holes" above.
- E. Horizontal Joint Reinforcement: Provide continuous horizontal joint reinforcement at a maximum interval of 16 in. o.c. vertically, unless otherwise shown. Lap reinforcement not less than 6 in. at ends. Place reinforcement to obtain min. 5/8 in. mortar cover at side rods. Install reinforcement to engage between joints in the cavity insulation and mechanically lock the insulation in place to prevent displacement.
- F. Additional Reinforcement: In locations where two-piece truss-type joint reinforcement is shown or required, provide an additional continuous horizontal wire or truss-type reinforcement within the face unit wythe at a maximum of 16 in. o.c. vertically. Locate wire reinforcement consistently one joint coursing above or below the adjustable pintle reinforcement and a minimum of 1 in. inward from the exterior face of the mortar joint.
- G. Use of Compatible Mastic Adhesive to Secure Insulation: Secure insulation to the substrate utilizing following the manufacturer's printed instructions; butter insulation edges, cutouts and seams to insure continuous sealed joints.
  - 1. Apply mastic barrier/adhesive in continuous film to surfaces to receive cavity insulation. Comply with mastic manufacturer's requirements for preparation of substrates and application. Apply mastic uniform in an unbroken film of uniform thickness.
  - 2. Apply mastic with special attention and care to provide a complete seal at masonry anchors and other cavity projections.
- H. Insulation in Mastic Barrier: Embed insulation in mastic barrier while mastic adhesive is still open.
- I. Coordination of Installation Sequence: Coordinate installation sequence with flashing and other materials in cavity construction.

### **3.7 ANTI-GRAFFITI COATING APPLICATION**

- A. Manufacturer's Technical Representative: At the start of the installation and periodically as work progresses provide the services of the anti-graffiti manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.
- B. Surface Preparation: CMU surfaces to receive sealer shall be cleaned of dirt, oil, graffiti, grease, laitance, and other contaminants. All other surfaces shall be cleaned by mid-pressure water (1500 psi). Pressure wash all surfaces scheduled to receive anti-graffiti coating unless manufacturer recommends other acceptable method of cleaning. Remove dirt, dust and materials that will interfere with the proper and effective application of the anti-graffiti coating. Check the compatibility of all sealants and other material contiguous to or scheduled to be used with the anti-graffiti coating. Protect glass, metal, plastic and other non-porous substrates from overspray
- C. Application
  - 1. Anti-graffiti coating shall be applied as per manufacturer's written application instructions and recommendations. Apply as a minimum 2 full coats (depending on porosity of CMU) allowing first coat to dry as per manufacturer's requirements.
  - 2. Apply at temperature and weather conditions recommended by the manufacture or written in this specification. Surface residue shall be brushed out thoroughly until they completely penetrate into the surface. Protect treated areas from rain and other surface water for a period of not less than four hours after application.

### **3.8 CITY OF NEW YORK'S MONITORING ACTIVITIES**

- A. City of New York's Testing and Inspection Program: Testing and inspection will be performed, at any time during the progress of the Work, by an independent testing agency retained by the City of New York. Furnish materials and access to the Work as required by the City of New York's Testing Agency.

### **3.9 ADJUSTING**

- A. Remove and replace defective materials; correct defective workmanship; leave masonry clean.

### **3.10 POINTING AND CLEANING**

- A. Removal of Excess Materials and Mortar Droppings: Execute work in as clean a manner as possible, removing excess materials and mortar droppings daily. Remove mortar droppings on connecting or adjoining work before it has attained final set.
- B. Cleaning of Concrete Masonry: Concrete masonry units which are to remain exposed in the finished work shall be cleaned down daily at the end of each day's Work by the use of wire brushes or other method which will produce a satisfactory surface and in accordance with NCMA "TEK Note 45, Removal of stains from Concrete Masonry Walls".

### 3.11 ANTI-GRAFFITI COATING APPLICATION

- A. Manufacturer's Technical Representative: At the start of the installation and periodically as work progresses provide the services of the anti-graffiti manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.
- B. Surface Preparation: CMU surfaces to receive sealer shall be cleaned of dirt, oil, graffiti, grease, laitance, and other contaminants. All other surfaces shall be cleaned by mid-pressure water (1500 psi). Pressure wash all surfaces scheduled to receive anti-graffiti coating unless manufacturer recommends other acceptable method of cleaning. Remove dirt, dust and materials that will interfere with the proper and effective application of the anti-graffiti coating. Check the compatibility of all sealants and other material contiguous to or scheduled to be used with the anti-graffiti coating. Protect glass, metal, plastic and other non-porous substrates from overspray
- C. Application
  - 1. Anti-graffiti coating shall be applied as per manufacturer's written application instructions and recommendations. Apply as a minimum 2 full coats (depending on porosity of CMU) allowing first coat to dry as per manufacturer's requirements.
  - 2. Apply at temperature and weather conditions recommended by the manufacture or written in this specification. Surface residue shall be brushed out thoroughly until they completely penetrate into the surface. Protect treated areas from rain and other surface water for a period of not less than four hours after application.

### 3.12 PROTECTION

- A. General: Protect masonry from rain and snow until the work is complete and the mortar has set.
- B. Waterproof Covering: Protect on-going and completed portions of work with strong waterproof membrane well secured in place, or other suitable protective methods. Where one wythe of multi-wythe masonry walls is completed in advance of other wythes, secure waterproof cover a minimum of 24 inches down face next to unconstructed wythe and hold cover in place.
- C. Loads: Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least 3 days after building masonry walls or columns
- D. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Remove immediately any grout, mortar, and soil that come in contact with such masonry. Protect base of walls from rain-splashed mud and mortar splatter by means of coverings spread on ground and over wall surface. Protect sills, ledges, and projections from mortar droppings. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes from mortar droppings.

**END OF SECTION**

## SECTION 05 50 00 – METAL FABRICATIONS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide metal fabrications in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Bollards, footings, curb nosings, edge angles, nosings, frames, and other such items are furnished under this Section and installed under "Cast-in- Place Concrete" work.
  - 2. Loose lintels, relieving angles, anchor bolts and miscellaneous supports for masonry walls are furnished under this Section and installed under Section 04 20 00 "Unit Masonry".
  - 3. Steel Tube Supports for Sinks and Countertops furnished under this Section and installed under Section 05 80 00 "Architectural Formed Metals" and Plumbing requirements.
  - 4. Waterproofing and flashing is specified in Sections 07 55 56 "Fluid-Applied Membrane Roofing" and 07 55 66 "Vegetated Fluid-Applied Protected Membrane Roofing".
  - 5. Structural Steel Door Frames as required for door support are furnished under this Section and installed under Section 08 33 00 "Hollow Metal Doors and Frames".
  - 6. Steel Frames for Coiling Doors as required for coiling door support are furnished under this Section and installed under Section 08 33 23 "Overhead Coiling Doors".
  - 7. Finish painting is specified in Section 09 90 00 "Painting".

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Society for Testing and Materials (ASTM)
    - a. ASTM E894 "Standard Test Method for Anchorage of Permanent Metal Railing Systems and Rails for Buildings "
    - b. ASTM E935 "Standard Test Methods for Performance of Permanent Metal Railing Systems and Rails for Buildings".

- c. ASTM E985 "Standard Specification for Permanent Metal Railing Systems and Rails for Buildings".
  - d. ASTM E1481 "Standard Terminology of Railing Systems and Rails for Buildings".
2. American Welding Society
    - a. AWS D1.1 "Structural Welding Code".
    - b. AWS D1.3 "Structural Welding Code -Sheet Steel".
    - c. AWS D1.2 "Structural Welding Code - Aluminum".
    - d. AWS D1.6 "Structural Welding – Stainless Steel".
  3. National Association of Architectural Metal Manufacturers
    - a. ANSI/NAAMM MBG 532 "Heavy Duty Metal Bar Grating Manual."
    - b. NAAMM "Pipe Railing Manual".
    - c. NAAMM "Metal Stairs Manual".
  4. The Society for Protective Coatings (SSPC): "Steel Structures Painting Manual, Volume 2, Systems and Specifications".
  5. Industrial Fasteners Institute (IFC)
    - a. "Fastener Standards Book".

### 1.3 SYSTEM DESCRIPTION

- A. Performance Requirements
  1. Structural Performance: Provide metal fabrications capable of withstanding design loads of the Work within limits and under conditions indicated and as follows:
    - a. Structural requirements shall be as indicated on project structural contract document requirements and as required by the NYC Building Department.
    - b. Wind Loading: Design, fabricate and install metal fabrications so that the installed metal fabrications will withstand project, ASCE-7, and New York City Building Code required inward and outward pressure.
  2. Temperature Change Provisions: Design, fabricate and install exterior components to provide for expansion and contraction over an ambient temperature range of 120 deg. F. and a surface temperature range of 180 deg. F. without buckling, undue stress on members or anchors, and other detrimental effects. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.
  3. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and

coordinate the work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted to the Engineer for review. Maintain the general design concept without altering profiles and alignments shown.

4. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and coordinate the work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted to the Engineer for review. Maintain the general design concept without altering profiles and alignments shown.

#### **1.4 SUBMITTALS**

- A. Product Data: Submit for Engineer's approval. Furnish manufacturer's literature describing the general properties of each product to be used in the Work. Include, manufacturer's technical data documenting the primary function, quality and performance of each system and containing specification for each material, load tables, dimension diagrams and installation instructions, or other such information as required by the drawings and specifications.
- B. Shop Drawings: Submit for Engineer's action Provide shop drawings detailing fabrication, installation and erection of each metal fabrication item, including dimensioned plans and elevations, drawn at a minimum scale of 1 in. = 1 ft. and details of sections, connections, anchorage and accessory items, drawn at a minimum scale of 3 in. = 1 ft.. Provide templates for anchors and bolts specified for installation under other Sections.
  1. Setting Drawings: Provide setting drawings and templates for the location of metal fabrications items that are to be embedded in or anchored to concrete or masonry.
- C. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide the following:
  1. Ballard: Two (2) 24 inch long sections with cap, fully finished.
- D. Quality Control Submittals: Submit the following for Engineer's information:
  1. Reports: copies of welder pre-qualification and other welding procedures in form prescribed in AWS "Structural Welding Code".

#### **1.5 QUALITY ASSURANCE**

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.

- B. Single Source Responsibility: Obtain each type metal fabrication from one source of a single manufacturer and with sufficient production capacity to produce required units without causing delay to the Work. Obtain accessory products used in conjunction with metal fabrications from the metal fabrications manufacturer or from sources acceptable to the metal fabrications manufacturer. The manufacturer must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Pre-Installation Meetings: Prior to the start of the Work, meet at the Project site to review methods and sequence of metal fabrication installation, special details and conditions, standard of workmanship, testing and quality control requirements, job organization and other pertinent topics related to the Work.

## **1.6 DELIVERY, STORAGE, AND HANDLING**

- A. Storage and Handling: Store metal fabrications items under cover and off the ground. Handle in a manner so as to protect surfaces and to prevent distortion of, and any other type of damage to, fabricated pieces.

## **PART 2 - PRODUCTS**

### **2.1 METAL MATERIALS**

- A. Metal Surfaces, General: For metal fabrications work which will be exposed to view in the finished work, use only materials which are smooth and free of surface blemishes including pitting, seam marks, roller marks, rolled trade names and roughness. Remove blemishes by grinding, or by welding and grinding, prior to cleaning, treating, and applying surface finishes.
- B. Steel
  1. Structural Steel Shapes, Plates and Bars: ASTM A36.
  2. Rolled Steel Floor Plates: ASTM A786 rolled from plate complying with ASTM A36 or ASTM A283, Grade C or D. Thickness shown for raised pattern safety plates is exclusive of projected pattern.
  3. Steel Tubing: ASTM A500; Cold-formed, welded or seamless process. For exterior use and other locations noted, provide hot-dip galvanized (minimum spangle) tubing in accordance with ASTM A153.
  4. Steel Pipe: ASTM A53, Type S, Grade B, suitable for close coiling, black finish unless galvanizing is required; standard weight (Schedule 40), unless otherwise indicated or required to satisfy performance criteria.
  5. Steel Bars and Bar Size Shapes: ASTM A675, Grade 65, or ASTM A36.
  6. Cold Finished Steel Bars: ASTM A108, grade as selected by

fabricator.

7. Cold Rolled Carbon Steel Sheets: Commercial quality, or structural quality, complying with ASTM A1008 , Grade A, unless another grade is required by design loads, stretcher leveled if exposed, free from scale, pitting or other defects.
  8. Galvanized Carbon Steel Sheets: ASTM A653, hot-dip galvanized with G90 coating (minimum spangle), either commercial quality or structural quality, Grade 33, unless another grade is required for design loads.
  9. Uncoated, Hot-Rolled Steel Sheet: Commercial quality, or structural quality, complying with ASTM A1011, Grade 30, unless another grade is required by design loads.
- C. Aluminum: Provide alloy and temper recommended by aluminum producer or finisher for type of use and finish specified or shown, and with not less than the strength and durability properties of the alloy and temper designated below for each aluminum form required.
1. Extruded Bar and Shapes: ASTM B221, 6063-T6.
  2. Extruded Pipe and Tube: ASTM B429, 6063-T6.
  3. Plate and Sheet: ASTM B209, 6061-T6.
  4. Aluminum-Alloy Rolled Tread Plate: ASTM B632, aluminum alloy 6061-T4 for treads. Thickness shown for raised aluminum pattern plates is exclusive of projected pattern.
  5. Aluminum Finishes: Finish designations prefixed by "AA" conform to the system established by the Aluminum Association for designating aluminum finishes.
    - a. As Fabricated Finish: AA-M10; (Mechanical Finish as fabricated, unspecified).
- D. Stainless Steel
1. ASTM A240; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide Type 316 and low carbon 316L for components to be welded (exterior), type 304 and low carbon 304L for components to be welded (interior), unless otherwise noted.
    - a. Plate and Sheet: ASTM A480, Stretcher level sheets.
    - b. Bar Stock and Shapes: ASTM A276.
    - c. Round, Square and Rectangular Welded Tubing: ASTM A554, Grades MT 316 or MT 316L as standard.
    - d. Pipe: ASTM A312 (A312M), Grade TP 304.
    - e. Castings: ASTM A743 (A743M), Grade CF8 or CF20.
- E. Castings
1. Gray Iron Castings: ASTM A48, Class 30 unless another class is indicated or required by structural loads.

2. Malleable Iron Castings: ASTM A47, Grade 32510.
3. Ductile Iron Castings: ASTM A536, grade as selected by fabricator.
4. Abrasive Castings: Metal shown or specified, of suitable alloy for casting and for structural strength, with an evenly distributed exposed surface treatment of not less than 2 oz./ft.<sup>2</sup> of abrasive granules. Provide electric furnace produced virgin aluminum oxide granules ranging in size from No. 16 to No. 24 and fired into the metal surface.

## 2.2 FASTENER AND ANCHORAGE MATERIALS

- A. Concrete Inserts and Anchors: Anchors and inserts capable of sustaining, without failure, the load imposed within a safety factor of 4 as determined by tested in accordance with ASTM E448. Threaded or wedge type, galvanized ferrous castings, either malleable iron ASTM A47 or cast steel ASTM A27. Provide bolts, washers and shims as required, hot dip galvanized, ASTM A153, Class A.
- B. Fasteners and Anchorage Devices: Provide fasteners complying with the requirements of Industrial Fasteners Institute standards. Type, grade, class and style best suited for the respective purpose. Use countersunk flat-head Phillips type machine screws for exposed fasteners, except where Allen head screws are required. Use stainless steel fasteners for exterior construction and for fastening components fabricated of galvanized steel.
  1. Provide Type 304 or 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B633, Class Fe/Zn 5, where fastening components fabricated of galvanized steel.
  2. Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where required, flat washers
  3. Stainless-Steel Bolts and Nuts: Regular hexagon-head annealed stainless- steel bolts, nuts and, where required, flat washers; ASTM F593 for bolts and ASTM F594 for nuts.
  4. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488, conducted by a qualified independent testing agency.
    - a. Material for Indoor Conditions: Carbon-steel components zinc-plated to comply with ASTM B633, Class Fe/Zn 5.
    - b. Material for Exterior Conditions: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.
- C. Non-metallic Shrinkage Resistant Grout: Premixed, prepackaged, nonmetallic, noncorrosive, nonstaining, non-gaseous, shrinkage resistant product containing selected silica sands, Portland cement, shrinkage compensating agents, plasticizing and water-reducing agents, complying with CE-CRD-C621 and ASTM C1107 Grade B or Grade C, free of gas-producing

or gas-releasing agents, oxidizing catalysts, inorganic accelerators and chlorides. Grout shall be bleed free and attain 7,500 psi compressive strength in 28 days at a fluid consistency of 20 to 30 seconds. Provide one of the following:

1. "Five Star Grout" (U.S. Grout Corp.).
2. "Masterflow 713 Plus" (Chemrex Inc.).
3. "Crystex" (L&M Construction Chemicals, Inc.).
4. "Sure Grip Grout" (Dayton Superior).
5. Or approved equal.

### 2.3 PAINT MATERIALS

- A. Paint: Provide primer and finish paint as supplied by a single manufacturer for the entire project.
  1. Exterior Ferrous Metal Primer: Compatible with finish coats of paint; shop apply primer to the respective dry film mil thickness specified or as recommended by the manufacturer; Provide one of the following:
    - a. "Hi-Build Epoxoline II Series N69" (Tnemec Co. Inc.); 4.0 - 6.0 mils  
(100 $\mu$ m -150 $\mu$ m) d.f.t.
    - b. "Carboguard 888 Series" (Carboline Co.); 4.0 - 6.0 mils  
(100 $\mu$ m -  
150 $\mu$ m) d.f.t.
    - c. "Interseal 670HS (International Paint), 4.0-8.0 mils (100 $\mu$ m -  
200 $\mu$ m) min d.f.t.
    - d. Or approved equal.
  2. Finish Paint for Exterior Exposed Ferrous Metals, Loose Lintels, Shelf and Relieving Angles and Dunnage: Color as selected by the Engineer. Shop finish paint apply to the respective dry film mil thickness specified or as recommended by the manufacturer; one of the following:
    - a. "Carbothane 133 Series/833" (Carboline Co.). 3.0 - 5.0 mils  
(75 $\mu$ m -125 $\mu$ m) d.f.t.
    - b. "Endura-Shield II 1075" (Tnemec Co. Inc.); 3.0 - 5.0 mils  
(75 $\mu$ m -  
125 $\mu$ m) d.f.t.
    - c. "Interthane 870UHS" (International Paint), 5.0- 8.0 mils  
(125 $\mu$ m -  
200 $\mu$ m) min d.f.t.
    - d. Or approved equal.
  3. Interior Ferrous Metal Primer: Compatible with the finish coats of paint (see Section 09 90 00 "Painting" for finish coats of Paint); shop apply

primer to the respective dry film mil thickness specified or as recommended by the manufacturer; Provide one of the following:

- a. "Series 10-99" (Tnemec Co. Inc.); 2.0 - 3.5 mils (50 $\mu$ m -80 $\mu$ m) d.f.t.
  - b. "Carbocoat 115" (Carboline Co.); 1.5 - 2.0 mils (38 $\mu$ m to 50 $\mu$ m)d.f.t.
  - c. "Interprime 298" (International Paint), 3.0-4.0 mils (75 $\mu$ m - 100 $\mu$ m) min d.f.t.
  - d. Or approved equal.
4. Galvanizing Repair Paint: Zinc rich paint for repairing galvanized surfaces and field welds complying with requirements of ASTM A780. Thickness of applied galvanizing repair paint shall be not less than coating thickness required by ASTM A123 or ASTM A153 as applicable.
  5. Dielectric Separator: Cold applied, asphalt emulsion type complying with ASTM D1187, non-sagging, resistant to severe corrosion conditions; applied in two coats for an overall minimum dry film thickness of 25 mils (625 $\mu$ m) or heavy coating of epoxy paint in minimum 2.0 mils (50 $\mu$ m) dry film.

## 2.4 FABRICATION

- A. Supplementary Parts: Include supplementary parts necessary to complete metal fabrications work though not definitely shown or specified. Such parts include, but are not limited to, interface components necessary for the installation or anchorage to Work.
- B. Verification of Measurements and Dimensions and Coordination and Schedule of Work: Verify measurements and dimensions at the job site and cooperate in the coordination and scheduling of the work of this Section with the work of related trades (with particular attention given to the installation of items embedded in concrete and masonry).
- C. Formation of Exposed Work: Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges. Ease exposed edges to a radius of approximately 1/32 in., unless otherwise shown. Form bent metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- D. Formation of Exposed Connections: Form exposed connections with hairline joints, flush and smooth; using concealed fasteners where possible. Exposed threaded portion of bolts and screws shall be cut off flush with adjacent metal. Cut, drill, punch and tap as required for the installation and attachment of other work to metal fabrications work. Shear and punch metals cleanly and accurately. Remove burrs. Remove sharp or rough areas on exposed traffic surfaces.
- E. Formation of Metal Work: Form metal work built in with concrete or masonry for anchorage, or provide suitable anchors, expansion shields, or other anchoring devices shown or required to provide support for intended use.

Furnish metal work in ample time for setting and securing in place.

- F. Procedures for Joints and Welds: Make joints as strong and rigid as adjoining sections. Make welds continuous along entire line of contact, except where spot welding is indicated. Grind exposed welds flush and smooth to match and blend with adjoining surfaces. Welded connections may be used where bolted connections are shown. Fabricate joints exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.
1. Make up threaded connections tight so that threads are entirely concealed. Shoulder and head, dowel and pin abutting bars. Provide bolt and screw heads flat and countersunk in exposed work. Carefully machine, fit and secure removable members by means of Allen-head set screws of proper size and spacing.
- G. Galvanizing
1. ASTM A153, Classes A and B, for galvanizing iron and steel hardware.
  2. ASTM A123, for galvanizing rolled, pressed and forged steel shapes, plates, bars, strip 1/8 in. thick and heavier and for assembled steel
  3. Items to be Galvanized: Galvanize ferrous metal utilized on the exterior and items embedded in concrete whether interior or exterior, unless otherwise specified. Galvanize other items where specified or shown.
- H. Preassembly of Items: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Following trial fit, disassemble units only as necessary for shipping and handling. Clearly mark units for reassembly. Provide alignment and splice plates for accurate field fit.

## 2.5 OPENING FRAMES, GUARDS AND COVERS

- A. Opening Frames, Guards and Curbs: Provide frames and strips of the sizes, shapes and profiles shown or, if not shown, of the required dimensions to receive adjacent grating, plates, doors or other work to be retained by the framing. Fabricate from structural steel shapes and plates and steel bars, using welded construction with mitered corners, welded brackets and splice plates and a minimum number of joints for field connection. cut, drill and tap units to receive hardware and similar items to be anchored to the work.
1. Anchors: Equip units with integrally welded anchor straps for casting into concrete or building into masonry. Unless otherwise noted, space anchors 24 in. o.c., and provide minimum 1/4 in. thick anchor units of 1-1/4 in. x 8 in. steel straps.
- B. Bollards: Provide bollards of steel pipe, diameter and height as shown, inset into cast-in-place concrete and filled with concrete. Weld top plate to steel bollard, grinding down welds smooth unless otherwise indicated on drawings.
- C. Pipe Guards: Provide pipe guards of 3 in. x 3 in. x 5/16 in. steel angles, extending from floor to 3 ft. 4 in. above floor. Provide with 3/8 in. steel base plates for bolting to floor, and with 1/4 in. x 2 in. steel strap braces at top. Provide at least 2 vertical angles at each location, except at internal corners, and extend strap between angles and from each angle to wall or column.

- D. Pipe Guards: Custom fabricate to the sizes shapes and profiles shown using bent steel plate or steel shapes as indicated. Provide system for anchoring into structure.
- E. Corner Guards: Provide steel angle corner guards of size as shown, with anchors welded to backs of angles at 2 ft. centers with a minimum of three (3) anchors per unit.
- F. Curb Nosings: Provide where shown 13 in. high x 3/8 in. thick galvanized steel plate curb nosing complete with 1/2 in. dia. anchors welded to back of nosing at 1 ft. staggered centers. Top of nosing shall be rounded to a 1 in. inside radius as shown.
- G. Edge Angles
1. Provide edge angles of size as shown, with welded-on strap or stud anchors 2 ft. on centers.
  2. Provide angles in as long lengths as possible. Miter and weld corners and provide splice plates for alignment between sections.

## 2.6 SUPPORTS FOR MASONRY

- A. Loose Lintels
1. Furnish loose stainless steel lintels as shown and/or as required over openings in masonry walls, partitions and shafts. Include lintels for mechanical openings as required. Furnish lintels 16 in. longer than the opening widths. Where metal door frames are provided with integral head reinforcement, furnish loose lintels only for such openings 3 ft. 4 in. wide and wider. Weld adjoining members together to form a single unit where indicated. Provide 2B finish where exposed.

- B. Loose Lintel Schedule (angle sizes, inches)

Opening Width (Max.)	□	□	□	10 in. and 12 in. Wall*
2 ft.	3-1/2 x 3-1/2 x 1/4	5 x 5 x 5/16	3-1/2 x 3-1/2 x 1/4	8 x 4 x 1/2
3 ft.	3-1/2 x 3-1/2 x 1/4	5 x 5 x 5/16	3-1/2 x 3-1/2 x 1/4	8 x 4 x 1/2
4 ft.	3-1/2 x 3-1/2 x 1/4	5 x 5 x 5/16	3-1/2 x 3-1/2 x 1/4	8 x 4 x 1/2
5 ft.	3-1/2 x 3-1/2 x 1/4	5 x 5 x 5/16	3-1/2 x 3-1/2 x 1/4	8 x 4 x 1/2
6 ft.	3-1/2 x 3-1/2 x 1/4	5 x 5 x 5/16	3-1/2 x 3-1/2 x 1/4	8 x 4 x 1/2
7 ft.	3-1/2 x 3-1/2 x 1/4	5 x 5 x 5/16	3-1/2 x 3-1/2 x 1/4	8 x 4 x 1/2
8 ft.	4 x 3-1/2 x 1/4	5 x 5 x 5/16	4 x 3-1/2 x 1/4	8 x 4 x 5/8

\* Furnish two angles at all openings in 8 in., 10 in. and 12 in. walls. Furnish a lintel angle for each masonry wythe.

- C. Loose Bearing and Closure Plates: Provide stainless steel loose bearing and

leveling plates for steel items bearing on masonry or concrete construction, fabricated flat, free from warps or twists and of required thickness and bearing area. Provide integral anchorages as indicated or if not indicated as required for a complete installation.

- D. Leveling Plates: Provide stainless steel loose leveling plates for steel columns bearing on concrete construction, fabricated flat, free from warps or twists and of required thickness and bearing area. Leveling plates to be 1/4 in. thick and match column base plate dimensions. Leveling plates to be set on 1 1/4 in. grout bed as shown.
- E. Shelf and Relieving Angles: Furnish shelf and relieving angles fabricated from stainless steel angles of sizes indicated and for attachment to structural framing. Provide slotted holes to receive 3/4 in. dia. bolts, spaced not more than 6 in. from ends and not more than 24 in. on center, unless otherwise shown or specified. Provide 2B finish where exposed.
  - 1. Fabricate units in convenient lengths from field measurements for each location of use, provide joint gaps in angles at all locations of masonry control joints and expansion joints. Size joint gaps to match width of the masonry joints in the location of use. Provide joints in other locations, as required for fabrication only, with tight joints.
  - 2. Provide slotted holes to allow adjustment of shelf and relieving angles to building substrates and to allow for proper installation of masonry elements.
  - 3. Provide units at corners and other transitions fabricated into one piece.

## 2.7 STEEL LADDERS

- A. Steel Ladder ( **LDR-01** ):
  - 1. Provide hot-dipped galvanized steel ladders as shown, complete with supporting brackets, stringers, railings and rungs.
  - 2. Provide non-slip surface on the top of each rung, either by coating the rung with aluminum oxide granules set in epoxy resin adhesive, or by using a type of manufactured rung which is filled with aluminum oxide grout.

## 2.8 MISCELLANEOUS FRAMING AND SUPPORTS

- A. Steel Framing, Subframing and Supports: Provide steel framing and subframing and supports for applications shown and not specifically provided as part of the work of other trades.
  - 1. Exterior work and within and/or on exterior walls and roof: Stainless Steel (Type 316 and 316L) with No. 4 finish.
  - 2. Interior Work: Hot-dipped Galvanized Steel unless otherwise specified.
- B. Steel Weld Plates and Angles: Provide stainless steel weld plates and angles not specified in other Sections, for items supported from concrete construction as needed to complete the Work. Provide each unit with not less than two integrally welded steel strap anchors for embedding in concrete

- C. Items Required for Framing and Support: Furnish bent, or otherwise custom-fabricated, bolts, plates, anchors, hangers, dowels, and other miscellaneous stainless steel shapes as required for framing and supporting woodwork and other type items, and for anchoring or securing woodwork and other type items, to concrete or other structures. Fabricate items to sizes, shapes, and dimensions required. Furnish stainless steel washers for heads and nuts that bear on connections.
- D. Fabrication of Miscellaneous Units: Fabricate miscellaneous units to sizes, shapes and profiles shown or, if not shown, of required dimensions to receive adjacent work to be retained by framing. Fabricate from structural steel shapes and plates and steel bars, of welded construction using mitered joints for field connection, except where otherwise shown. Cut, drill and tap units to receive hardware and similar items.
- E. Anchors and Inserts: Provide units with integrally welded anchors for casting into concrete or building into masonry. Furnish inserts if units must be installed after concrete is placed.
  - 1. Space anchors 24 in. o.c. and provide minimum anchor units of 1-1/4 in. x 8 in. x 3 in. steel straps, except as otherwise shown.
- F. Steel Tube Supports for Sinks and Countertops: Where required, utilize hot-dipped galvanized steel tube supports sized to support dead loads of countertops, and in addition a uniform live load of 300 psf. Where exposed in the finish work, provide welded connections, ground smooth and primed for field painting specified in Section 09 90 00, "Paints and Coatings ". Where concealed, utilize bolts and connectors of capacity required to support imposed live and dead loads. Anchor steel tubes to structural walls and slabs as required for a secure and rigid installations. Fasten tubes to countertops with fasteners applied through the tubes into the underside of tops, and in sufficient quantity for a secure installation.
- G. Steel Frames for Coiling Doors: Provide hot-dipped galvanized steel door frames for coiling doors fabricated from structural shapes in accordance with the requirements of the door manufacturer. Plug weld built-up members and continuously weld exposed joints. For securing door frames into adjacent masonry or concrete, provide stainless steel strap anchors 1/8 in. thick x 2 in. wide length required for a minimum 8 in. embedment, unless otherwise shown. Weld anchors to frame jambs not more than 12 in. from both bottom and head of frame and space anchors not more than 30 in. apart. Extend bottom of frames to floor elevation indicated with steel angle clips welded to frames. Reinforce, drill, tap and prepare as required to receive finish hardware.
- H. Structural-Steel Door Frames: Fabricate hot-dipped galvanized structural-steel door frames from steel shapes, plates, and bars of size and to dimensions indicated, fully welded together, with 5/8 in. by 1-1/2 in. steel channel stops, unless otherwise indicated. Plug-weld built-up members and continuously weld exposed joints. Secure removable stops to frame with countersunk machine screws, uniformly spaced at not more than 10 in. o.c. Reinforce frames and drill and tap as necessary to accept finish hardware. Provide with integrally welded steel strap anchors for securing door frames into adjoining concrete or masonry.

## **2.9 SHOP CLEANING AND PAINTING**

- A. Metal Fabrications Work: Hot-dip galvanize metal fabrications work, except members of stainless steel, unless otherwise specified.
- B. Removal Of Oil, Grease And Similar Contaminants: Remove oil, grease and similar contaminants in accordance with SSPC SP-1 "Solvent Cleaning", prior to additional surface preparation specified.
- C. Metal Surfaces: Clean and prepare metal surfaces before hot-dip galvanizing. Remove rust and mill scale in accordance with SSPC SP-3 "Power Tool Cleaning", and SSPC SP-6 for exterior exposed ferrous metal.
- D. Application of Primer for Painting Prep: Immediately after surface preparation, apply primer in accordance with manufacturer's instructions. Use painting methods which will result in full coverage and dry film thickness specified.
- E. Procedures for Primer and Finish Paint: Apply one shop coat of primer to fabricated metal items, except apply 2 coats of primer to surfaces inaccessible after assembly or erection. In addition, apply one shop coat of finish paint to entire surfaces of exterior loose lintels, shelf and relieving angles, dunnage and other items as noted or specified. Use thinners only as specified by the coating manufacturer. The entire coating system shall be as supplied by a single manufacturer.
- F. Dissimilar Materials: Separate dissimilar metals with coating of dielectric separator. Do not extend coating onto exposed or finished surfaces.

## **2.10 SOURCE QUALITY CONTROL**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. Contractor's Inspection and Testing Agency: Contractor shall employ, at its own expense, an independent full time inspection agency to perform testing and inspection services for metal fabrication work as follows. Non-conforming Work shall be retested and paid for by Contractor.
- C. Shop Inspection of Connections: Perform 100% visual inspection at bolted and welded connections in the Work. Examine the size, quality and placement of each connection to verify installation in accordance with Contract Documents and approved shop drawings.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including, components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the

Work. Do not proceed until unsatisfactory conditions have been corrected.

### **3.3 COORDINATION**

- A. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Coordinate installation of steel weld plates and angles for casting into concrete that are specified in this Section but required for work of another Section. Deliver such items to Project site in time for installation.

### **3.4 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer

### **3.5 INSTALLATION**

- A. General: Install work as shown, plumb, level and in line with adjacent materials where required. Provide fastenings as indicated on the Drawings, specified herein or as shown on final shop drawings. Fit exposed connections accurately together to form tight hairline joints.
  - 1. Weld Plates and Angles: Coordinate installation of weld plates and angles for casting into concrete construction that are specified in this Section but required for work of another Section. Deliver such items to Project site in time for installation.
  - 2. Anchorages: Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions and directions for installation of anchorages, including steel weld plates and angles, concrete inserts, sleeves, anchor bolts and other miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to the project site. Deliver items which are to be built into the work of other Sections in time so as not to delay the progress of the Work.
- B. Procedures for Fastening Metal Work: Except where otherwise specified for a particular item for built-in work, fasten metal work to concrete or solid masonry with embedded anchors or expansion bolts, and to hollow block with toggle bolts. Fastening to wood plugs will not be permitted. Drill holes for bolts to the exact diameter of the bolt. Provide screws threaded full length to the screw head.
- C. Field Welding: Comply with AWS Welding Code for procedures related to field welding as related to appearance and quality of welds made and for methods used in correcting welding work. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals. Obtain fusion without undercut or overlap. Remove welding flux immediately. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing and contour of welded surface matches those adjacent.

- D. Protection of Finished Surfaces: Protect finished surfaces against damage during construction and remove protection at time of substantial completion.
- E. Dissimilar Materials: Separate dissimilar metals with heavy coating of dielectric separator. Do not extend coating onto exposed or finished surfaces.
- F. Bollards
  - 1. Anchor bollards in concrete with pipe sleeves preset and anchored into concrete. After bollards have been inserted into sleeves, fill annular space between bollard and sleeve solidly with nonshrink, nonmetallic grout, mixed and placed to comply with grout manufacturer's directions.
  - 2. Fill bollards solidly with concrete. Weld top plate to steel bollard, grinding down welds smooth.
- G. Installation of Pipe Guards: Anchor pipe guards to concrete or masonry construction as shown.
- I. Nosings and Thresholds: Install with anchorage system indicated or if not indicated to comply with manufacturer's written instructions and recommendations. Seal thresholds exposed to exterior with elastomeric sealant complying with Section 07 92 00 "Joint Sealants" to provide a watertight installation.

### **3.6 FIELD QUALITY CONTROL**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. Connection Identification: Assign each bolting crew and welder an identifying symbol, and require them to mark every connection, so that an inspector may identify the person(s) making each connection.
- C. Qualification for Field Welding: Qualify the welding operators and welding procedures in accordance with AWS D1.1 and D1.3 requirements.
- D. Field Inspection of Connections: Perform 100% visual inspection at bolted and welded connections in the Work. Examine the size, quality and placement of each connection to verify installation in accordance with Contract Documents and actioned shop drawings.

### **3.7 ADJUSTING**

- A. Procedures for Cleaning, Painting and Touch-Up: Immediately after erection, clean field welds, bolted connections, marred and abraded surfaces. Paint and touch-up paint with the specified paint system. Touch up galvanized surfaces in accordance with ASTM A780.

**END OF SECTION**

**SECTION 05 80 00 – ARCHITECTURAL FORMED METALS****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide architectural formed metals in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Non-architectural metal fabrications specified in Section 05 50 00 "Metal Fabrications".
  - 2. Finish painting is specified in Section 09 90 00 "Paints and Coatings".

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Architectural Manufacturers Association (AAMA)
    - a. AAMA 2605 "Voluntary Specification, Performance Requirements and Test Procedures for Pigmented Organic Coatings on Aluminum Extrusions and Panels".
  - 2. American Welding Society (AWI)
    - a. AWS D1.1 "Structural Welding Code - Steel".
    - b. AWS D1.3 "Structural Welding Code - Sheet Steel".
    - c. AWS D1.6 "Structural Welding Code - Stainless Steel".
  - 3. National Association of Architectural Metal Manufacturers (NAAMM)
    - a. NAAMM "Metal Finishes Manual".
  - 4. Industrial Fasteners Institute (IFI): "Fastener Standards Book."

**1.3 SYSTEM DESCRIPTION**

- A. Performance Requirements
  - 1. General: Comply with the performance requirements and criteria as specified:
    - a. Structural Performance: Provide for architectural metal panels capable of withstanding design loads of the Work within limits and under conditions indicated and as follows:
      - 1) Structural requirements shall be as indicated on project structural contract document requirements.
  - 2. Expansion and Contraction: Design, fabricate and install exterior architectural metal component parts to provide for expansion and

contraction of each assembly or system over an ambient temperature range of 120 deg. F. and a surface temperature range of 180 deg. F. without buckling, joint failure, undue stress on members or anchors, and other detrimental effects on any exterior architectural metal assemblies of systems or to contiguous work by others.

3. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and coordinate the work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted for review. Maintain the general design concept without altering profiles and alignments shown.

#### 1.4 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Furnish manufacturer's literature describing the general properties of each product to be used in the Work. Include, manufacturer's technical data documenting the primary function, quality and performance of each system and containing specification for each material, load tables, dimension diagrams and installation instructions, or other such information as required by the drawings and specifications.
- B. Shop Drawings: Provide shop drawings for architectural metal work, including dimensioned plans and elevations drawn at a minimum scale of 1 in. = 1 ft. and details of sections, connections and anchorage drawn at a minimum scale of 3 in. = 1 ft. Indicate materials and profiles of each architectural metal member, fittings, joinery, finishes, fasteners, and accessory items.
  1. Setting Drawings: Provide setting drawings and templates for the location of architectural metal items that are to be embedded in or anchored to concrete or masonry.
- C. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide the following:
  1. Metal Panel System: 24 in. square sample complete with frame and specified finish.
  2. Each finish of each metal on the gage and alloy to be used in the final work, 3 in. x 4 in.
  3. Typical welded corner and butt joints.
  4. Other specified items as requested.
- D. Closeout Submittals: Submit the following:
  1. Maintenance Manual: Submit two (2) copies of a bound maintenance manual, describing the materials, and procedures for cleaning and maintaining each metal type. Include manufacturer's data describing the materials and finishes used in the work.
- E. Special Warranty Organic (Powder) Coated Finish: Provide a written Manufacturer's Warranty for a period of (5) five years, warranting that the

organic (powder) coated finish will not fade, stain or discolor excessively or to a non-uniform appearance, and will not corrode, crack, craze, peel, or deteriorate due to weather and atmospheric exposure. Upon notification of defects, within the warranty period, make the necessary replacements at the convenience of the City of New York.

## 1.5 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain each architectural metal system from one source of a single fabricator/manufacturer. Obtain accessory products used in conjunction with architectural metal from the architectural metal fabricator/manufacturer or from sources acceptable to the architectural metal fabricator/manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Mock-Ups
  - 1. Provide mock-ups of the following items consisting of all the specified components of sizes as shown:
    - a. Metal Panel System: One full height panel, full panel width.
      - 1) Mock up shall include all components for one full panel and as indicated on drawings for mock-up requirements.
  - 2. Alter or revise mock-ups, as directed, to obtain the approval of the Design consultant. The approved mock-up(s) shall serve as a standard of quality for specified item(s) for the project and may remain as a permanent part of the Work if in same condition as new at time of final acceptance.
- E. Pre-Installation Meetings: Prior to the start of the Work, meet at the Project site to review methods and sequence of architectural metal installation, special details and conditions, standard of workmanship, testing and quality control requirements, job organization and other pertinent topics related to the Work.

## 1.6 DELIVERY, STORAGE AND HANDLING

- A. Packing, Shipping, Handling, and Unloading: Deliver architectural metal work fully sealed and identified.
- B. Storage and Protection: Store indoors, above the floor, protected from construction activities and other sources of damage. Protect from damage

from any source. Provide removable protection as required.

## **PART 2 - PRODUCTS**

### **2.1 METAL MATERIALS**

#### **A. General:**

1. **Metal Surfaces:** For the fabrication of architectural metal work which will be exposed to view, use only materials which are smooth and free of surface blemishes. Do not use materials which have stains and discolorations including welds which do not match the material, or do not match the Design consultant's sample in color and grain characteristics.
2. **Surface Flatness and Edges:** For exposed work provide materials which have been cold-rolled, cold-finished, cold-drawn, extruded, stretcher leveled, machine cut and otherwise produced to the highest commercial standard for flatness with edges and corners sharp and true to angle or curvature as required.
3. **Alloys and Tempers:** Wherever alloys or tempers of metals are not shown or specified, or are shown or specified only by series or other general designation, provide the specific alloy which will weld and machine properly, and will finish to match the Design consultant's sample and other work in the same area, which is shown or specified to have the same finish. Use the temper or hardness which will provide the greatest strength and durability, consistent with necessary forming, fabrication and finishing processes.

#### **B. Stainless Steel**

1. **AISI Type 316.**
  - a. **Plate and Sheet:** ASTM A666, Stretcher level sheets.
  - b. **Bar Stock:** ASTM A276.
  - c. **Tubing:** ASTM A554, Grades MT 301, MT 302, or MT 304, as standard with manufacturer.
  - d. **Pipe:** ASTM A312, Grade TP 304.

#### **C. Steel**

1. **Structural Steel Shapes:** ASTM A36.
2. **Steel Pipe:** ASTM A53, Type S, Grade B, suitable for close coiling, black finish unless galvanizing is required; standard weight (Schedule 40), unless otherwise indicated or required to satisfy performance criteria.
3. **Steel Bars and Bar Size Shapes:** ASTM A675, Grade 65, or ASTM A36.
4. **Steel Wire:** ASTM A510.

### **2.2 FASTENER AND ANCHORAGE MATERIALS**

- #### **A. Fasteners:** Stainless steel type 316, type and size best suited for its intended

use. Where exposed in finished surfaces, use oval-head countersunk Phillips heads with head diameter one screw size larger than the shank diameter. Material and finish to match adjacent surfaces. Where fasteners screw-anchor into material less than 1/8 in. thick reinforce the interior surface with non-magnetic type stainless steel to receive screw thread threads or provide manufacturer's standard non-corrosive pressed-in splined grommet nuts. Provide fasteners meeting the requirements of IFI standards.

- B. Anchors and Inserts: Provide anchors and inserts for attachment of architectural items to masonry and concrete. Anchors and inserts shall be non-corrosive and compatible with contiguous metals.
- C. Welding Electrodes: Type and alloy recommended by the producer of the metal to be welded and as required for color match, strength and compatibility in the fabricated items.

### **2.3 PAINT AND COATING MATERIALS**

- A. Dielectric Separator: Cold applied, asphalt emulsion type complying with ASTM D1187, non-sagging, resistant to severe corrosion conditions; applied in two coats for an overall minimum dry film thickness of 25 mils or heavy coating of epoxy paint in minimum 2.0 mil dry film thickness.

### **2.4 FABRICATION**

- A. Field Measurements: Prior to fabrication, verify dimensions and conditions at the job site so that architectural metal work will accurately fit to adjacent work.
- B. Forming: Form work to true shapes, without distortion, with accurate surfaces and edges. Unless otherwise shown, form metal corners by bending to smallest radius possible without impairing the work. Produce flat, flush surfaces without cracking or grain separation at bends. Machine cut or saw material for butt jointed or square corners. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain profile of member throughout entire bend without buckling, twisting, or otherwise deforming exposed surfaces of components.
- C. Assembly: Carefully fit and assemble all work with continuity of line and design, using rigidly secured joints with hairline contact, unless otherwise shown. Form butt hairline joints with roll-over edge exposed. Grind off roll-over edge flush with and matching of adjacent metal. Shop assemble all work. Disassemble units too large for shipment and provide them with alignment and splice plates for accurate field fit. Build in straps, plates, and brackets as needed to support and anchor fabricated items to adjoining construction. Reinforce formed-metal units as needed to attach and support other construction.
- D. Welding: Weld with electrodes and by methods recommended by the base metal manufacturer, and in accordance with applicable recommendations of the AWS, to avoid distortion or discoloration of exposed faces. Make welds continuous unless otherwise shown. Grind exposed welds flush, to match adjacent metal. Bevel cut base metal before welding to maintain continuity of line at joints.

- E. Reinforcing: Reinforce members and joints with structural shapes and plates in concealed locations, as necessary for adequate strength and rigidity.
- F. Fastenings: Provide concealed fastenings unless otherwise shown. Locate necessary exposed fastenings in an orderly pattern, in accordance with reviewed shop drawings.
- G. Dissimilar Metals: Separate dissimilar metals with dielectric separator to prevent galvanic action. Do not extend coatings onto exposed surfaces.
- H. Protection of Finishes Prior to Shipment: Prior to shipment protect finishes on exposed surfaces from damage by application of strippable temporary protective covering or other means.

## 2.5 METAL PANEL SYSTEM

- A. Metal Panel System ( **MPS-01** ): Provide stainless steel (type 316) metal panel system of dimensions, thicknesses and at locations indicated on drawings. Provide stainless steel panels, support frames, brackets and all hardware required for complete installation. Provide metal panel systems by one of the following:
  - 1. Metalwerks by Metal Sales & Service Inc.  
200 Gale Ln.  
Kennett Square, PA
  - 2. M.G. McGrath  
1387 East Cope Avenue  
Maplewood, MN
  - 3. A. Zahner Company  
1400 East 9th Street  
Kansas City, MO
  - 4. Or equal as approved by Engineer.
- B. Metal Panel System ( **MPS-02** ): Provide stainless steel (type 316) metal panel system of dimensions, thicknesses and at locations indicated on drawings. Provide stainless steel panels, support frames, brackets and all hardware required for complete installation.
  - 1. Basis of Design for panel component of **MPS-02** metal panel system:
    - a. "7DL" with 2B finish as manufactured by Rigidized Metals but not intended to imply a preference for a specific manufacturer.
    - b. Other manufacturers include the following:
      - i. Moz Metals.
      - ii. Ferguson Perforating
      - iii. Or equal as approved by Engineer.
  - 2. Provide metal panel systems **MPS-02** by one of the following:
    - a. Metalwerks by Metal Sales & Service Inc.  
200 Gale Ln.  
Kennett Square, PA

- b. M.G. McGrath  
1387 East Cope Avenue  
Maplewood, MN
  - c. A. Zahner Company  
1400 East 9th Street  
Kansas City, MO
  - d. Or equal as approved by Engineer.
- C. Metal Panel System ( **MPS-03** ): Provide stainless steel (type 316) metal panel system of dimensions, thicknesses and at locations indicated on drawings. Provide stainless steel panels, support frames, brackets and all hardware required for complete installation. Provide metal panel systems by one of the following:
- 1. Metalwerks by Metal Sales & Service Inc.  
200 Gale Ln.  
Kennett Square, PA
  - 2. M.G. McGrath  
1387 East Cope Avenue  
Maplewood, MN
  - 3. A. Zahner Company  
1400 East 9th Street  
Kansas City, MO
  - 4. Or equal as approved by Engineer.
- D. Metal Panel System ( **MPS-04** ): Provide stainless steel (type 316) metal panel system of dimensions, thicknesses and at locations indicated on drawings. Provide stainless steel panels, support frames, brackets and all hardware required for complete installation. Provide metal panel systems by one of the following:
- 1. Metalwerks by Metal Sales & Service Inc.  
200 Gale Ln.  
Kennett Square, PA
  - 2. M.G. McGrath  
1387 East Cope Avenue  
Maplewood, MN
  - 3. A. Zahner Company  
1400 East 9th Street  
Kansas City, MO
  - 4. Or equal as approved by Engineer.

## 2.6 METAL TRIM SYSTEM

- A. Metal Trim System ( **MTS-01** ): Provide stainless steel (type 316) metal trim system of dimensions, thicknesses and at locations as indicated on drawings. Provide stainless steel trim, support frames, brackets and all hardware required for complete installation.
  - 1. As indicated on Drawings.
    - a. Stainless steel imbeds, structural attachment components, and fasteners as required for complete installations.

## 2.7 MISCELLANEOUS ARCHITECTURAL METAL TRIM

- A. Miscellaneous Items: Provide other items of architectural metal, exposed to view in the finished work, that is not included in other work.
- B. Steel Trim: Provide stainless steel trim, exposed to view in the finished Work, fabricated from longest lengths available, 16 gauge minimum stainless steel sheet material unless noted otherwise. Form trim to profiles and dimensions shown, complete with concealed fastening devices and finished on exposed surfaces with a **MTL-04** metal finish, unless otherwise specified or shown.

## 2.8 MISCELLANEOUS ARCHITECTURAL METALWORK

- A. Miscellaneous Items: Provide other items of architectural metal, exposed to view in the finished work that is not included in other work.
- B. Stainless Steel Trim: Provide stainless steel trim, exposed to view in the finished work, fabricated from longest lengths available, 18 gauge minimum stainless steel sheet material unless noted otherwise. Form trim to profiles and dimensions shown, complete with concealed fastening devices and finished on all exposed surfaces with a **MTL-04** metal finish, unless otherwise specified or shown.
- C. Corner Guards: Stainless Steel Corner Guard Fabricated from min. 16 ga. thick, type 316 stainless steel with No. 4 brushed finish, 3-1/2 in. x 3-1/2 in high with counter sunk phillips head stainless steel fasteners; 54 inches high unless otherwise shown.

## 2.9 METALWORK AND FINISHES

- A. General: As shown for the respective units and matching the reviewed samples. Remove scratches, abrasions, dents, die markings and other defects prior to finishing operations. Perform this work in addition to finish treatment specified. Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations unless otherwise specified.
- B. Stainless Steel Metalwork and Finishes
  - 1. ( **MTL-04** ): No. 4 (bright directional polish). Grain direction as indicated on drawings. If direction not indicated, match adjacent.
- C. Steel Metalwork and Finishes
  - 1. Hot Dipped Galvanized finish.
- D. Painted Ferrous Metalwork and Finish

1. Exposed surfaces shall receive hot dipped galvanized finish with high-performance paint.
2. General for painted Ferrous Metal: Hot-dipped galvanize and shop paint steel shapes and plates, except members or portions of members to be embedded in concrete, and edges to be field welded.
  - a. Removal of Oil, Grease and Similar Contaminants: Remove oil, grease and similar contaminants in accordance with SSPC SP-1 "Solvent Cleaning", prior to any additional surface preparation specified.
  - b. Metal Surfaces: Clean and prepare metal surfaces before applying shop coat. Remove rust and mill scale in accordance with SSPC SP-3 "Power Tool Cleaning".
  - c. Application of Primer: Immediately after surface preparation, apply primer in accordance with manufacturer's instructions. Use painting methods which will result in full coverage and dry film thickness specified.

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including equipment, components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

#### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Verify dimensions of supporting structure by field measurements so that architectural metal work will be accurately designed, fabricated and fitted to the structure. Tolerances for supporting structure are specified in other Sections.

#### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Coordination: Coordinate architectural metal work with the adjacent work of other sections. Provide items to be placed during the installation of other work at the proper time to avoid delays. Coordinate placement of such items, including inserts and anchors, accurately in relation to the final location of architectural metal work.

### 3.4 INSTALLATION: GENERAL

- A. Dimensions shown on Drawings are based on an assumed design temperature of 70 deg. F. Fabrication and erection procedures shall take into account the ambient temperature range at the time of the respective operations.
- B. Procedures: Perform all cutting, drilling and fitting required. Install work in locations shown, plumb, level and in line with adjacent materials where required. Provide fastenings as shown on shop drawings, and as necessary for a rigid, secure and permanent installation. Make provisions for removable items.
  - 1. Fasten to metal with bolts or machine screws threaded full length of the shank, with lock nuts on bolts.
  - 2. Fasten to inserts in concrete or solid masonry, or use expansion bolts. Fasten to hollow masonry units with toggle bolts. Drill holes for bolts no larger than shank diameter.
- C. Formation of Joints: Form tight joints with exposed connections accurately and uniformly fitted together. Do not cut or abrade finishes which cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing.
- D. Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of specified dielectric separator.
- E. Metal Panel System: Comply with fabricator's written instructions and recommendations for installation and as follows:
  - 1. Anchor metal panel system to properly prepared substrate as recommended intervals indicated on drawings. Adjust metal panels to achieve level and plumb installation.
  - 2. Anchor metal panel system to framing utilizing appropriate fastening devices for the substrate.
  - 3. Provide brackets and supports at locations recommended by the fabricator.
  - 4. Install door, window, and closure panels as indicated on drawings.
- F. Installation of Closures and Trim: Form closures and trim members from stainless steel sheet metal of type and minimum nominal thickness as indicated. Incorporate components required for support and installation of closures and trim. Fabricate closures and trim to tightly close with adjoining construction.
- G. Provide concealed fasteners at all locations. Size fasteners to support ornamental metal Work, with fasteners spaced to prevent buckling or waviness in finished surfaces. Drill and tap holes required for securing Work to other surfaces.
- H. Support joints with concealed stiffeners as required to hold exposed faces of adjoining units in flush alignment. Miter or cope trim members at corners to form tight joint.

- I. Installation: Closures and Trim: Form closures and trim members from stainless steel sheet metal of type and minimum nominal thickness as indicated. Incorporate components required for support and installation of closures and trim. Fabricate closures and trim to tightly close with adjoining construction.
- J. Provide concealed fasteners at all locations. Size fasteners to support work, with fasteners spaced to prevent buckling or waviness in finished surfaces. Drill and tap holes required for securing work to other surfaces.
- K. Support joints with concealed stiffeners as required holding exposed faces of adjoining units in flush alignment. Miter or cope trim members at corners to form tight joint.

### **3.5 ADJUSTING**

- A. Touch-Up Painting: Field paint all marred or abraded shop paint and welds after cleaning these areas. Separate dissimilar metals and metals in contact with concrete or masonry with dielectric separator or gaskets. Do not extend coatings onto exposed surfaces.

### **3.6 PROTECTION**

- A. Protection: Upon completion of installation clean exposed metal surfaces as recommended by manufacturer and install protection. Protect finished surfaces against damage during subsequent construction operations and remove protection at time of substantial completion.

**END OF SECTION**

**SECTION 06 15 00 – ROUGH CARPENTRY****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide rough carpentry in accordance with requirements of the Contract Documents.

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
1. American Forest & Paper Association (AFPA): "National Design Specification for Wood Construction", and the "Manual for Wood Frame Construction".
  2. American Wood Preserver' Association (AWPA)
    - a. AWPA C1, "All Timber Products, Pressure Treatment (General Requirements)".
    - b. AWPA C2 "Lumber, Timbers, Bridge Ties and Mine Ties, Pressure Treatment".
    - c. AWPA C9 "Plywood-Preservative Treatment by Pressure Process".
    - d. AWPA C20: "Structural Lumber—Fire-Retardant Treatment by Pressure Process".
    - e. AWPA C27 "Plywood-Fire Retardant Treatment by Pressure Process".
    - f. AWPA M4 "Care of Preservative-Treated Wood Products".
    - g. AWPA P5, "Standard for Waterborne Preservatives".
  3. The Engineered Wood Association (APA): "Engineered Wood Construction Guide".
  4. National Institute of Standards and Technology, U.S. Dept. of Commerce (NIST)
    - a. Voluntary Product Standard PS-20, "American Softwood Lumber Standards".
    - b. Voluntary Product Standard PS-1, "Construction and Industrial Plywood".
  5. National Lumber Grades Authority (NLGA): "Standard Grading Rules for Canadian Lumber".

6. Northeastern Lumber Manufacturers Association (NLMA): "Standard Grading Rules for Northeastern Lumber".
7. Southern Pine Inspection Bureau (SPIB): "Standard Grading Rules for Southern Pine Lumber".
8. West Coast Lumber Inspection Bureau (WCLIB): "Standard No. 17: Grading Rules for West Coast Lumber".
9. Western Wood Products Association (WWPA): "Western Lumber Grading Rules."

#### 1.4 SUBMITTALS

- A. Product Data: Submit manufacturer's product data for each type of product and process specified in this section and incorporated into items of rough carpentry indicating component materials and dimensions and include construction and application details. Provide the following:
  1. Data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used, net amount of preservative retained, and chemical treatment manufacturer's written instructions for handling, storing, installing, and finishing treated material.
  2. Data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials, both before and after exposure to elevated temperatures when tested according to ASTM D5516 and ASTM D5664. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.
  3. Include copies of warranties from chemical treatment manufacturers for each type of treatment specified.
- B. Quality Control Submittals
  1. Certifications
    - a. Certification of Wood Preservative Treatment: Certification stating compliance with specified standards, type and name of preservative solution used, pressure process utilized, retention in pounds per cu. ft. of lumber treated, and that the treated material conforms to paintability, drying time and surface deposit requirements of FS TT-W- 572, and for waterborne preservative treated materials, the moisture content upon shipment from the treating plant does not exceed 15%.
    - b. Certification of Fire Retardant Treatment: Certification stating name of fire retardant materials used, compliance with local building code requirements and with AWWA Specification C1 and C20 for lumber and C27 for plywood, and that fire retardant materials will not bleed through painted surfaces.

- c. Structural Lumber: Certification that lumber complies with minimum allowable unit stresses. List the lumber species and grade selected for each use, including the design values for each species and grade, together with evidence of compliance with specified requirements.

## 1.5 QUALITY ASSURANCE

- A. Single-Source Responsibility:
  - 1. Fire Retardant Treated Wood: Obtain each type of fire-retardant-treated wood product from one source for both treatment and fire-retardant formulation.
  - 2. Wood Preservative Treatment: Obtain each type of wood preservative treated wood product from one source for both treatment and wood preservative formulation.
- B. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
  - 1. Fire Retardant Treated Wood: Treat those items required by Building Code to be treated and those items shown or specified as "Fire Retardant Treated Wood".

## 1.6 DELIVERY, STORAGE AND HANDLING

- A. Storage and Protection: Keep rough carpentry work under cover and dry during delivery, storage and installation, and until finish is applied and building is enclosed. Protect against exposure to weather and contact with damp or wet surfaces. Provide for air circulation in stacks of lumber and plywood.

## PART 2 - PRODUCTS

### 2.1 WOOD MATERIALS

- A. General
  - 1. Grading Standards: Provide wood products graded and mill-stamped by the applicable grading agency to certify conformance with the specified standards.
    - a. Lumber Grading: Comply with "Simplified Practice Recommendations PS-20, American Softwood Lumber Standards" by U.S. Department of Commerce, and with the applicable lumbermen's association rules under which each species of lumber is produced.
    - b. Plywood Grading: Comply with PS-1 "U.S. Product Standard for Construction & Industrial Plywood" (ANSI A199.1).
  - 2. Grade Marking: Factory mark each piece of lumber with the official grade mark of the appropriate association or authorized inspection service under whose rules the lumber is graded.

3. Sizes and Patterns: Provide lumber which is dressed S4S and worked to such patterns as shown or specified. Dimensions on Drawings designate the nominal undressed size of the item.
4. Moisture Content: Provide lumber which has been seasoned by air drying or kiln drying to a moisture content not to exceed 19%.

B. Lumber

	USE	GRADE	SPECIES
1.	Grounds, nailers, blocking, cants, sleepers, furring	No. 2	Douglas Fir, Southern Pine, or Cedar

C. Plywood

	USE	GRADE	SPECIES
1.	Equipment Backerboards	APA B-C Exposure 1	Group 2
2.	Mirror Backerboards	APA B-C Exterior	Group 1
3.	Countertop Underlayment	APA Marine Grade B-B	Group 1

## 2.2 ANCHORS, FASTENERS AND HARDWARE

- A. Anchors and Fasteners: Where rough carpentry is exposed to weather, in ground contact, contiguous with roofing systems or in area of high relative humidity, provide fasteners of Type 304 stainless steel.
1. Bolts, Nuts, Studs and Washers: Steel bolts complying with ASTM A307, Grade A; with ASTM A563 hex nuts and, where indicated or required, flat washers.
  2. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete:
    - a. Interior Material: Carbon-steel components zinc-plated to comply with ASTM B633, Class Fe/Zn 5. Exterior Material: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.
  3. Lag Screws and Bolts: FS FF-B-561; Stainless steel for exterior use, hot dipped galvanized for interior, type and grade best suited for the purpose.
  4. Nails: FS FF-N-105; type and size best suited for the purpose. Stainless steel for exterior use, hot dipped galvanized for interior.
  5. Toggle Bolts: FS FF-B-588; type and class best suited for the purpose.
  6. Wood Screws: FS FF-S-111; style best suited for the purpose. Stainless steel for exterior use, hot dipped galvanized for interior.
  7. Powder-Driven Fasteners: May be used if permitted by code.

- B. Steel Plates and Shapes: ASTM A36, stainless steel for exterior use, hot dipped galvanized for interior use unless otherwise shown or specified.

### 2.3 PRESERVATIVE TREATMENT

- A. Preservative Treated Wood: Where lumber or plywood is indicated as preservative treated or is specified to be treated, or required to be treated, comply with applicable requirements of AWPA C2 (lumber) and AWPA C9 (plywood). Mark each treated item with the AWPB or SPIB Quality Mark Requirements.
- B. Wood to be Treated: Where lumber or plywood is indicated as preservative-treated wood or as follows:
  - 1. Wood embedded in or in contact with either concrete, masonry or plaster.
  - 2. Wood plates, cants, curbs, cleats and nailing strips in connection with waterproofing, roofing and flashing.
  - 3. Wood framing members less than 18 in. above grade.
- C. Treatment: Pressure treat in a closed retort by vacuum-pressure process in compliance with AWPA C-2 for lumber and AWPA C-9 for plywood.
  - 1. Pressure treat aboveground items with preservatives to a minimum retention of 0.25 lb/cu. ft. After treatment, kiln-dry lumber and plywood to a maximum moisture content of 19 and 15 percent, respectively.
  - 2. Pressure treat wood members in contact with ground or freshwater with preservatives to a minimum retention of 0.40 lb/cu. ft.
  - 3. Procedures for Wood Before Treatment: Complete fabrication of treated items prior to treatment, where possible. If cut after treatment, coat cut surfaces to comply with AWPA M4. Inspect each piece of lumber or plywood after drying and discard damaged or defective pieces.
  - 4. Procedures for Kiln Drying: Kiln-dry woodwork after treatment to levels required for untreated woodwork. Maintain moisture content required by kiln drying before and after treatment
  - 5. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not require incising, contain colorants, bleed through, or otherwise adversely affect finishes.
- D. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Chemical Specialties, Inc.
  - 2. Hickson Corp.
  - 3. Hoover Treated Wood Products, Inc.
  - 4. Osmose Wood Preserving, Inc.
  - 5. Or approved equal.

## 2.4 FIRE RETARDANT TREATED WOOD

- A. Materials: Fire retardant materials shall meet the requirements of AWPA P10.
- B. Treatment: Pressure treat to meet building code requirements and requirements of AWPA C1 and C20 for lumber and C27 for plywood. After fire retardant treatment, kiln dry to the moisture content specified. Do not use colorants in solution to distinguish treated lumber from untreated lumber. Guarantee fire retardant materials not to bleed through painted finish or natural finish. Provide the following:
  - 1. "D-Blaze" (J. H. Baxter Co.).□
  - 2. "D-Blaze" (Chemical Specialties, Inc.).□
  - 3. "Pyro-guard" (Hoover Treated Wood Products).□
  - 4. "Dricon" (Hickson Corp.).□
  - 5. Or approved equal.□
- C. Interior Fire Retardant Treatment: For interior use where relative humidity is normally below 80%; Low-Hygroscopic Formulation; interior Type A per AWPA C20. Provide fire retardant treatment from one of the following:
  - 1. "D-Blaze" (J. H. Baxter Co.).□
  - 2. "D-Blaze" (Chemical Specialties, Inc.).□
  - 3. "Pyro-guard" (Hoover Treated Wood Products).□
  - 4. "Dricon" (Hickson Corp.).□
  - 5. Or approved equal.□
- D. Procedures for Wood Before Treatment: Fabricate and mill wood before treatment wherever possible, and disassemble for treatment, so that cutting and jointing will not be required after treatment. Apply a heavy brush coat of the same fire retardant chemicals to any surfaces which are cut after treatment.
- E. Procedures for Kiln Drying: Kiln-dry woodwork after treatment to levels required for untreated woodwork. Maintain moisture content required by kiln drying before and after treatment.
- F. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not require incising, contain colorants, bleed through, or otherwise adversely affect finishes.

## PART 3 - EXECUTION

### 3.1 GENERAL

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including, components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### 3.2 EXAMINATION

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

### 3.3 PREPARATION

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Coordination: Schedule the Work and coordinate with other trades. Furnish anchors, fastenings and other miscellaneous items required for securing carpentry to other construction. Whenever rough carpentry is fitted to other work, obtain measurements of such other work. Verify dimensions shown and the shop drawing details.
- C. Discard units of material with defects that impair quality of rough carpentry construction and that are too small to use in fabricating rough carpentry with minimum joints or optimum joint arrangement.

### 3.4 INSTALLATION

- A. General Workmanship: Set rough carpentry to required levels and lines, with members plumb and true to line and cut and fitted. Fit rough carpentry to other construction; scribe and cope as required for accurate fit. Correlate location of furring, nailers, blocking, grounds, and similar supports to allow attachment of other construction. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated. Countersink nail heads on exposed carpentry work and fill holes. Select fasteners of size that will not penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting of wood; predrill as required.
- B. Blocking and Nailers
  - 1. Install wood nailers and blocking where shown and where required for attachment of other work. Form to shapes as shown and cut as required for true line and level of work to be attached. Coordinate location with other work involved.
  - 2. Attach to substrates as required to support applied loading. Countersink bolts and nuts flush with surfaces, unless otherwise indicated. Build into masonry during installation of masonry work. Where possible, anchor to formwork before concrete placement.
- C. Equipment Backerboards
  - 1. Provide 3/4 in. thick fire-retardant treated plywood equipment backerboards in telephone and electrical equipment rooms and other locations as shown or required to mount equipment. Comply with local utility company requirements for equipment backerboards.
  - 2. Secure to wall using proper fastening devices for substrates encountered, spaced 12 in. o.c. maximum at perimeter 2 in. from corners and three rows of 3 fasteners each in the backerboard field. Countersink fasteners flush with plywood surface. Butt adjacent panels without lapping. Prepare panels for finish painting as specified in Section 09 90 00 "Paints and Coatings".
- D. Mirror Backerboards: Furnish 1/2 in. thick fire-retardant treated plywood mirror backerboards in toilet rooms and other locations as shown or required to mount mirrors.

- E. Countertop Underlayment: Countertops underlayment to receive solid surfaces shall be primed and sealed on all surfaces and edges with materials compatible with the setting materials.
- F. Repair of Treated Wood Surfaces
  - 1. Apply two (2) heavy brush coats of same wood preservative material to surfaces exposed by sawing, cutting or drilling. Comply with AWPA M-4.
  - 2. Apply heavy brush coat of same fire retardant chemicals to any surfaces which are cut after treatment.
- G. Priming: Paint rough hardware and ferrous metal with one shop coat of specified paint. Paint fire retardant treated wood with one coat of alkyd type paint or a moisture transmission resistant sealer immediately after installation.

**END OF SECTION**

**SECTION 07 13 00 – SHEET WATERPROOFING****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide sheet waterproofing and underslab vapor retarder in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Cast-in-place concrete work.
  - 2. Wall construction is specified in Section 04 20 00 “Unit Masonry”.
  - 3. Building insulation is specified in Section 07 21 00 “Building Insulation”.
  - 4. Roofing is specified in Section 07 55 56 “Fluid-Applied Membrane Roofing”.
  - 5. Protected roofing is specified in Section 07 55 66 “Vegetated Fluid-Applied Protected Membrane Roofing”.

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, they shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. National Roofing Contractor's Association: The NRCA Roofing and Waterproofing Manual.

**1.3 SUBMITTALS**

- A. Product Data: Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work.
- B. Shop Drawings: Submit for Engineer's action. Submit project specific shop drawings for the fabrication and installation of the Work, including but not limited to the following: Prepare details at not less than 3 in. = 1 ft. minimum scale.
  - 1. Penetrations, drains, and projections.
  - 2. Details, including inside and outside corner reinforcements and terminations.
  - 3. Crack and joint treatments, including expansion joints.
  - 4. Interface with contiguous materials.
- C. Quality Control Submittals: Submit for Engineer's information:
  - 1. Test Reports: Furnish test reports indicating and interpreting test

results of membrane waterproofing water testing.

2. Certificates:

- a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree that the selected materials are proper, compatible with contiguous materials and adequate for the application shown.

D. Closeout Submittals

1. Warranties: Special warranties as specified.

#### 1.4 QUALITY ASSURANCE

- A. Qualified Installer/Applicator: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single-Source Responsibility: Obtain membrane waterproofing system from one source of a single manufacturer. Obtain accessory products used in conjunction with membrane waterproofing from the membrane waterproofing manufacturer or from sources acceptable to the membrane waterproofing manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review methods and sequence of membrane installation, special details and conditions, standard of workmanship, testing and quality control requirements, job organization and other pertinent topics related to the Work.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. Packing, Shipping, Handling, and Unloading: Deliver materials in manufacturer's unopened containers identified with name, brand, type, grade, class and other qualifying information. Deliver bulk materials with a certification from the manufacturer stating the name, type and grade of each product used. Furnish certificate accompanying each load (or furnish manufacturer's blanket certificate) for each bulk product used in the Work.
- B. Storage and Protection: Store materials in a dry location, in a manner as to prevent damage or intrusion of foreign matter. Conspicuously mark "Rejected" on materials which have once been wet or damaged and remove from the job site.

## 1.6 PROJECT/SITE CONDITIONS

- A. Requirements: Take necessary precautions against fire and other hazards during delivery, storage and installation of flammable materials specified herein. Comply with local ordinances and fire regulations in the installation of hazardous materials specified or required under this Section.
- B. Weather Conditions: Proceed with sheet waterproofing and associated work only when weather conditions will permit unrestricted use of materials and adequate quality control of work being installed, in compliance with requirements and with recommendations of primary materials manufacturers.

## 1.7 WARRANTY

- A. General: Warranties and guaranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties and guaranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty: Provide a written warranty, signed by the Contractor, Installer and Manufacturer, for a two (2) year period, against leaks or other failures resulting from defects of materials or workmanship. Upon notification of defects, within the warranty period, make the necessary removals, repairs and replacements, at the convenience of the City of New York.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Sheet Waterproofing Membrane System ( **WPS-01** ): Pre applied membrane, factory- made composite, specifically manufacturer for blind side applications, composed of high density polyethylene film, synthetic rubber adhesive and a protective coating, a detackifying surface treatment, an uncoated self-adhering side lap strip, and a release liner formed into uniform flexible sheets.
  - 1. Products: Subject to compliance with requirements, provide the following:
    - a. "Preprufe 300R" (Grace Construction Products) .
    - b. "Colphene BSW (F)" (Soprema Inc.).
    - c. "Underseal Blindside" (Polyguard).
    - d. Or approved equal.
- B. Sheet Waterproofing Membrane System ( **WPS-02** ): Self adhering membrane, minimum 60 mil thickness, composed of 56 mil (1.4mm) rubberized asphalt compound or SBS Modified bitumen factory laminated to a 4 mil (0.10mm) thick polyethylene film with release liner on adhesive side and formed into uniform flexible sheets. Provide one of the following:
  - 1. "Bituthene 4000" (GCP Applies Technologies).
  - 2. "Colphene 3000" (Soprema Inc.).

3. "Blueskin WP 200" (Henry Company).
  4. "SealTight Mel-Rol" (W.R. Meadows, Inc.).
  5. "CCW-MiraDRI 860/861" (Carlisle Coatings & Waterproofing).
  6. Or approved equal.
- C. Underslab Vapor Barrier ( **VB-01** ): ASTM E1745, Class A, min.15 mils, maximum 0.04 perms water vapor permeance. Include manufacturer's recommended adhesive or pressure-sensitive joint tape Provide one of the following:
1. "Vapor Block 15" ( Raven Industries Inc.).
  2. "Griffolyn Type T105" (Reef Industries, Inc.).
  3. "Stego Wrap (15 mil)" (Stego Industries).
  4. Or approved equal.
- D. Insulation: Refer to Section 07 21 00 "Building Insulation".
- E. Water Pervious Fabric (Filter Fabric): Woven or nonwoven polypropylene, polyolefin, or polyester fabric mat, water permeable and resistant to UV degradation, of type and weight recommended by insulation manufacturer for application. One of the following:
1. "Confil Fabric, Grade No. D689H, Product Code No. 9206890" (International Paper Co.).
  2. "Rufon P3B" (Phillips fibers, Inc.)
  3. "Fabrene VIE" (Fabrene, Inc.)
  4. "Trevira Type 0114" (Hoechst Celanese)
  5. Or approved equal.

## 2.2 ACCESSORIES

- A. Substrate Conditioners, Liquid Membrane, Primers, Patching Membranes, Sheet Strips, Mastics, Adhesives, Cleaners, Fillets, Internal and External Angles and Flashings: As recommended by the membrane manufacturer for the purpose intended and compatible with membrane, and with the materials to which it is bonded.
- B. Detail Tape: Two-sided, pressure-sensitive, self-adhering reinforced tape, 4 in. wide, with a tack-free protective adhesive coating on one side and release film on self-adhering side.
- C. Joint Tape: Two-sided, pressure-sensitive, self-adhering reinforced tape, 8 in. wide, with a tack-free protective adhesive coating on one side and release film on self- adhering side.
- D. Metal Termination Bars: Aluminum bars, approximately 1 in. x 1/8 in. thick, predrilled at 9 in. centers.
- E. Protection Board: Premolded, 1/8 in. thick for vertical surfaces and 1/4 in. thick for horizontal surfaces, semi-rigid board complying with ASTM D6506 Type 2 Class B consisting of mineral stabilized core sandwiched between

layers of asphalt saturated felt, surface coated with asphalt and sealed to core under heat and pressure and provide with polyethylene film facings.

- F. Nonwoven-Geotextile-Faced, Molded-Sheet Drainage Panel: Manufactured composite subsurface drainage panels consisting of a nonwoven, needle-punched geotextile facing with an apparent opening size not exceeding No. 70 sieve laminated to 1 side and a polymeric film bonded to the other side of a 3-dimensional, non-biodegradable, molded-plastic-sheet drainage core, with a vertical flow rate of 9 to 15 gpm/ft.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates, apply primers and install the work of this Section, including (equipment, components, and) accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Manufacturer's Representation: The manufacturer of the sheet waterproofing membrane and the applicator shall inspect the first pour of concrete substrate to review the acceptability of the concrete for application of the waterproofing membrane system.
- C. Verify that curing compounds or surface hardeners incompatible with membrane waterproofing system have not been used on concrete surfaces.

### **3.3 PREPARATION**

- A. Substrate Acceptability Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Cleaning of Substrate: Clean substrate of debris and deleterious material which would impair the Work. Patch cracks, voids and honeycombs to provide a smooth, structurally sound surface. Cut off high spots and grind smooth. Apply surface conditioners as required.
- C. Piping, Conduit And Other Penetrations: Do not proceed with membrane waterproofing until drains, piping, conduit, vents, ducts and other projections through the substrate have been installed. Holes, honeycombs and cavities shall be pointed or filled and finished flush. Cut off high spots and grind smooth.
- D. Treatment of Corners: Treat external and internal corners of substrate as shown and recommended.

### **3.4 INSTALLATION: SHEET MEMBRANE WATERPROOFING**

- A. Services Of The Manufacturer: At the start of the installation and periodically as work progresses provide the services of the manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.
- B. Priming, Cleaning and Treatment of Joints. Prime substrate surfaces. Remove dust and dirt from joints and cracks according to ASTM D4258. Treat non-moving cracks, penetrations, control joints and other joints in substrate with materials, methods and designs.
- C. Seams: Follow recommended techniques for cleaning, seam, lap and splice areas, for the method and sequence of forming field joints in the membrane. Weld roll seams, with no gaps in adhesion. Seal membrane terminations, exposed edges of membrane terminations not concealed by metal counterflashings or ending in reglets and "T" joints with mastic sealant bead.
- D. Flashing: Install flashing as shown or required, properly lapped and adhered in place. Flash pipes, conduits, sleeves, and other projections passing through membrane waterproofing and provide tight construction throughout. Use prefabricated boots or field-fabricated boots, fitted coverings, and other accessories as required. Where pipes or conduits pass through floor areas to be waterproofed or where floor drains occur in areas to be waterproofed, apply membrane waterproofing only after flashing around pipes, conduits and drains is in place. Lap flashing into the membrane with reinforcing strips provided as required.
- E. Protection Board: Install protection board forming a continuous overall protective layer. Butt edges tightly, stagger end joints and cut to fit at intersecting surfaces
- F. Water Cutoffs: Provide water cut-offs as required.

### **3.5 VAPOR RETARDER INSTALLATION**

- A. Install vapor barrier per manufacturer's written instructions. Avoiding cutting or puncturing vapor barrier during reinforcement placement and concreting operations.
- B. Do not place concrete over vapor barrier until breaks have been patched and sealed.

### **3.6 FIELD QUALITY CONTROL**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.

### **3.7 CITY OF NEW YORK'S MONITORING ACTIVITIES**

- A. City of New York's Testing Agency: A testing agency, engaged at the City of New York's expense, will perform the following activities to monitor the Contractor's Quality Control Program. The monitoring activities do not relieve the Contractor of responsibilities under the Contract.
- B. Contractor's Assistance to the City of New York's Testing Agency: Furnish the City of New York's Testing Agency with access to the Work, materials and

facilities as required by the Agency. Provide adequate notice of construction activities to allow timely inspections and observation of Contractor tests, and be available for pre- installation meetings. Furnish the City of New York's Testing Agency with on-site office facilities.

- C. The testing agency shall inspect and report on the following:
  - 1. Field Seams: Inspection of the field seams to assure manufacturer's quality requirements are maintained throughout the installation period. Each field seam, shall be 100% inspected and a written report prepared by the testing agency shall be submitted.
  - 2. Membrane Adhesion: Inspection of the membrane to verify full membrane adhesion to the substrate including inspection of inside and outside corners and to assure manufacturer's quality requirements are maintained throughout the installation period.

### **3.8 PROTECTION**

- A. General: Protect sheet waterproofing from damage during construction period so that it will be without indication of abuse or damage at time of acceptance. Protect the building and adjacent construction from damage resulting from spillage, dripping and dropping of materials. Repair and restore other work damaged during sheet waterproofing operations. Prevent materials from running into and clogging drains.
- B. Insulation over Waterproofing: Where insulation occurs over waterproofing install to assure complete coverage.

**END OF SECTION**

## SECTION 07 23 00 – BUILDING INSULATION

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide building insulation in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Wall insulation as part of wall construction is specified in Section 04 20 00 “Unit Masonry”.
  - 2. Roof insulation as part of roofing construction is specified in Section 07 55 56 “Fluid Applied Membrane Roofing”.
  - 3. Roof insulation as part of roofing construction is specified in Section 07 55 66 “Vegetated Fluid Applied Protected Membrane Roofing”.
  - 4. Mechanical equipment, piping and ductwork insulations are specified in Division 21, 22 and 23 specification sections.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.

#### 1.3 SYSTEM DESCRIPTION

- A. Performance Requirements:
  - 1. Fire Resistive Rating: Identify materials with appropriate markings of applicable testing and inspecting agency.
    - a. Where materials are required by law or are specified to have a fire resistive rating, provide materials, accessories and application procedures which have been listed by UL or tested according to ASTM E814/UL 1479 to achieve the rating required.
    - b. Surface-Burning Characteristics: ASTM E84. Where specified or required provide the following maximum flame spread and smoke developed ratings when materials are tested in accordance with ASTM E84:
      - 1) Unfaced material will have a maximum flame spread and smoke-developed of 0.
      - 2) Faced material will have maximum flame spread and smoke- developed of 25 and 0 respectively.
    - c. Combustibility: Glass, slag-wool-fiber/rock-wool-fiber insulations shall be rated as non combustible as defined by

NFPA standard 220 when tested in accordance with ASTM E136.

2. Fungi Resistance: Blanket and/or Batt Insulation and facing shall be fungi resistant when tested in accordance with ASTM C1338 "Standard Test Method for Determining Fungi Resistance of Insulation Materials and Facings".

#### **1.4 SUBMITTALS**

- A. Product Data: Submit for Engineer's action. Submit manufacturer's literature specifications, and installation instructions describing the general properties of each material and accessory to be used in the Work.
- B. Closeout Submittals Submit for City of New York's documentation.
  1. Warranties: Special warranties as specified.

#### **1.5 QUALITY ASSURANCE**

- A. Single-Source Responsibility for Insulation Products: Obtain each type of building insulation from a single source with resources to provide products complying with requirements indicated without delaying the Work.
- B. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- C. Pre-Installation Conference: Prior to the start of the Work, meet at the Project site to review methods and sequence of building insulation installation, special details and conditions, standard of workmanship, quality control requirements, job organization and other pertinent topics related to the Work.

#### **1.6 DELIVERY, STORAGE, AND HANDLING**

- A. Packing, Shipping, Handling, and Unloading: Deliver insulation materials in manufacturer's unopened containers or packages, fully identified with trade name, type, class, and other identifying information.
- B. Storage and Protection: Store above grade and protect from weather and damage. Do not allow insulation to become wet, soiled, or covered with ice or snow. Protect insulation from exposure to high temperatures, excessive exposure to sunlight, and contact with hot surfaces in excess of the safe temperature indicated by the manufacturer
- C. Extruded Polystyrene Insulation Exposure: Prohibit exposure of extruded polystyrene board insulation to sunlight except to extent necessary for period of installation and concealment. Protect against ignition at all times.

#### **1.7 WARRANTY**

- A. General: Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  1. Special Warranty: Upon completion of the work, provide the extruded polystyrene insulation manufacturer's fifteen (15) year warranty

stating that the thermal resistance of the extruded polystyrene insulation will not vary more than 10% from its published value.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Extruded Polystyrene Board Insulation ( **INS-01** ): Rigid, closed-cell extruded expanded polystyrene with integral high density skin complying with ASTM C578, Type VI, minimum compressive strength of 40 psi, minimum R-Value of 5.0 per 1 in. thickness at 75 deg. F.; manufacturer's standard sizes; thickness as shown; with channeled edges; one of the following:
1. "Styrofoam RoofMate" (The Dow Chemical Co.).
  2. "Foamular 400 XPS" (Owens-Corning Corp.).
  3. "CertiFoam 40" (DiversiFoam Products).
  4. "GreenGuard CM Insulation Board" (Pactiv Building Products).
  5. Or approved equal.
- B. Extruded Polystyrene Board Insulation ( **INS-02** ): Rigid, closed-cell extruded expanded polystyrene with integral high density skin complying with ASTM C578, Type VII, minimum compressive strength of 60 psi; minimum R-Value of 5.0 per 1 in. thickness at 75 deg F. standard sizes; thickness as shown; with channeled edges; one of the following:
1. "Styrofoam PlazaMate" (The Dow Chemical Co.).
  2. "Foamular 604" (Owens-Corning Corp.).
  3. "CertiFoam Plaza Deck" (DiversiFoam Products).
  4. Or approved equal.
- C. Semi-Rigid Insulation Board for Use in Exterior Enclosure Vertical Cavities ( **INS-03** ): Water repellant mineral wool fiber insulation made from basalt rock and slag for specific use as cavity wall insulation and thermo-setting resins complying with ASTM C612, Type IVB;; minimum R-Value of 4.3 at 75 deg F.; non-corrosive to steel, fungi resistant, flame spread rating of 0 smoke developed 0 or less when tested in accordance with ASTM E84; a moisture resistance of 0.07% when tested in accordance with ASTM C1104; manufacturer's standard sizes in dark color if available; thickness shown. Provide one of the following
1. "CavityRock DD" (Rockwool).
  2. "Rainbarrier HD" (Thermafiber).
  3. "Cladstone" (Johns Manville).
  4. Or approved equal.

### 2.2 ACCESSORIES

- A. Adhesive for Bonding Insulation: Type recommended by insulation manufacturer and having fire resistance characteristics similar to that of the

insulation.

- B. Cavity Wall Insulation Adhesive: As recommended by the cavity wall insulation manufacturer, compatible with contiguous substrates and materials.
- C. Sealer and Tape: Type recommended by insulation manufacturer and having perm rating and fire resistance characteristics similar to that of the insulation.
- D. Welded or Adhesively Attached Mechanical Fasteners: Stainless steel fasteners consisting of a perforated stainless steel plate and stainless steel prongs or spindles and self-locking washer; length to suit depth of insulation shown; Where spindles will be exposed to human contact after installation, protect ends with capped self-locking washers; Provide one of the following:
  - 1. "Tactoo Insul-Hangers" (AGM Industries, Inc.).
  - 2. "Insulation Hangers" (Gemco).
  - 3. "Stic-Klip Type N Fasteners" (Eckel Industries of Canada).
  - 4. Or approved equal.
- E. Insulation Standoff: Spacer fabricated from stainless steel sheet for fitting over spindle of insulation anchor to maintain air space between face of insulation and substrate to which anchor is attached where indicated and/or required by substrate manufacturer.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates, apply primers and apply the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.
- B. Markings: Manufacturer's identification tags or marks are not acceptable on surfaces where products are considered to be finish material. Evidence of patching after removal of tags or marks is not acceptable.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

### **3.3 INSTALLATION**

- A. Extent of Insulation: Extend insulation full thickness over entire area to be insulated. Install in single layer unless otherwise shown or recommended by manufacturer. Cut and fit insulation tightly around obstructions and against each other. Neatly finish insulation exposed to view without broken corners or open joints. Use **Type INS-03** insulation where no other specific type is shown.

- B. Installation over Waterproofing: Lay rigid insulation over waterproofing with beveled edges down and with slightly open joints. Seal edges of other board insulation with sealer to form a tight seal between units.
- C. Installation of Cavity Wall Board Insulation: Install as recommended by manufacturer. Fit courses of insulation between ties, anchors, supports and other obstructions, with edges butted tightly in both directions. Press units firmly against inside substrates.
- D. Installation of Insulation: Apply insulation units to substrates by method indicated, complying with manufacturer's written instructions. If no specific method is indicated, bond units to substrate with adhesive or use mechanical anchorage to provide permanent placement and support of units.
  - 1. Mineral-Wool Blanket Insulation: Install in cavities according to the following requirements:
  - 2. Use insulation widths and lengths that fill the cavities. If more than one length is required to fill the cavities, provide lengths that will produce a snug fit between ends.
  - 3. Place insulation in cavities to produce a friction fit between edges of insulation and adjoining framing members.
  - 4. Maintain  $\frac{3}{4}$  in. clearance of insulation around recessed lighting fixtures not rated for or protected from contact with insulation.
  - 5. For wall cavities where cavity heights exceed 8 ft. support unfaced blankets mechanically and support faced blankets by taping flanges of insulation to flanges of metal studs.
  - 6. Vapor-Retarder-Faced Blankets: Tape joints and ruptures in vapor-retarder facings, and seal each continuous area of insulation to ensure airtight installation.
  - 7. Exterior Walls: Set units with facing placed toward exterior of construction as indicated on Drawings unless otherwise shown or required by manufacturer.
- E. Installation of Insulation for Concrete Vertical Substrates: Verify, with manufacturer, methods of installation of insulation for vertical concrete substrates.
  - 1. Install board insulation on concrete substrates by adhesively attached, spindle-type insulation anchors as follows:
  - 2. Fasten insulation anchors to concrete substrates with insulation anchor adhesive according to anchor manufacturer's written instructions. Space anchors according to insulation manufacturer's written instructions for insulation type, thickness, and application indicated.
  - 3. Apply insulation standoffs to each spindle to create cavity width indicated between concrete substrate and insulation.
  - 4. After adhesive has dried, install board insulation by pressing insulation into position over spindles and securing it tightly in place with insulation-retaining washers, taking care not to compress insulation

below indicated thickness.

5. Where insulation will not be covered by other building materials, apply capped washers to tips of spindles.
- F. Miscellaneous Voids: Install insulation in miscellaneous voids and cavity spaces where required to prevent gaps in insulation.
- G. Installation of Vapor Retarders: Place vapor retarders on side of construction indicated on Drawings. Extend vapor retarders to extremities of areas to protect from vapor transmission. Secure vapor retarders in place with adhesives or other anchorage system as indicated. Extend vapor retarders to cover miscellaneous voids in insulated substrates, including those filled with loose-fiber insulation.
1. Seal vertical joints in vapor retarders over framing by lapping no fewer than two studs.
  2. Before installing vapor retarders, apply urethane sealant to flanges of metal framing including runner tracks, metal studs, and framing around door and window openings. Seal overlapping joints in vapor retarders with vapor-retarder tape according to vapor-retarder manufacturer's written instructions. Seal butt joints with vapor-retarder tape. Locate all joints over framing members or other solid substrates.
  3. Firmly attach vapor retarders to metal framing and solid substrates with vapor-retarder fasteners as recommended by vapor-retarder manufacturer.
- H. Maintenance of Vapor Barrier: Maintain integrity of vapor barriers of insulation by taping and sealing joints, ruptures and edges of units adjoining other surfaces. Seal joints caused by pipes, conduits, electrical boxes and similar items penetrating vapor barriers to create an air-tight seal between penetrating objects and vapor barrier. Repair any tears or punctures in vapor retarders immediately before concealment by other work. Cover with tape or another layer of vapor barrier

### **3.4 PROTECTION**

- A. General: Protect installed insulation, vapor barriers and accessories from harmful weather exposures and from possible physical abuse. Replace insulation damaged or unsuitable for use.

**END OF SECTION**

## SECTION 07 27 10 – AIR VAPOR BARRIER

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide building insulation in accordance with requirements of the Contract Documents.
- B. This Section includes but is not limited to the following:
  - 1. Provide air vapor barrier system at all exterior wall locations.
  - 2. Provide all accessory components required for a complete installation, including transitions to maintain continuity of the air vapor barrier to adjacent construction.
  - 3. Coordinate with testing agencies performing specified field testing and inspections. Testing agency and Special Inspector may be two separate entities.
- C. Related Sections include but are not limited to the following:
  - 1. Exterior Wall Construction components related to self adhering sheet air vapor barriers:
  - 2. Section 07 23 00, "Building Insulation".
  - 3. Sealants and joint fillers are specified in Section 07 92 50 "Joint Sealers".
  - 4. Section 07 62 00 "Flashing and Sheet Metal" for through-wall flashings. Through wall flashings shall be metal.

#### 1.2 REFERENCES

- A. References and industry standards listed in this Section are applicable to the Work. Unless more restrictive criteria or differing requirements are explicitly stated in the Specifications, or mandated by governing codes or regulations, the recommendations, suggestions, and requirements described in the referenced standards shall be deemed mandatory and applicable to the Work.
  - 1. American Society of Testing and Materials (ASTM).
  - 2. National Institute of Standards and Technology (NIST).
  - 3. Code of Federal Regulations (CFR).

#### 1.3 DEFINITIONS

- A. Air Vapor Barrier: The collection of air vapor barrier materials and auxiliary materials applied to an opaque wall, including joints and junctions to abutting construction, to control movement of air and water through the wall.

#### 1.4 SUBMITTALS

- A. Product Data
  - 1. Include manufacturer's written instructions for evaluating, preparing,

and treating substrate; technical data; and tested physical and performance properties of air vapor barrier. Include curing requirements for all substrates and membrane materials. Include installation instructions for all materials. Installation instructions shall take into account the sequence of installation of adjacent construction materials.

B. Shop Drawings

1. Show locations and extent of air vapor barrier. Include details for substrate joints and cracks, counterflashing strip, penetrations, inside and outside corners, terminations, and tie-ins with adjoining construction. Details shall include all conditions and auxiliary materials required for the provision of an air vapor barrier continuous with other elements of the building envelope, whether or not these are indicated explicitly on the contract Drawings.
2. Include details of interfaces with other materials that form part of air vapor barrier. Include details of interfaces with other materials that form part of the water drainage plane, including metal through-wall flashing, termination bars, and sealants.
3. Details shall indicate conditions specific to the Project. Manufacturer's typical details that do not reflect the actual Project conditions are insufficient. Details shall allow for proper sequence of installation of all components of the building envelope.
4. Include details of mockups.

C. Product Certificates

1. For air vapor barriers, provide manufacturer's product certification documents certifying compatibility of air vapor barrier and accessory materials with Project materials that connect to or that come in contact with the specified air vapor barrier system.
2. Contacted materials shall include, but not be limited to, exterior sheathing board, concrete, steel members, building insulation, insulation adhesives, flashing, stainless steel flashing, flashing termination bar, termination bar sealant, door and window frames, roofing membranes.

D. Warranty

1. Submit Manufacturer's Warranty.

E. Mock-up: Provide mock-up as indicated under Quality Assurance.

F. Qualification Data

1. For applicator/installer.
2. For membrane manufacturer.
3. For Company Field Advisor.

G. Test and Inspection Reports

1. Product test reports: Based on evaluation of comprehensive tests performed by a qualified independent testing agency, for air vapor

- barriers.
- 2. Test Reports
- 3. Field Inspection Reports
- H. Certifications
  - 1. Air Water barrier manufacturer's Field Advisor's certification of completed Work: As specified.
- I. Closeout Submittals
  - 1. Warranties: Special warranties as specified.

## 1.5 QUALITY ASSURANCE

- A. Qualifications
  - 1. Applicator Qualifications: A firm experienced in applying air vapor barrier materials similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in-service performance.
  - 2. Membrane Manufacturer Qualifications: The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- B. Company Field Advisor
  - 1. Secure the services of a Company Field Advisor of the air vapor barrier manufacturer. The Field Advisor shall be certified in writing by the manufacturer to be technically qualified in design, installation, and servicing of the required products. Personnel involved solely in sales do not qualify. The Field Advisor shall be present at the pre-installation conference, at construction of the mockup, at the beginning of the actual air vapor barrier installation, and as necessary throughout the project for the purpose of:
    - a. Rendering technical assistance to the Contractor regarding installation procedures of the system.
    - b. Familiarizing the Engineer with all aspects of the system.
    - c. Answering all questions which might arise.
  - 2. The Field Advisor shall make periodic visits during the execution of the Work, and shall certify the Work upon completion.

C. Mockups

1. Before beginning installation of air vapor barrier, build mockups of exterior wall assembly, at least 150 sq. ft. of each assembly type, incorporating backup wall construction, window or window receptor, door frame and sill, insulation, and flashing to demonstrate surface preparation, sequence of installation, crack and joint treatment, and sealing of gaps, terminations, transitions, and penetrations of air vapor barrier membrane.
  - a. Include parapet condition, building corner condition, and foundation wall intersection.
2. Coordinate construction of mockup to permit access for inspection by testing agency of air vapor barrier before architectural precast concrete or metal wall panel assembly is installed.
3. If the Engineer determines that mockups do not comply with requirements, reconstruct mockups and apply air vapor barrier until mockups are approved.
4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

D. Pre-installation Conference

1. Conduct conference at Project site.
2. Include installers of other construction connecting to air vapor barrier, including but not limited to waterproofing, exterior sheathing board, sealants, flashing, windows, door frames, and roofing as applicable.
3. Review air vapor barrier requirements including surface preparation, substrate condition and pretreatment, minimum substrate curing period, forecasted weather conditions, special details and flashings, mockups, installation procedures, sequence of installation, testing and inspecting procedures, and protection and repairs.

## 1.6 PERFORMANCE REQUIREMENTS

- A. General: Air vapor barrier shall perform as a continuous vapor-retarding air vapor barrier and as a liquid-water drainage plane flashed to discharge to the exterior incidental condensation or water penetration. Air vapor barrier assemblies shall accommodate substrate movement and seal substrate expansion and control joints, construction material changes, and transitions at perimeter conditions without deterioration and air leakage exceeding specified limits. Air vapor barrier shall withstand positive and negative air pressure without damage or displacement. Air vapor barrier shall pass preconstruction testing and field quality control testing and inspection as specified.

## 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Store rolls according to manufacturer's written instructions.
- B. Store liquid membrane accessory materials in their original undamaged packages in a clean, dry, protected location and within temperature range

required by air vapor barrier manufacturer. Remove and replace liquid membrane accessory materials that cannot be applied within their stated shelf life.

- C. Protect stored materials from direct sunlight.

## 1.8 ENVIRONMENTAL REQUIREMENTS

- A. Apply air vapor barrier within the range of ambient and substrate temperatures recommended by air vapor barrier manufacturer. Protect substrates from environmental conditions that affect performance of air vapor barrier. Do not apply air vapor barrier to a damp or wet substrate or during snow, rain, fog, or mist.

## 1.9 WARRANTY

- A. Manufacturer's Warranty
  - 1. Submit manufacturer's two (2) year Warranty that air vapor barrier and accessories are free of defects and are manufactured to meet manufacturer's published properties and the requirements of this Specification. Manufacturer shall promptly replace defective materials without cost or expense to New York City.

## PART 2 – PRODUCTS

### 2.1 MATERIALS

- A. Sheet Air Vapor Barrier Membrane System ( **WPS-03** ): Sheet applied, vapor impermeable, air vapor barrier, weather membrane formed into uniform flexible sheets. Provide one of the following:
  - 1. Basis of Design: "Perm-A-Barrier" (GCP Applied Technologies) but not intended to imply a preference for a specific product.
  - 2. Or equal as approved by Engineer as manufactured by:
    - a. Henry Company.
    - b. W.R. Meadows, Inc.
    - c. Carlisle Coatings & Waterproofing.
    - d. Or approved equal.
  - 3. Products selected shall comply with the following minimum physical characteristics:
    - a. Sheet Waterproofing Membrane:
      - 1) Air Permeance, ASTM E2178: Not to exceed 0.004 cfm/sq. ft. under a pressure differential of 0.3 in. water. (1.57 psf)
      - 2) Water Vapor Permeance, Not to exceed 0.05 perm; ASTM E 96, Water Method.
      - 3) Tensile Strength: 400 psi minimum; ASTM D412, Die C, modified.
      - 4) Ultimate Elongation: 200% minimum; ASTM D412, Die C, modified.

- 5) Low-Temperature Flexibility: Pass at -45 deg. F.; ASTM D1970.
  - 6) Puncture Resistance: 40 lbf min.; ASTM E154.
  - 7) Lap Peel Adhesion: 5lbf/in. width; ASTM D1876, at minimum application temperature, modified.
  - 8) Water Absorption: 0.10% weight gain max. after 72 hour immersion at 70.
- b. Transition Membrane:
- 1) Perm-A-Barrier Detail Membrane manufactured by GCP; a 36 mil (0.9mm) of self-adhesive rubberized asphalt integrally bonded to 4 mil (0.1 mm) of cross-laminated, high-density polyethylene film to provide a min. 40 mil (1.0 mm) thick membrane. Membrane shall be interleaved with disposable silicone-coated release paper until installed, conforming to the following:
    - a) Water Vapor Transmission, ASTM E96, Method B: 2.9 ng/m<sup>2</sup>sPa (0.05 perms) max.
    - b) Air Permeance at 75Pa (0.3 in. water) pressure difference: 0.0006 L/(s.m<sup>2</sup>) (0.00012 cfm/ft<sup>2</sup>) max.
    - c) Puncture Resistance, ASTM E154: 178 N (40 lbs.) min.
    - d) Lap Adhesion at -4°C (25°F), ASTM D1876: 880 N/m (5.0 lbs./in.) of width
    - e) Low Temperature Flexibility, ASTM D1970: Unaffected to -43°C (-45°F)
    - f) Tensile Strength, ASTM D412, Die C Modified: min. 2.7 MPa (400 psi)
    - g) Elongation, Ultimate Failure of Rubberized Asphalt, ASTM D412, Die C: min. 200%.
- c. Primers
- 1) Primer for Primary Self-adhered air vapor barrier membrane: Perm-A-Barrier Primer Plus manufactured by GCP; a water- based primer which imparts an aggressive, high tack finish on the treated substrate. Product shall have the following minimum physical properties:
    - a) Color: Milky White (wet), Clear (dry)
    - b) Weight: 8.25 lbs./gal.
    - c) Solids Content (by wt.): 53-57%
    - d) Solvent Type: Water
    - e) VOC Content: Not to excess 1 g/L
    - f) Application Temperature: 4°C (40°F) and above
  - 2) Wall Primer for Self-adhered transition membrane and Self- adhered flexible membrane wall flashing: Perm-A- Barrier WB Primer manufactured by GCP; a water-

based primer which imparts an aggressive, high tack finish on the treated substrate. Product Shall have the following minimum physical properties:

- a) Flash Point: No flash to boiling point
  - b) Solvent Type: Water
  - c) VOC Content: Not to exceed 10 g/L
  - d) Application Temperature: -4°C (25°F) and above
  - e) Freezing point (as packaged): -7°C (21°F)
- d. Penetrations and Termination Sealant
- 1) Liquid Membrane for Details and Terminations: Bituthene Liquid Membrane manufactured by GCP; a two-part, elastomeric, trowel grade material designed for use with self-adhered membranes and tapes. 10 g/L max. VOC content.
- e. Substrate Patching Membrane: Bituthene Liquid Membrane manufactured by GCP; a two-part, elastomeric, trowel grade material designed for use with self-adhered membranes and tapes. 10 g/L max. VOC content.

## 2.2 ACCESSORIES

- A. General: Auxiliary materials recommended by air vapor barrier manufacturer for intended use and compatible with air vapor barrier membrane. Provide auxiliary materials required for the provision of an air vapor barrier continuous with other elements of the building envelope, whether or not these materials are indicated explicitly on the contract Drawings.
- B. Joint Reinforcing Strip: Air vapor barrier manufacturer's glass-fiber-mesh tape.
- C. Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304, 0.0250 inch thick, and Series 300 stainless-steel fasteners.
- D. Sprayed Polyurethane Foam Sealant: 1- or 2-component, foamed-in-place, polyurethane foam sealant, 1.5 to 2.0 lb/cu. ft. density; flame spread index of 25 or less according to ASTM E 162; prepare substrate with non-corrosive materials as recommended by foam sealant manufacturer. Air vapor barrier manufacturer shall confirm compatibility.
- E. Joint Sealant: ASTM C 920, single-component, neutral-curing silicone; Class 100/50 (low-modulus), Grade NS, Use NT related to exposure, and, as applicable to joint substrates indicated, Use O. Air vapor barrier manufacturer shall confirm compatibility with this and all other joint sealants that contact air vapor barrier system materials.

## PART 3 - EXECUTION

### 3.1 GENERAL

- A. Examine substrates, areas, and conditions for compliance with requirements

and other conditions affecting performance.

- B. Verify that substrates are sound and free of oil, grease, dirt, or other contaminants.
- C. Verify that sealants have cured for minimum time period recommended by sealant manufacturer.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 SURFACE PREPARATION**

- A. Clean, prepare, treat, and seal substrate according to manufacturer's written instructions. Provide clean, dust-free, and dry substrate for air vapor barrier application.
- B. Mask off adjoining surfaces not covered by air vapor barrier to prevent spillage and overspray affecting other construction.
  - 1. Remove projections, and fill honeycomb, holes, and other voids in concrete with substrate patching material recommended by air vapor barrier manufacturer.
  - 2. At changes in substrate plane, apply sealant or termination mastic beads at sharp corners and edges to form a smooth transition from one plane to another.
  - 3. Cover gaps in substrate plane and form a smooth transition from one substrate plane to another with stainless-steel sheet mechanically fastened to structural framing to provide continuous support for air vapor barrier. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations with termination mastic and according to ASTM D 6135.
  - 4. Apply primer to substrates at required rate and allow it to dry. Limit priming to areas that will be covered by air-barrier sheet on same day. Reprime areas exposed for more than 24 hours.
    - a. Prime glass-fiber-surfaced exterior sheathing with number of prime coats needed to achieve required bond, with adequate drying time between coats.

### **3.3 INSTALLATION OF TRANSITION STRIPS AND OTHER AUXILIARY MATERIALS**

- A. Install strips, transition strips, and auxiliary materials according to air vapor barrier manufacturer's written instructions to form a seal with adjacent construction and maintain a continuous air vapor barrier meeting all performance requirements.
  - 1. Coordinate the installation of air vapor barrier with installation of roofing membrane and parapet flashing to ensure continuity of air vapor barrier.
  - 2. Coordinate the installation of air vapor barrier to allow for proper sequence of installation of all components of the building envelope.
- B. Apply adhesive primer to substrates at required rate. Cover with air vapor barrier strips in accordance with manufacturer's instructions.

- C. Align and position transition membrane, remove protective film and press firmly into place. Ensure minimum 2 inch overlap at all end and side laps.
- D. Connect and seal exterior wall air vapor barrier membrane continuously to concrete below-grade structures, floor-to floor construction, parapet/roof construction, exterior glazing and window systems, exterior louvers, exterior door frames, other construction used in exterior wall openings, moving joints, and the interface of dissimilar materials, using strips and auxiliary materials. Provide a continuous air-tight covering over all surfaces, transitions and around penetrations. Allow for relative movement of different assemblies. Promptly roll all laps and membrane with a counter top roller to effect seal.
- E. A continuous air vapor barrier shall be installed, sealing all seams, joints, openings, and penetrations, maintaining the integrity of the air vapor barrier. Sealing materials spanning joints between construction materials shall allow for expansion, contraction, and other movement of the materials. Provide sealed connections between all transitions in planes and changes in materials. Provide flexible seals where necessary to accommodate relative movement of adjacent components.
- F. At end of each working day, seal top edge of strips and transition strips to substrate with termination mastic.
- G. Apply joint sealants forming part of air vapor barrier assembly within manufacturer's recommended application temperature ranges. Consult air vapor barrier and sealant manufacturers for equivalent alternative when specified sealant cannot be applied within these temperature ranges.
- H. Connect and seal exterior wall air-barrier membrane continuously to roofing-membrane, concrete below-grade structures, floor-to-floor construction, exterior glazing and window systems, glazed curtain-wall systems, storefront systems, exterior louvers, exterior door framing, and other construction used in exterior wall openings, using accessory materials.
- I. Wall Openings: Apply adhesive primer to concealed perimeter frame surfaces of windows, doors, and curtain wall systems. Apply aluminum faced detail membrane flashing so that a minimum of 3 inches of coverage is achieved over both substrates. Maintain 3 inches of full contact over firm bearing to perimeter frames. Roll transition strip firmly to enhance adhesion.
- J. Fill gaps in perimeter frame surfaces of windows, doors, curtain wall systems, and miscellaneous penetrations of air vapor barrier membrane with foam sealant (type as recommended by manufacturer). Ensure that foam sealant does not interfere with drainage or cause deflection of frames or other adverse effects.
- K. Seal strips and transition strips around penetrations with termination mastic.
- L. Seal top of through-wall flashings and termination bars to air vapor barrier with an additional 6-inch-wide counterflashing strip, or with additional overlapping air vapor barrier membrane material, as recommended by the membrane manufacturer. Use material compatible with copper/fabric flashing, termination bar, and sealant bead at top of termination bar.
- M. Seal exposed edges of strips at seams, cuts, penetrations, and terminations not concealed by metal counterflashings or ending in reglets with termination

mastic.

- N. Repair punctures, voids, and deficient lapped seams in strips and transition strips. Slit and flatten fishmouths and blisters. Patch with transition strips extending 6 inches beyond repaired areas in strip direction.

### **3.4 AIR VAPOR BARRIER MEMBRANE INSTALLATION**

- A. Apply and firmly adhere air vapor barrier membrane to substrates, in conjunction with and sealed to strips and transition strips, to achieve a continuous, fully adhered air vapor barrier system. Installation shall be in accordance with air vapor barrier manufacturer's written instructions. Seal all leakage pathways.
- B. Apply air vapor barrier membrane within manufacturer's recommended application temperature ranges.
- C. Detail membrane strips and air membrane shall overlap a minimum of 3", or in accordance with air vapor barrier manufacturer's written instructions.
- D. Install air vapor barrier sheets and auxiliary materials to form a seal with adjacent construction and to maintain a continuous air vapor barrier.
- E. Coordinate the installation of air vapor barrier with installation of roofing membrane and base flashing to ensure continuity of air vapor barrier with roofing membrane.
- F. Install flashing strip recommended by air vapor barrier on roofing membrane or base flashing so that a minimum of 3 in. of coverage is achieved over both substrates.
- G. Connect and seal exterior wall air vapor barrier membrane continuously to roofing membrane barrier, exterior glazing and window systems, storefront systems, exterior louvers, exterior door framing, and other construction used in exterior wall openings using accessory materials and according to manufacturer's tested assembly.
- H. Wall Openings: Prime concealed perimeter frame surfaces of windows, storefronts, doors and other wall openings. Apply aluminum faced detail flashing sheet as recommended by air vapor barrier manufacturer so that a minimum of 3 in. of coverage is achieved over both substrates. Maintain 3 in. of full contact over firm bearing to perimeter frames with not less than 1 in. of full contact.
- I. Fill gaps in perimeter frame surfaces of storefronts, doors, and miscellaneous penetrations of air vapor barrier membrane with compatible sealant approved by air vapor barrier manufacturer.
- J. At end of each working day, seal top edge of membrane to substrate with termination mastic.
- K. Apply joint sealants forming part of air vapor barrier assembly within manufacturer's recommended application temperature ranges. Consult manufacturer when sealant cannot be applied within these temperature ranges.
- L. Repair punctures, voids, and deficient lapped seams in air vapor barrier. Slit and flatten fishmouths and blisters. Patch with air vapor barrier sheet

extending 6 in. beyond repaired areas in all directions.

- M. Provide access to the air vapor barrier for testing and inspection by the testing agency and by the Engineer. Do not cover air vapor barrier until the completion of a curing period if recommended by the membrane manufacturer for air vapor barrier systems requiring a separate application of adhesive. Do not leave air vapor barrier exposed longer than recommended by manufacturer.
- N. Correct deficiencies in or remove air vapor barrier that does not comply with requirements; repair substrates and reapply air vapor barrier components.
- O. Provide protection from UV degradation in accordance with manufacturer's written instruction until full building air infiltration testing is complete.

### **3.5 JOB COMPLETION**

- A. A representative of the air vapor barrier manufacturer (Company Field Advisor) shall inspect the Work periodically and notify the contractor of any defects. All defects must be corrected. The representative shall submit written certification to the Engineer that representative has consulted on and inspected the work and that the materials and installation are in conformance with the manufacturer's published physical properties and installation recommendations and with the Contract Documents.
- B. Cleaning and Protection: Protect sheet air vapor barriers from damage during construction period so that it will be without indication of abuse or damage at time of acceptance. Protect the building and adjacent construction from damage resulting from spillage, dripping and dropping of materials. Repair and restore other work damaged during sheet air vapor barrier installation.
  - 1. Protect air vapor barrier system from damage during application and remainder of construction period. Comply with manufacturer's instructions.
    - a. Protect air vapor barrier from exposure to UV light and harmful weather exposure as required by manufacturer. Remove and replace air vapor barrier exposed for more than 30 days or longer than recommended by the manufacturer.
    - b. Protect air vapor barrier from contact with creosote, uncured coal-tar products, EPDM, sealants not approved by air vapor barrier manufacturer, and other non-compatible materials.
    - c. Protect air vapor barrier from mechanical damage.
  - 2. Clean spills, stains, and soiling from construction that would be exposed in the completed work using cleaning agents and procedures recommended by manufacturer of affected construction.

**END OF SECTION**

## SECTION 07 55 56 – FLUID APPLIED MEMBRANE ROOFING

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide fluid-applied membrane roofing in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Wood grounds, nailers, blocking, cants and other wood items required for complete roof installation is specified under Section 06 15 00 "Rough Carpentry".
  - 2. Roof specialties and accessories as part of roofing construction is specified in Section 07 70 00 "Roof and Wall Specialties and Accessories".
  - 3. Metal flashings, prefabricated flashing systems, reglets and associated metal trim as part of roofing construction is specified in Section 07 62 00 "Sheet Metal Flashing and Trim".
  - 4. Sealants and joint fillers are specified under Section 07 92 00 "Joint Sealants".

#### 1.2 DEFINITIONS

- A. Roofing Terminology: Refer to ASTM D 1079, glossary of NRCA's "The NRCA Roofing and Waterproofing Manual" and Roof Consultants Institute "Glossary of Terms" for definition of terms related to roofing work in this Section.

#### 1.3 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. National Roofing Contractors Association (NRCA)
    - a. "Roofing and Waterproofing Manual"
    - b. "Handbook of Accepted Roofing Practices".
  - 2. Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA): "Architectural Sheet Metal Manual."

#### 1.4 SYSTEM DESCRIPTION

- A. General: Fluid applied membrane roofing and flashing system with compatible components that will not permit passage of liquid and withstands wind loads, building movement, flotation loads, thermally induced movement, and exposure to weather without failure.
- B. Design Wind Pressure: Design, fabricate, and install component parts so that

the completed Work shall withstand the design wind pressure as required by Project conditions and New York City Building Code.

- C. Fire Hazard Classification: Provide roofing system which has been tested by UL in accordance with ASTM E108 methods and listed for a Class A rating on noncombustible decks
- D. Thermal Barrier: Design fabricate and install fluid applied membrane roofing system with continuous insulation to provide an thermal barrier. Provide thickness of insulation required to achieve a minimum effective thermal R-value of 30. Provide additional insulation thickness to compensate for losses in insulation value due to supports, configuration, gaps and tolerances within roof assemblies.

## 1.5 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work
  - 1. Submit manufacturer's installation instructions for the fluid applied protected membrane roofing system and other data as may be required to show compliance with the Contract Documents.
  - 2. Indicate by transmittal form that a copy of manufacturer's installation details have been sent to the applicator.
- B. Shop Drawings: Submit for Engineer's action. Submit manufacturer approved shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum scale. Provide the following:
  - 1. Penetrations, curbs, drains, scuppers, and projections.
  - 2. Flashing details, including inside and outside corner reinforcements and terminations.
  - 3. Crack and joint treatments, including expansion joints.
  - 4. Interface with contiguous materials.
  - 5. Edge terminations including parapet flashing termination.
- C. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide samples of the following:
  - 1. Roofing Membrane: 12 in. square sample of fully cured fluid-applied roofing membrane.
  - 2. Elastomeric Flashing Membrane: 12 in. square.
  - 3. Protection Sheet: 12 in. square.
  - 4. Reinforcing Membrane: 12 in. square.
  - 5. Walking Pads.
- D. Quality Control Submittals: Submit for Engineer's information.

1. Certificates:
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown
    - b. Manufacturer's Acceptance: Upon completion of the Work submit a written statement signed by the manufacturer stating that the field supervision by the manufacturer's representative was sufficient to insure proper application of the materials, that the Work was installed in accordance with the Contract Documents and that the installation was inspected by and is acceptable to the manufacturer.
    - c. Installer Certification: Furnish certification signed by the primary manufacturer of the roofing materials, stating that the Installer is approved as a qualified applicator of said roofing system. Include certification from an independent testing laboratory verifying that the roofing membrane meets or exceeds the project's required performance requirements.
  2. Quality Control Testing and Inspection Reports: Provide documentation as to manufacturer's representative site visits and approval of systems for warranty purposes. Furnish written test reports of the procedures, findings and determinations as a result of the required roof membrane water testing.
- E. Closeout Submittals: Submit for City of New York's documentation
1. Warranties: Special warranties as specified.
  2. Maintenance Manuals: Two (2) sets of manufacturer's printed instructions and recommendations for proper maintenance of the specified roof system including inspection frequencies, penetration addition policies, temporary repairs, and leak call procedures.

## 1.6 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain fluid applied roofing system from one source of a single manufacturer. Obtain accessory products used in conjunction with fluid applied roofing system from the fluid applied roofing system manufacturer or from sources acceptable to the fluid applied roofing system manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.

- C. **Single-Source Responsibility:** In order to have a single-source responsibility and receive a system warranty from the fluid applied membrane manufacturer, provide flashing, insulation, substrate surface conditioner, reinforcing sheet, adhesive sealants, as directed by the membrane manufacturer.
- D. **Regulatory Requirements:** Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- E. **Preliminary Roofing Conference:** Before starting roof deck construction, conduct conference at Project site. Review methods and procedures related to roof deck construction and roofing system including, but not limited to, the following:
  1. Meet with City of New York, Engineer, testing and inspecting agency representative, roofing Installer, roofing system manufacturer's representative, deck Installer, and installers whose work interfaces with or affects roofing including installers of curtain walls, roof accessories and roof-mounted equipment.
  2. Review methods and procedures related to roofing installation, including manufacturer's written instructions.
  3. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
  4. Examine deck substrate conditions and finishes for compliance with requirements, including flatness and fastening.
  5. Review structural loading limitations of roof deck during and after roofing.
  6. Review base flashings, special roofing details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that will affect roofing system.
  7. Review temporary protection requirements for roofing system during and after installation.
  8. Review roof observation and repair procedures after roofing installation
- F. **Pre-Installation Meeting:** Prior to the start of the Work, meet at the Project site to review methods and sequence of installation, special details and conditions, standard of workmanship, testing and quality control requirements, job organization and other pertinent topics related to the Work.
- G. **Manufacturer's Technical Representative:** At the start of the installation and periodically as work progresses provide the services of the manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.

## **1.7 DELIVERY, STORAGE AND HANDLING**

- A. **Delivery:** Deliver materials in manufacturer's unopened containers identified with name, brand, type, grade, class and other qualifying information,

including UL and other specified insurance agency's labels.

- B. Storage: Store in accordance with product manufacturer's instructions. Handle and store roofing materials and place equipment in a manner to avoid significant or permanent damage to deck or structural supporting members. Protect roofing insulation materials from damage and from deterioration by sunlight, moisture, soiling, and other sources. Store in a dry location.

## 1.8 PROJECT/SITE CONDITIONS

- A. Weather Condition Limitations: Proceed with fluid-applied membrane roofing and associated work only when weather conditions will permit unrestricted use of materials and adequate quality control of work being installed, in compliance with requirements and with recommendations of primary roofing materials manufacturers.

## 1.9 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of roofing system that fail in materials or workmanship within specified warranty period.
  - 1. Warranty also includes base flashings, insulation, and other components of roofing system.
- B. Warranty Period: 20 years from date of Substantial Completion.

## PART 2 - PRODUCTS

### 2.1 SYSTEM TYPES

- A. Roof System ( **RS-01** ): Provide a complete roof system with surface conditioners, specified reinforced fluid applied roof membrane, flashing and underlayment.

### 2.2 FLUID APPLIED ROOFING MATERIALS

- A. Membrane Roofing Assembly shall be constructed as an exposed roof membrane assembly. The system will be comprised of the following:
  - 1. Roof Membrane System: Prefabricated, reinforced, homogeneous Styrene- Butadiene-Styrene (SBS) block copolymer modified asphalt membrane applied over a prepared substrate, covered with a liquid applied, flexible, polymethylmethacrylate (PMMA) based monolithic membrane formed by the combination of liquid PMMA resin and fleece fabric.
    - a. Resin for Field Membrane Construction: A flexible, polymethylmethacrylate (PMMA) based resin for use in combination with fleece fabric to form a monolithic, reinforced membrane.
      - 1) Parapro Roof Resin by Siplast; Irving, TX shall be the basis of design but not intended to imply a preference for a specific product.
      - 2) Other manufacturers include the following:

- a) Soprema
  - b) Kemper Systems.
  - c) or approved equal
- b. Fleece for Field Membrane Reinforcement: A non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement as supplied by the membrane system manufacturer.
- 1) Pro Fleece by Siplast; Irving, TX shall be the basis of design but not intended to imply a preference for a specific product.
  - 2) Other manufacturers include the following:
    - a) Soprema
    - b) Kemper Systems.
    - c) or approved equal
- c. Flashing system:
- 1) Flashing Membrane Assembly: A flashing membrane assembly consisting of a liquid applied, flexible, polymethylmethacrylate (PMMA) based monolithic membrane formed by the combination of liquid PMMA-based resin and fleece fabric.
    - a) Siplast Parapro Waterproofing System shall be the basis of design but not intended to imply a preference for a specific product.
    - b) Other manufacturers include the following:
      - (1) Soprema
      - (2) Kemper Systems.
      - (3) or approved equal.
  - 2) Resin for Flashing Applications: A flexible, polymethylmethacrylate (PMMA) based resin combined with a thixotropic agent for use in combination with non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement to form a monolithic, reinforced flashing membrane.
    - a) Parapro 123 Flashing Resin by Siplast; Irving, TX shall be the basis of design but not intended to imply a preference for a specific product.
    - b) Other manufacturers include the following:
      - (1) Soprema
      - (2) Kemper Systems.
      - (3) or approved equal.
- d. Fleece for Flashing Reinforcement: A non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement as supplied by the membrane system manufacturer.

- 1) Pro Fleece by Siplast; Irving, TX. shall be the basis of design but not intended to imply a preference for a specific product.
  - 2) Other manufacturers include the following:
    - a) Soprema.
    - b) Kemper Systems.
    - c) or approved equal.
2. Surface Conditioner
  3. Underlayment/Roof Board Materials
    - a. Cementitious Roof Cover Panel: Portland cement formulation with a high performance polymer-coated glass fiber mesh; moisture and mold resistant; manufactured to conform to ASTM C1325. Provide panels having a nominal thickness of 5/8 inch. Acceptable types are as follows:
      - 1) Securock Cement Roof Board by US Gypsum shall be the basis of design but not intended to imply a preference for a specific product.
      - 2) Other manufacturers include the following:
        - a) Georgia Pacific Corporation
        - b) CertainTeed.
        - c) or approved equal.
  4. Insulation Fasteners: Insulation fasteners and plates shall be FM Approved, and/or approved by the manufacturer of the primary roofing products. The insulation fasteners shall provide attachment required to meet the specified uplift performance and to restrain the insulation panels against the potential for ridging. The fastening pattern for each insulation panel to be used shall be as recommended by the insulation manufacturer and approved by the manufacturer of the primary roofing products.
  5. Insulation: Extruded polystyrene board (60 psi) with water drainage channels. 6 inch minimum thickness.
  6. Vapor Barrier as manufactured by roof membrane manufacturer or approved equal.
  7. Integral Walking Pads as manufactured by roof membrane manufacturer or approved equal.

### 2.3 INSULATION MATERIALS

- A. Extruded Polystyrene Board Insulation ( **INS-02** ): Rigid, closed-cell extruded expanded polystyrene with integral high density skin complying with ASTM C578, Type VII, minimum compressive strength of 60 psi ; minimum R-Value of 5.0 per 1 in.thickness at 75 deg F. (24 deg C); standard sizes; thickness as shown, 6 in. min.; with channeled edges; one of the following:
  1. "Styrofoam PlazaMate" (The Dow Chemical Co.).

2. "Foamular 604" (Owens-Corning Corp.).
3. "CertiFoam Plaza Deck" (DiversiFoam Products).
4. Or approved equal.

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. **Manufacturer's Instructions:** Prepare substrates, apply primers and apply the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

#### **3.2 EXAMINATION**

- A. **Verification of Conditions:** Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. **Manufacturer's Representation:** The manufacturer of the roofing membrane and the applicator shall inspect the first pour of concrete substrate to review the acceptability of the concrete for application of the roofing system. Verify that curing compounds or surface hardeners incompatible with fluid applied membrane roofing system have not been used on concrete surfaces.

#### **3.3 PREPARATION**

- A. **Substrate Acceptability:** Inspect areas and accept surfaces designated to receive fluid applied roofing system, as satisfactory for the reception of the Work specified in this Section, without conflict with "Warranty" requirements. Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. **Cleaning and Patching of Substrate:** Clean substrate of debris and deleterious material which would impair the Work. Patch cracks, voids and honeycombs to provide a smooth, structurally sound surface. Cut off high spots and grind smooth. Apply surface conditioners in accordance with roofing membrane manufacturer's instructions.
- C. **Structural concrete surface to be finished with wood float (not steel trowel or power floated).** Concrete density 135 lbs/ft.<sup>3</sup> minimum, cured for 28 days
- D. **Piping, Conduit and Other Penetrations:** Do not proceed with membrane roofing until drains, piping, conduit, vents, ducts and other projections through the substrate have been installed. Holes, honeycombs and cavities shall be pointed or filled and finished flush in accordance with manufacturer's directions utilizing materials recommended by the manufacturer of the roofing membrane.

### 3.4 INSTALLATION

- A. General: Install the roofing substrate and roofing system in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified. Install and complete the system to assure that no water leakage through the system occurs.
- B. Vapor Barrier: Install in accordance with vapor barrier manufacturer's printed instructions
- C. Insulation: Install in accordance with insulation manufacturer's printed instructions. Loosely lay extruded insulation units over substrate, with long joints of insulation in continuous straight lines and with end joints staggered between rows. Fit insulation neatly and accurately at walls, curbs and other projections and bring edges and ends of units into moderate contact with open joints. Install one or more layers of insulation to achieve required thickness over roofing membrane. Cut and fit to within 3/4 in. of projections and penetrations. Where overall insulation thickness is 2 in. or more, install required thickness in two or more layers with joints of each succeeding layer staggered over joints of previous layer a minimum of 6 in. in each direction.
- D. Roof Board: Install in accordance with roofing manufacturer's printed instructions in preparation to receive resin: Ensure that the insulation panels have been properly secured. Inspect the surface of the panel insulation system to ensure that edges are level and even between adjoining panels. Prime surfaces using the specified PMMA-based primer at the rate specified by the resin manufacturer and allow primer to cure. Tape the panel joints and panel terminations at nailers, walls, perimeter and penetrations using gaffer's tape, centering the tape strips over the joints or panel edges.
- E. Priming: Prime surface conditioner substrate surfaces. Use products, equipment and methods recommended by the roofing materials manufacturer and approved for use in New York City. Treat non-moving cracks, penetrations, control joints and other joints in substrate with materials, methods and designs as recommended by the roofing membrane manufacturer.
- F. Wood Blocking: Provide such wood blocking, cants and nailers not shown but necessary to comply with the roofing materials manufacturer's requirements. Comply with requirements of Section 06 10 00 "Rough Carpentry".
- G. Flashing: Install flashing using products and systems specified in the roofing membrane manufacturer's requirements. Flash pipes, conduits, sleeves, and other projections passing through roof membrane and provide tight construction throughout. Where pipes or conduits pass through areas to be roofed or where drains occur in such areas, apply membrane roofing only after flashing around pipes, conduits and drains is in place. Lap flashing into the membrane in accordance with manufacturers recommendations and instructions.
- H. Stripping: Set metal flanges in roofing membrane. Prime flanges and strip in flanges of metal roof accessories, metal flashings and elastomeric

flashings with roofing membrane. Set roof drains as per manufacturer's written instructions.

- I. Application Thickness: Apply an initial roofing membrane in a continuous monolithic coating to a minimum thickness of 90 mils, 3/32 in.. Into the initial membrane fully embed a layer of spunbond polyester fabric reinforcing sheet with 4 in. side laps and 12 in. head laps followed by an additional continuous monolithic coating of roofing membrane of 125 mils 1/8 in., resulting in a total minimum roofing membrane thickness of 215 mils, 7/32 in. at any location. Utilize methods recommended by the roofing membrane manufacturer. Apply additional material to correct areas deficient in thickness by procedures recommended by the membrane manufacturer.
- J. Integral Walking Pads: Install integral walking pads as indicated on drawings or as a minimum, from roof access to and around all roof top equipment.
- K. Roofing Metal Work: Be responsible for the proper attachment of specified work to roofing metal or related work that is embedded in, or in contact with, and becomes an integral part of specified roofing or flashing system, even when such roofing metal or related work is provided under other Sections of the Specifications. Where flashings terminate against parapet walls, curbs, pipe and vent penetrations and other such obstructions, provide termination bars and pipe clamping rings as recommended by the roofing membrane manufacturer. Provide continuous sealant bead at top of termination bars and clamping rings.

### **3.5 FIELD QUALITY CONTROL**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. High Voltage Electronic Leak Detection: Perform leak testing by an electronic detection process administered by a certified High Voltage ELD tester and monitored by qualified testing agency as follows:
  - 1. Test equipment shall consist of conductive phosphor bronze brush electrodes and a portable battery powered generator capable of providing variable DC current from 1000-30,000 volts at low amperage.
  - 2. The ELD Technician shall connect one terminal of the generator to a ground in the assembly (typically a steel or concrete deck, or alternative grounding medium such as a conductive primer or metal grid). Connect the other terminal to the phosphor bronze brush. Calibrate the voltage level to the thickness of the membrane being tested.
  - 3. The ELD Technician shall methodically pass the brush electrode over all testable vertical membrane surfaces in the contract and approximately 1 foot (25 cm) of horizontal membrane directly adjacent to the vertical membrane areas. Successive passes will overlap previous passes by a minimum of 3 inches (75 mm). Breaches will be identified when an audible alarm indicates that

- the electric current has passed through a defect and grounded to the conductive material beneath the membrane.
4. The ELD Technician shall mark breach locations on the membrane with spray paint, chalk, tape or other approved method.
- C. Low Voltage Electronic Water Testing: Perform leak testing by an electronic detection process (Electric Field Vector Mapping) administered by a certified electric field mapping tester and monitored by qualified testing agency as follows:
1. Test the entire roofing membrane on an area-by-area basis as required by the conduct of the Work. Install stationary impulse conductor wire around perimeter of area to be tested. The testing agency will determine size and shape of area. Provide conductor wire consisting of braided polyethylene 1/16 in. (1.5mm) diameter interwoven with a minimum of six strands of stainless steel wire. Place conductor wire 6 in. (150mm) from perimeter and secure against accidental movement or damage. Place wire directly on membrane. Isolate metal items contacting the membrane by placing four to six additional stands of conductor wire to isolate the field or by removing the metal items temporarily if possible. Bring connection wires to an agreed upon location and place within watertight conduit and identified watertight junction box so as to allow for future testing.
  2. Wet the membrane test area with water or other suitable conductor fluid prior to start of each test and maintain wet for duration of testing. Utilizing a potentiometer and two probes placed at the surface of the membrane detect the presence or absence of electrical flow across the surface of the membrane. Verify integrity of the membrane at drains and penetrations by localized testing.
  3. Provide a report of each day's test results containing a written description and photograph of defects and any corrections made and a schematic CAD drawing indicating location of stationary conductor wire and of any defects found in testing to within 1 in. (25mm) of accuracy.
- D. Water and Leak electronic testing may be conducted on an area by area basis as the Work permits but in no case shall less than 100% of the roof and waterproofing membranes be tested. If leaks occur, remove existing components and replace with new materials (matching existing) to eliminate the causes and sources of the leaks.

### **3.6 CITY OF NEW YORK'S MONITORING ACTIVITIES**

- A. City of New York's Testing Agency: A testing agency, engaged at the City of New York's expense, will perform the following activities to monitor the Contractor's Quality Control Program. The monitoring activities do not relieve the Contractor of responsibilities under the Contract.
1. The testing agency shall inspect and report on the following:
    - a. Flashings: Inspection of flashings to assure

manufacturer's quality requirements are maintained throughout the installation period.

- b. Membrane Thickness: Inspection of the membrane to verify thickness by taking random samples in locations selected by the Engineer. Take one (1) sample for each 100 ft.<sup>2</sup> prior to cooling of the membrane and installation of the protection sheet utilizing a pin or needle gauge as recommended by the membrane manufacturer. Testing agency shall submit written test results noting location and thickness.
  - c. Electronic Water Test Observation: Observe electronic water testing and examine underside of decks and terminations for evidence of leaks during testing.
- B. Contractor's Assistance to the City of New York's Testing Agency: Furnish the City of New York's Testing Agency with access to the Work, materials and facilities as required by the Agency. Provide adequate notice of construction activities to allow timely inspections and observation of Contractor tests, and be available for pre- installation meetings. Furnish the City of New York's Testing Agency with on-site office facilities.
- C. Contractor's Responsibility
- 1. Upon award of Contract, complete the form furnished by the Inspection Agency.
  - 2. Provide the Inspection Agency with safe access to the Work.
  - 3. Notify the Inspection Agency whenever work is to be done, in sufficient time to arrange inspection.
  - 4. Discontinue any practice immediately when notified which, in the Inspection Agency's opinion, is not in accordance with the Specifications or will act to the detriment of the system. The Inspection Agency will notify the City of New York, the Engineer, the Contractor and the manufacturer immediately of violations. Work affected by the practice will be subject to complete replacement.
  - 5. Give written notice to the Inspection Agency stating that the installation has been completed in accordance with the Contract Documents and requesting that a final inspection be conducted.

### **3.7 ADJUSTING**

- A. Correct deficiencies in or remove fluid applied membrane roofing system components that do not comply with requirements. Repair substrates, and repair or reinstall components or system to a condition free of damage and deterioration at time of Substantial Completion and in compliance with warranty requirements.

### **3.8 PROTECTION**

- A. Protect adjacent construction from damage resulting from spillage, dripping and dropping of material. Prevent materials from entering and clogging drains and water conductors. Repair and restore, or replace

other work which is soiled or damaged in connection with the performance of this work.

- B. Until roofing membrane is protected with insulation and the ballast system, keep areas free from traffic and other trades. Upon completion of roofing, provide necessary temporary protection to prevent damage from any source.

**END OF SECTION**

**SECTION 07 55 66 – VEGETATED FLUID APPLIED PROTECTED MEMBRANE ROOFING****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide vegetated fluid-applied protected membrane roofing in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Wood grounds, nailers, blocking, cants and other wood items required for complete roof installation is specified under Section 06 15 00 "Rough Carpentry".
  - 2. Metal flashings, prefabricated flashing systems, reglets and associated metal trim as part of roofing construction is specified in Section 07 62 00 "Sheet Metal Flashing and Trim".
  - 3. Sealants and joint fillers are specified under Section 07 92 00 "Joint Sealants".

**1.2 DEFINITIONS**

- A. Roofing Terminology: Refer to ASTM D 1079, glossary of NRCA's "The NRCA Roofing and Waterproofing Manual" and Roof Consultants Institute "Glossary of Terms" for definition of terms related to roofing work in this Section.

**1.3 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. Canadian General Standards Board (CGSB): CGSB 37.50-M89, "Hot- Applied, Rubberized Asphalt for Roofing and Waterproofing".
  - 2. National Roofing Contractors Association (NRCA)
    - a. "Roofing and Waterproofing Manual"
    - b. "Handbook of Accepted Roofing Practices".
    - c. "The NRCA Green Roof Systems Manual".
  - 3. Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA): "Architectural Sheet Metal Manual."
  - 4. ANSI/SPRI VR-1 2011 "Procedure for Investigating Resistance to Root Penetration on Vegetative Roofs"

#### 1.4 SYSTEM DESCRIPTION

- A. General: Fluid applied protected membrane roofing and flashing system with compatible components that will not permit passage of liquid and withstands wind loads, building movement, flotation loads, thermally induced movement, and exposure to weather without failure.
- B. Design Wind Pressure: Design, fabricate, and install component parts so that the completed Work shall withstand the design wind pressure as shown on the Drawings.
- C. Fire Hazard Classification: Provide roofing system which has been tested by UL in accordance with ASTM E108 methods and listed for a Class A rating on noncombustible decks
- D. Thermal Barrier: Design fabricate and install fluid applied membrane roofing system with continuous insulation to provide an thermal barrier. Provide thickness of insulation required to achieve a minimum effective thermal R-value of 30. Provide additional insulation thickness to compensate for losses in insulation value due to supports, configuration, gaps and tolerances within roof assemblies.
- E. Garden Roof System: Garden Roofing System shall be designed so as to allow the natural growth of selected landscaping without detrimental effects to roof membrane system or any other contiguous materials. The garden roof insulated membrane system shall be designed as an "Extensive" Green Roof.

#### 1.5 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work
  - 1. Submit manufacturer's installation instructions for the fluid applied protected membrane roofing system and other data as may be required to show compliance with the Contract Documents.
  - 2. Indicate by transmittal form that a copy of manufacturer's installation details have been sent to the applicator.
- B. Shop Drawings: Submit for Engineer's action. Submit manufacturer approved shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum scale. Provide the following:
  - 1. Penetrations, curbs, drains, scuppers, and projections.
  - 2. Flashing details, including inside and outside corner reinforcements and terminations.
  - 3. Crack and joint treatments, including expansion joints.
  - 4. Interface with contiguous materials.
  - 5. Edge terminations including parapet flashing termination.

6. Layout of precast concrete roof ballast units complete with description of paver support pedestal and stainless steel strapping system for pavers.
  7. Locations and depths of garden roof areas showing elements of system. Note locations of components including drain inspection device.
- C. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide samples of the following:
1. Roofing Membrane: 12 in. square sample of fully cured fluid-applied roofing membrane.
  2. Elastomeric Flashing Membrane: 12 in. square.
  3. Protection Sheet: 12 in. square.
  4. Water Pervious Fabric: 12 in. square.
  5. Reinforcing Membrane: 12 in. square.
  6. Roof Pavers: Full size samples showing color, texture and finish specified.
  7. Roof Paver Pedestal: One of each type including each individual component and accessory.
  8. Water Retention Assembly: 12 in. square.
  9. Drainage aggregate: 1 lb.
  10. Growth Medium: 1 lb.
  11. Planting Samples: Three (3) 12 in. square of selection.
  12. Prefabricated Drainage Course: 12 in. square
- D. Quality Control Submittals: Submit for Engineer's information.
1. Certificates:
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown
    - b. Manufacturer's Acceptance: Upon completion of the Work submit a written statement signed by the manufacturer stating that the field supervision by the manufacturer's representative was sufficient to insure proper application of the materials, that the Work was installed in accordance

- with the Contract Documents and that the installation was inspected by and is acceptable to the manufacturer.
- c. Installer Certification: Furnish certification signed by the primary manufacturer of the roofing materials, stating that the Installer is approved as a qualified applicator of said roofing system. Include certification from an independent testing laboratory verifying that the roofing membrane meets or exceeds the requirements of CGSB 37.50-M89.
- 2. Quality Control Testing and Inspection Reports: Provide documentation as to manufacturer's representative site visits and approval of systems for warranty purposes. Furnish written test reports of the procedures, findings and determinations as a result of the required roof membrane water testing.
- E. Closeout Submittals: Submit for City of New York's documentation
    - 1. Warranties: Special warranties as specified.
    - 2. Maintenance Manuals: Two (2) sets of manufacturer's printed instructions and recommendations for proper maintenance of the specified roof system including inspection frequencies, penetration addition policies, temporary repairs, and leak call procedures.

## 1.6 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain fluid applied protected roofing system from one source of a single manufacturer. Obtain accessory products used in conjunction with fluid applied protected roofing system from the fluid applied protected roofing system manufacturer or from sources acceptable to the fluid applied protected roofing system manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Single-Source Responsibility: In order to have a single-source responsibility and receive a system warranty from the fluid applied membrane manufacturer, provide flashing, insulation, substrate surface conditioner, reinforcing sheet, adhesive sealants, protection course/root barrier, drainage core, filter fabric, aggregate, precast concrete pavers as directed by the membrane manufacturer.
- D. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.

- E. Preliminary Roofing Conference: Before starting roof deck construction, conduct conference at Project site. Review methods and procedures related to roof deck construction and roofing system including, but not limited to, the following:
1. Meet with City of New York, Engineer, testing and inspecting agency representative, roofing Installer, roofing system manufacturer's representative, deck Installer, and installers whose work interfaces with or affects roofing including installers of curtain walls, roof accessories and roof-mounted equipment.
  2. Review methods and procedures related to roofing installation, including manufacturer's written instructions.
  3. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
  4. Examine deck substrate conditions and finishes for compliance with requirements, including flatness and fastening.
  5. Review structural loading limitations of roof deck during and after roofing.
  6. Review roof garden requirements as related to materials and installation.
  7. Review base flashings, special roofing details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that will affect roofing system.
  8. Review temporary protection requirements for roofing system during and after installation.
  9. Review roof observation and repair procedures after roofing installation
- F. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review methods and sequence of installation, special details and conditions, standard of workmanship, testing and quality control requirements, job organization and other pertinent topics related to the Work.
- G. Manufacturer's Technical Representative: At the start of the installation and periodically as work progresses provide the services of the manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.

## **1.7 DELIVERY, STORAGE AND HANDLING**

- A. Delivery: Deliver materials in manufacturer's unopened containers identified with name, brand, type, grade, class and other qualifying information, including UL and other specified insurance agency's labels.
- B. Storage: Store in accordance with product manufacturer's instructions. Handle and store roofing materials and place equipment in a manner to avoid significant or permanent damage to deck or structural supporting members. Protect roofing insulation materials from damage and from

deterioration by sunlight, moisture, soiling, and other sources. Store in a dry location.

- C. Store and handle pavers and related materials to prevent their deterioration or damage due to moisture, temperature changes, contaminants, corrosion, breakage, chipping, or other causes.
- D. Store pavers on wood skids or pallets, covered with non-staining, waterproof membrane. Place and stack skids and pavers to distribute weight evenly and to prevent breakage or cracking of pavers. Allow air circulation around pavers.

## 1.8 PROJECT/SITE CONDITIONS

- A. Weather Condition Limitations: Proceed with fluid-applied protected membrane roofing and associated work only when weather conditions will permit unrestricted use of materials and adequate quality control of work being installed, in compliance with requirements and with recommendations of primary roofing materials manufacturers.
- B. Cold Weather Protection Pavers: Comply with the following requirements:
  - 1. Do not use frozen materials or materials mixed or coated with ice or frost.
  - 2. Do no build on frozen subgrade or setting beds.
  - 3. Remove and replace work damaged by frost or freezing.

## 1.9 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of roofing system that fail in materials or workmanship within specified warranty period.
  - 1. Warranty also includes base flashings, insulation, roof pavers, and other components of roofing system.
- B. Warranty Period: 20 years from date of Substantial Completion.

## PART 2 - PRODUCTS

### 2.1 SYSTEM TYPES

- A. Roof System ( **RS-02** ): In areas designated Garden Roof System provide a complete system with surface conditioners, specified reinforced fluid applied roof membrane, protection sheet, root barrier, insulation, drainage mat, moisture retention mat, drainage panels, filter fabric, growth medium and intensive vegetation.

### 2.2 FLUID APPLIED ROOFING MATERIALS

- A. Membrane Roofing Assembly shall be constructed as an inverted roof membrane assembly (IRMA). The system will be comprised of the following:

1. Surface Conditioner
2. **Option 1 – Cold Fluid Applied**
  - a. Roof Membrane System: Prefabricated, reinforced, homogeneous Styrene-Butadiene-Styrene (SBS) block copolymer modified asphalt membrane applied over a prepared substrate, covered with a liquid applied, flexible, polymethylmethacrylate (PMMA) based monolithic membrane formed by the combination of liquid PMMA resin and fleece fabric.
    - 1) Resin for Field Membrane Construction: A flexible, polymethylmethacrylate (PMMA) based resin for use in combination with fleece fabric to form a monolithic, reinforced membrane.
      - a) Parapro Roof Resin by Siplast; Irving, TX shall be the basis of design.
      - b) Other manufacturers include the following:
        - (1) Soprema
        - (2) Kemper Systems.
        - (3) or approved equal
    - 2) Fleece for Field Membrane Reinforcement: A non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement as supplied by the membrane system manufacturer.
      - a) Pro Fleece by Siplast; Irving, TX shall be the basis of design.
      - b) Other manufacturers include the following:
        - (1) Soprema
        - (2) Kemper Systems.
        - (3) or approved equal
    - 3) Flashing system:
      - a) Flashing Membrane Assembly: A flashing membrane assembly consisting of a liquid applied, flexible, polymethylmethacrylate (PMMA) based monolithic membrane formed by the combination of liquid PMMA-based resin and fleece fabric.
        - (1) Siplast Parapro Waterproofing System shall be the basis of design.
        - (2) Other manufacturers include the following:
          - (a) Soprema

- (b) Kemper Systems.
    - (c) or approved equal.
  - b) Resin for Flashing Applications: A flexible, polymethylmethacrylate (PMMA) based resin combined with a thixotropic agent for use in combination with non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement to form a monolithic, reinforced flashing membrane.
    - (1) Parapro 123 Flashing Resin by Siplast; Irving, TX shall be the basis of design.
    - (2) Other manufacturers include the following:
      - (a) Soprema
      - (b) Kemper Systems.
      - (c) or approved equal.
- 4) Fleece for Flashing Reinforcement: A non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement as supplied by the membrane system manufacturer.
  - a) Pro Fleece by Siplast; Irving, TX. shall be the basis of design.
  - b) Other manufacturers include the following:
    - (1) Soprema.
    - (2) Kemper Systems.
    - (3) or approved equal.
- 5) Drainage Mat:
  - a) "Paradrain" by Siplast shall be the basis of design.
  - b) Other manufacturers include the following:
    - (1) Soprema.
    - (2) Kemper Systems.
    - (3) or approved equal.

### 3. Option 2 – Hot Fluid Applied

- a. Hot Fluid-Applied Rubberized Asphalt Waterproofing Membrane: Hot melt rubberized asphalt, 100 % solids, complying with CAN/CGSB- 37.50M; one of the following:
  - 1) "FR System" utilizing "Liquid Membrane 6125" (American Hydrotech, Inc.)

- 2) "Ram Tough 250-DM" (The Barrett Co.).
  - 3) "790-11 (Reinforced)" (Henry Company).
  - 4) Or approved equal.
- b. Flashing Membrane Assembly:
- 1) Flashing Membrane Assembly: A flashing membrane assembly consisting of a liquid applied, flexible, polymethylmethacrylate (PMMA) based monolithic membrane formed by the combination of liquid PMMA-based resin and fleece fabric.
  - 2) Resin for Flashing Applications: A flexible, polymethylmethacrylate (PMMA) based resin combined with a thixotropic agent for use in combination with non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement to form a monolithic, reinforced flashing membrane.
  - 3) Fleece for Flashing Reinforcement: A non-woven, 110 g/m<sup>2</sup>, needle-punched polyester fabric reinforcement as supplied by the membrane system manufacturer.
- c. Reinforcing Sheet; Continuous filament needle-punched spun bond polyester bonded with an acrylic binder and as recommended by the hot fluid-applied rubberized asphalt waterproofing membrane manufacturer.
- d. Adhesives, Thinners, Primers, Sealers, Tape, Sealant and Solvents: Type as recommended by the manufacturer of the hot fluid-applied rubberized asphalt waterproofing.
- e. Protection Board: Manufacturer approved, premolded, 1/8 in. (3mm) thick, semi-rigid board complying with ASTM D6506 Type 2 Class B consisting of mineral stabilized core sandwiched between layers of asphalt saturated felt, surface coated with asphalt and sealed to core under heat and pressure and provide with polyethylene film facings.
- f. Nonwoven-Geotextile-Faced, Molded-Sheet Drainage Panel: Manufactured composite subsurface drainage panels consisting of a nonwoven, needle-punched geotextile facing with an apparent opening size not exceeding No. 70 (0.21mm) sieve laminated to 1 side and a polymeric film bonded to the other side of a 3-dimensional, non-biodegradable, molded-plastic-sheet drainage core, with a vertical flow rate of 9 to 15 gpm/ft. (112 to 188 L/min./m).
4. Insulation: Extruded polystyrene board (60 psi) with water drainage channels. 6 inch minimum thickness.

5. Vapor Barrier as manufactured by roof membrane manufacturer or approved equal.

## 2.3 AUXILIARY MATERIALS

### A. Garden Roof Components:

1. Protection Sheet/Root Barrier for Roof Garden Areas: Manufacturer approved continuous 160 mils thick polyester reinforced SBS modified bitumen sheet with granular surface and root inhibiting additive in areas scheduled as garden insulated membrane roofing system.
2. Prefabricated Drainage Course for Roof Garden Areas: Three dimensional, molded panels, 1.5 in. thickness, made of recycled HDPE with drainage channels with holes on top side and water retention reservoirs, crushproof drainage core in areas schedule as garden insulated membrane roofing (waterproofing) system.
3. Water and Moisture Retention Assembly: Provide water retention assembly with active water control valve system for Roof Garden Areas as indicated on the drawings. Provide and moisture retention mat for Roof Garden Areas as indicated on the drawings: Water retention structure to provide storage capacity indicated and complete support of Roof Garden and project design loads. Rot proof fibrous mat strength class 3, used for additional water and nutrient retention as recommended by the system membrane manufacturer
4. Drainage Inspection Devices: Provide hinged stainless steel drain inspection device with keyed locking device, over each drain and other noted accessories, within the soft landscape area.
5. Growth Media for Roof Garden Areas
  - a. Intensive Growth Media: Custom growing media mix with an application density of 38 lbs/ft<sup>3</sup> – 69 lbs/ft<sup>3</sup> and pH of 6.5 to 7.5 capable of supporting vigorous growth of the specified vegetation installed onto the filter sheet to a depth of 6 in. or as indicated on drawings, complete with appropriate nutrients and organic material as recommended and supplied by roof garden system manufacturer.
  - b. Drainage Ballast: 3/8 in. to 3/4 in. expanded lightweight aggregate for use as fill material within drainage course only areas scheduled as component of insulated membrane roofing (waterproofing) system.
  - c. Hydromulch: Wood fiber-based hydromulch with natural-based tackifier for use in securing plantings on roof. Where hydromulching equipment is available and has access to roof; hydromulch shall be mixed with tackifier and applied as wet slurry to cutting installations.

6. Plantings:
  - a. Vegetative Sedum Carpet from selection of plants (eight (8) different species minimum) that are appropriate for project location and roof assembly.
    - 1) InstaGreen Sedum Carpet as provided by American Hydrotech, Inc.
    - 2) Paragreen Pre-Grown Vegetated Mat as provided by Siplast.
    - 3) Sopranature Toundra as provided by Soprema.
7. Metal Edging:
  - a. Extruded aluminum edging perforated to allow water flow as shown on drawings. Size as noted on plans.
8. Miscellaneous Materials for Roof Garden System: Provide water retaining boards, moisture retention assembly and other products and materials to provide a complete watertight garden roof system in accordance with manufacturer's requirements and requirements of scheduled plantings and landscaping.

#### 2.4 INSULATION MATERIALS

- A. Extruded Polystyrene Board Insulation ( **Type INS-02** ): Rigid, closed-cell extruded expanded polystyrene with integral high density skin complying with ASTM C578, Type VII, minimum compressive strength of 60 psi ; minimum R-Value of 5.0 per 1 in.thickness at 75 deg F. (24 deg C); standard sizes; thickness as shown, 6 in. min.; with channeled edges; one of the following:
  1. "Styrofoam PlazaMate" (The Dow Chemical Co.).
  2. "Foamular 604" (Owens-Corning Corp.).
  3. "CertiFoam Plaza Deck" (DiversiFoam Products).
  4. Or approved equal.

#### 2.5 BALLAST AND PAVER MATERIALS

- A. Precast Concrete Paver ( **PAV-01** ): Precast concrete pavers with cast-in tie-down system as required for project uplift restraint conditions and as indicated on drawings, complying with the following minimum requirements:
  1. Compressive Strength: 8500psi. (55Mpa).
  2. Flexural Strength: 1100 psi (7.6MPa).
  3. Absorption: Less than 5%.
  4. Density: 155 lb./ft.3 (2480kg/m3)
  5. Color/Finish: As selected by Engineer's from Manufacturer's full range.
  6. Texture/Exposed aggregate: As selected by Engineer's from Manufacturer's full range.

7. Manufacturer: One of the following:
  - a. Wausau Tile Inc.
  - b. Hanover Architectural Products.
  - c. Westile Roofing Products.
  - d. Or approved equal.
- B. Paver Pedestal Supports: As shown and/or as required, provide paver manufacturer's standard SBR rubber, high-density polyethylene, or polyurethane paver support assembly consisting of pedestals supports with spacer tabs for joint spacing as noted on the drawings. Provide pedestal supports and every paver corner and intersection.
- C. Adjustable Leveling Paver Pedestal Supports: As shown and/or as required, provide one of the following systems:
  1. "High-Tab Pedestal Assembly System" (Hanover Architectural Products).
  2. "Terra-Adjust Pedestals" (Wausau Tile, Inc
  3. "Bison ScrewJack Pedestal Systems" (United Construction Products).
  4. Or approved equal.
- D. Paver Strapping Securement System: Paver securement strapping fabricated from 3 in. wide x 12 ft. long stainless steel, a minimum of 22 gauge thick. Provide ¼ in. x 1- 1/4 in. stainless steel expansion type fasteners anchored to predrilled holes in each paver as required for NYC Building Code and FM Global acceptance.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates, apply primers and apply the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Manufacturer's Representation: The manufacturer of the roofing membrane and the applicator shall inspect the first pour of concrete substrate to review the acceptability of the concrete for application of the roofing system. Verify that curing compounds or surface hardeners incompatible with fluid applied protected membrane roofing system have not been used on concrete surfaces.

### 3.3 PREPARATION

- A. Substrate Acceptability: Inspect areas and accept surfaces designated to receive fluid applied roofing system, as satisfactory for the reception of the Work specified in this Section, without conflict with "Warranty" requirements. Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Cleaning and Patching of Substrate: Clean substrate of debris and deleterious material which would impair the Work. Patch cracks, voids and honeycombs to provide a smooth, structurally sound surface. Cut off high spots and grind smooth. Apply surface conditioners in accordance with roofing membrane manufacturer's instructions.
- C. Piping, Conduit And Other Penetrations: Do not proceed with membrane roofing until drains, piping, conduit, vents, ducts and other projections through the substrate have been installed. Holes, honeycombs and cavities shall be pointed or filled and finished flush in accordance with manufacturer's directions utilizing materials recommended by the manufacturer of the roofing membrane.
- D. Preparation of Cracks and Joints: Prepare, treat, rout, and fill joints and cracks in substrate according to CAN/CGSB-37.51, "Application of Rubberized Asphalt, Hot- Applied, for Roofing and Waterproofing," and waterproofing manufacturer's recommendations.
- E. Do not proceed with paver installation until surfaces and conditions comply with requirements indicated in specifications.
- F. Clean paver surfaces that have become dirty or stained prior to setting to remove soil, stains and foreign materials. Clean pavers by thoroughly scrubbing pavers with fiber brushes followed by a thorough drenching with clear water. Use only mild cleaning compounds that contain no caustic or harsh filler or abrasives.

### 3.4 INSTALLATION

- A. General: Install the roofing system in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified. Install and complete the system to assure that no water leakage through the system occurs.
- B. Priming: Prime surface conditioner substrate surfaces. Use products, equipment and methods recommended by the roofing materials manufacturer and approved for use in New York City. Treat non-moving cracks, penetrations, control joints and other joints in substrate with materials, methods and designs as recommended by the roofing membrane manufacturer.
- C. Wood Blocking: Provide such wood blocking, cants and nailers not shown but necessary to comply with the roofing materials manufacturer's requirements. Comply with requirements of Section 06 10 00 "Rough Carpentry".
- D. Flashing Membrane Application

1. General: Flash in accordance with details or recommendations by Membrane manufacturer. Install the flashings before installing the field membrane to minimize foot traffic over newly installed field membrane.
2. Provide a minimum vertical height of 12 in. for all flashing terminations wherever possible. Flashing height shall be at least as high as the potential water level that could be reached as a result of a deluging rain, snowbuildup and/or poor slope.
3. All flashing shall be terminated as required by the membrane manufacturer, properly installed in accordance with industry-accepted practice.
4. Mix and apply cold fluid-applied membrane flashing in strict accordance with written instructions of membrane manufacturer.
5. Apply an even layer of cold fluid-applied resin at the minimum consumption rate recommended by the membrane manufacturer. Work reinforcement into the wet resin, removing trapped air. Maintain 2 in. minimum overlap at all side and butt laps of reinforcement and extend flashing a minimum of 4 in. horizontally onto deck.
6. Apply an even topcoat of cold fluid-applied resin at the minimum consumption rate recommended by the membrane manufacturer.
7. Wall, curb and base flashings shall be installed to solid substrate surfaces only. Adhering to gypsum-based panels, wood or metal siding, and other similar materials is not acceptable.
8. Flash all walls, curbs and base flashings using cold fluid-applied polyester waterproofing membrane. Flashing material shall be the same resin used in the field membrane with fleece reinforcement, if required by manufacturer. Reinforce all transition locations and other potential wear areas with a 4 in. wide polyester fleece bottom layer evenly positioned over the transition prior to installing the exposed flashing layer. Reinforce all inside and outside corners with a 4 in. diameter conical piece of fleece prior to installing the exposed flashing layer.
9. All pins, dowels and other fixation elements shall be flashed separately with a vertical flashing component prior to installing the exposed flashing layer.
10. Extend flashing a minimum of 4 in. onto the field substrate surface.
11. Metal accessories and fabrications shall be installed to solid substrate surfaces only.
12. Allow completed membrane to cure as recommended by the membrane manufacturer prior to continuing application or applying loads.

13. Pipes, Conduits, and Unusual Shaped Penetrations:
    - a. Pipes conduits and other items to be flashed must be separated with 1 in. minimum clearance or as recommended by membrane manufacturer to adequate waterproof each individual penetration.
    - b. All penetrations must be flashed individually. Two or more items ganged together in a flashing shall not be permitted.
    - c. Flash penetrations using cold fluid-applied membrane or membrane manufacturers proprietary flashing matrix as recommended.
  14. Drains: Flash waterproofing drains using cold fluid-applied membrane. Flashing shall consist of target flashing extending minimum 12 in. horizontally onto the substrate and extend down into the prepared drain bowl a minimum of 3 in. At no time should the fluid-applied membrane be installed to restrict or reduce the drain inlet in size.
- B. Option 1 – Cold Fluid Applied Membrane Application
1. Stripping: Set metal flanges in roofing membrane. Prime flanges and strip in flanges of metal roof accessories, metal flashings and elastomeric flashings with roofing membrane. Set roof drains as per manufacturer's written instructions.
  2. Mix and apply cold fluid-applied waterproofing membrane in strict accordance with written instructions of membrane manufacturer. Apply an even layer of cold fluid-applied resin at the minimum consumption rate recommended by the membrane manufacturer.
  3. Work reinforcement into the wet resin, removing trapped air. Maintain a minimum 2 in. overlap at all side and butt laps of adjacent reinforcement rows. Maintain a minimum 4 in. overlap at all flashings and penetrations.
  4. Apply an even topcoat of cold fluid-applied resin at the minimum consumption rate recommended by the membrane manufacturer.
  5. Allow completed membrane to cure as recommended by the membrane manufacturer prior to continuing application or applying loads.
- C. Option 2 – Hot Fluid Applied
1. Stripping: Set metal flanges in roofing membrane. Prime flanges and strip in flanges of metal roof accessories, metal flashings and elastomeric flashings with roofing membrane. Set roof drains as per manufacturer's written instructions.
  2. Application Thickness: Apply an initial roofing membrane in a continuous monolithic coating to a minimum thickness of 90 mils. 3/32 in.. Into the initial membrane fully embed a layer of spunbond polyester fabric reinforcing sheet with 4 in. side laps and 12 in.

head laps followed by an additional continuous monolithic coating of roofing membrane of 125 mils 1/8 in., resulting in a total minimum roofing membrane thickness of 215 mils, 7/32 in. at any location. Utilize methods recommended by the roofing membrane manufacturer. Apply additional material to correct areas deficient in thickness by procedures recommended by the membrane manufacturer.

- D. Separator/Protection Sheet: Install flexible membrane, lapping joints a minimum of 3 in. to ensure complete coverage. Cover separator/protection sheet immediately with insulation.
- E. Drainage Board: Install three dimensional molded panels in accordance with manufacturer's requirements.
- F. Roofing Metal Work: Be responsible for the proper attachment of specified work to roofing metal or related work that is embedded in, or in contact with, and becomes an integral part of specified roofing or flashing system, even when such roofing metal or related work is provided under other Sections of the Specifications. Where flashings terminate against parapet walls, curbs, pipe and vent penetrations and other such obstructions, provide termination bars and pipe clamping rings as recommended by the roofing membrane manufacturer. Provide continuous sealant bead at top of termination bars and clamping rings.
- G. Insulation: Install in accordance with insulation manufacturer's printed instructions. Loosely lay extruded insulation units over roofing membrane, with long joints of insulation in continuous straight lines and with end joints staggered between rows. Fit insulation neatly and accurately at walls, curbs and other projections and bring edges and ends of units into moderate contact with open joints. Install one or more layers of insulation to achieve required thickness over roofing membrane. Cut and fit to within 3/4 in. of projections and penetrations. Where overall insulation thickness is 2 in. or more, install required thickness in two or more layers with joints of each succeeding layer staggered over joints of previous layer a minimum of 6 in. in each direction.
- H. Water Pervious Fabric Mat: Install water pervious fabric mat over insulation in accordance with the roofing membrane manufacturer's printed instructions. Install fabric mat over insulation, overlapping edges and ends at least 12 in. Do not end lap fabric sheets within 72 in. of roof perimeter. Extend fabric 2 in. to 3 in. above ballast at perimeter and penetrations. Apply additional layer of fabric around penetrations to prevent aggregate from getting between penetration and insulation. Do not cover drains or restrict water flow to drains.
- I. Roof Paver Ballast
  - 1. Paver Roof Ballast: As soon as possible after insulation is installed, but in no case exceeding the maximum time of exposure of the insulation permitted by the insulation manufacturer, apply precast units and pedestal supports at each corner directly over water pervious fabric in areas as shown and in accordance with final shop drawings.

- a. Establish grid system matching grid system shown. Provide pedestals and shims at each corner and intersection of each paver to provide a level surface which will result in a level paver system with uniform open joint pattern.
  - b. In areas where entire roof is covered with precast ballast, cut precast pavers precisely around penetrations to form a tight joint and totally covering insulation and roof membrane.
  - c. Pedestals and shim plates are placed at intersection of gridline if finished surface is to follow slope of substrates. Paver size centerlines must be adhered to.
  - d. Level surface installation using adjustable pedestal system following manufacturer's installation procedure. No variances to system procedure allowed.
    - 1) Minor height and pitch adjustments to be corrected using 1/8" shim plates.
  - e. Lay out pattern of precast units so that units terminate on an even line no more than 2 in. from the vertical surface or penetration, cutting units as necessary.
  - f. Install roof paver and paver pedestal at each corner in accordance with manufacturers written instructions and recommendations.
  - g. In corners, provide strapping over precast concrete pavers with 22 gauge x 3 in. wide x 12 ft. long stainless steel straps with stainless steel fasteners in configurations and methods as recommended by insulation manufacturer for building height and wind speeds noted. (Comply with Dow TechNote 508).
  - h. Tolerances:
    - 1) Maximum of 1/16" height variation between adjacent pavers.
    - 2) Individual pavers shall not vary more than 1/16" from level across width of the paver.
    - 3) Paved areas shall not vary more than 1/4" from level in a distance of 10' measured at any location and in any direction.
    - 4) All joints to be 1/8 inch.
- J. Garden Roof Installation
1. Protection Sheet/Root Barrier in areas as Scheduled for Roof Garden System: Install while flexible membrane is warm, lapping joints a minimum of 4 in. to ensure complete coverage. The protection sheet/root stop barrier shall be turned up all vertical, roofed/flushed surfaces to completely protect roofing and

- flashings. Cover separator/protection sheet immediately with insulation.
2. Drainage Course in areas as Scheduled for Roof Garden System: Install three dimensional molded panels in accordance with manufacturer's requirements. Place expanded shale directly over drainage system at specified depth to meet fill and grade shape requirement. Cover expanded shale with filter cloth before placing growth media mix or surface treatment.
  3. Moisture Retention Mat. Provide a layer of moisture retention mat installed over the protection sheet/root barrier or drainage course layer/ insulation, lapping adjacent rolls a minimum of 4 in. The moisture retention mat shall be turned up all vertical, roofed/flushed surfaces a minimum of 6 in. beyond the anticipated growth media level. Any excess shall be trimmed down to the level of the growth media.
  4. Drainage Inspection Devices: Provide drain inspection device over each drain and other accessories within the soft landscape area. The drainage layer shall be close butted to the base of the inspection device. The filter sheet shall be dressed up all sides of the inspection device to growth media level. Provision shall be made to install and form a barrier between the vegetation and all vulnerable roof details, i.e. at parapets, outlets, vent pipes etc. The barrier must be a minimum of 12 in. wide, and consist of large rounded aggregate 3/8 in. to 3/4 in.
  5. Growth Media Installation
    - a. Growth media shall be placed carefully to avoid damage or displacement of other materials such as walls, paving, drainage components, filter fabric, and roofing membrane.
    - b. Growth media shall be placed to within 1 in. greater than final grade or to a depth of no greater than 8 in. and compacted. For final grades less than 8 in. only one round of compaction shall be performed and remaining growth media loosely placed such that top of growth media exceeds final grade by 1 in. For final grades greater than 8 in., place growth media at no greater than 6 in. and repeat procedure until growth media has been compacted within 1 in. of final grade.
    - c. Compaction shall be performed with a 200 lb. – 300 lb. landscape roller or lightly compacted with a hand held mechanical compactor to achieve a 50% – 60% compaction as determined by ASTM D1557. After compaction remaining growth media shall be placed at 1 in. greater than final grade and thoroughly watered or jetted over entire area. Low settled areas shall be filled with additional growth media and re-wet to achieve uniform prescribed final grade.
    - d. After compaction remaining growing media shall be placed at 1 inch greater than final grade and thoroughly

watered or jetted over entire area. Low settled areas shall be filled with additional growing media and re-wet to achieve uniform prescribed final grade.

- e. Erosion Control Mat: The erosion control mat shall be installed directly over the growing media and properly anchored into place
  - 1) Anchor fastening pattern is based on local wind speed, building height and roof slope.
- 6. Vegetation Installation
  - a. Vegetation planting shall be installed in accordance with the Installation and Maintenance Guidelines.
  - b. Plant materials shall not be installed between the fall frost date and the following spring frost date.
  - c. Growing media shall be thoroughly watered and saturated immediately prior to installing new plant material.
  - d. All vegetation shall be thoroughly watered and saturated immediately after installation. Media is saturated when water is seen flowing into roof drains from adjacent areas.

### 3.5 FIELD QUALITY CONTROL

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. High Voltage Electronic Leak Detection: Perform leak testing by an electronic detection process administered by a certified High Voltage ELD tester and monitored by qualified testing agency as follows:
  - 1. Test equipment shall consist of conductive phosphor bronze brush electrodes and a portable battery powered generator capable of providing variable DC current from 1000-30,000 volts at low amperage.
  - 2. The ELD Technician shall connect one terminal of the generator to a ground in the assembly (typically a steel or concrete deck, or alternative grounding medium such as a conductive primer or metal grid). Connect the other terminal to the phosphor bronze brush. Calibrate the voltage level to the thickness of the membrane being tested.
  - 3. The ELD Technician shall methodically pass the brush electrode over all testable vertical membrane surfaces in the contract and approximately 1 foot (25 cm) of horizontal membrane directly adjacent to the vertical membrane areas. Successive passes will overlap previous passes by a minimum of 3 inches (75 mm). Breaches will be identified when an audible alarm indicates that the electric current has passed through a defect and grounded to the conductive material beneath the membrane.

4. The ELD Technician shall mark breach locations on the membrane with spray paint, chalk, tape or other approved method.
- C. Low Voltage Electronic Water Testing: Perform leak testing by an electronic detection process (Electric Field Vector Mapping) administered by a certified electric field mapping tester and monitored by qualified testing agency as follows:
1. Test the entire roofing membrane on an area-by-area basis as required by the conduct of the Work. Install stationary impulse conductor wire around perimeter of area to be tested. The testing agency will determine size and shape of area. Provide conductor wire consisting of braided polyethylene 1/16 in. (1.5mm) diameter interwoven with a minimum of six strands of stainless steel wire. Place conductor wire 6 in. (150mm) from perimeter and secure against accidental movement or damage. Place wire directly on membrane. Isolate metal items contacting the membrane by placing four to six additional stands of conductor wire to isolate the field or by removing the metal items temporarily if possible. Bring connection wires to an agreed upon location and place within watertight conduit and identified watertight junction box so as to allow for future testing.
  2. Wet the membrane test area with water or other suitable conductor fluid prior to start of each test and maintain wet for duration of testing. Utilizing a potentiometer and two probes placed at the surface of the membrane detect the presence or absence of electrical flow across the surface of the membrane. Verify integrity of the membrane at drains and penetrations by localized testing.
  3. Provide a report of each day's test results containing a written description and photograph of defects and any corrections made and a schematic CAD drawing indicating location of stationary conductor wire and of any defects found in testing to within 1 in. (25mm) of accuracy.
- D. Water and Leak electronic testing may be conducted on an area by area basis as the Work permits but in no case shall less than 100% of the roof and waterproofing membranes be tested. If leaks occur, remove existing components and replace with new materials (matching existing) to eliminate the causes and sources of the leaks.

### **3.6 CITY OF NEW YORK'S MONITORING ACTIVITIES**

- A. City of New York's Testing Agency: A testing agency, engaged at the City of New York's expense, will perform the following activities to monitor the Contractor's Quality Control Program. The monitoring activities do not relieve the Contractor of responsibilities under the Contract.

1. The testing agency shall inspect and report on the following:
  - a. Flashings: Inspection of flashings to assure manufacturer's quality requirements are maintained throughout the installation period.
  - b. Membrane Thickness: Inspection of the membrane to verify thickness by taking random samples in locations selected by the Engineer. Take one (1) sample for each 100 ft.<sup>2</sup> prior to cooling of the membrane and installation of the protection sheet utilizing a pin or needle gauge as recommended by the membrane manufacturer. Testing agency shall submit written test results noting location and thickness.
  - c. Electronic Water Test Observation: Observe electronic water testing and examine underside of decks and terminations for evidence of leaks during testing.
- B. Contractor's Assistance to the City of New York's Testing Agency: Furnish the City of New York's Testing Agency with access to the Work, materials and facilities as required by the Agency. Provide adequate notice of construction activities to allow timely inspections and observation of Contractor tests, and be available for pre- installation meetings. Furnish the City of New York's Testing Agency with on-site office facilities.
- C. Contractor's Responsibility
  1. Upon award of Contract, complete the form furnished by the Inspection Agency.
  2. Provide the Inspection Agency with safe access to the Work.
  3. Notify the Inspection Agency whenever work is to be done, in sufficient time to arrange inspection.
  4. Discontinue any practice immediately when notified which, in the Inspection Agency's opinion, is not in accordance with the Specifications or will act to the detriment of the system. The Inspection Agency will notify the City of New York, the Engineer, the Contractor and the manufacturer immediately of violations. Work affected by the practice will be subject to complete replacement.
  5. Give written notice to the Inspection Agency stating that the installation has been completed in accordance with the Contract Documents and requesting that a final inspection be conducted.

### **3.7 VEGETATION MAINTENANCE**

- A. Contractor/Installer shall maintain plantings in accordance with the Installation and Maintenance Guideline.
- B. Maintenance activities shall include, but are not limited to, the following:
  1. Periodic on-roof monitoring of vegetation.
  2. Watering to maintain proper growing media moisture content (especially during periods of hot and dry weather).

3. Weeding to remove unwanted vegetation from planted areas and vegetation free zones.
  4. Removal of debris.
  5. Reporting and photo-documentation of progress of vegetation during maintenance and warranty period.
- C. Maintenance shall begin immediately after vegetation installation and shall continue through final acceptance and turn-over of the project to the City of New York.
- D. Maintenance activities shall continue throughout the two-year warranty period (from date of vegetation installation) to keep vegetation warranty in effect.

### **3.8 ADJUSTING**

- A. Correct deficiencies in or remove fluid applied protected membrane roofing system components that do not comply with requirements. Repair substrates, and repair or reinstall components or system to a condition free of damage and deterioration at time of Substantial Completion and in compliance with warranty requirements.

### **3.9 PROTECTION**

- A. Protect adjacent construction from damage resulting from spillage, dripping and dropping of material. Prevent materials from entering and clogging drains and water conductors. Repair and restore, or replace other work which is soiled or damaged in connection with the performance of this work.
- B. Until roofing membrane is protected with insulation and the ballast system, keep areas free from traffic and other trades. Upon completion of roofing, provide necessary temporary protection to prevent damage from any source.

**END OF SECTION**

**SECTION 07 62 00 – SHEET METAL FLASHING AND TRIM****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide sheet metal flashing and trim in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Stainless steel flashing for CMU walls is specified in Section 04 20 00 "Masonry Units".
  - 2. Wood grounds, nailers, blocking, cants and other wood items required for complete roof installation is specified under Section 06 15 00 "Rough Carpentry".
  - 3. Roofing system is specified in Section 07 55 56 "Vegetated Fluid Applied Protected Membrane Roofing".
  - 4. Roofing system is specified in Section 07 55 66 "Fluid Applied Membrane Roofing".
  - 5. Sealants and joint fillers are specified under Section 07 92 00 "Joint Sealants".
  - 6. Counterflashing of mechanical and electrical equipment items penetrating roofing or waterproofing systems is specified in applicable specification sections.

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. International Nickel Company: "Stainless Steel Roofing, Flashing and Accessories Volume 3".
  - 2. Sheet Metal and Air Conditioning Contractors National Association (SMACNA): "Architectural Sheet Metal Manual"
  - 3. National Association of Architectural Metal Manufacturers (NAAMM): NAAMM "Metal Finishes Manual".
  - 4. American Architectural Manufacturer's Association (AAMA): AAMA 2605 "Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels"

**1.3 SUBMITTALS**

- A. Product Data: Submit manufacturer's literature, specifications and

installation instructions describing the general properties of each material and accessory to be used in the Work.

- B. Shop Drawings: Submit manufacturer approved shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum scale. Show complete information concerning fabrication, installation, joint details, fastenings contiguous construction and other information required.
- C. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor
  - 1. Samples of each metal required, minimum 12 in. sq.
- D. Closeout Submittals Submit the following:
  - 1. Warranties: Special warranties as specified.

#### **1.4 QUALITY ASSURANCE**

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Field Samples: Prior to installation, provide a field sample for each type of flashing in the building at designated areas. Utilize the same materials and installation methods in the sample as required for the final Work. Schedule the installation so that the sample may be examined, and any necessary adjustments made, at least 1 week prior to date scheduled for commencing installation of the Work. When accepted, sample areas shall serve as the standard for materials, workmanship, and appearance for such Work throughout the project and shall remain a part of the final Work.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.

#### **1.5 DELIVERY, STORAGE AND HANDLING**

- A. General: Deliver and store materials in manufacturer's original packaging labeled to show name, brand, type, and grade. Store materials in protected dry location off ground in accordance with manufacturer's instructions. Do not open packaging nor remove labels until time for installation

#### **1.6 PROJECT/SITE CONDITIONS**

- A. Weather Conditions: Do not proceed with the Work during inclement weather nor when weather forecasts are unfavorable, unless the Work will proceed in accordance with the manufacturer's requirements and instructions.

## 1.7 WARRANTY

- A. Warranty specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
1. Special Warranty: Provide a written warranty, for a period of two (2) years, warranting against leaks resulting from defects of materials or workmanship. Upon notification of such defects, within the warranty period, make the necessary repairs and replacements at the convenience of the City of New York.

## PART 2 - PRODUCTS

### 2.1 SHEET METAL MATERIALS

- A. Sheet Metal Materials
1. Stainless Steel Flashing ( **FLH-01** ): ASTM A666, Type 316, dead soft fully annealed except where harder temper required for forming or performance; 0.015 in. thick (28 gage) unless otherwise shown or specified, finish No. 2D.
- B. Prefabricated Flashing System: The flashing closure system is specified herein by proprietary designation prefabricated flashings for column, pipe and other penetrants as manufactured by SBC Industries and establish the quality standards required for these systems. Equivalent products of other manufacturers will be considered provided they meet those established standards. Fabricated from 26 gage stainless steel type 304, with 2B finish, complying with ASTM A240, and in strict compliance with manufacturer's fabrication requirements.
1. Pipe Flashings: Provide fabrications as follows:
    - a. Fabrication of flashings for pipes, conduits and other round items penetrating, resting on or anchored to roof which allows a tubular flashing to be slipped over.
      - 1) Form tubular flashing sleeve no less than 9 in. high and of proper diameter to provide min. 1/8 in. and max. 1/4 in. clearance form pipe or conduit.
      - 2) Fabricate square flashing plate to a size 7-1/2 in. larger than protrusion. Punch hole of appropriate size in center and extrude surrounding material upward 1/4 in. providing a continuous vertical soldering flange and solder 9 in. high tubular flashing sleeve. Cut 1 in. min. radius on flashing plate corners.
      - 3) Fabricate counter flashing 5 in. high with a diameter 1/2 in. to 2 in. larger.
      - 4) Shop solder seams watertight.
    - b. Fabrication of flashings for connected pipes, conduits and

other round items not allowing a tubular flashing to be slipped over.

- 1) Form semi-cylindrical tubular flashing sleeves (180 deg.) not less than 9 in. high, tightly seam intersecting halves to mate snugly. Provide a split flashing plate with radial corners and being formed upward to provide a continuous soldering flange for semi-cylindrical sleeve engagement. Size each unit to allow for vibration and thermal movement of pipe or conduit with 1/8 in. minimum by 1/4 in. maximum.
  - 2) Form cylindrical counter flashing 5 in. high with seamed edge to a diameter 1/4 in. larger than 9 in. high sleeve.
  - 3) Provide conical sealant cover, sloped outward and downward at 30 deg. to 45 deg. from a horizontal plane, with an inside diameter equal to pipe or conduit size and an outside diameter 2 in. larger.
2. Column, Angles, Channels, Square Tubing and Beam Flashings: Provide fabrications as follows:
- a. Form a 6 in. high two piece angular configuration similar to penetration but allowing 3/16 in. min. to 3/8 in. max. clearance in any direction. Fabricate flashing flanges in two pieces stainless steel; ASTM A240, 26 gauge, type 304, finish No. 2B, and shop solder to 6 in. angular stacks. Provide an umbrella type counter flashing conforming to protrusion. Extend 3/4 in. at 45 degree outward from angular stack flashing.
3. Custom Shapes: Provide custom shaped flashings for penetrants as shown or required formed to shape of penetrating elements, and counter flashed as required by manufacturer's specifications, recommendation and instructions to provide a water-proof, air tight system.
- C. Surface Applied Reglets: Stainless steel Type 316; 0.018 in. thick; complete with factory punched slots, factory fabricated reglet corners, cap/counter flashing, sealant flange, neoprene-steel washers and other required accessories. Provide one of the following:
1. "SM Surface Mounted Reglet" (Fry Reglet Corp.).
  2. "Type D Reglet" (Cheney Flashing Company).
  3. "Two Piece Cap Flashing" (Keystone Flashing).
  4. or approved equal.

## 2.2 AUXILIARY MATERIALS

- A. Solder for Stainless Steel: ASTM B32; provide 60% tin- 40% lead solder, with acid-chloride type flux, except use rosin flux over tinned surfaces.
- B. Fasteners: Screws, rivets and nails shall be non-corrosive, of same material as sheet metal flashing and trim or of compatible material. Match finish of exposed heads with material being fastened.
- C. Metal Accessories: Provide sheet metal clips, cleats, straps, anchoring devices, and similar accessory units as required for installation of work, matching or compatible with material being installed, noncorrosive, size and gage required for performance.
- D. Sealant: As specified in Section 07 92 00 Joint Sealants.
- E. Foam Tape: ASTM D-1056; closed cell foam, PSA on one side, 1/4 in. or 3/8 in. x 1 in. wide.
- F. Epoxy Seam Sealer: 2-part noncorrosive metal seam cementing compound, recommended by metal manufacturer for exterior/interior nonmoving joints including riveted joints.
- G. Mastic Sealant: Polyisobutylene; nonhardening, nonskinning, non-drying, nonmigrating sealant.
- H. Paper Slip Sheet: 5 lb. rosin-sized building paper.
- I. Polyethylene Underlayment: Minimum 6 mil carbonated polyethylene film resistant to decay when tested in accordance with ASTM E154.
- J. Dielectric Separator: Cold applied, asphalt emulsion type complying with ASTM D1187, non-sagging, resistant to severe corrosion conditions; applied in two coats for an overall minimum dry film thickness of 25 mils or heavy coating of epoxy paint in minimum 2.0 mil dry film thickness.

## 2.3 FABRICATION

- A. General Metal Fabrication: Shop-fabricate work to greatest extent possible. Comply with details shown and with applicable requirements of SMACNA "Architectural Sheet Metal Manual" and other recognized industry practices. Fabricate for waterproof and weather-resistant performance, with expansion provisions for running work, sufficient to permanently prevent leakage, damage, or deterioration of the work. Form work to fit substrates. Comply with material manufacturer instructions and recommendations for forming material. Form exposed sheet metal flashing and trim work without excessive oil-canning, buckling, and tool marks, true to line and levels indicated, with exposed edges folded back to form hems.
- B. Seams: Fabricate nonmoving seams in sheet metal flashing and trim with flat-lock seams. For metal other than aluminum, tin edges to be seamed, form seams, and solder. Form aluminum seams with epoxy seam sealer; rivet joints for additional strength where required.
- C. Expansion Provisions: Where lapped or bayonet-type expansion provisions in work cannot be used or would not be sufficiently water/weatherproof, form expansion joints of intermeshing hooked

flanges, not less than 1 in. deep, filled with mastic sealant concealed within joints.

- D. Sealant Joints: Where movable, non-expansion type joints are indicated or required for proper performance of work, form metal to provide for proper installation of elastomeric sealant, in compliance with SMACNA standards.
- E. Separations: Provide for separation of metal from noncompatible metal or corrosive substrates by coating concealed surfaces at locations of contact, with dielectric coating or other permanent separation as recommended by manufacturer/fabricator.

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates, apply primers and install the work of this Section, including accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

#### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

#### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Cleaning of Substrate Clean surfaces of laitance, dust, dirt, oil, wax and other foreign materials.
- C. Piping, Conduit and Other Penetrations: Proceed with flashing work only after pipe sleeves, vents, curbs, inserts, drains, and other projections through the substrate to be flashed have been completed. Proceed only after concrete and masonry substrate defects, including honeycombs, voids, and cracks, have been repaired to provide a sound substrate free of forming materials, including reveal inserts.

#### **3.4 INSTALLATION**

- A. General: Install the materials in accordance with SMACNA standards and the manufacturers' instructions, except where more stringent requirements are shown or specified. Conceal fasteners and joints wherever possible in exposed Work, and locate to prevent leakage. Maintain a water-tight installation at fasteners, joints and seams. In general, furnish metal flashings in 8 ft. lengths joined with flat locked soldered seams. Provide an expansion joint at not over 24 ft. on centers with a loose lock filled with sealant. Provide separation of dissimilar materials by coating or covering metal with inert material to prevent galvanic corrosion.

- B. Stainless Steel: Follow guide specifications for "Stainless Steel Roofing, Flashing and Accessories" published by the International Nickel Company in their Design Consultant's Stainless Steel Library, Volume 3.
- C. Temperature: Sheet metal flashing and trim shall be designed and detailed for a temperature of 70 deg. F. at time of installation with allowance made for a 150 deg. F. ambient temperature range. Make necessary adjustments for installations at other than design temperature.
- D. Underlayment: Where stainless steel or aluminum is to be installed directly on cementitious or wood substrates, install a slip sheet of red rosin paper and a course of polyethylene underlayment.
- E. Reglets: Install reglets to receive counterflashing in manner and by methods shown as recommended. Where shown in concrete, furnish reglets to trades of concrete work for installation as work of Division 3 sections. Where shown in masonry, furnish reglets to trades of masonry work, for installation as work of Division 4 sections. Install counterflashing in reglets, either by snap-in seal arrangement or by welding in place for anchorage and filling reglet with elastomeric sealant.
- F. Metal Through-Wall Flashing: Provide continuous through-wall flashing, lap-seamed and soldered at splices and intersections, complete with preformed corners and end dams. Cover and seal Work as required for a minimum of 4" embedment.
- G. Prefabricated Flashing System: Install prefabricated flashing system complete with base sleeves, cap flashing, tape, sealant, solder, fasteners and accessories, as shown, and as required for a waterproof, airtight installation.

### **3.5 CLEANING AND PROTECTION**

- A. Upon completion of Work, clean the exposed surfaces to make neat and obtain uniform appearance.
- B. Protect the Work during the remainder of the construction period, so that there will be no indication of deterioration or damage at the time of acceptance by the City of New York.

**END OF SECTION**

**SECTION 07 70 00 – ROOF AND WALL SPECIALTIES AND ACCESSORIES****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide roof and wall specialties and accessories in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Wood grounds, nailers, blocking, cants and other wood items required for complete roof installation is specified under Section 06 10 00 "Rough Carpentry".
  - 2. Prefabricated metal flashing system, sheet metal flashing and trim as part of roofing construction is specified in Section 07 62 00 "Sheet Metal Flashing and Trim".
  - 3. Sealants and joint fillers are specified under Section 07 92 00 "Joint Sealants".
  - 4. Fluid applied protected membrane roofing system is specified in Section 07 55 56 "Fluid Applied Membrane Roofing" and Section 07 55 66 "Vegetated Fluid-Applied Protected Membrane Roofing".

**1.2 REFERENCE**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Welding Society (AWS)
    - a. D1.1 "Structural Welding Code - Steel"
    - b. D1.2 "Structural Welding Code - Aluminum"
    - c. D1.3 "Structural Welding Code - Sheet Steel"
  - 2. National Association of Architectural Metal Manufacturers (NAAMM): "Metal Finishes Manual"
  - 3. National Roofing Contractors Association (NRCA)
    - a. "Roofing and Waterproofing Manual"
    - b. "Handbook of Accepted Roofing Practices"
  - 4. Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA): "Architectural Sheet Metal Manual"

5. American Architectural Manufacturer's Association (AAMA): 2605 "Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels"

### 1.3 SYSTEM DESCRIPTION

- A. Performance Criteria
  1. General Performance: Roof and wall specialties and accessories shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.
  2. Loading Criteria: Design, fabricate and install roof and wall accessories to withstand the inward and outward wind loads, live loads, building movement, and wind uplift loads shown.
    - a. Provide copings and accessories capable of being used by personnel from roof access or from scaffolding capable of supporting a minimum additional concentrated live loading of 200 psf or a uniform load of 150 lbs./ft. (whichever is greater) without permanent deflection, deformation or leakage of air or water. Include stiffeners and supports as required for strength and rigidity. Include brackets, plates and straps in the assemblies for support of contiguous work.
  3. Temperature Requirements: Design, fabricate and install component parts to provide for expansion and contraction over an ambient temperature range of (120 deg. F.) and a surface temperature range of (180 deg. F.) without buckling, sealed joint failure, undue stress on members or anchors, and other detrimental effects.
  4. Watertightness: Provide tight joints and effectively seal roof and wall specialties and accessories against water leakage and air infiltration. Water leakage is defined as the appearance of uncontrolled water, other than condensation, on any inboard part of a roof and wall specialty or roof and wall accessory.
  5. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and coordinate the work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted to the Engineer for review.

### 1.4 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work
- B. Shop Drawings: Submit for Engineer's action. Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than

3 in. = 1 ft. minimum scale of roof and wall accessories detailing fabrication and erection of each roof and wall specialty and accessory item, including dimensioned plans and elevations, and details of sections, connections, anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections. Show complete information concerning fabrication, installation, joint details, fastenings and other information required. In addition, locate expansion joints.

1. Roof Coordination Drawings: As part of the shop drawing submittal, provide coordination drawings showing complete roof plans, drawn to scale, and coordinating penetrations and roof-mounted items noting the following:
    - a. Size and location of roof accessories specified in this Section.
    - b. Method of attaching roof accessories to roof or building structure including flashing requirements.
    - c. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
    - d. Required clearances for roof accessories.
- C. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor.
1. Color and Finish Samples: Samples for each finish and color required. Submit sample finishes on aluminum having the specified alloy, temper, substrate preparation treatment and thickness of metal required for the Work. Provide 12 in squares for sheet showing the maximum range or variation in color and shade.
- D. Quality Control Submittals: Submit for Engineer's information.
1. Certificates:
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Installer certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree that the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
    - b. Manufacturer's and fabricator's certifications indicating that the PVDF coating complies with the Contract Documents.
- E. Closeout Submittals Submit for City of New York's documentation.
1. Warranties: Special warranties as specified.
  2. Maintenance Manuals: Two (2) complete maintenance manuals describing the materials, devices and procedures to be followed

in cleaning and maintaining the Work. Include manufacturers' brochures and lists describing the actual materials used in the Work.

## **1.5 QUALITY ASSURANCE**

- A. **Single-Source Responsibility:** Obtain each roof specialty from one source of a single manufacturer. Obtain accessory products used in conjunction with roof accessories from each roof specialty manufacturer or from sources acceptable to each roof specialty manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- B. **Qualified Installer:** The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- C. **Regulatory Requirements:** Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. **Product Options:** Information on Drawings and in Specifications establishes requirements for system's aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including preconstruction testing, field testing, and in-service performance.

## **1.6 DELIVERY, STORAGE AND HANDLING**

- A. **Delivery:** Deliver materials in tagged bundles or in manufacturer's unopened containers fully identified to show name, brand, type, grade and thickness. Store, protect and keep materials dry.
- B. **Protective Coatings or Coverings:** Temporary coating and coverings may be furnished at manufacturer's or Contractor's option to protect the Work during shipment and construction. Such protection shall avoid development of non- uniformity in finishes, shall not impart a residue which would adversely affect the adhesion of sealants, nor cause other deleterious effects in the Work.

## **1.7 PROJECT/SITE CONDITIONS**

- A. **Weather Conditions:** Do not proceed with the Work during inclement weather nor when weather forecasts are unfavorable, unless the Work will proceed in accordance with the manufacturer's requirements and instructions.

## 1.8 WARRANTIES

- A. Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
1. Special Roof Access Hatch and Skylight Warranties: Submit for City of New York's documentation. Furnish two (2) year written warranty in form stipulated by Engineer, signed by the Contractor and Installer, agreeing to repair or replace Work which has leaked or otherwise failed as a result of defects in materials or workmanship. Upon notification of such defects, within the warranty period, make necessary repairs or replacement at the convenience of the City of New York.
  2. Special Warranty, PVDF Coatings: Provide a written warranty, from the manufacturer and finisher of PVDF coating system and the finisher, directly to the City of New York, for a period of 20 years, warranting against the loss of film integrity, chalking, fading, non-uniformity, corrosion and the overall performance of color of the PVDF coatings. Upon notification of such defects, within the warranty period, make the necessary replacements at the convenience of the City of New York.
    - a. Color retention not to exceed 5 $\Delta$ E Units (Hunter) color change as calculated in accordance with ASTM D2244 on exposed surfaces cleaned with clean water and a soft cloth.
    - b. Degree of chalking not to exceed rating No. 8 for colors and No. 6 for whites when measured in accordance with ASTM D4214 Test Method, Test Method A on exposed unwashed surfaces.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Galvanized Steel: ASTM A653, Hot-dip galvanized with G90 coating (minimum spangle), either commercial quality or structural quality, Grade 33, unless another grade is required for design loads.
- B. Steel Shapes: ASTM A36, hot-dip galvanized to comply with ASTM A123, unless otherwise indicated.
- C. Stainless Steel Flashing: ASTM A666, Type 316 dead soft fully annealed except where harder temper required for forming or performance; 0.015 in. (28 gauge) thick unless otherwise shown, finish No. 2D. Provide 60% - 40% tin/lead solder, with acid-chloride type flux, except use rosin flux over tinned surfaces in accordance with ASTM B32.

### 2.2 FASTENERS, ANCHORAGE DEVICES AND REINFORCING

- A. Aluminum Angles, Plates, Bars, and other Aluminum Members

Required to Join or Reinforce Assembly of Aluminum Components: Alloys recommended by manufacturer or fabricator to develop required strength of assembly.

- B. Fasteners and Anchorage Devices: Stainless steel, type, grade, class and style best suited for the respective purpose. Use countersunk flathead Phillips type machine screws for exposed fasteners except where Allen head screws are required. Finish of fasteners shall match finish of contiguous material.

### 2.3 AUXILIARY MATERIALS

- A. Sealant: Refer to Specification Section 07 92 00 "Joint Sealants".
- B. Insulation: Refer to Specification Section 07 21 00 "Building Insulation".
- C. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, or PVC; or flat design of foam rubber or sponge neoprene.
- D. Wood Nailers: Pressure treated lumber in accordance with Section 06 15 00 "Rough Carpentry" but in no case less than 1-1/2 in. thick.
- E. Other Materials: Manufacturer's standard for the product specified.

### 2.4 FINISHES

- A. Steel:
  - 1. General: Clean, treat and shop-prime the metal surfaces of roof and wall specialty and accessory items, unless otherwise specifically noted. Clean the metal surfaces to remove dirt, rust, or other deleterious matter, and prepare for painting.
  - 2. Galvanized Steel: Clean and prepare surfaces in accordance with SSPC SP- 1 solvent cleaning.
- B. Aluminum:
  - 1. General: Clean surfaces with inhibited chemicals and acid-chromate fluoride- phosphate treatment, AA-C12C42 in accordance with Aluminum Association standards.
  - 2. Finishes: Remove die markings prior to finishing operations. Where necessary to remove die markings from any part of the work, members must be finished by the same process, whether or not die markings exist. Perform this work in addition to the finish specified. Scratches, abrasions, dents and similar defects are unacceptable.
    - a. Fluoropolymer PVDF coating 3 Coat System: Standard 3-coat, thermocured system composed of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluorocarbon topcoat complying with AAMA 2605 and AA-C12C42R1x in custom colors and gloss as selected, using 70% minimum polyvinylidene fluoride resin by weight either "Kynar 500 or Hylar 5000 Fluorocarbon Resin" (Arkema Inc. or Solvay Solexis, Inc. or approved equal), applied to a total dry film thickness of 1.6 mil.

3. Primer: Provide corrosion-inhibiting primer paint of type suitable to receive the intended field-applied finish paint such as catalyzed epoxy enamel. Shop- apply primer paint to uniform 2 mils dry film thickness in accordance with paint manufacturer's recommendations.
- C. Galvanizing Repair Paint: Zinc rich paint for repairing galvanized surfaces in accordance with ASTM A780.
- D. Dielectric Separator: Cold applied, asphalt emulsion type complying with ASTM D1187, non-sagging, resistant to severe corrosion conditions; applied in two coats for an overall minimum dry film thickness of 25 mils or heavy coating of epoxy paint in minimum 2.0 mil dry film thickness.

## 2.5 FABRICATION

- A. Shop Fabrication: Shop fabricate each unit to the extent possible, complete with framing, structure, flashing flanges, accessories, anchorage and other components required for a secure watertight installation. Include supplementary parts necessary to complete work though not definitely shown or specified.
- B. Welding, Cutting, Drilling and Fitting: Complete the welding, cutting, drilling and fitting of joints prior to finishing. Weld with electrodes and by methods recommended by the aluminum manufacturer in accordance with applicable recommendations of the AWS. Use only methods which will avoid distortion or discoloration of exposed faces. Grind weld areas smooth and restore mechanical finish condition before proceeding with other treatment.
- C. Fasteners: Conceal fastenings unless otherwise shown or specified. Do not use self tapping screws for any fastener under load. Where fasteners screw-anchor into aluminum members less than 1/8 in. thick, reinforce the interior with aluminum or nonmagnetic stainless steel to receive screw threads, or provide standard noncorrosive pressed-in splined grommet nuts.

## 2.6 FABRICATION, SPECIFIC ITEMS

- A. Roof Access Hatches: Provide prefabricated roof hatches fabricated as follows: Covers shall be 14 gauge paint bond galvanized steel with 3 in. beaded welded flange, covering 1 in. thick fiberglass insulation with a 22 gauge galvanized steel interior liner. Curb shall be 14 gauge galvanized steel 12 in. high covering 1 in. thick fiberboard insulation. Cover shall have a heavy extruded EPDM rubber gasket that is bonded to the cover interior to assure a continuous seal when compressed to the top surface of the curb. Provide a 14 ga. galvanized steel exterior curb cover fully welded and made watertight. Provide 5 deg. pitch on curb to deck to allow for water and snow runoff. Entire hatch to have 14 gauge galvanized steel cap flashing fully welded. Provide stainless steel hardware, including a positive hold/release mechanism, heavy pintle hinges, compression spring operators, heavy duty shock absorbers, pull rings for inside and outside operation, neoprene draft seals and padlock hasps inside and out. Provide one of the following:

1. Single Leaf ( **RH-01** ) : Provide one of the following, with Safety Post and Railing System:
    - a. "Type S" (The Bilco Co.).
    - b. "B-RHG Series" (Babcock-Davis).
    - c. "Ladder Hatch Model LH" (Dur-Red Products).
    - d. Or approved equal.
  2. Safety Posts for Roof Access Hatches: Provide black enameled steel spring balanced safety posts mounted on top two rungs of ladder which telescopes up and down, and locks in the upright position.
    - a. "LadderUP Model LU-1" (The Bilco Co.) shall be the basis of design but not intended to imply a preference for a specific product.
    - b. Other manufacturers include the following:
      - 1) Babcock-Davis.
      - 2) Dur-Red Products.
      - 3) or approved equal.
  3. Safety Railing System for Roof Access Hatches: Provide posts and rails of pultruded fire retardant, fiberglass-reinforced polymer (FRP). FRP material shall be molded-in, high visibility, safety yellow color and is treated with a UV inhibitor. Mounting brackets shall be fabricated from 1/4" thick hot dip galvanized steel. Gate hinges and post guides shall be constructed of 6063- T5 aluminum and torsion rod of type 302 stainless steel. All fasteners shall be type 316 stainless steel. Hatch rail system shall satisfy the requirements of OSHA 29 CFR 1910.23 and meet OSHA strength requirements with a safety factor of two.
    - a. "Bil-Guard Hatch Railing System" (The Bilco Co.) shall be the basis of design but not intended to imply a preference for a specific product.
    - b. Other manufacturers include the following:
      - 1) Babcock-Davis.
      - 2) Dur-Red Products.
      - 3) or approved equal.
    - c. Provide high-performance painted finish.
- B. Tubular Skylight ( **LT-01** ) : Transparent roof-mounted skylight dome and self-flashing curb, reflective tube, and ceiling level diffuser assembly, transferring sunlight to interior spaces; complying with ICC AC-16 as indicated on the Drawings and as follows:
1. Provide Solatube Model 160 DS 10 Inch diameter daylighting system as basis of design consisting of roof dome, reflective tube, and diffuser assembly; in a configuration as indicated

on the Drawings.

- a. Model: "Solatube Model 160 DS" as manufactured by Solatube International, Inc. but not intended to imply a preference for a specific product.
  - b. Other tubular skylights models and manufacturers include the following:
    - 1) "Sun Tunnel" as manufactured by Velux USA.
    - 2) "LightFlex" as manufactured by Sunoptics.
    - 3) or approved equal.
2. Roof Dome Assembly: Transparent, UV and impact resistant dome with flashing base supporting dome and top of tube.
- a. Outer Dome Glazing: 0.125 inch (3 mm) minimum thickness injection molded acrylic; UV inhibiting, impact modified acrylic blend.
    - 1) Prism optic molded into outer dome to capture low angle sunlight and limit high angle sunlight.
  - b. Inner Dome Glazing: 0.115 inch (2.9 mm) minimum thickness high impact injection molded acrylic rated for high velocity wind zones.
  - c. Tube Ring: Attached to top of base section; 0.090 inch (2.3 mm) nominal thickness injection molded high impact acrylic; prevent thermal bridging between base flashing and tubing; channel condensed moisture out of tubing.
    - 1) Dome Seal: Polyethylene foam seal, black, 0.13 inch (3.2 mm) thick by 10.73 (272.5 mm) diameter, 2 PCF polyethylene foam.
    - 2) Light tracking reflector, made of aluminum sheet, thickness 0.015 inch (0.4 mm). Positioned in the dome to capture low angle sunlight.
    - 3) Dome Edge Protection Band: Aluminized steel nominal thickness of 0.028 inches (0.7 mm).
3. Roof Flashing Base:
- a. Provide one piece, seamless, leak-proof flashing functioning as base support for dome and top of tube. Sheet steel, corrosion resistant conforming to ASTM A 653/A 653M or ASTM A 463/A 463M or ASTM A792/A 792M, 0.028 inch (0.7 mm) plus or minus .006 inch (.015 mm) thick. Provide the following:
    - 1) Base: As indicated on drawing.
    - 2) Flashing Insulator: Thermal isolation material for use

- under flashing.
- 3) Metal Roof Flashing Kit.
  - 4) Roof Flashing Turret Extensions: Provide manufacturer's standard extension tubes as required and as indicated on drawings.
4. Extension Tubes: Provide aluminum sheet, thickness 0.015 inch (0.4 mm) and as follows:
    - a. Reflective Tubes: Reflective angle adapter tube (Top and Bottom Tubes), providing angle adjustment required and as indicated on drawings.
    - b. Interior Finish: Ultra-high Visible Light reflectance with Ultra-low Infrared (IR) reflectance.
    - c. Thermal Insulation Panel: High-performance dual-glazed, tube insulation system.
  5. Light Diffuser:
    - a. Upper glazing: Provide PET plastic with EPDM low density sponge. Minimize condensation and bug, dirt, and air infiltration. The nominal thickness is 0.039 inches (0.99 mm).
      - 1) Natural Effect Lens: Type LN.
    - b. Lower glazing with integral injection molded acrylic Dress Ring. Nominal thickness is 0.110 inches (2.8 mm)
      - 1) Fresnel Lens Diffuser: Molded polycarbonate plastic, nominal thickness 0.022 inches (0.61 mm) with injection molded acrylic Diffuser Trim Ring.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Verification of Conditions: Examine substrates, adjoining construction and conditions under which Work is to be installed. Do not proceed with work until unsatisfactory conditions have been corrected. Examine walls, roof edges, and parapets for suitable conditions for manufactured roof and wall specialties. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored. Proceed with installation only after unsatisfactory conditions have been corrected
- B. Field Measurements: Verify measurements and dimensions at the job site and cooperate in the coordination and scheduling of the work of this Section with the work of related trades (with particular attention given to the installation of items embedded in concrete and masonry).

### **3.2 PREPARATION**

- A. Substrate Acceptability: Inspect areas and accept surfaces designated to receive roof and wall specialties and accessories, as satisfactory for the reception of the Work specified in this Section, without conflict with "Warranty" requirements. Commencement of installation shall constitute acceptance of substrate conditions by the Installer.

- B. Substrates: Clean the substrates to remove dirt, loose particles and deleterious matter which would impair the Work. Patch cracks and voids as required to obtain a sound surface. Commencement of installation shall constitute acceptance of substrate conditions by the Installer.

### **3.3 INSTALLATION**

- A. General: Provide access hatches, prefabricated flashing, equipment hatches, skylights, and other roof and wall accessories to provide a watertight installation. Comply with manufacturer's instructions and the "Architectural Sheet Metal Manual" published by the Sheet Metal and Air Conditioning Contractors National Association, Inc. Set units level and plumb, true to line and coordinate with other work. Anchor securely in place by bolting to the substrate or as recommended by manufacturer. Set flanges in an adhesive compatible with the roof and wall system materials and coordinate with the work specified.
- B. Temperature at Time of Installation: Roof and wall specialty and accessory work shall be designed and detailed for a surface temperature of 70 deg. F. at time of installation. Make necessary adjustments for installations at other than design temperature.
- C. Cap and/or Counter Flashing: Where cap and/or counter flashing is required as component of accessory or elsewhere shown, install to provide adequate waterproof overlap with roofing or roof flashing (as counter-flashing) or separately as its own component. Seal with thick bead of mastic sealant, except where overlap is indicated to be left open for ventilation.
- D. Prefabricated Flashing: Refer to Section 07 62 00 "Sheet Metal Flashing and Trim" for prefabricated flashing system. Install prefabricated flashing system complete with base sleeves, cap flashing, tape, sealant, solder, fasteners and accessories in accordance with manufacturer's strict installation instructions, as shown, and as required for a waterproof, airtight installation.
- E. Installation of Hatches: Install hatches in accordance with manufacturer's written instructions and recommendations coordinated with specified roofing system to provide a water and weather tight installation. Test-operate units with operable components. Clean and lubricate joints and hardware. Adjust for proper operation.
- F. Installation of Curbs: Install roof curbs in accordance with manufacturer's written instructions and recommendations coordinated with specified roofing system to provide a water and weather tight installation.
- G. Installation of Skylights: Install skylights in accordance with manufacturer's written instructions and recommendations coordinated with specified roofing system to provide a water and weather tight installation.
- H. Dissimilar Materials: Coat concealed contact surfaces of dissimilar metals and metals contacting concrete with dielectric separator.

### **3.4 ADJUSTING**

- A. Upon completion of Work, repair leaks and other defects including surfaces which have been stained, marred or otherwise damaged. Remove flux residue with a solution of washing soda or ammonia, then drench with clear water. Replace components which cannot be satisfactorily repaired.

**3.5 PROTECTION**

- A. Protect the Work during shipment, storage, erection and construction so as to avoid damage or other deleterious effects in the Work.

**END OF SECTION**

## SECTION 07 84 00 – FIRESTOPPING

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide Firestopping in accordance with requirements of the Contract Documents. Firestopping within the context of this specification shall encompass fire stops, fire resistive joint systems and perimeter fire barriers.
- B. Related Work Specified Elsewhere
  - 1. Openings
    - a. Fire Rated: Metal sleeves for fire rated openings shall be provided under applicable mechanical, electrical, plumbing and fire protection specifications sections.
    - b. Non-Rated: Non-rated openings shall be sealed under applicable mechanical and electrical specification sections.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the contract documents. Where a recommendation or suggestion occurs in the referenced standards, they shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Society for Testing and Materials (ASTM):
    - a. ASTM E84, "Standard Test Method for Surface Burning Characteristics of Building Materials".
    - b. ASTM E119, "Standard Test Methods for Fire Tests of Building Construction and Materials".
    - c. ASTM E814, "Standard Test Method for Fire Tests of Through- Penetration Fire Stops".
    - d. ASTM E1399, "Standard Test Method for Cyclic Movement and Measuring the Minimum and Maximum Joint Widths of Architectural Joint Systems".
    - e. ASTM E1725, "Standard Test Methods for Fire Tests of Fire-Resistive Barrier Systems for Electrical System Components".
    - f. ASTM E1966, "Standard Test Method for Fire-Resistive Joint Systems".
    - g. ASTM E2174, "Standard Practice for On-Site Inspection of Installed Fire Stops".

- h. ASTM E2307, "Standard Test Method for Determining Fire Resistance of Perimeter Fire Barrier Systems Using Intermediate-Scale, Multi- Story Test Apparatus".
  - i. ASTM E2837 "Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies"
2. Factory Mutual Research (FM): FM 4991, "Approval of Firestop Contractors".
  3. International Firestop Council (IFC): "Recommended IFC Guidelines for Evaluating Firestop Systems Engineering Judgments".
  4. National Fire Protection Association (NFPA): NFPA 285, "Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Non-Load Bearing Wall Assemblies Containing Combustible Components Using the Intermediate-Scale, Multi-Story Test Apparatus".
  5. Underwriters Laboratories Inc. (UL):
    - a. UL "Fire Resistance Directory".
    - b. ANSI/UL 263, "Standard for Fire Tests of Building Construction and Materials".
    - c. ANSI/UL 723, "Standard Test for Surface Burning Characteristics of Building Materials".
    - d. ANSI/UL 1479, "Standard for Fire Tests of Through-Penetration Firestops".
    - e. ANSI/UL 2079, "Standard for Tests for Fire Resistance of Building Joint Systems".

### 1.3 SYSTEM DESCRIPTION

- A. Performance Requirements: Provide firestop materials and systems produced, tested and installed to resist the spread of fire and the passage of smoke and gases through openings in fire rated assemblies, in accordance with ANSI/UL 263 (ASTM E119).
- B. Firestop System Tests and Ratings: Provide materials which have been tested and rated as systems applicable to each firestop condition in the Work, as listed by UL "Fire Resistance Directory" or by other qualified testing agency acceptable to the Engineer.
  1. Test methods are specified by reference to standards listed in the UL "Fire Resistance Directory", and also by reference to equivalent (ASTM) standards for use in comparison with ratings from other acceptable testing agencies. In the event of a discrepancy in methods or ratings, the provisions of UL standards shall apply.
- C. Leakage: Provide systems rated to function as an effective airtight seal preventing passage of smoke and gases in normal service as well as

under exposure to heat and fire conditions. Do not use materials to function as air seals if such materials are known to shrink with curing or aging.

1. Provide through-penetration and fire-resistive joint systems subjected to an air leakage test conducted in accordance with Standard, ANSI/UL1479 and/or ANSI/ UL2079 with published L-Ratings for ambient and elevated temperatures as evidence of the ability of the through-penetration or fire- resistive joint system to restrict the movement of smoke.
- D. Building Movement: Provide systems rated to withstand building movements, including thermal movements, loading deflections, shrinkage, creep and similar movements, when tested in accordance with the specified standards. In addition, provide firestopping sufficiently flexible to accommodate motion such as pipe vibration and water hammer without damage to the seal.
1. Provide fire-resistive joint sealants designed to accommodate a specific range of movement and tested for this purpose in accordance with a cyclic movement test criteria as outlined in ASTM E1399, ASTM E1966 or ANSI/ UL 2079.
- E. Compatibility: Provide only the firestop materials which are explicitly recommended by the manufacturer for the application, and which have been determined by tests to be totally compatible with the adjoining construction and each other, as stated in the manufacturer's published data or certified by the manufacturer for each application.
- F. Material Content: Provide firestop materials which are non-toxic, non-hazardous, do not contain asbestos fibers or dust particles nor other substance prohibited by law, and do not require hazardous waste disposal of used containers. Provide firestopping that upon curing, do not re-emulsify, dissolve, leach, breakdown or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water or other forms of moisture characteristic during and after construction.
- G. Coordination with Insulation Coverings: Provide firestopping which does not require the removal of insulation coverings integral to the penetrating item. Insulation coverings include thermal and acoustical insulations and their protective jackets and coverings and insulation/coverings for electrified components.
- H. Surface Burning Characteristics: Provide firestop materials rated not more than flame spread 25 and smoke developed 450, when tested in accordance with ANSI/UL 723 (ASTM E84).
- I. Water Resistance: Provide firestop systems resistant to degradation from moisture during normal service before exposure to heat and fire. Firestop systems used in the following locations shall also function as a watertight seal preventing passage of water.
1. Penetrations in exterior wall and roof construction.

2. Penetrations in mechanical and electrical equipment rooms, janitorial rooms or closets, toilet and shower rooms, garage and loading dock areas, and rooms or spaces having a floor drain. Wall penetrations in such spaces where any portion of the firestop is 3 in. or less above the floor.
- J. Through-Penetration Firestop Systems: Provide systems tested in accordance with ANSI/UL 1479 or ASTM E814 methods and a positive pressure differential not less than 0.01 in. water column and classified with ratings for fire resistance, temperature rise, leakage, and movement capability to meet the specified requirements.
1. Flame Rating: For gypsum board construction, provide systems having an F rating equal to, but not greater than, the fire-resistive rating of the surrounding gypsum board construction. For non-gypsum board construction, provide systems having an F rating equal or greater than the fire-resistive rating of the surrounding construction, but not less than 1-hour.
  2. Temperature Rating: Provide systems having a T rating equal to the F rating, except where a T rating for the firestop condition is specifically exempted by the applicable code.
  3. Water-Tight Rating: Provide systems having a W rating of Class 1 with resistance up to 3 ft. of water pressure for firestopping at locations where a watertight seal is required.
- K. Firestop Joint Systems: Provide systems tested in accordance with ANSI/UL 2079 (ASTM E1966), under a positive pressure differential not less than 0.01 in. water column, and classified with ratings for fire resistance, leakage, and movement capability to meet the specified requirements.
- L. Perimeter Fire Containment Systems: Provide systems tested in accordance with NFPA 285 and ANSI/UL 2079 (ASTM E2307 and E1966), under a positive pressure differential not less than 0.01 in. water column, and classified with ratings for integrity, insulation, leakage, and movement capability to meet the specified requirements.
- M. Chase Walls: Penetrants passing through fire-resistance rated floor-ceiling assemblies contained within chase wall assemblies shall be protected with products tested by being fully exposed to the fire outside of the chase wall. Systems within the UL Fire Resistance Directory that meet this criterion are identified with the words "Chase Wall Optional".
- N. Accessories: Provide components for each firestopping system that are needed to install fill materials. Use only components specified by the firestopping manufacturer and approved by the qualified testing and inspecting agency for the designated
- fire-resistance-rated systems. Accessories include but are not limited to the following items:
1. Permanent forming/damming/backing materials.
  2. Temporary forming materials.

3. Substrate primers or bond breakers.
  4. Collars.
  5. Steel sleeves.
- O. Firestopping Exposed to View: For firestopping exposed to view, traffic, moisture, and physical damage, provide products that do not deteriorate when exposed to these conditions.

#### 1.4 SUBMITTALS

- A. Combined Submittals for Firestop Systems: Combine the submittals required for every component part in the various firestop systems to be used in the Work. Show in the submittals that the firestop systems have received the prior approval of the Contractor, the single firm awarded the firestopping Work, and the manufacturer of each principal component.
- B. Product Data: Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work. Product Technical Data Sheets for each material component required as shown within the firestop system drawing(s) shall be included in the submittal.
- C. Shop Drawings: Submit for Engineer's action. Furnish shop drawings or full size 8- 1/2 in. x 11 in. system drawings to include the information that is typically contained within a UL System Drawing for each type firestopping condition for the fabrication and installation of the Work. Include illustrations from a qualified testing and inspection agency, which are applicable to every firestop system and indicate configuration of the construction and penetrating item. Furnish the following information in the form stipulated by Engineer.
1. Indicate for each firestopping condition the specific firestop system and construction assembly, including size and configuration of penetrations or voids, the thickness and attachment of materials, and the surrounding construction. Indicate the material, size and function of the penetrant. List the tested performance ratings of the firestop system for each specific application as well as fire resistance rating of the surrounding construction.
  2. Furnish a legend indicating location of each firestop system in the Work.
  3. Identify each specific firestop system with a type designation specific to the Project and include in location legend. Indicate corresponding testing agency and system identification with year of test.
  4. Identify each condition for which there is no tested and rated firestop system in existence, and furnish a certified design suitable for the condition as approved by the manufacturer's qualified Fire Protection Engineer. Use of an engineered deviation shall not be permitted if a tested and rated firestop system exists for the condition.

5. Where Project conditions require modification of qualified testing and inspecting agency's illustration to suit a particular through-penetration or joint firestop condition, submit illustration drawing approved by firestopping manufacturer's fire protection engineer with all relevant information identified pertaining to modifications.
- D. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide the following:
1. Firestopping Material: Each type, cured, 6 in. long.
  2. Damming Materials: 6 in. sq. of each type.
  3. Metal Accessories: One representative sample
- E. Quality Control Submittals: Submit for Engineer's information.
1. Test Reports
    - a. Submit certified copies of test reports (conclusions and summary only) from approved independent testing laboratories showing compliance with the Contract Documents and including current system number per UL Listing for each type of firestop and penetration to be utilized on the project.
  2. Certifications: Submit the following:
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown
    - b. Certificate(s) of Conformance: Submit "Certificate(s) of Conformance" from UL for each product/system showing that listed products/systems have been tested to the appropriate standards.
    - c. Applicator Statement: Statement from applicator of firestopping system(s) attesting to the fact that each system has been accepted by the New York City Building Department for each specific condition on Project and that materials were installed in accordance with the manufacturer's installation instructions and details.
    - d. Installer's Certification: Furnish evidence that the Installer is an approved firestop contractor, certified in accordance with FM 4991 requirements.

- e. Manufacturer's Certification: Furnish certification signed by the primary manufacturer of the firestop materials, stipulating which firestop systems are proposed for use in the Work, and stating that the Installer is approved as an experienced applicator of said firestop systems.
  - f. System Test Reports: Furnish certified test reports from the testing agency performing the firestop system tests, indicating identification of the corresponding system design number, a test summary and a conclusion verifying compliance with specified requirements.
  - g. Engineered Deviations: Furnish certification from firestop systems manufacturer, identifying each condition for which there is no tested and rated firestop system in existence, and describing a suitable design for the condition as based on modification of a tested system and approved by the manufacturer's qualified Fire Protection Engineer. Engineered deviations will be reviewed in accordance with IFC recommended guidelines. Use of an engineered deviation from a manufacturer shall not be permitted if a tested and rated firestop system from another manufacturer exists for the condition.
  - h. NYC Building Department Acceptance: Submit a copy of the NYC Building Department acceptance sheet for each firestopping system submitted for each specific condition on Project.
- F. Closeout Submittals: Submit for City of New York's documentation.
- 1. Warranty: Furnish specified warranty.
  - 2. Record Documents: Furnish record drawings annotated with the changes made during installation of the Work so as to be a complete set of "as installed" plans. Use shop drawings as basis to show changes. Accurately depict the entire firestop system and surrounding construction.

## 1.5 QUALITY ASSURANCE

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. Firestop Manufacturer: Do not use firestop material produced by any manufacturer who will not agree to send a direct employee as a qualified technical representative to the project site, during the initial installation and when requested, for the purpose of instructing appropriate installer personnel in proper selection and installation procedures and for rendering advice concerning the proper installation of materials. Manufacturer shall employ a professional Fire Protection Engineer with qualifications acceptable to the Society of Fire Protection Engineers (SFPE).
- C. Firestop Systems: Provide only firestop systems which have been tested and listed as firestop systems to meet every condition in the Work. Do not provide materials or systems not part of a tested firestop system suitable for the

condition or not certified by manufacturer as an engineered deviation suitable for the condition as approved by manufacturer's qualified Fire Protection Engineer. Use of an engineered deviation from a manufacturer shall not be permitted if a tested and rated firestop system from another manufacturer exists for the condition.

- D. **Qualified Installer:** The Installer shall be an approved firestop contractor, certified in accordance with FM 4991 requirements, trained and approved by the firestop system manufacturer in the use of the materials and equipment to be employed in the Work.
- E. **Single Responsibility:** Contract the firestopping Work to a single firm so as to establish undivided responsibility of the firestop systems for the entire Work.
  - 1. Contract the firestopping not later than contracts for any of the building services and wall systems, (including for Work such as ducts, piping, conduit, masonry, gypsum board, and exterior wall,) to allow time for coordination of firestopping with the other trades.
- F. **Regulatory Requirements:** Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
  - 1. Comply with NYC Building Law, Reference Standard RS 5-19, "Fire Tests for Through-Penetration Fire Stops", including referenced provisions for ASTM E814. In addition, provide materials, accessories and application procedures which have been approved for use in the City of New York.
- G. **Field Samples:** Provide a field sample for each type, condition, and application of firestopping in the building at final installation locations. Utilize the same materials and installation methods in the sample as required for the final Work. Schedule the installation with allowance for sufficient curing time so that the sample may be examined, and any necessary adjustments made, at least 1 week prior to date scheduled for commencing installation of the Work. When accepted, sample areas shall serve as the standard for materials, workmanship, and appearance for such Work throughout the project and shall remain a part of the final Work.
- H. **Pre-Installation Meetings:** Prior to installation of the building services and walls, Contractor shall meet with the various trades for such Work and the firestopping Installer to review installation clearances, framing around openings, minimum spacing of penetrants, correct opening sizes for penetrant systems to be used, penetrant materials permitted, the maximum number of penetrants in each opening, and access at both sides of penetrations for installation of firestopping.

## **1.6 DELIVERY, STORAGE, AND HANDLING**

- A. **General:** Deliver and store materials in manufacturer's original packaging labeled to show name, brand, type, and grade. Store materials in protected dry location off ground in accordance with manufacturer's instructions. Do not open packaging nor remove labels until time for installation.

## 1.7 PROJECT / SITE CONDITIONS

- A. Requirements: Do not proceed with the Work when project/site conditions are unfavorable, unless the Work will proceed in accordance with the manufacturer's requirements and instructions and any agreements or restrictions of the Pre- Construction Conference. Maintain adequate temperature and ventilation conditions to ensure proper application and curing of firestopping.

## 1.8 SEQUENCING

- A. Coordination: Verify that construction and sizing of sleeves, openings, core-drilled holes, cut openings and penetrating items shall ensure that firestop systems can be installed according to specified requirements. Determine that installation of the penetrants shall not compromise the integrity of the elements being penetrated, that access and working clearances are adequate, and that the approved firestop systems can be properly installed. Coordinate the sequencing of Work to permit access at both sides of penetrations for installation of firestopping.
- B. Inspection: Notify the inspecting agency at least 7 days in advance of firestopping system installations. Confirm the dates and times on days preceding each series of installations. Do not cover or conceal firestopping system installations behind other construction until after each installation has been examined by the inspecting agency, and building inspector if required by the NYC Building Department.

## 1.9 WARRANTY

- A. General: Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents
  - 1. Special Warranty: Submit two (2) year written warranty agreeing to repair or replace Work which has shown any evidence of deterioration, failed to provide an airtight seal, failed to provide a watertight seal where required, failed in adhesion or cohesion, or otherwise failed as a result of defects in materials or workmanship. Upon notification of such defects, within the warranty period, make necessary repairs or replacement at the convenience of the City of New York.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Acceptable Manufacturers: Firestop systems produced by the following manufacturers will be acceptable, approved equal subject to review by Engineer. For each type of firestop system used throughout the Work, provide only firestop materials made or recommended by a single manufacturer.
  - 1. Specified Technologies Inc.
  - 2. Hilti Construction Chemicals Inc.
  - 3. Isolatek International

4. Minnesota Mining & Mfg. Co. (3M)
  5. Tremco Inc.
  6. United States Gypsum Co.
- B. Firestop Systems: Provide only firestop systems which have been tested and listed as firestop systems to meet every condition in the Work. Do not provide materials or systems not part of a tested firestop system suitable for the condition or not certified by manufacturer as an engineered deviation suitable for the condition as approved by manufacturer's qualified Fire Protection Engineer. Use of an engineered deviation from a manufacturer shall not be permitted if a tested and rated firestop system from another manufacturer exists for the condition.
- C. Firestop systems indicated on the Drawings are based on design conditions. Contractor's selection of firestop systems shall be suitable for the field conditions, based on the actual size, location and materials used in the Work.
- D. Auxiliary Materials: Provide the miscellaneous accessory items necessary to complete each firestopping condition, including, but not limited to, temporary or permanent damming, backing or forming materials, fillers, mechanical fastenings, support devices, collars, sleeves, cleaners, primers and other materials, as made or recommended by the firestop material manufacturer and tested with the rated firestop system.

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the work.

#### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Do not apply firestop material until the construction defining the opening and installation of all penetrants through the opening has been completed. Verify that pipe, conduit, cable, and other penetrants have been secured.

#### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Surface Preparation: Perform cleaning and surface preparation

immediately prior to installation of firestopping. Prepare the substrate surfaces for proper adhesion of firestop materials and for compatibility of materials to be in contact. Clean substrates to remove coatings or other substances which might interfere with bond of firestop materials. Remove materials and substances from openings which are not part of the tested firestop system, unless otherwise recommended by manufacturer. Provide masking materials or use other precautions to prevent spillage or migration of firestop material onto adjoining surfaces.

### 3.4 INSTALLATION

- A. Firestopping Applications: Provide in accordance with the manufacturers' instructions and the accepted shop drawings. Apply materials to obtain complete filling to the correct depth and dimensions without gaps or voids. Remove excess material, except where overlapping onto adjoining construction is a normal part of the tested and recommended system. Provide firestopping for applications including, but not limited to, the following conditions.
  - 1. Penetrations or empty openings for the passage of ducts, cable, cable trays, conduit, piping, electrical busways and raceways through fire-rated barriers such as ceilings, roofs, walls and partitions.
  - 2. Joints or gaps within fire rated construction.
  - 3. Expansion joints.
  - 4. Gaps between the top of fire rated walls, ceilings, or roof assemblies.
  - 5. Openings around structural members.
  - 6. Perimeter fire barrier for gaps.
- B. Engineered Deviations: Where field conditions deviate from tested system conditions or are not otherwise reflected on shop drawings and certified by manufacturer as an engineered deviation, consult with manufacturer's technical representative to determine the proper system, and submit the proposed design before proceeding.
- C. Priming: Prime or seal substrates in accordance with the manufacturer's recommendations for proper adhesion in each application. Promptly remove any spillage and avoid migration of primer or surface sealer onto adjoining surfaces.
- D. Damming: Provide leakproof damming or containment to seal openings and otherwise prevent flow or displacement of firestopping from the spaces to be filled. Provide only non-combustible damming where the damming cannot be removed after application of firestopping. Combustible damming may be used temporarily, but only if damming is completely removed as soon as the firestopping is cured and self-supporting.
- E. Void Filler: Provide to seal gaps in noncombustible type damming materials and to seal around penetrants where the void filler is an integral part of the firestop system.

- F. Bundled and Touching Penetrants: Where penetrants are bundled together or contact each other in passing through the same opening, sufficiently separate each penetrant and completely encapsulate with firestopping to make a smoketight and airtight installation.
- G. Intumescent Materials at Fire Rated HVAC Duct Dampers: Do not use intumescent firestopping that could during intumescence cause stress or buckling of construction surrounding duct dampers and impair the damper operation.

### 3.5 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: At the start of the installation, periodically as the Work progresses, and after completion, furnish the services of the firestop material manufacturers' technical representative at the job site as necessary to advise on every phase of the Work. As a minimum, furnish representative's attendance during the first day of installation for each major type of firestop material, and furnish technical assistance to the Installer as may be required.
- B. Inspections:
  - 1. Firestopping materials shall be inspected by the manufacturers' technical representative as required to assure proper mixing and application.
  - 2. Prior to concealing and enclosing an area containing firestopping, Contractor shall notify the inspection agency and also arrange for inspections required by the NYC Building Department.
- C. Field Identification of Firestop Systems: Provide an identification tag at the location of each firestop system with a permanent label or marking to indicate the name of the installer, the date of installation, the name of manufacturer and firestop system, the name of testing agency and tested firestop system identification, and the words "**Rated Through-Penetration Firestop System - Do Not Disturb**" or equal wording as approved by the NYC Building Department.
  - 1. Identification Tags: Provide identification on melamine plastic or brass tags, either engraved on red plastic tags with white characters in one or both faces, or stamped on brass tags with clear protective coating with a self-adhesive that is suitable for the substrate and causes partial tag destruction if removal is attempted. Secure tag to a penetrant item with a snug compression-fit plastic or brass wire tie in visible location suitable for inspection within 6 in. of the firestop system, and not more than 50 ft. intervals along the system length.

### 3.6 CITY OF NEW YORK'S MONITORING ACTIVITIES

- A. City of New York's Inspection Agency: An independent inspection agency, engaged at the City of New York's expense, will perform the following activities to monitor the Contractor's Quality Control Program. The monitoring activities do not relieve the Contractor of sole responsibility for maintaining the Quality Control Program.

1. Inspections of the firestopping work shall comply with New York City "Special Inspections" statutory requirements for the requirements of the component materials and installation.
- B. Inspections: Provide in accordance with ASTM E2174 requirements and perform inspections as the work progresses. Verify that firestopping systems have been constructed in compliance with the submitted designs for fire rating required by the Contract Documents and are acceptable to the Engineer.
  1. Visually inspect firestop materials and substrates before installation to ascertain that preparation has been performed in accordance with the Contract Documents.
  2. Inspect the completed Work, including removal of damming materials, if used, to ensure an adequate and complete fire and smoke seal.
  3. Perform final inspection after other trades have completed Work in contact with firestopping material, but before the firestop system is covered.

### **3.7 ADJUSTING**

- A. Repair: Repair damaged firestopping or remove and replace if damaged beyond successful repair. Comply with manufacturer's recommendations for repair and replacement.

### **3.8 CLEANING**

- A. Upon completion of the Work, remove unused materials, debris, containers and equipment from the project site.

### **3.9 PROTECTION**

- A. Protect the Work during the construction period so that it will be without any indication of use or damage at the time of acceptance.

**END OF SECTION**

## SECTION 07 92 00 – JOINT SEALANTS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide joint sealants in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Masonry control and expansion joint fillers and gaskets for masonry is specified in Section 04 20 00 "Unit Masonry"
  - 2. Sealing penetrations in fire rated construction is specified in Section 07 84 00 "Firestopping".
  - 3. Glazing sealants are specified in Section 08 80 00 "Glazing".
  - 4. Sealing of electrical and mechanical work is specified under applicable Mechanical and Electrical specification sections.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
- B. American Society for Testing and Materials (ASTM):
  - 1. ASTM C1193 "Standard Guide for Use of Joint Sealants".
  - 2. ASTM C1401 "Standard Guide for Structural Sealant Glazing".
  - 3. ASTM C1330 "Standard Specification for Cylindrical Sealant Backing for Use with Cold Liquid- Applied Sealants".
  - 4. ASTM C1087 "Test Method for Determining Compatibility of Liquid-Applied Sealants with Accessories Used in Structural Glazing Systems".

ASTM C1247 "Standard Test Method for Durability of Sealants Exposed to Continuous Immersions in Liquids".

#### 1.3 SYSTEM DESCRIPTION

- A. Design Requirements
  - 1. Exterior Joint Sealants: Provide exterior elastomeric joint sealants that establish and maintain watertight and airtight continuous joint seals without staining or deteriorating joint substrates.
  - 2. Interior Joint Sealants: Provide joint sealants for interior applications that establish and maintain airtight and water-resistant continuous

joint seals without staining or deteriorating joint substrates.

3. **Compatibility:** Provide only the sealants and joint fillers which are explicitly recommended by the manufacturer for the application, and which have been determined by tests to be totally compatible with the joint surfaces and each other, as stated in the manufacturer's published data or certified by the manufacturer for each application.
4. **Staining:** Provide sealant systems which shall not cause or contribute to staining of substrate surfaces. Manufacturer shall perform staining tests of sealant systems in accordance with ASTM C1248 for each joint substrate condition in the Work
5. **Suitability for Immersion in Liquids.** Where sealants are indicated for joints that will be continuously immersed in liquids, provide products that have undergone testing according to ASTM C1247. Liquid used for testing sealants is deionized water, unless otherwise indicated.

#### 1.4 SUBMITTALS

- A. **Product Data:** Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work.
  1. Statement that each product to be furnished is recommended for the application shown.
  2. Complete instructions for handling, storage, mixing, priming, installation, curing and protection of each type of sealant.
  3. Provide independent validation from the "Sealant Waterproofing and Restoration Institute" that the manufacturers of the weatherproofing sealants meet their claimed movement capability.
- B. **Samples:** Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Submit the following:
  1. Sealant Samples: 12 in. long and installed between samples of the materials to be sealed for the Project complete with backer rods and fillers.
- C. **Quality Control Submittals:** Submit the following for Engineer's information:
  1. Test Reports
    - a. **Preconstruction Compatibility And Adhesion Testing:** Submit results of preconstruction compatibility and adhesion testing as specified herein, indicating which joint sealants and joint preparation methods resulted in optimum adhesion to joint substrates based on preconstruction testing including which substrates require priming and recommended primer type(s).
    - b. **Preconstruction Stain Resistance Testing:** Submit results of preconstruction stain resistance testing as specified herein,

indicating which joint sealants and substrates combinations resulted in staining or other detrimental conditions. Along with test results, submit sealant manufacturer's letter stating agreement to provide warranty against staining based on ASTM C1248.

- c. Preconstruction Field Testing: Submit results and evaluations of preconstruction field testing as specified herein.

## 2. Certificates

- a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
- b. Certification (in the form of standard data sheet or letter) that each type of compound and sealant to be furnished complies with these Specifications.
- c. Certification that each type of sealant joint filler and sealant backer rod has been tested for compatibility with selected sealant in accordance with ASTM C1087 and is recommended by the sealant manufacturer for the intended use.

## D. Closeout Submittals: Submit for documentation.

- 1. Warranties: Special warranties as specified.
- 2. Reinstallation Instructions: Submit a set of reinstallation instructions for each sealant type provided in a form suitable for the City's maintenance staff to be able to repair and replace failed sealants within the scope of building maintenance.

## 1.5 QUALITY ASSURANCE

- A. Installer/Applicator: The sealant work shall be performed by a firm having five (5) years experience in the installation of specified materials on comparable projects.
- B. Manufacturer's Representative: Do not use joint sealants until the manufacturer has a qualified representative at the project site at the start of the work to review conditions of application, verify joint width conditions and to ensure proper installation of his materials.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Mock-Ups: Provide joint sealants, fillers, gaskets, related accessories and miscellaneous materials for testing and visual mock-ups, as specified under other Sections, representing the materials and installation techniques which will be used in the final Work.
- E. Field Samples: Prior to the Pre-Installation Meeting, provide a field sample for each type of joint sealer system in the building at areas to be designated

by the Engineer. Samples shall represent the primary types of materials, substrate surfaces, joint size, exposure, and other conditions to be encountered in the Work. Utilize the same materials and installation methods in the sample as required for the final Work. Schedule the installation with allowance for sufficient curing time so that the sample may be examined, and any necessary adjustments made, at least 1 week prior to date scheduled for commencing installation of the Work. When accepted, sample areas shall serve as the standard for materials, workmanship, and appearance for such Work throughout the project.

1. Examination of Field Samples: As part of the Pre-Installation Meeting, visually examine the samples for staining, dirt pickup, shrinkage, color, general workmanship and appearance. Cut and pull the sealant from each sample joint, and examine for internal bubbles or voids, adhesion, and general compatibility with substrate
2. Field work shall conform to the parameters set in the mockup and at the preinstallation meeting with regards to acceptable joint design, surface preparation, appearance, color, backer rod selection, adhesion and compatibility.

F. Testing

1. Preconstruction Compatibility and Adhesion Testing: Prior to testing of mock-ups and construction, submit samples of materials that will contact or affect joint sealants to sealant manufacturers for compatibility and adhesion testing, as indicated below:
  - a. Perform sealant adhesion evaluation at the earliest possible time after award of the Contract.
  - b. The sealant manufacturer shall perform adhesion evaluation tests in accordance with ASTM C794 using the sealant and production run samples of the finished substrates which are to be used in the final Work.
  - c. Use test methods standard with manufacturer to determine if priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates. Perform tests under laboratory conditions of 72 deg. F. temperature and 50% relative humidity. Manufacturer(s) of sealant(s) shall submit written recommendations when installations involve adverse temperature or humidity conditions.
  - d. Furnish to the sealant manufacturer the finished substrate samples of such size and quantity as he requires for compatibility and adhesion evaluation. The substrate metal samples shall be of the alloy and with the temper, surface treatment and preparation, primer and finish in each specified color, as are to be used in the test mock-ups and in the final Work
  - e. Schedule sufficient time for testing and analysis of results to

- prevent delay in the progress of the Work.
- f. Investigate materials failing compatibility or adhesion tests and obtain sealant manufacturer's written recommendations for corrective measures, including use of specially formulated primers.
  - g. If the materials used fail to meet the sealant manufacturer's requirements for structural glazing, furnish additional samples with such modifications as may be necessary to meet the sealant manufacturer's requirements and the requirements of /the Contract documents.
  - h. Testing will not be required when sealant manufacturer is able to submit joint preparation data required above which is acceptable to Engineer and is based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.
2. Preconstruction Stain Resistance Testing: Prior to testing of mock-ups and construction, submit fully identified samples of materials that will contact or affect joint sealants to sealant manufacturers, in sizes and quantities as required, for stain testing, as indicated below:
    - a. Manufacturer shall perform staining tests of sealant systems for exterior applications in accordance with ASTM C1248 method for each joint substrate condition in the Work Submit quantities of each type of contiguous joint substrate material as required by referenced standard and in sizes as required by the sealant manufacturer for testing.
    - b. Schedule sufficient time for testing and analysis of results to prevent delay in the progress of the Work.
  3. Preconstruction Field Testing: Prior to installation of joint sealants, field-test their adhesion to joint substrates as follows:
    - a. Locate test joints where indicated or, if not indicated, as directed by Engineer.
    - b. Conduct field tests for each type of exterior elastomeric sealant and joint substrate application.
    - c. Arrange for tests to take place with the Contactor, the Engineer and the sealant manufacturer's technical representative present.
    - d. Test Method: Test joint sealants according to "Method A, Field-Applied Sealant Joint Hand Pull Tab", in Appendix X1 in ASTM C1193 "Standard Guide for Use of Joint Sealants" or Method A, Tail Procedure in ASTM C1521 "Standard Practice for Evaluating Adhesion of Installed Weatherproofing Joints". For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side

- e. Report whether or not sealant in joint connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate.
  - f. Evaluation of Field Test Results: Joint sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use joint sealants which fail to meet manufacturers guidelines for adhesion to joint substrates during testing.
- G. Pre-Installation Meeting: Prior to the installation of sealant, meet at the Project site to review the material selections, joint preparations, installation procedures and coordination with other trades. Examine sample installations which have been prepared and determine (and record) whether everyone present is in agreement that the proposed installations are likely to perform as required

## **1.6 DELIVERY, STORAGE AND HANDLING**

- A. Delivery: Deliver materials to Project site in manufacturer's unopened containers, with manufacturer's name, brand, hardness, type, class, grade, and color fully indicated thereon. In addition, provide manufacturer's expiration date on sealant containers and/or include with shipping and installation packaging. Store in accordance with manufacturer's instructions.

## **1.7 PROJECT/SITE CONDITIONS**

- A. Temperature Limitations: Do not install materials when the temperature is below 40 deg. F., unless the manufacturer specifically recommends application of his materials at lower temperatures. If job progress or any other condition requires installations when temperatures are below 40 deg. F. (or below the minimum installation temperature recommended by the manufacturer) consult the manufacturer's representative and establish the minimum provisions required to ensure satisfactory work. Record in writing to the manufacturer, with copy to the Engineer, the conditions under which such installation must proceed and the provisions made to ensure satisfactory work.
- B. Weather Limitations: Do not proceed with installation of bulk compounds during inclement weather unless all requirements and manufacturer's instructions can be complied with and unless the work can proceed in accordance with the agreements of the pre-installation meeting. Do not proceed with the installation of elastomeric joint sealants under extreme temperature conditions which would cause joint openings to be at either maximum or minimum width or when such extreme temperatures or heavy wind loads are forecast during the period required for initial or nominal cure of elastomeric joint sealants. Whenever possible, schedule the installation and cure of elastomeric joint sealants during periods of mean temperatures (nominal joint width shown) so that subsequent stresses upon the cured joint sealants will be minimized.

## **1.8 WARRANTIES**

- A. General: Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents
1. Special Warranty: Submit a written manufacturer's warranty agreeing to repair or replace sealant compounds which have failed to provide airtight and watertight joints for any reason, or which appear to have failed in adhesion, cohesion, abrasion-resistance, migration-resistance, stain-resistance, general durability or any other form of apparent deterioration (excluding inherent qualities and limitations clearly specified in the manufacturer's data which was submitted). Period of warranty shall be two (2) years. Comply with these Specifications for repair or replacement of work.
  2. Special Warranty: Submit a written manufacturer's warranty agreeing to repair or replace silicone sealant compounds which have failed to provide airtight and watertight joints for any reason, or which appear to have failed in adhesion, cohesion, abrasion-resistance, migration-resistance, stain-resistance, general durability or any other form of apparent deterioration (excluding inherent qualities and limitations clearly specified in the manufacturer's data which was submitted). Period of warranty shall be twenty (20) years. Comply with these Specifications for repair or replacement of work.
  3. Special Warranty: Submit a written manufacturer's warranty agreeing to repair or replace sealant compounds which have stained contiguous materials (excluding inherent qualities and limitations clearly specified in the manufacturer's data which was submitted). Period of warranty shall be twenty (20) years. Comply with these Specifications for repair or replacement of work.

## **PART 2 - PRODUCTS**

### **2.1 MATERIALS, BULK COMPOUNDS**

- A. General: Provide joint sealants, joint fillers and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience. Use non-sag compounds except as shown or specified.
- B. Elastomeric Compounds
1. Silicone Rubber (Building Sealant): ASTM C920, class and use as best suited for the intended purpose; Provide one of the following:
    - a. "795 Building Sealant" or "790 Silicone Building Sealant"(Dow Corning Corp.).
    - b. "SilPruf SCS2000" (Momentive Performance Materials Inc.).
    - c. "Sikasil WS-305 Building Sealant" (Sika Corp.).
    - d. Or approved equal.

2. Silicone Rubber Sealant for stone and pre-cast concrete work (non-staining): ASTM C920, Type S, Grade NS, neutral cure, Class and Use as best suited for the intended purpose; Provide one of the following:
  - a. "756 SMS Building Sealant" (Dow Corning Corp.).
  - b. "SilPruf NB SCS9000 " (Momentive Performance Materials Inc.).
  - c. "Non-Staining Silicone Rubber Sealant" (Sika Corp).
  - d. Or approved equal.
3. Silicone Rubber (Structural Sealant): Complies with ASTM C920 and ASTM C1184 requirements, is compatible with system components with which it comes in contact, and is specifically formulated and tested for use as a structural sealant; class and use as best suited for the intended purpose; Provide one of the following:
  - a. "995 Silicone Building Sealant" (Dow Corning Corp.) for field use and "983 or 995 Silicone Building Sealant"(Dow Corning Corp.) for use in the shop.
  - b. "Ultraglaze SSG4000 or Ultraglaze SSG4000AC Silicone Structural Glazing Sealant" (Momentive Performance Materials Inc.); for field use and "Ultraglaze SSG4400 Silicone Structural Glazing Sealant" (Momentive Performance Materials Inc.) for use in the shop.
  - c. "Sikasil SG-18 Building Sealant" (Sika Corp.) for field use and "Sikasil SG-18 Building Sealant" or SG-500 Silicone Building Sealant"( Sika Corp.) for use in the shop.
  - d. Or approved equal.
4. Multi-Component Polyurethane: ASTM C920, Type M, Grade NS, Class and Use as best suited for the intended purpose; Products meeting these requirements are: Provide one of the following:
  - a. "Dymeric 240" (Tremco).
  - b. "Dynatrol II (Pecora Corp.).
  - c. "PSI-270" (Polymeric Systems, Inc.).
  - d. Or approved equal.
5. Multi-component, Pourable, Self-leveling Polyurethane: ASTM C920, Type M, Grade P, high traffic class and high traffic use; Products meeting these requirements are: Provide one of the following:
  - a. "Sikaflex-2C SL" (Sika Corporation).
  - b. "NR-200 Urexpan" (Pecora Corporation).
  - c. "THC 900/901" (Tremco).
  - d. Or approved equal.

6. Silicone Rubber Concrete and Precast Concrete Sealant: Low modulus, non-sag one component silicone sealant; ASTM C920, Type S, Grade NS, Class 100/50 and Use T, A, M, and O. Provide one of the following:
    - a. "NS Parking Structure Sealant" Gray color (Dow Corning Corp.)
    - b. "Bondaflex Sil 728 NS" (May National Associates, Inc.).
    - c. "Spectrem 800" (Tremco Incorporated).
    - d. Or approved equal.
  7. Immersible Multicomponent, Nonsag, Traffic-Grade, Urethane Joint Sealant:  
ASTM C920, Type M, Grade NS, Class 25, for Uses T and I
    - a. "Bondaflex PUR 2 NS" (May National Associates, Inc.).
    - b. "Dynatred" (Pecora Corporation).
    - c. "Vulkem 227" (Tremco Incorporated).
    - d. Or approved equal.
- C. Non-Elastomeric Mildew Resistant Compounds
1. Silicone Sanitary Rubber: ASTM C920, Type S, Grade NS; Provide white color unless otherwise shown or specified. Provide one of the following:
    - a. "Silicone Sanitary SCS 1700 Sealant" (Momentive Performance Materials Inc.).
    - b. "786 Mildew Resistant Silicone Sealant" (Dow Corning Corp.).
    - c. "898 Sanitary Silicone Sealant" (Pecora Corp.).
    - d. "Tremsil 200 Sanitary" (Tremco).
    - e. Or approved equal.
- D. Non-Elastomeric Compounds
1. Acrylic Latex (Paint Grade): ASTM C834 Non-sag emulsion sealant, suitable for  $\pm 7.5$  percent joint movement; Provide one of the following:
    - a. "AC-20" (Pecora Corp.).
    - b. "Tremflex 834" (Tremco).
    - c. "Sonolac" (BASF Building Systems) .
    - d. "Bondaflex 600" (May National Associates, Inc.).
    - e. Or approved equal.
- E. Color of Sealant: For concealed joints provide the manufacturer's standard color which has the best overall performance qualities for the application shown. For exposed joints the Engineer will select colors from the manufacturer's standard colors unless special colors are shown or specified.

## 2.2 JOINT FILLER MATERIALS

- A. Compressible Rod (Backer Rod): ASTM C1330; types as recommended by sealant manufacturer. Provide non-gassing rod fillers, types as shown, or as required for proper performance of the sealant in the specific joint, which is compatible with sealant, as recommended by sealant manufacturer. Sealant compatibility shall be confirmed by the sealant manufacturer. Compatibility characteristics of sealants in contact with sealant backings shall be determined by ASTM Test Method C1087.
- B. Filler for Concrete Paving: ASTM D1751, asphalt-saturated cellulosic fiber.
- C. Filler For Concrete Pedestrian Walkways: Provide non water absorbing type filler which has been tested for compatibility with the intended sealants. Fillers may be manufactured from polypropylene, polyethylene or polystyrene and shall be used for the purpose of resisting deflection of the joint under load and long term compatibility. Do not use typically asphaltic based or open cell polyurethane foam type materials for these type installations.
- D. Shape And Size: Select shape and size of joint filler in consultation with the manufacturer for proper performance in the specific condition of use in each case.

## 2.3 AUXILIARY MATERIALS

- A. Joint Cleaner: Provide nonstaining, chemical cleaners of type which are recommended by and acceptable to manufacturers of joint sealants and sealant backing materials, which are not harmful to substrates and adjacent nonporous materials, and which do not leave oily residues or otherwise have a detrimental effect on sealant adhesion or in-service performance.
- B. Joint Primer and Sealer: Provide non-staining compounds recommended by the manufacturer of the sealant for the specific joint surface and condition.
- C. Bond-Breaker Tape: Polyethylene tape as recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape where applicable.
- D. Masking Tape: Provide nonstaining, nonabsorbent type compatible with joint sealants and to surfaces adjacent to joints.

## PART 3 - EXECUTION

### 3.1 GENERAL

- A. Manufacturer's Instructions: Prepare substrates, apply primers and install (erect, apply) the work of this Section, including (equipment, components, and) accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### 3.2 EXAMINATION

- A. Verification of Conditions: Examine the areas to receive the Work and the

conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

- B. Joint Widths: Do not proceed with sealant installation where joint widths are less than allowed for application intended. In addition, examine the substrates to determine if they are strong enough to withstand the forces which will be induced by the joint sealants. Repair or strengthen substrates as required before proceeding with the work.

### 3.3 PREPARATION

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealers to comply with the following requirements:
  - 1. Remove foreign material from joint substrates which could interfere with adhesion of joint sealer, including dust; paints, (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility), old joint sealers, oil, grease, waterproofing, water repellants, water; surface dirt, and frost.
  - 2. Clean concrete, masonry, unglazed surfaces of ceramic tile and similar porous joint substrate surfaces, by brushing, grinding, blast cleaning, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealers. Remove loose particles remaining from above cleaning operations by vacuuming or blowing out joints with oil-free compressed air.
  - 3. Remove laitance and form release agents from concrete.
  - 4. Clean metal, glass, porcelain enamel, glazed surfaces of ceramic tile; and other nonporous surfaces by chemical cleaners or other means which are not harmful to substrates or leave residues capable of interfering with adhesion of joint sealers.
- C. Joint Priming: Prime or seal substrates, except where written reports of tests conducted by an independent testing agency have been submitted which demonstrate that primer or sealer is not required for the conditions of use and the substrates involved. Apply primer to comply with recommended application requirements. Confine primers to areas of joint sealer bond, do not allow spillage or migration onto adjoining surfaces.
- D. Previously Treated Joints: Do not apply elastomeric compounds to joint surfaces previously treated with paint, lacquer, sealer, curing compound, water repellent or other coatings unless a laboratory test for durability of bond has been successfully completed in accordance with ASTM C794.
- E. Masking Tape: Use masking tape where required to prevent contact of sealant with adjoining surfaces which otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing sealant.

### 3.4 INSTALLATION

- A. Installation of Sealant Backings: Install sealant backings to comply with the following requirements:
  - 1. Where joint filler is used as backup for bulk compounds, install filler continuously to depth and shape required for proper application and performance of products. Install joint fillers to provide support of joint sealants during application and at position required to produce the cross-sectional shapes and depths of installed joint sealants relative to joint widths which allow optimum sealant movement capability. Provide watertight and airtight corners and joints in a manner recommended by the manufacturer. Do not leave gaps between ends of joint fillers and do not stretch, twist, puncture, or tear joint fillers. Remove absorbent joint fillers which have become wet prior to sealant application and replace with dry material.
  - 2. Install bond breaker tape between joint sealants and joint fillers, compression seals, or back of joints where adhesion of sealant to surfaces at back of joints would result in sealant failure.
- B. Elastomeric Sealant Installation Standard: Comply with ASTM C1193 for installation of joint sealants as applicable to materials, applications and conditions indicated.
  - 1. Apply compounds in continuous beads without open joints, voids or air pockets so as to provide a watertight and airtight seal for the entire joint length and to allow optimum sealant movement capability.
  - 2. Apply compounds to the depth and width ratio recommended.
- C. Tooling of Joints: Immediately after sealant application and prior to time skinning or curing begins, tool joint sealants to form smooth, uniform beads of configuration indicated, to eliminate air pockets, and to ensure contact and adhesion of sealant with sides of joint. Remove excess joint sealants from surfaces adjacent to joint. Do not use tooling agents which discolor joint sealants or adjacent surfaces or are not approved. Tool exposed surfaces of compounds to the profile shown or if none is shown, tool slightly concave to match configuration per Figures 1, 4 and 8 in ASTM C1193, unless otherwise indicated.
- D. Horizontal Joints, General: Joints Not Subject to Traffic or Other Abrasion: Apply sealant to a depth equal to 50% of the joint width, but not less than 1/4 in. and not more than 1/2 in. against rough surfaces or in joints of uneven widths avoid the appearance of excess sealant by locating the sealant well back into joint wherever possible. Tool exposed surfaces slightly concave, except provide a slight wash on horizontal joints where horizontal and vertical surfaces meet.
- E. Sidewalk, Pavement, and Similar Horizontal Joints: Apply sealant to a depth equal to 75% of the joint width, but not less than 3/8 in. and not more than 3/4 in. Pour self- leveling sealant in horizontal joints to a level 1/16 in. below the adjoining surfaces, unless otherwise shown or recommended by the manufacturer.

### 3.5 FIELD QUALITY CONTROL

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. Field-Adhesion Testing: During exterior joint sealant installation, field test sealant adhesion to joint substrates as follows:
  - 1. Extent of Testing: Test completed exterior elastomeric sealant joints as follows:
    - a. Perform 2 tests for the first 1000 ft. of joint length for each type of exterior elastomeric sealant and joint substrate.
    - b. Perform 1 test for each 1000 ft. of joint length thereafter.
  - 2. Test Method: Test joint sealants according to "Method A, Field-Applied Sealant Joint Hand Pull Tab" in Appendix X1 in ASTM C1193 and ASTM C1521. For joints with dissimilar substrates, verify adhesion to each substrate separately; do this by extending cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
  - 3. Inspect joints for complete fill, for absence of voids, and for joint configuration complying with specified requirements. Record results in a field-adhesion- test log.
  - 4. Inspect tested joints and report on the following:
    - a. Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate. Compare these results to determine if adhesion passes field-adhesion hand-pull test criteria.
    - b. Whether sealants filled joint cavities and are free of voids.
    - c. Whether sealant dimensions and configurations comply with specified requirements.
  - 5. Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.
  - 6. Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.
  - 7. Evaluation of Field Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.
- C. Waterproof Test: After curing exterior compounds, test joints for leaks by applying a stream of water perpendicularly from a 3/4 in. dia. hose equipped

with a control valve, pressure gage, and 1/2 in. inside dia. brass nozzle. Adjust the water flow to 30 psi at the nozzle inlet, and spray the water perpendicular to the joint at a distance 12 in. from the surface. Slowly move the nozzle back and forth for 5 minutes along a 5 ft. segment of joint. Starting from the lowest point and working upward, repeat the process on successive segments until every designated location has been tested. Test the sealed joint system of not less than 25% of the construction components. Test the sealed joint system comprised of the actual construction components. Conduct tests in the presence of the Engineer's representative who will determine the actual percentage of joints to be tested and the period of waterflow exposure, based upon any evidence of leakage. Repair leaks or other defects and retest as directed. Repair or replace other work damaged by such leaks.

### **3.6 ADJUSTING**

- A. Cleaning: Clean off excess joint sealants or sealant smears adjacent to joints as work progresses by methods and with approved cleaning materials.

### **3.7 PROTECTION**

- A. Protection: Protect joint sealants and related accessories during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealers immediately and reseal joints with new materials to produce joint sealer installations with repaired areas indistinguishable from original work.
- B. Coatings: Do not apply paint or other coatings near joint surfaces until after sealants have been installed and are nominally cured, so that adhesion will not be impaired by migration of such substances onto the joint surfaces.

**END OF SECTION**

## SECTION 08 31 00 – ACCESS DOORS AND PANELS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide access doors and panels for concealed equipment requiring access in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Masonry construction is specified in Section 04 20 00 "Unit Masonry".
  - 2. Finishes scheduled for installation in recessed pan-type access doors is specified in various Division 9 specification sections.
  - 3. Finish painting of factory prime painted access doors and frames is specified in Section 09 90 00 "Paints and Coatings".
  - 4. Valves, gauges, alarm devices, fire dampers, fire and smoke dampers, automatic and balancing dampers, junction boxes, ballasts, pull boxes, control panels, devices, and other concealed equipment requiring access are specified in applicable Division 21, 22, 23, 26 Specifications sections.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. National Association of Architectural Metal Manufacturers (NAAMM): NAAMM "Metal Finishes Manual".
  - 2. American Welding Society (AWS)
    - a. AWS D1.1 "Structural Welding Code - Steel".
    - b. AWS D1.2 "Structural Welding Code - Aluminum".
    - c. AWS D1.3 "Structural Welding Code - Sheet Steel".
  - 3. Industrial Fasteners Institute (IFI): "Fastener Standards Book."
  - 4. National Fire Protection Association (NFPA): NFPA 80, "Standard for Fire Doors and Windows".

#### 1.3 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work for each type of access door and panel assembly, including instructions, and directions for installation of anchorage devices. Include maintenance instructions for doors with exposed factory finishes.

- B. Shop Drawings: Submit for Engineer's action. Submit shop drawings for the fabrication and installation of the Work including details of each frame type, elevations of door design types, anchorage and accessory items. Prepare details at not less than 3 in. = 1 ft. minimum scale.
1. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items with concealed framing, suspension systems, piping, ductwork, and other construction. Show the following:
    - a. Method of attaching door frames to surrounding construction.
    - b. Ceiling-mounted items including access doors and frames, lighting fixtures, diffusers, grilles, speakers, and special trim.
- C. Samples: Submit samples for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide sample for each access door face material, at least 3 in. x 5 in. in size, in specified finish.
- D. Access Door Schedule: Submit, for Engineer's information, complete access door and panel schedule, including types, ratings, general locations, sizes, wall and ceiling construction details, finishes, latching or locking provisions, and other data pertinent to installation.
- E. Quality Control Submittals: Submit for Engineer's information.
1. Certificates
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
    - b. Fire Rated Floor Access Door Test Certification: Submit, for Engineer's information, certification attesting to the fact that fire rated floor access doors are tested in accordance with ASTM E119, NFPA 252, UL 10B or UL263 and are UL Listed for the specified rating and when installed and in the closed position the temperature on the unexposed surface of the door assembly shall not exceed 325 deg. F. above ambient for the duration of the tested period.
- F. Closeout Submittals: Submit, for City of New York's documentation.
1. Warranties: Special warranties as specified.
  2. Maintenance Manuals: Two (2) copies of bound maintenance manuals, describing the materials, and procedures for cleaning and maintaining each type of access door. Include manufacturer's data describing the materials and finishes used in the work.

## 1.4 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work
- B. Manufacturer Qualifications: The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
  - 1. Single-Source Responsibility: Obtain each type of access door for the entire project through one source from a single manufacturer.
  - 2. Size Variations: Obtain Engineer's acceptance of manufacturer's standard size units, which may vary slightly from sizes indicated.
- C. Verification: Obtain specific locations and sizes for required access doors and panels from trades requiring access to concealed equipment, and indicate on access door schedule submittal.
- D. Requirements of Regulatory Agencies: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
  - 1. Fire-Resistance Ratings: Wherever a fire-resistance rating is shown for construction into which access doors and panels are to be installed, provide an access door assembly (door, frame, hinge, and lock or latch) of type and manufacturer listed by Underwriter's Laboratories, "Classified Building Materials Index". Provide access doors and panels, UL rated 1-1/2 hour for 2 hour partition, Class "B" with a temperature rise rating of 250 deg. F maximum in 30 minutes of fire exposure. Provide UL label on each fire-resistance rated access door assembly.
  - 2. Label Requirements: Comply with the label requirements of NFPA and UL. Fabricate units in accordance with requirements of NFPA Standard No. 252, ASTM E152, ASTM E119, UL 10B or UL263 corresponding to the construction type and the hourly rating shown.

## 1.5 DELIVERY STORAGE AND HANDLING

- A. General: Store access door and panel items and accessories under cover and off the ground. Handle in such a manner so as to protect surfaces and to prevent distortion of, and other type of damage to, fabricated pieces.

## PART 2 - PRODUCTS

### 2.1 MATERIALS, GENERAL

- A. Metal Surfaces, General: For fabrication of access door and panel metal work which will be exposed to view in the finished work, use only materials which

are smooth and free of surface blemishes including pitting, seam marks, roller marks, rolled trade names and roughness. Remove such blemishes by grinding, or by welding and grinding, prior to cleaning, treating, and applying surface finishes.

- B. Galvanized Carbon Steel Sheets: ASTM A653, hot-dip galvanized with G90 coating (minimum spangle), either commercial quality or structural quality, Grade 33, unless another grade is required for design loads.
- C. Cold Rolled Carbon Steel Sheets: ASTM A366; commercial quality, stretcher leveled, free from scale, pitting or other defects.
- D. Steel Angles, Plates, Bars, Rods and Other Steel Accessories: ASTM A36.
- E. Stainless Steel.
  - 1. ASTM A240; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide Type 304 or Type 316 and low carbon Type 304L or 316L for components to be welded, unless otherwise noted.
    - a. Plate and Sheet: ASTM A480, Stretcher level sheets.
    - b. Bar Stock and Shapes: ASTM A276.
- F. Aluminum: Provide alloy and temper recommended by aluminum producer or finisher for type of use and finish specified or shown, and with not less than the strength and durability properties of the alloy and temper designated below for each aluminum form required.
  - 1. Extruded Bar and Shapes: ASTM B221, 6063-T6.
  - 2. Plate and Sheet: ASTM B209, 6061-T6.
- G. Fasteners and Anchorage Devices: Provide fasteners complying with the requirements of Industrial Fasteners Institute standards. Type, grade, class and style best suited for the respective purpose. Use countersunk flat-head Phillips type machine screws for exposed fasteners, except where Allen head screws are required. Use galvanized steel or stainless steel fasteners for exterior construction and for fastening components fabricated of galvanized steel.
  - 1. Provide Type 304 or Type 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, where built into exterior walls and fastening components fabricated of galvanized steel.
- H. Finishes
  - 1. Ferrous Metal Finish: Chemically bonded with prime coat of baked-on electrostatically applied primer.
  - 2. Stainless Steel: No. 4 (bright directional polish) unless otherwise shown or specified.
  - 3. Aluminum Finishes: Finish designations prefixed by "AA" conform to the system established by the Aluminum Association for designating aluminum finishes. Provide as fabricated finish: AA-M10; (Mechanical Finish as fabricated, unspecified) unless otherwise shown or

specified.

## 2.2 FABRICATION, GENERAL

- A. General: Provide each access door assembly manufactured as an integral unit, complete with components, accessories and fasteners ready for installation.
- B. Forming: Form exposed surfaces free from warp, wave and buckle, with corners square, unless otherwise shown. Form molded members straight and true, with welded joints coped or mitered, well formed, and in true alignment. Dress welded joints on exposed surfaces smooth so they are invisible after finishing and flush with adjacent surfaces. Provide attachment devices and fasteners of type required to secure access doors and frames to contiguous support construction.
- C. Reinforcing: Reinforce members and joints with structural shapes and plates in concealed locations, as necessary for adequate strength and rigidity. Provide concealed fastenings unless otherwise shown. Locate necessary exposed fastenings in an orderly pattern, in accordance with reviewed shop drawings. Separate dissimilar metals with dielectric separator to prevent galvanic action. Do not extend coatings onto exposed surfaces
- D. Locations: Access doors, panels, related frames and accessories to be located in exterior areas, areas of high humidity or other locations noted, shall be hot dip galvanized and finish painted. Factory prime mild steel not galvanized. Access doors and panels exposed to public view shall be finish painted in color(s) as selected by the Engineer.
- E. Locking Devices: Provide locking devices for access doors and panels in sufficient number for the size door to be installed. Provide six keys for keyed locks and masterkey locks for the entire project unless otherwise indicated or specified.
- F. Strippable Protection: Prior to shipment protect finishes on exposed surfaces from damage by application of strippable temporary protective covering or other means.

## 2.3 FABRICATION, ACCESS DOORS AND PANELS

- A. Flush Access Door for Installation in Toilet Rooms:
  - 1. Features: Frame shall be 16 gauge stainless steel with a nominal 1 in. exposed frame flange. Door shall be 14 gauge stainless steel, fitted flush with frame flange. Reinforce access doors over 24 in. in width to prevent sagging. Provide galvanized steel anchors appropriate for substrate. Provide concealed spring hinges permitting 175° opening. Provide flush key operated stainless steel cylinder locks.
  - 2. Provide one of the following:
    - a. "Style TMS" (J. L. Industries).
    - b. "Type DSC-214M Stainless Steel" (Karp Associates Inc.).
    - c. "Style MS" (Milcor).
    - d. "NT Series Stainless Steel" (Nystrom, Inc.).

- e. Or approved equal.
- B. Flush Access Door for Installation in Masonry and Ceramic Tile Substrates, not Toilet Rooms:
  - 1. Features: Frame shall be 16 gauge steel with a nominal 1 in. exposed frame flange. Door shall be 14 gauge steel, fitted flush with frame flange. Reinforce access doors over 24 in. in width to prevent sagging. Provide galvanized steel anchors appropriate for substrate. Provide concealed spring hinges permitting 175° opening. Provide flush screwdriver operated cam locks for access doors except provide flush key operated cylinder locks for access doors in public areas.
  - 2. Provide one of the following:
    - a. "Style TM" (J. L. Industries).
    - b. "Type DSC-214M" (Karp Associates Inc.).
    - c. "Style M" (Milcor).
    - d. "NT Series" (Nystrom, Inc.).
    - e. Or approved equal.

## 2.4 FABRICATION, FIRE RATED DOORS

- A. General: Construct doors and frames to comply with the requirements of the NFPA and Underwriters' Laboratories, Inc. for "B" Label, 1-1/2 hour rating. Install UL label on each door in a non-exposed location unless otherwise required by the NYC Building Department.
- B. Fire Rated Steel Access Door
  - 1. Features: Frame shall be 16 gauge steel with a nominal 1 in. frame flange and integral appropriate anchors. Door shall be 2 in. thick, fabricated of 20 gauge steel face sheets, sandwich construction, with a non-combustible insulation core. Provide continuous stainless steel piano type hinge with stainless steel pin for the length of the door and an automatic latching device with operating turn ring (flush key operated cylinder lock in public areas) and interior latch release. Provide an automatic spring door closer for doors.
  - 2. Manufacturer:
    - a. "Style FD" (J. L. Industries).
    - b. "Type KRP-150FR" (Karp Associates, Inc.).
    - c. "IT Series" (Nystrom, Inc.).
    - d. Or approved equal.

## PART 3 - EXECUTION

### 3.1 GENERAL

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are

shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected. Do not hang doors with an apparent defect.

### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.

### **3.4 INSTALLATION**

- A. Verification of Dimensions: Verify dimensions of openings by field measurements so that access doors and related items will be accurately designed, fabricated and fitted to the substrate.
- B. Coordination: Coordinate access doors and panels with the work of other Sections and provide items to be placed during the installation of other work. Coordinate delivery of such items to the project site. Deliver items which are to be built into the work of other Sections in time so as not to delay the progress of the Work.
- C. Installation: Install access doors and panels in locations shown, plumb, level and in line with adjacent materials where required. Provide fastenings as indicated on the final shop drawings. Fit exposed connections accurately together to form tight hairline joints. Adjust hardware and doors for proper operation.
- D. Installation of Fire Rated Access Doors: Install fire rated items in a manner which will not compromise the ratings of the substrate where installation is scheduled.

### **3.5 ADJUSTING**

- A. Touch-Up: Paint and touch-up paint with the specified paint system. Touch up galvanized surfaces in accordance with ASTM A780.
- B. Adjustment: Adjust doors and hardware after installation for proper operation.
- C. Damaged Doors: Remove and replace doors and frames that are warped, bowed, or otherwise damaged.

### **3.6 CLEANING**

- A. Cleaning: Clean surfaces and leave free from smears. Repair minor scratches and other finish imperfections. Immediately after erection, clean field welds, bolted connections, marred and abraded surfaces. Remove and replace panels or frames that are warped, bowed, or otherwise damaged.

### **3.7 PROTECTION**

- A. Protection: Protect finished surfaces against damage during construction and remove protection at time of substantial completion.

**END OF SECTION**

**SECTION 08 33 00 – HOLLOW METAL DOORS AND FRAMES****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide hollow metal doors and frames in accordance with requirements of the Contract Documents. The Work of this Section includes, but is not limited to the following:
  - 1. Hollow metal doors and frames.
    - a. Type 316 Stainless Steel Doors and Frames – Exterior
    - b. Type 304 Stainless Steel Doors and Frames - Interior
  - 2. Installation of hardware on hollow metal doors and frames.
- B. Related Work Specified Elsewhere
  - 1. Furnishing of finish hardware as specified in Section 08 71 00 "Finish Hardware".
  - 2. Finish painting of hollow metal doors and frame requiring finish painting is specified in Section 09 90 00 "Paints and Coatings".

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American National Standards Institute (ANSI)
    - a. ANSI 250.8" Recommended Specifications for Standard Steel Doors and Frames".
    - b. ANSI/DHI A115 "Specifications for Hardware Preparations in Standard Steel Doors and Frames" and ANSI A 250.6 "Hardware on Steel Doors (Reinforcement Application)".
    - c. ANSI/DHI A115.IG "Installation Guide for Doors and Hardware"
    - d. Hollow metal doors and frames ANSI A250.10 "Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces".
  - 2. Industrial Fasteners Institute (IFI): "Fastener Standards Book".
  - 3. Steel Door Institute (SDI)
    - a. SDI-112 "Galvanized/Galvannealed Standard Steel Doors and Frames".
  - 4. National Association of Architectural Metal Manufacturers (NAAMM):

- a. "Metal Finishes Manual".
  - b. NAAMM Standard HHMA 810 "Hollow Metal Doors".
  - c. NAAMM Standard HHMA 820 "Hollow Metal Frames".
  - d. NAAMM Standard HHMA 831 "Hardware Locations for Hollow Metal Doors and Frames".
  - e. NAAMM Standard HHMA 840 "Installation and Storage of Hollow Metal Doors and Frames".
- 5. American Welding Society (AWS)
    - a. AWS D1.1 "Structural Welding Code - Steel".
    - b. AWS D1.3 "Structural Welding Code - Sheet Steel".
  - 6. ICC ANSI A117.1 - 2009

### 1.3 DEFINITIONS

- A. Steel Sheet Thicknesses: Thickness dimensions, including those referenced in ANSI A250.8, are minimums as defined in referenced ASTM standards.

### 1.4 SYSTEM DESCRIPTION

- A. Performance Requirements for Doors and Frames.
  - 1. Wind Loading: Design, fabricate and install hollow metal doors so that the total, installed, units will withstand the inward and outward pressure normal to the plane of the door as shown on Structural Drawings.
  - 2. Building Movement: Design, fabricate and install hollow metal doors to withstand building movements including loading deflections, shrinkage, creep, seismic and similar movements.
  - 3. Anchorage: Anchorage disengagement or breakage shall not occur when installed hollow metal window or door frame unit is subjected to a force equal to 2.5 times the design load. Anchorage shall be properly braced in three orthogonal directions (vertical, transverse, and longitudinal) to resist specified loadings from any direction (both positive and negative pressure).
  - 4. Water Drainage: Make provisions at sill to drain water and condensation to exterior face of the frames. Show locations and sizes of these provisions on the shop drawings.
  - 5. Temperature Requirements: Design, fabricate and install hollow metal window frame and door component parts to provide for expansion and contraction of the window or door frame over an interior temperature range of +55 deg. F. to 100 deg. F. without buckling, sealed joint failure, undue stress on members or anchors, and other detrimental effects.
  - 6. Unacceptable Conditions: Vibration harmonics, wind whistles, noise or vibration created by thermal movement, structural movement, or wind; thermal movement transferred to building structure; loosening,

weakening or failure of fasteners, attachments or other components.

7. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and coordinate the work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted for review.

## 1.5 SUBMITTALS

- A. Product Data: Provide manufacturer's literature and specifications describing the general properties of each material and accessory to be used in the Work including a material list with technical data documenting the location and primary function, quality, and performance of each material component or system to be used in the Work, including primary characteristics as required by the Contract Documents.
- B. Shop Drawings: Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum scale.
  1. Submit shop drawings for hollow metal doors and frames which shall include for each opening, details of frame, elevation of door or window design type, conditions at opening, details of construction including horizontal and vertical edge conditions,, details of joints and connections, description of anchorage and accessory items and location and preparation of reinforcement and installation requirements for finish hardware.
    - a. Coordination Drawings for Hollow Metal Doors and Frames: As part of shop drawing submittal, submit complete coordination drawings of each door opening, including door and frame, drawn to scale and coordinating door hardware. Show elevations of each door design type, showing dimensions, locations and types of door hardware.
    - b. Schedule of Doors and Frames: As part of shop drawing submittal, submit a complete schedule of doors and frames utilizing reference numbers for details and openings as shown.
    - c. Setting Drawings: Provide setting drawings and templates for the location of hollow metal window and door fabrications items that are to be embedded in or anchored to concrete or masonry.
- C. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Submit the following:
  1. 18 in. x 24 in. cut-away sample door with provisions for lockset and a pair of hinges and corner section of door frame. Include samples of anchorage. Provide a metal sample of a entrance door which is indicative of the hot dip galvanized finish.
- D. Quality Control Submittals

1. Certificates
  - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
  - b. Primer Certification: Certification that the prime finish on the hollow metal doors and frames has been tested and complies with ANSI A250.10
  - c. Reports: copies of welder pre-qualification and other welding procedures in form prescribed in AWS D1.1.
2. Primer: Description of primer and method of application proposed for factory primed hollow metal doors and frames. Describe process utilized in treating and priming galvanized and metallic coated sheet hollow metal doors and frames.

## 1.6 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain hollow metal doors and frames from one source of a single manufacturer. Obtain accessory products used in conjunction with hollow metal doors and frames from the hollow metal doors and frames manufacturer or from sources acceptable to the hollow metal doors and frames manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Requirements of Regulatory Agencies
  1. General: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Pre-Installation Meetings: Prior to the start of the Work, meet at the Project site to review methods and sequence of hollow metal doors and frames installation, special details and conditions, standard of workmanship, testing and quality control requirements, job organization and other pertinent topics related to the Work.

## 1.7 DELIVERY, STORAGE AND HANDLING

- A. Precautions: Protect hollow metal door, window and frame units from damage during transit, storage and installation. Tool marks, rust, blemishes and other

damage on exposed surfaces will not be acceptable. Store material in a dry location, off the ground and in a manner as to prevent deterioration. Avoid using nonvented plastic or canvas shelters that could create a humidity chamber. If packaging becomes wet, remove cartons immediately. Provide spaces between stacked units to permit air circulation.

- B. Delivery:
1. Deliver hollow metal door frames packaged with one (1) frame per bundle, marked with frame type, size, swing and wall thickness. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions. Inspect doors and frames on delivery for damage, and notify shipper and supplier if damage is found.
  2. Deliver hollow metal window frames packaged with one (1) frame per bundle, marked with frame type, size, and wall thickness. Deliver welded frames with two removable diagonal spreader bars across bottom of frames, tack welded to jambs and mullions. Inspect doors and frames on delivery for damage, and notify shipper and supplier if damage is found.

## **PART 2 - PRODUCTS**

### **2.1 MATERIALS**

- A. Metal Surfaces, General: For hollow metal door, window and frame work which will be exposed to view in the finished work, use only materials which are smooth and free of surface blemishes including pitting, seam marks, roller marks, rolled trade names and roughness. Remove blemishes by grinding, or by welding and grinding, prior to cleaning, treating, and applying surface finishes.
- B. Stainless Steel
1. ASTM A240; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide Type 316 and low carbon 316L for components to be welded (exterior), type 304 and low carbon 304L for components to be welded (interior), unless otherwise noted.
    - a. Provide stainless steel sheet for all hollow metal doors and frames.
  2. Plate and Sheet: ASTM A480, Stretcher level sheets.
  3. Bar Stock and Shapes: ASTM A276.
  4. Round, Square and Rectangular Welded Tubing: ASTM A554, MT 316, or MT 316L as standard with manufacturer.
- C. Structural Steel Shapes, Plates and Bars: ASTM A36.
- D. Stainless Sheet Steel for Hollow Metal Doors: Stretcher leveled standard of flatness for doors.
- E. Reinforcing Steel, Supports and Anchoring Devices: Stainless steel.
- F. Core Filler for Hollow metal Doors: Sound deadening and heat-retarding mineral fiber insulating material. At doors required to have temperature rise

rating, provide mineral fiberboard core.

1. Exterior Thermal-Rated (Insulated) Doors: Provide doors fabricated with cores which have a thermal-resistance value (R-value) of not less than 4.0 deg F x h x ft.<sup>2</sup>/Btu when tested according to ASTM C1363
- G. Fasteners: Stainless steel.
1. Bolts and Nuts: Stainless steel.
  2. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete:
    - a. Interior Material: Stainless steel.
  3. Machine Screws: ANSI/ASME B18.6.3, and ASTM A307, carbon steel, Phillips flat head.
- H. Dielectric Separator SSPC- Paint 12 compounded for 15 mil dry film thickness per coat; Cold applied type, inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities, non-sagging, resistant to severe corrosion conditions; applied in two coats for an overall minimum dry film thickness of 30 mils.
- I. Grout: Comply with ASTM C476, with a slump of 4 in. for standard hollow metal door and window frames built into concrete or masonry, as measured according to ASTM C143.

## 2.2 FABRICATION, GENERAL

- A. Supplementary Parts: Include supplementary parts necessary to complete fabrications work though not definitely shown or specified. Such parts include, but are not limited to, interface components necessary for the installation or anchorage to Work.
- B. Verification of Measurements and Dimensions and Coordination and Schedule of Work: Verify measurements and dimensions at the job site and cooperate in the coordination and scheduling of the work of this Section with the work of related trades (with particular attention given to the installation of items embedded in concrete and masonry).
- C. Formation of Exposed Work: Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges. Form bent metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- D. Formation of Exposed Connections: Form exposed connections with hairline joints, flush and smooth; using concealed fasteners where possible. Exposed threaded portion of bolts and screws shall be cut off flush with adjacent metal. Cut, drill, punch and tap as required for the installation and attachment of other work to metal fabrications work. Shear and punch metals cleanly and accurately. Remove burrs. Remove sharp or rough areas on exposed traffic surfaces.
- E. Formation of Metal Work: Form metal work built in with concrete or masonry for anchorage, or provide suitable anchors, expansion shields, or other

anchoring devices shown or required to provide support for intended use. Furnish metal work in ample time for setting and securing in place.

- F. Procedures for Joints and Welds: Make joints as strong and rigid as adjoining sections. Make welds continuous along entire line of contact, except where spot welding is indicated. Grind exposed welds flush and smooth to match and blend with adjoining surfaces. Welded connections may be used where bolted connections are shown. Fabricate joints exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.
  - 1. Make up threaded connections tight so that threads are entirely concealed. Shoulder and head, dowel and pin abutting bars. Provide bolt and screw heads flat and countersunk in exposed work. Carefully machine, fit and secure removable members by means of Allen-head set screws of proper size and spacing.
- G. Galvanizing
  - 1. ASTM A123 for galvanizing rolled, pressed and forged steel shapes, plates, bars, strip and for assembled steel products.
  - 2. Items to be Galvanized: Galvanize ferrous metal utilized on items embedded in concrete, unless otherwise specified. Utilize hot dip galvanized steel for all steel doors and frames. Galvanize other items where specified or shown. Finished hot dip galvanized surfaces of all steel doors and frames shall match with regard to aesthetics.
- H. Preassembly of Items: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Following trial fit, disassemble units only as necessary for shipping and handling. Clearly mark units for reassembly. Provide alignment and splice plates for accurate field fit.

### **2.3 HOLLOW METAL DOOR AND FRAME FABRICATION**

- A. General: Fabricate hollow metal doors and frames to the design and dimensions shown and scheduled in accordance with best shop practices and in compliance with SDI 117 "Manufacturing Tolerances Standard Steel Door and Frames". Unless otherwise shown or specified, fabricate doors and panels to a thickness of 1-3/4 in. Take field measurements where coordination with adjoining work is necessary.
- B. Workmanship: Make hollow metal door and frame work strong, rigid, neat in appearance and free from defects. Reinforce corners of doors as required to prevent twisting or sagging. Form exposed surfaces free from warp, wave and buckle, with corners square, unless otherwise shown. Form molded members straight and true, with welded joints, ground smooth, coped or mitered, well formed, and in true alignment. Provide a full miter continuously welded on back side at frame corners with edges straight and true. Grind welds smooth and flush on exposed surfaces so they are invisible after finishing. Accurately machine, file and fit exposed connections with hairline joints unless otherwise shown. Conceal fastenings wherever possible. Countersink exposed screws using flat, Phillips head screws. Provide welds of adequate strength and durability.
- C. Clearances: Provide clearances for doors, not otherwise specified or shown,

as follows: 1/8 in. at jambs and heads, 1/8 in. at meeting stiles of pairs of doors and 3/8 in. at bottom where no threshold or carpet is required. Where a threshold is scheduled provide 3/8 in. clearance above the threshold. Where carpet is scheduled provide 3/8 in. clearance above the carpet. Prepare doors to receive weatherstripping where required.

1. Round lock edges of stiles for pairs of double acting doors; bevel lock edge 1/8 in. in 2 in. for other hollow metal doors.

- D. Preparation for Hardware: Mortise, reinforce, drill and tap doors and frames at factory to receive mortise type hardware including installation of 2 in. dia. galvanized steel conduit for routing of low voltage wire from electrical hinges to electro- mechanical locks, in accordance with reviewed hardware schedule and templates.

Provide steel reinforcing, drill and tap for doors and frames to receive surface applied hardware, except at push plates and kickplates provide reinforcing only. Use steel secured by spot welding as reinforcement. Prepare doors and frames in accordance with ANSI A250.6 and ANSI A115, except with the following modifications:

1. Butt and Intermediate Pivot Hinge Reinforcements: 10 gauge or equivalent number of threads on doors and 7 gauge on frames.
2. Top and Bottom Pivot Reinforcements: 7 gauge steel by size as required by hardware manufacturer.
3. Lock Fronts: 12 gauge by size as required by approved hardware manufacturer.
4. Flush Bolts: 12 gauge by size as required by approved hardware manufacturer.
5. Lock Reinforcement Units: 14 gauge by size as required by hardware manufacturer.
6. Closers and Hold Open Arms: 12 gauge one-piece channel, size as required by approved hardware manufacturer.
7. Panic Device Reinforcement: 1/8 in. thick by 10 in. high by 4 in. wide centered on panic device case body, unless otherwise recommended by panic device manufacturer.
8. Other Hardware: Other hardware reinforcements as required for adequate strength and anchorage.
9. Alternate Reinforcement: In lieu of reinforcement specified, hardware manufacturers' recommended reinforcing units may be used. Submit for review.

- E. Flush Seamless Door Fabrication

1. Standards and Door Construction: Fabricate flush doors with minimum gauge face sheets below, with edges welded and finished flush. Provide seamless construction, with no seams or joints on door faces, and continuous vertical mechanical interlocking joints at lock and hinge edges; intermittently welded, with one inch long tack-welds spaced a minimum of 6 in. o.c. vertically. Provide tack-welds at top

and bottom of each hardware cutout. Fill edge seams with epoxy filler and grind smooth. No body filler or "bondo" shall be allowed. Comply with the following:

- a. Compliance: Provide metal doors complying with ANSI 250.8 for level and model and ANSI A250.4 for physical-endurance level and models:
  - 1) Interior Flush Doors below 7 ft. height: ANSI 250.8 Level 2 and ANSI A250.4 Physical Performance Level 'B', heavy-duty, Model 2, Seamless Design, minimum 18 gauge cold-rolled sheet steel faces or metallic coated sheet steel faces.
  - 2) Interior Flush Doors above 7 ft. height: ANSI 250.8 , Level 3 and ANSI A250.4 Physical Performance Level 'A', extra heavy-duty, Model 2, Seamless Design, minimum 16 gauge cold-rolled sheet steel faces or metallic coated sheet steel faces.
  - 3) Exterior Flush Doors: ANSI 250.8, Level 3 and ANSI A250.4 Physical Performance Level 'A', extra heavy-duty, Model 2, Seamless Design, minimum 16 gauge stainless steel faces. Provide flush stainless steel cap at top of door at inverted top channels. Provide weep-hole openings in bottom of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.
- b. Reinforcement: Reinforce face sheets of flush doors with 20 gauge interlocking vertical C or Z shaped reinforcing members spaced not over 6 in. apart and spot welded to face sheets not more than 6 in. o.c. Provide flush inverted 16 gauge steel channels welded to face sheets at top and bottom of door. Place filler between reinforcing members for full height of door.
- c. Framing for Temperature Rise Rated Doors: A continuous mineral fireboard core, permanently bonded to the inside face of the outer sheets.

#### F. Flush Panel Fabrication

1. Forming of Panels: Form to thicknesses specified and dimensions shown and comply with applicable requirements for flush doors. Prepare panels for concealed support and anchorage.

#### G. Hollow Metal Door Frame Fabrication

1. General: Provide combination type, fully welded, hollow metal door frames (knocked-down frames will not be accepted) to be used as both door buck and trim, formed to standard frame profiles shown and, unless otherwise shown, of the following minimum gages:
  - a. Interior Door Frames: 16 gauge steel for doors 7 ft. and under; 14 gauge steel for doors above 7 ft and/or over 4 ft. wide. In addition, frames scheduled to receive electrical locking devices shall be minimum 14 gauge steel.

- b. Exterior Frames: 14 gauge stainless steel.
  - c. Cased Opening Frames: 14 gauge steel.
  - d. Code Requirements: As required per the NYC Building Department.
2. Corner Joints: Corner joints of frames shall have contact edges closed tight, with trim faces mitered and continuously welded and stops mitered. The use of gussets shall not be permitted.
3. Throat Opening: Where partitions are set into door frames, fabricate frames with throat opening 1/16 in. larger than partition thickness unless otherwise shown or specified.
4. Anchorage
- a. Provide tee shaped corrugated or perforated metal anchors into adjoining masonry or concrete construction. Use adjustable anchors with friction fit for frames set in masonry. Weld to frames set in concrete. Fabricate anchors of steel no lighter than the gauge used for the frame, 2-1/2 in. wide by 10 in. long, three (3) per jamb up to 7 ft. high and four (4) per jamb up to 8 ft. high.
  - b. Anchor frame jambs to concrete or masonry which has been placed prior to setting of frames with 3/8 in. countersunk concealed flat head bolts into expansion type shields or inserts, provide one not more than 6 in. from the top and bottom of each jamb with intermediate anchors spaced a maximum of 26 in. o.c. with a minimum of 4 per jamb. Apply removable stops to cover anchor bolts.
  - c. Provide 16 gauge steel channel temporary spreaders at the bottom of 3 sided frames to prevent distortion during shipment and storage and to hold frames in proper position until anchorage and adjacent construction has been completed.
  - d. Terminate bottom of frames at the indicated finished floor level. Where floor fill or setting beds occur support frame by adjustable clip angles anchored to the structural substrate. Angle floor clips shall be 12 gauge, welded to frame and punched for two (2) 3/8 in. fasteners.
5. Mullions and Transom Bars: Provide mullions and transom bars of closed or tubular construction, or as otherwise shown. Attach members to heads and jambs of frame with butt-welded and ground smooth joints unless shown to be removable. Reinforce the joints with concealed clip angles of the same thickness as the frame.
6. Head Reinforcement: Reinforce head of frames over 3 ft. wide with 12 gauge steel channel unless a structural lintel is provided to support the wall construction above the frame or unless there is no wall construction above the frame.
7. Mortise Enclosures: Provide full enclosing electrical junction boxes or mortar shields over mortises. Provide removable access plates in the

heads of frames to receive concealed door closers. Offset reinforcement so that faces of hinges or keepers are flush with face of the frame rebate.

8. Rubber Door Silencers: Provide holes for rubber door silencers: 3 for single doors and 4 for pairs of doors. Install plastic plugs in silencer holes to keep holes clear during contiguous construction. Remove plastic plugs and replace with rubber door silencers after hardware installation.
9. Back Coating of Frames: Where frames are to be fully grouted, coat the back of the frame with bituminous paint.

## 2.4 DOOR LOUVERS

- A. Ventilation Louvers: Provide minimum 20 gauge stainless steel sheet stationary ventilation type louvers (blades and baffles) matching inverted 'Y' blade type complete with 18 gauge stainless steel frame. Do not stamp louvers directly into door panels. Size and location as indicated on drawings.

## 2.5 FINISHES

- A. Stainless Steel Finishes
  1. Finish: No. 4 (satin directional polish) to match Engineer's approved sample.
- B. Shop Prime Painting
  1. Only prime paint steel doors and frames where scheduled.
  2. Cleaning and Treating: Clean, treat and paint surfaces of fabricated steel door and frame work, inside and out, whether exposed or concealed in the construction.
    - a. Thoroughly clean metal surfaces of loose scale, shavings, filings, dirt and other deleterious materials by use of wire brushes or other effective means. Remove grease and oil by one of the methods specified in SSPC-SP-1 "Solvent Cleaning". Fill as required to fill seams in edges.
    - b. Prepare galvanized and metallic coated sheet steel doors and frames to receive prime paint by chemically treating surfaces with phosphate compound or other approved means to assure maximum paint adhesion. Galvanized and metallic coated sheet steel doors and frames shall be treated and prime painted prior to finish coats of paint. Comply with requirements of Section 09900 "Paints and Coatings"
  3. Primer for Steel not Galvanized: Apply a sufficient number of coats of an approved enamel filler, baked on, to obtain uniformly smooth exposed surfaces. In addition, apply one coat of light-colored primer, baked on, to both inside and outside surfaces. Touch-up surfaces having runs, smears or bare spots.
    - a. Apply 2 coats of metal primer to reinforcement and attachment steel and framing which will be in contact with masonry or

concrete.

- b. Comply with ANSI A250.3 for performance and acceptance criteria. Provide minimum mil thicknesses of coatings as recommended by the paint manufacturer.

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates, and install the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

#### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

#### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.

#### **3.4 HOLLOW METAL DOOR AND FRAME INSTALLATION**

- A. Hollow Metal Frames: Set hollow metal frames at locations shown and scheduled, in perfect alignment and elevation, plumb, level, straight, true and free from rack. Brace frames to prevent displacement. Comply with provisions in SDI 105, unless otherwise indicated. □
  1. Place frames before construction of enclosing walls and ceilings
  2. Extend frame anchorages below fills and finishes, except over membrane waterproofed areas. Anchor bottom of frames to floors with anchor bolts or with power driven fasteners. Coordinate the installation of built-in anchors for wall and partition construction as required with other work. For openings 90 in. or more in height, install an additional anchor at hinge and strike jambs.
  3. In masonry construction, provide at least three wall anchors per jamb; install adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb. Acceptable anchors include masonry wire anchors and masonry T-shaped anchors.
  4. In metal-stud partitions, provide at least three wall anchors per jamb; install adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb. Attach wall anchors to studs with screws.
  5. After wall construction has been completed, remove temporary braces. Leave surfaces smooth and undamaged.
- B. Adjust and securely brace hollow metal door frames for squareness, alignment, twist, and plumb to the following tolerances:

1. Squareness: Plus or minus 1/16 in., measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
  2. Alignment: Plus or minus 1/16 in., measured at jambs on a horizontal line parallel to plane of wall.
  3. Twist: Plus or minus 1/16 in., measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
  4. Plumbness: Plus or minus 1/16 in., measured at jambs on a perpendicular line from head to floor.
- C. Hollow metal Door Installation: Comply with ANSI A250.8. Fit hollow-metal doors accurately in frames, within clearances specified in ANSI A250.8. Shim as necessary to comply with SDI 122 and ANSI/DHI A115.1G.
- D. Finish Hardware: Apply hardware in accordance Section 08700 "Finish Hardware" of these Specifications. Drill and tap for machine screws as required. Do not use self-tapping sheet metal screws. Anchor panels in place with concealed fasteners. Adjust door installation to provide uniform clearance at head and jambs, and to contact stops uniformly. Remove and replace doors which are found to be warped, bowed or otherwise damaged and cannot be properly fitted in frames.

### **3.5 ADJUSTING**

- A. Operation: Re-adjust, re-hang or replace doors which do not swing or operate freely.
- B. Prime-Coat Touchup: Immediately after installation, sand smooth rusted or damaged areas of prime coat and apply touch up of compatible air-drying primer. Upon completion of installation, clean exposed metal surfaces and leave ready for final painting.
- C. Procedures for Cleaning and Touch-Up for Hot Dip Galvanized Steel Surfaces: Immediately after erection, clean field welds, bolted connections, marred and abraded surfaces. Touch up galvanized surfaces in accordance with ASTM A780.

### **3.6 CLEANING**

- A. Maintenance: Maintain the hollow metal doors and frames throughout the construction period in a clean and properly protected condition so that they will not be damaged at the time of acceptance by the City of New York. Cleaning and protective methods shall be carefully selected, applied and maintained so that finishes will not become uneven or otherwise impaired as a result of unequal exposure to light and weathering. Remove deleterious materials from surfaces immediately. Protect from breakage immediately upon installation.

### **3.7 PROTECTION**

- A. Protect units during construction period so that they will be without indication of deterioration, use or damage at time of acceptance.

**END OF SECTION**

## SECTION 08 33 23 – OVERHEAD COILING DOORS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide overhead coiling doors in accordance with the Contract Documents. The Work of this Section includes coiling door and grille assemblies, including curtains, guides, counter-balance mechanism, hardware, operators, and installation accessories.
- B. Related Work Specified Elsewhere
  - 1. Steel hangers and framing are specified in Section 05 50 00, "Metal Fabrications."
  - 2. Furnishing of locks is specified in Section 08 71 00 "Hardware."
  - 3. Finish painting of exposed metal surfaces requiring painting other than prefinished items is specified in Section 09 91 00, "Painting."
  - 4. Electrical service and connections for motor operators, controls, limit switches and system disconnect switches is specified in applicable Division 26 Electrical specification sections.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Welding Society (AWI)
    - a. AWS D1.1 "Structural Welding Code – Steel."
    - b. AWS D1.3 "Structural Welding Code – Sheet Steel."
  - 2. Industrial Fasteners Institute (IFI): "Fastener Standards Book."
  - 3. National Electric Code (NEC): "NFPA 70: National Electrical Code."
  - 4. National Electrical Manufacturers Association (NEMA).
    - a. NEMA ICS 1: Industrial Control and Systems General Requirements
    - b. NEMA ICS 6: Industrial Control and Systems Enclosures

#### 1.3 SYSTEM DESCRIPTION

- A. System Description: Overhead coiling doors consist of a powder coated galvanized steel slated door designed to travel in an overhead vertical plane, smoothly and without binding. Curtain shall be driven to the open and close position by a motor operated controller activated by control panels located as noted.

- B. Performance Criteria
1. Structural Performance, Exterior Doors: Exterior overhead coiling doors shall withstand the wind loads, the effects of gravity loads, and loads and stresses within limits and under conditions indicated according to SEI/ASCE 7.
    - a. Wind Loading: Design, fabricate and install units so that the total, installed unit will withstand project, ASCE-7, and New York City Building Code required inward and outward pressure.
    - b. Deflection Limits: Design overhead coiling doors to withstand design wind load without evidencing permanent deformation or disengagement of door components.
  2. Thermal Performance, Exterior Doors: Exterior doors shall have an R-value of 6.25 calculated in accordance with ASHRAE requirements.
  3. Operation Cycles: Provide overhead coiling door components and operators capable of operating for not less than 50,000 cycles. One operation cycle is complete when a door is opened from the closed position to the fully open position and returned to the closed position.
- C. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and coordinate the work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted to the Engineer for review. Maintain the general design concept without altering profiles and alignments shown.

#### 1.4 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work. Include the following:
1. Setting drawings, templates, and installation instructions for built-in or embedded anchor devices.
  2. Summary of forces and loads on walls and jambs.
  3. Motors: Show nameplate data and ratings; characteristics; mounting arrangements; size and location of winding termination lugs, conduit entry, and grounding lug; and coatings.
  4. Provide documentation from a certified testing agency that door operators have been tested for a minimum of 50,000 cycles.
  5. Finish data referenced to requirements specified herein.
- B. Shop Drawings: Submit for Engineer's action. Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum scale. Submit shop drawings showing location and extent of coiling doors. Include plans, elevations, large-scale details of anchorages, dimensions, weights, conditions at openings and for operating clearances. Include location and installation requirements for electric operators.
1. Wiring Diagrams: Submit wiring diagrams detailing wiring for coiling door operators, signal, and control systems differentiating clearly

between manufacturer-installed wiring and field-installed wiring. Show the locations of connections to electrical service provided as a unit of work under other Sections.

- C. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide the following:
  - 1. Submit three (3) 12 in. square samples of each type of door curtain complete with specified powder coating.
- D. Quality Control Submittals: Submit for Engineer's information.
  - 1. Certificates
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Installer certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
    - b. Certification signed by manufacturer of the coiling doors certifying that their products are approved for use in the City of New York.
- E. Closeout Submittals: Submit, for City of New York's documentation.
  - 1. Warranties: Special warranties as specified.
  - 2. Maintenance Manuals: Two (2) copies of bound maintenance manuals, describing the materials, and procedures for cleaning and maintaining coiling door. Include manufacturer's data describing the materials and finishes used in the work including parts lists.

## 1.5 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain coiling doors from one source of a single manufacturer. Obtain accessory products used in conjunction with coiling doors from the coiling door manufacturer or from sources acceptable to the manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities.

Obtain necessary approvals from the NYC Building Department.

- D. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review material selections, methods and sequence of installation, special details and conditions, standard of workmanship, quality control requirements, job organization, coordination with other trades, and other pertinent topics related to the Work.

## **1.6 DELIVERY, STORAGE, AND HANDLING**

- A. Packing, Shipping, Handling, and Unloading: Pack, ship and handle components in accordance with manufacturer's instructions. Protect coiling doors during transit, delivery, storage, and handling to prevent damage, soilage, and deterioration. Cover and keep covered with non-staining protective wrapping. Do not deliver coiling doors until painting, wet work, grinding, and similar operations that could damage, soil, or deteriorate panels have been completed in installation areas.
- B. Storage and Protection: Store coiling doors in a dry, well ventilated space, matching the environmental conditions of the finished installation. Cover and keep covered with non-staining protective wrapping.

## **1.7 WARRANTIES**

- A. General: Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
1. Warranty: Provide a written warranty, directly to the City of New York, for a period of two (2) years, warranting that the coiling doors will be free of defects in material or workmanship and free of operating defects during the warranty period. Warranty shall be signed by the Contractor and the firm awarded the work. Failures, include but are not limited to:
    - a. Failure of the system to meet performance requirements including but not limited to excessive deflection, racking and warpage.
    - b. Faulty operations of doors, hardware or automatic equipment.
    - c. Deterioration of metals, metal finishes and other materials beyond normal weathering.
    - d. Upon notification of such defect, within the warranty period, make the necessary repairs at the convenience of the City of New York.

## **PART 2 - PRODUCTS**

### **2.1 MATERIALS**

- A. Metal Surfaces, General: For fabrication of coiling door metal work which will be exposed to view in the finished work, use only materials which are smooth and free of surface blemishes including pitting, seam marks, roller marks, rolled trade names and roughness. Remove such blemishes by grinding, or by welding and grinding, prior to cleaning, treating, and applying surface

finishes.

- B. Stainless Steel
  - 1. ASTM A240; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide Type 316 and low carbon 316L for components to be welded, unless otherwise noted.
    - a. Plate and Sheet: ASTM A480, Stretcher level sheets.
    - b. Bar Stock and Shapes: ASTM A276.
    - c. Round, Square and Rectangular Welded Tubing: ASTM A554, Grades MT 316 or MT 316L as standard.
- C. Galvanized Carbon Steel Sheets: ASTM A653, hot-dip galvanized with G90 coating (minimum spangle), either commercial quality or structural quality, Grade 33, unless another grade is required for design loads.
- D. Structural Steel Shapes, Steel Angles, Plates, Bars, Rods and Other Steel Accessories: ASTM A36, primed painted or hot dip galvanized.
- E. Steel Plates: ASTM A283, Grade C, primed.
- F. Fasteners: Stainless steel type 300 Series, type and size best suited for its intended use. Where exposed in finished surfaces, use oval-head countersunk Phillips heads with head diameter one screw size larger than the shank diameter. Material and finish to match adjacent surfaces. Where fasteners screw-anchor into material less than 1/8 in. thick, reinforce the interior surface with non-magnetic type stainless steel to receive screw thread threads or provide manufacturer's standard non-corrosive pressed-in splined grommet nuts. Provide fasteners meeting the requirements of IFI standards
- G. Anchors and Inserts: Provide anchors and inserts for attachment of items to masonry and concrete. Anchors and inserts shall be non-corrosive and compatible with contiguous metals.
- H. Welding Electrodes: Type and alloy recommended by the producer of the metal to be welded and as required for color match, strength and compatibility in the fabricated items.
- I. Paints and Coatings
  - 1. Galvanizing: ASTM A123 for galvanizing rolled, pressed and forged steel shapes, plates, bars, strip 1/8 in. thick and heavier and for assembled products.
  - 2. Galvanizing Repair Paint: Zinc rich paint for repairing galvanized surfaces and field welds.
  - 3. Dielectric Separator: Cold applied, asphalt emulsion type complying with ASTM D1187, non-sagging, resistant to severe corrosion conditions; applied in two coats for an overall minimum dry film thickness of 25 mils or heavy coating of epoxy paint in minimum 2.0 mil dry film thickness.
  - 4. Shop Primer for All Ferrous Metal: Compatible with the finish coats of paint (see Section "Painting" for finish coats of paint); shop apply primer to the respective dry film mil thickness specified or as recommended by the manufacturer; Provide one of the following:

- a. "Series 10-99" (Tnemec Co. Inc.); 2.0 - 3.5 mils d.f.t.
  - b. "Carbocoat 115 SG" (Carboline Co.); 2.0 mils d.f.t.
  - c. "Amercoat 5105" (Ameron Protective Coatings); 2.0 - 3.0 mils d.f.t.
  - d. Or approved equal.
- J. All Other Materials: Manufacturer's standard for the product specified.

## 2.2 FINISHES

- A. Shop Preparation for Overhead Coiling Door Curtains: Manufacturer's standard shop preparation primer compatible with finish paint coats.
- B. Finish (Exterior): Stainless Steel, finish to match Engineer's approved sample and adjacent panels.
- C. Thermoset Powder Coat Finish (Interior): Provide thermoset powder coat finish on coiling door curtain slats, guides, exposed hoods, brackets and bottom bars. Heat catalyzed organic polyester or urethane powder coat applied over conversion coat providing a smooth, uniform and durable finish complying with the following:
  - 1. Thickness: 2.5 -3.5 mils.
  - 2. Pencil Hardness: 2H or better in accordance with ASTM D3363.
  - 3. Salt Spray Resistance: 1000 hrs or better in accordance with ASTM B117; no blistering.
  - 4. Humidity Resistance: 1000 hrs or better in accordance with ASTM D2247; no blistering.
  - 5. Impact Test: Up to 80 in/lb., in accordance with ASTM D2794; No appearance of cracks.
  - 6. Flexibility: 180 degrees, 1/8 in. conical mandrel when tested in accordance with ASTM D1737.
- D. Application: Entire systems for overhead coiling door curtains shall be shop applied (either in manufacturer's shop or a specialty finishing shop) to exposed surfaces, under suitable conditions as approved by the powder paint manufacturer, so that finished paint surface is smooth, unbroken, free of pinholes, orange peel, sags or runs.
- E. Touch-Up: Finish paint shall have the capability to be touched-up in the field without noticeable difference in color, texture, specular gloss or dry film thickness.
- F. Color: Color and sheen of interior finish coat for coiling door curtains matching Engineer selected manufacturers color sample on file in Engineer's office.

## 2.3 MANUFACTURERS

- A. General: Products specified herein establish the basis of design. Equivalent products of McKeon Coiling Steel Door Company, Cornell Iron Works, Wayne Dalton, Kinnear, or approved equal will be considered provided they meet those established standards of the basis of design. Basis of design not intended to imply

a preference for a specific product.

1. Motorized Overhead Insulated Coiling Doors ( **OHD-01** ): “Stormtite Series 625 Rolling Service Doors” (Overhead Door Corp.) Insulated to R-7 minimum.
  - a. Material: Stainless steel
  - b. Operation: Electric.
  - c. Finish Stainless Steel No 4 Satin.
2. Motorized Vertical Service Counter Shutter ( **OHD-02** ): “CS3000” (McKeon).
  - a. Material: Stainless steel
  - b. Operation: Electric.
  - c. Finish Stainless Steel No 4 Satin.

## 2.4 FABRICATION, GENERAL

- A. General: Provide each exterior coiling door assembly manufactured as an integral unit, complete with components, accessories and fasteners ready for installation.
- B. Forming: Form exposed surfaces free from warp, wave and buckle, with corners square, unless otherwise shown. Form molded members straight and true, with welded joints coped or mitered, well formed, and in true alignment. Dress welded joints on exposed surfaces smooth so they are invisible after finishing and flush with adjacent surfaces. Provide attachment devices and fasteners of type required to secure access doors and frames to contiguous support construction.
- C. Reinforcing: Reinforce members and joints with structural shapes and plates in concealed locations, as necessary for adequate strength and rigidity. Provide concealed fastenings unless otherwise shown. Locate necessary exposed fastenings in an orderly pattern, in accordance with reviewed shop drawings. Separate dissimilar metals with dielectric separator to prevent galvanic action. Do not extend coatings onto exposed surfaces

## 2.5 FABRICATION, SPECIFIC ITEMS

- A. Coiling Door Components
  1. Curtains, Exterior: Formed of interlocking double flat metal slats, 18 gage sheet front panel (finished to match adjacent metal panels) and a painted 20 gage galvanized sheet back panel and where insulated, insulated with a foamed in place polyurethane insulation, permanently bonded to both interior and exterior slats of curtain, and providing a thermal value complying with performance requirements. Back slat interlocks with front slat panel at both the top and bottom of the slat section. All interior surfaces shall receive a powder coat factory finish.
    - a. Provide each slat with end locks designed to engage the guide safety internal angle and so as to withstand specified minimum wind pressure.
  2. Bottom Bar: Equip each curtain with bottom bar of two galvanized steel angles with a powder coat factory finish not less than 2 in. by 2

in. by 1/8 in., securely fastened to the bottom of the curtain for reinforcement and an approved continuous safety bottom edge.

3. Motor Operations: Provide for each door; heavy duty motor, "Model RDB" (Overhead) for exterior doors, reduction gears, automatic safety devices, two (2) remote control switches, located where shown, limit switches and emergency chain-hoist operator. Provide all wiring between motors and controls in accordance with the approved wiring diagrams and the applicable requirements of the National Electrical Code. Provide components of electric operator as follows:
  - a. Motors: Motor Operator, high starting torque, NEMA type heavy duty, instantly reversible, prewired, with sealed ball bearings lubricated for life, of sufficient capacity to raise and lower the doors at 8 in. to 12 in. per second without overloading the motor, totally enclosed, fan cooled, nonventilated type, fitted with a plugged drain. Motor shall be removable without precluding use of emergency hood chain device or upsetting timing of geared limit switch. Wiring requirement and voltage characteristics of motors shall be coordinated with the building electrical system.
  - b. Reduction Gears: Machine-cut gears completely housed and running in oil bath.
  - c. Photo-sensor eye: Safety device to detect any obstruction in the opening and return to the fully open position.
  - d. Automatic Safety Reversing Device through the safety edge along the bottom rail of the curtain, shall cause the door to stop its descent immediately upon contact with any obstruction in the opening and return to the fully open position. Provide cable reel.
  - e. Control Station: In locations as shown on the drawings, provide two (2) momentary-contact, button operated control stations, standard duty, surface-mounted, NEMA Type 1 enclosure, key -operated, clearly labeled "open," "close" and "stop." Provide timer function on control station to allow for delayed closing.
  - f. Limit Switches: Rotary type with worm and gear driven by timing chain. Cams on gear shall operate micro-type switches allowing vernier adjustment. Geared limit switch shall contain a spare set of contacts.
  - g. Emergency Manual Operator: Provide manual chain-hoist operator to allow hand operating of door in the event of a power failure. Provide a safety interlock switch which automatically prevents the electric motor from operating when the emergency chain-hoist operator is in neutral or is engaged.
  - h. Magnetic Reversing Starter: Provide internal type with thermal overload protection and reset button.

- i. Provide overhead coiling door manufacturer's industrial duty magnetic switch.
- 4. Brackets: Mounting brackets of square design fabricated of hot rolled 1/4 in. thick steel plate with a powder coat factory finish, designed to house ends of counterbalance system.
- 5. Guides: Fabricated of a minimum 3 in. by 3 in. structural steel wall angle, a 2 in. by 3 in. steel inner guide angle and a 3 in. by 3 in. steel outer guide angle. Provide guides with neoprene weatherstripping, providing weather sealed coiling door and guide track assembly. Entire assembly shall receive a powder coat factory finish.
- 6. Hoods: Provided to entirely enclose curtain and counterbalance assemblies. Fabricated of not less than 20 gage galvanized steel sheet with a powder coat factory finish. Top and lower edges bent and reinforced for stiffness. Include an internal neoprene air baffle. Provide closed ends for surface- mounted hoods and fascia for any portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sag. Hoods contained with ceiling space or not exposed to view shall receive a galvanized finish prepared for field painting.
- 7. Counterbalance Assembly: Counterbalance system consists of adjustable steel helical torsion springs attached to a shaft enclosure in a pipe with required mounting blocks or rings for attachment of curtain. Grease sealed bearings or self lubricating bearings shall be spring barrel fabricated of hot formed structural quality carbon steel seamless pipe of sufficient diameter and wall thickness to carry curtain and door load with a deflection not to exceed 0.03 in. per foot of opening.
- 8. Locking: Equip doors curtains for locking by padlocks.
- B. Hangers, Bracing and Framing: Galvanized steel, designed to support imposed loads. Framing shall be adequate to support enclosures and panels.
- C. Panels and Enclosures: Panels and enclosures shall be of galvanized steel with a powder coat factory finish finished to match slats, one piece, removable and shall be free of warp, wave and buckle. Enclosures with weather baffles shall be provided around motors and door mechanism and secured to framing at exterior doors.
- D. Painting: Shop paint all surfaces of ferrous metals. Galvanized steel shall be chemically cleaned and bonderized prior to shop painting. Parts inaccessible after installation shall be given an additional field coat of the same paint. Finish paint for insulated motorized exterior overhead coiling door shall be as specified herein and applied totally in the shop by the manufacturer.
- E. Nameplates: Attach a permanent, corrosion resistant nameplate showing the manufacturer's name and address, serial number, if any, and type number to each unit in a clearly visible but inconspicuous location. The Engineer will designate the nameplate location on the Shop Drawings.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected. Do not hang doors with an apparent defect.

### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Verify measurements and dimensions at the job site and cooperate in the coordination and scheduling of the work of this Section with the work of other trades.
- C. Deliver items which are to be built into the work of other sections in time so as not to delay the progress of the Work.

### **3.4 INSTALLATION**

- A. Coordination: Coordinate exterior coiling doors with the work of other Sections and provide items to be placed during the installation of other work. Coordinate delivery of such items to the project site. Deliver items which are to be built into the work of other Sections in time so as not to delay the progress of the Work.
- B. Perform the Work of this Section, so that the completed installation is in perfect operating condition. Install door and operating equipment complete with necessary hardware, jamb and head mold strips, anchors, inserts, hangers, and equipment supports in accordance with final shop drawings, manufacturer's written instructions, and as specified herein. All items shall be installed within the clearances and space limitations shown, except as follows:
- C. Install labeled coiling smoke door assembly to meet requirements of the Insurance Inspection and Rating Bureaus having jurisdiction at the Project site so as to avoid any rate penalty. Correct any installation which would subject the Employer to a rate penalty.
- D. Install door and operating equipment complete with necessary hardware, jamb and head mold strips, anchors, hangers, and equipment supports in accordance with final shop drawings, manufacturer's instructions, and as specified herein.
- F. Install exterior coiling doors and operating equipment complete with necessary hardware, jamb and head mold strips, anchors, inserts, hangers, and equipment supports in accordance with final shop drawings, manufacturer's written instructions, and as specified herein. All items shall be installed within the clearances and space limitations shown.

- G. Dimensions shown on Drawings are based on an assumed design temperature of 70 deg. F. Fabrication and erection procedures shall take into account the ambient temperature range at the time of the respective operations.
- H. Do not erect members which are warped, bowed, deformed or otherwise damaged to such extent as to impair strength or appearance. Remove and replace members damaged in the process of erection.
- I. Dielectric Separator: Separate dissimilar metals and metals in contact with concrete or masonry with a dielectric separator.
- J. Touch-up marred and abraded surfaces with the specified prime paint after erection in the field. Touch-up galvanized surfaces in accordance with ASTM A780.
- K. Upon completion of installation, lubricate and adjust doors to operate easily free from warp, twist or distortion and fitting tightly for entire perimeter.

### **3.5 TESTING, OPERATION AND INSTRUCTING**

- A. At the completion of the Work, test exterior coiling doors when activated by operation of smoke or fire detection system. Perform tests in the presence of the City of New York's and the Engineer and demonstrate operation to their complete satisfaction.
- B. Instruct maintenance personnel on procedures and schedules related to door operation, servicing, preventive maintenance, and procedures. Provide 4 hours of instruction, scheduled at the convenience of the City of New York's maintenance personnel.

### **3.6 CLEANING AND PROTECTION**

- A. Cleaning: Upon completion of installation of exterior coiling doors and adjacent finishes, clean exposed metal surfaces as recommended by the manufacturer.
- B. Protection: Protect units during construction period. Replace damaged components as directed by the Engineer.

**END OF SECTION**

**SECTION 08 51 13 – ALUMINUM WINDOWS****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide aluminum windows in accordance with requirements of the Contract Documents. The Work of this Section includes, but is not limited to the following:
  - 1. Aluminum windows.
  - 2. Hardware for operable units.
  - 3. Glass and glazing for aluminum windows.
- B. Related Work Specified Elsewhere
  - 1. Sealants and joint fillers installed at interface of aluminum window assemblies and other building components are specified under Section 07 92 00 "Joint Sealants".
  - 2. Insulation is specified in Section 07 21 00 "Building Insulation".
  - 3. Sheet metal flashing and trim is specified in Section 07 62 00 "Sheet Metal Flashing and Trim".
  - 4. Glass and glazing is specified in Section 08 80 00 "Glazing".

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. Aluminium Association (AA)
    - a. Aluminum Standards and Data
    - b. Designation System for Aluminum Finishes
    - c. Engineering Data for Aluminum Structures
  - 2. National Association of Architectural Metal Manufacturers (NAAMM): NAAMM "Metal Finishes Manual".
  - 3. American Architectural Manufacturers Association (AAMA)
    - a. ANSI/AAMA/NWWDA 101/I.S.2 "Voluntary Specifications for Aluminum, Vinyl (PVC) and Wood Windows and Sliding Glass Doors".
  - 4. American Welding Society AWS
    - a. AWS D1.2 "Structural Welding Code - Aluminum".

### 1.3 SYSTEM DESCRIPTION

#### A. Performance Requirements

1. General: Except as otherwise indicated, comply with applicable requirements including structural loading, air infiltration, water resistance, thermal and condensation resistance and fabrication specifications specified in ANSI/AAMA 101 classification AW.
2. Wind Loading: Design, fabricate and install aluminum windows so that the total, installed, glazed unit will withstand project, ASCE-7, and New York City Building Code required inward and outward pressure.
3. Building Movement: Design, fabricate and install aluminum windows to withstand building movements including loading deflections, shrinkage, creep, seismic and similar movements as indicated on project structural contract documents.
4. Water Drainage: Make provisions at sill to drain water and condensation to exterior face of the frames.
5. Temperature Requirements: Design, fabricate and install aluminum window component parts to provide for expansion and contraction of the window over an ambient exterior temperature range and exterior metal surface temperature of  $-10$  deg. F. ( $-23$  deg. C.) through  $+180$  deg. F. ( $82$  deg. C.); an interior temperature range of  $+55$  deg. F. ( $13$  deg. C.) to  $100$  deg. F. ( $38$  deg. C.) without buckling, sealed joint failure, glass breakage, undue stress on members or anchors, and other detrimental effects.
6. Thermal Transmittance: Provide window units which have been tested in accordance with ASTM C1363 utilizing a guarded hot box and resulting in a "U" value not to exceed 0.69.
7. Air and Water Control: Provide tight joints and effectively seal windows against water leakage and air infiltration. Water leakage is defined as the appearance of uncontrolled water, other than condensation, on inboard part of window or panel, either during testing or under actual weather conditions. Uncontrolled water is defined as leakage that is not contained and/or drained away in a manner as to cause no damage to the wall or adjacent construction of finishes. When tested in accordance with ASTM E283, at 6.24 psf test pressure, the air infiltration shall not exceed  $0.06$  cfm/ft.<sup>2</sup> of window area for fixed portions of window and  $0.10$  cfm/min.per linear ft. 12in. of crack length for operable portions of window.
8. Unacceptable Conditions: Vibration harmonics, wind whistles, noise or vibration created by thermal movement, structural movement, or wind; thermal movement transferred to building structure; loosening, weakening or failure of fasteners, attachments or other components.
9. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and coordinate the work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted to the Engineer for review.

## 1.4 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Furnish a material list with technical data documenting the location and primary function, quality, and performance of each material component or system to be used in the Work. In addition, submit a statement that each product to be furnished is recommended for the application shown.
- B. Shop Drawings: Submit for Engineer's action. Provide shop drawings for the fabrication and installation of the aluminum windows work. Prepare details at not less than 3 in. = 1 ft. (1:5) minimum scale. Shop drawings shall bear seal of a Professional Engineer licensed in the State of New York. Include the following:
  - 1. Show typical details of conditions for every member, joint, anchorage and glazing system. Show details of support system, method of attachment to building structure, anchorage details and interface with adjacent work.
  - 2. Show component locations and intersection details, method of isolating dissimilar materials, provisions for expansion and contraction, method of drainage of the system including gutters, weeps and flashings including method of drainage of condensation which might form external to the vapor barrier and reglazing sequence both in the factory and remedial for the field.
  - 3. Setting Drawings: Submit for Engineer's information, setting drawings and templates for the location of aluminum window items that are to be embedded in or anchored to concrete or masonry.
- C. Glazing Schedule: Submit for Engineer's information, a glazing schedule utilizing the same designations shown on Drawings for glazed windows listing glass types and thicknesses for each size opening and location.
- D. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor.
  - 1. Submit 3 sets of samples for each metal type, metal finish and color required. Submit sample finishes on 12 in. lengths of metal having the specified alloy, temper, pretreatment and thickness of metal required for the work, showing the maximum range or variation in color and shade.
  - 2. Submit one sample corner of window unit, representative of fabrication techniques and workmanship of the final products.
  - 3. Submit one sample of each type of window hardware specified.
- E. Engineering Services: Submit for Engineer's action. Provide calculations to verify materials provided meet specified performance requirements. Calculations shall bear the seal of a Professional Engineer registered in the State of New York. Submit the following:
  - 1. Engineering calculations to show that maximum deflections do not

- exceed specified performance requirements under full design loading.
- 2. Structural calculations for frames, panels, connections and window anchorage system.
- 3. Submit calculations of expansion and contraction.
- F. Quality Control Submittals: Submit for Engineer's information.
  - 1. Test Reports
    - a. Up-to-date (within 5 years), certified test reports from an independent testing laboratory stating that similar sized aluminum windows have been tested and meet the performance for structural requirements and for air and water infiltration and comply with references.
    - b. Up- to- date (within 5 years) certified test reports from an independent testing laboratory stating that similar sized aluminum windows have been tested and meet the performance requirements for condensation and thermal resistance and comply with references.
  - 2. Copies of the following laboratory test reports:
    - 1) ASTM B137 - Anodic Coating Weight
    - 2) ASTM B244 - Anodic Coating Thickness
    - 3) ASTM B136 - Stain Test
  - 3. Certificates
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
    - b. Manufacturer's and fabricator's certification indicating that anodic coating complies with the Contract Documents.
- G. Closeout Submittals: Submit for City of New York's documentation.
  - 1. Warranties: Special warranties specified.
  - 2. Maintenance Data: Two (2) copies of an assembled and bound maintenance manual, describing the materials, devices, and procedures to be followed in cleaning and maintaining the aluminum windows. Include manufacturer's brochures describing the actual materials used in the work, including metal alloys, finishes, glass, gaskets and other major components.

## 1.5 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size

and type to the required work.

- B. Source Limitations: Obtain windows from one source of a single manufacturer. The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- C. Engineering Services: Engage the services of a qualified Professional Engineer who is licensed to practice in the State of New York and who is experienced in providing engineering services of the kind indicated to prepare or supervise the preparation of data for the aluminum windows, including drawings, testing program development, test-result interpretation, and comprehensive engineering analysis that show the systems' compliance with the specified requirements. Engineering services are defined as those performed for installations of systems that are similar to those indicated for this Project in material, design, and extent.
- D. Intended Aesthetic Effects: Do not modify intended aesthetic effects, as judged solely by Engineer, except with Engineer's approval and only to the extent needed to comply with performance requirements. Where modifications are proposed, submit comprehensive explanatory data to Engineer for review.
- E. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- F. Pre-Construction Meeting: Prior to the start of the Work, meet at the Project site to review material selections, methods and sequence of installation, special details and conditions, standard of workmanship, quality control requirements, job organization, coordination with other trades, and other pertinent topics related to the Work.

## **1.6 DELIVERY, STORAGE AND HANDLING**

- A. Delivery of Fabricated Units: Deliver fabricated window units and component parts to project site completely identified in accordance with erection diagrams. Store in accordance with manufacturer's instructions, above grade on dunnage, properly protected from the weather and construction activities.
- B. Protective Coatings or Coverings: Temporary coating and coverings may be furnished at manufacturer's or Contractor's option to protect the Work during shipment and construction. Such protection shall avoid development of non-uniformity in finishes, shall not impart a residue which would adversely affect the adhesion of sealants, nor cause other deleterious effects in the Work. Temporarily remove protection when requested by Engineer for inspection of finishes, and completely remove protection when no longer required.
- C. Material Delivery: Deliver materials to Project site in manufacturers' unopened containers, fully identified with trade name, color, size, hardness, type, class, and grade. Store each item in accordance with manufacturer's instructions. Deliver, store and handle glass in accordance with manufacturer's recommendations; protected from weather, staining and damage. During

storage and handling of glass provide cushions at edges to prevent impact damage. Protect glass from scratches and abrasion.

## 1.7 PROJECT/SITE CONDITIONS

- A. Field Glazing: Do not perform glazing when temperature is below 40 deg. F., unless the manufacturer of the glazing materials specifically recommends application of his materials at lower temperatures. If job progress or other conditions require glazing work when temperatures are below 40 deg. F. (or below the minimum temperature recommended by the manufacturer), consult the manufacturer and establish the minimum provisions required to ensure satisfactory work. Record in writing to the manufacturer, with copy to the Engineer, the conditions under which glazing work was performed and the provisions made to ensure satisfactory work.
- B. Bulk Compounds: Do not proceed with installation of bulk compounds during inclement weather unless requirements and manufacturer's instructions can be complied with and unless the work can proceed in accordance with the agreements of the pre-installation meeting. Do not proceed with the installation of sealants under extreme temperature conditions which would cause joint openings to be at either maximum or minimum width or when extreme temperatures or heavy wind loads are forecast during the period required for initial or nominal cure of sealants. Whenever possible, schedule the installation and cure of sealants during periods of mean temperatures (nominal joint width shown) so that subsequent stresses upon the cured sealants will be minimized.

## 1.8 WARRANTIES

- A. Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty, Aluminum Windows: Submit for City of New York's documentation. Provide a written warranty for a period of ten (10) years. Repair or replace window work and correct leaks or other defects in material or workmanship during the warranty period. Warranty shall be signed by the manufacturer and the single firm awarded the window work. Upon notification of defects, within the warranty period, make the necessary repairs or replacements at the convenience of the City of New York. Defects are defined to include, but not limited to the following:
    - a. Failure of the system to meet performance requirements including but not limited to excessive deflection, racking, warpage, excessive water leakage or air infiltration.
    - b. Failure of operational parts to function normally.
    - c. Deterioration, fading, excessive non-uniformity, pitting, cracking, peeling, crazing or discoloration of finishes and other materials beyond normal weathering.

- d. Deflection exceeding specified limits.
  - e. Thermal stresses transferred to the building structure.
  - f. Framing members transferring stresses, including those caused by thermal and structural movement, to glazing.
  - g. Noise or vibration created by thermal and structural movement and wind.
  - h. Loosening or weakening of fasteners, attachments, and other components
2. Warranty, Anodized Coatings: Submit for City of New York's documentation. Provide a written Warranty, for a period of five (5) years warranting that the anodized aluminum will not develop excessive fading or excessive non- uniformity of color or shade, and will not crack, peel, pit, or corrode; within limits defined as follows:
- a. "Excessive fading": means a change in appearance which is perceptible and objectionable as determined by the Engineer when viewed visually in comparison with the original color range standards.
  - b. "Excessive non-uniformity": means non-uniform fading during the period of the Warranty to the extent that adjacent panels have a color difference greater than the original acceptable color range.
  - c. "Will not crack, peel, pit or corrode": means there shall be no cracking, peeling, pitting or other type of corrosion discernible from a distance of 10 ft. (3m), resulting from the natural elements in the atmosphere.
  - d. Upon notification of defects, within the warranty period, make the necessary replacements at the convenience of the City of New York.

## **PART 2 - PRODUCTS**

### **2.1 MANUFACTURERS**

- A. General: Products specified herein establish the basis of design. Equivalent products of Graham Windows, EFCO, Wausau Windows, or approved equal will be considered provided they meet those established by basis of design. Basis of design not intended to imply a preference for a specific product.
- 1. Operable In-Swing Hopper Windows ( **WND-01** ):
    - a. Manufacturer: YKK
    - b. Model: YOW 225 TU
    - c. Glass: **GL-01**
    - d. Finish: Clear Sealed Clear Anodized
  - 2. Fixed Windows ( **WND-02** ):
    - a. Manufacturer: YKK

- b. Model: YOW 225 TU
- c. Glass: **GL-01**
- d. Finish: Clear Sealed Clear Anodized
- 3. Operable Double Hung Windows ( **WND-03** ):
  - a. Manufacturer: YKK
  - b. Model: YOW 225 TU
  - c. Glass: **GL-01**
  - d. Finish: Clear Sealed Clear Anodized
- 4. Service Window ( **WND-04** ):
  - a. Manufacturer: Nissen & Company
  - b. Model: BP
  - c. Glass: **GL-02**
  - d. Operation: Manual with interior locking device.
  - e. Finish: Clear Anodized

## 2.2 MATERIALS

- A. Aluminum Extrusions: Shapes as shown and as required to fulfill performance requirements, but not less than 1/8 in. thick, unless otherwise shown. Suitable alloy and proper temper for extruding and fabricating with adequate structural characteristics, and suitable controlled alloy and temper as recommended by aluminum manufacturer to provide required color and color matching.
- B. Aluminum Sheets and Plates: Sizes and minimum gauge as shown and as required to fulfill performance requirements. Suitable alloy and proper temper for forming and fabricating with adequate structural characteristics and suitable for finishing as specified.

## 2.3 FASTENERS, ANCHORAGE AND REINFORCING

- A. Anchor Assemblies: 3-way adjustable anchors that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer/fabricator.
  - 1. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A23 or ASTM A153 requirements. Provide bolts, washers and shims as required, hot dip galvanized, ASTM A153, Class A.
  - 2. Steel Anchorage: Anchor assemblies secured to structural steel framing shall be fabricated in accordance with the criteria governing structural steel and where exposed, architecturally exposed structural steel.
- B. Steel Angles, Plates, Anchors, Clips, Bars, Rods and other Steel Accessories Required to Join or Reinforce Assembly of Aluminum Components: ASTM A36 and ASTM A283, galvanized or, if galvanized is not compatible with alloy of component parts, shop painted with primer specified herein after cutting to size. Galvanize ferrous metals embedded in concrete or masonry unless

otherwise shown or specified.

- C. Aluminum Angles, Plates, Bars, and other Aluminum Members Required to Join or Reinforce Assembly of Aluminum Components: Alloys recommended by manufacturer or fabricator to develop required strength of assembly.
- D. Fasteners and Accessories: Manufacturer's standard non-corrosive fasteners and accessories that are compatible with materials used in the window framing system and with exposed portions that match finish of the windows. Where movement should be expected, provide 3-way adjustable anchors that accommodate fabrication and installation tolerances and slip-joint linings of sheets, pads, shims, or washers of fluorocarbon resin or a similar material recommended by the manufacturer.
  - 1. Items For Bolting Aluminum Extrusions And Connecting Members: Stainless steel complying with ASTM A193, Series 300; unless otherwise recommended by the window manufacturer.
  - 2. Where fasteners anchor into aluminum less than 1/8 in. thick, provide non-corrosive pressed-in splined grommet nuts or other type reinforcement to receive fastener threads.

## 2.4 GLASS SCHEDULE

- A. General: The following glass schedule contains all glass types scheduled for the project windows and exterior openings. Refer to Section 08 80 00 "Glazing" and paragraph "Related Work Specified Elsewhere" for additional information locations and additional requirements.
- B. Schedule:
  - 1. Glass **GL-01**: Clear insulating glass unit.
  - 2. Glass **GL-02**: Clear laminated glass.

## 2.5 MISCELLANEOUS MATERIALS AND ACCESSORIES

- A. Sealants: As specified in Section 07 92 00 "Joint Sealants".
- B. Thermal Separators: Polyvinylchloride, 50 Shore A durometer hardness +/- 5 or poured homogeneous structural polyurethane of a cross sectional profile, interlocking with aluminum extrusions (minimum 3/8 in. separation) forming an integral structural unit.
- C. Weatherstripping: AAMA 701 & AAMA 702 "Voluntary Specifications for Pile Weatherstripping and Replaceable Fenestration Weatherseals". Provide compressible, removable and replaceable type weatherstripping formed from neoprene or EPDM complying with ASTM D2000 or molded expanded EPDM or neoprene complying with ASTM C509, grade as selected by the manufacturer.
- D. Stainless Steel Flashing: ASTM A666, Type 304, dead soft fully annealed except where harder temper required for forming or performance; 0.015 in. (28 gage) thick unless otherwise shown, finish No. 2D. Provide 60 - 40 tin/lead solder, with acid-chloride type flux, except use rosin flux over tinned surfaces in accordance with ASTM B32.
- E. Weep Baffles: PVC coated, reticulated, flexible open cell reticulated

polyurethane foam; 30-40 pores per 1 in. or as recommended by the fabricator. PVC coating shall have a bacteriostat additive added to the formulation.

## 2.6 OPERABLE WINDOW HARDWARE

- A. Hardware for Operable Windows: AAMA Series 900 for hardware appropriate to each specified type window. Provide manufacturer's standard or custom design for operation specified; fabricated of stainless steel complying with ASTM A167 or ASTM A666 and finished to match frame of window.
  - 1. Provide the following hardware for each window noted as "Operable".

## 2.7 PAINTS AND COATINGS

- A. Rust Inhibitive Primer for Ferrous Metals Not Galvanized: Compatible with finish coats of paint (if any) of the respective dry film mil thickness specified; One of the following:
  - 1. "Hi-Build Epoxoline II Series N69/N69F" (Tnemec Co. Inc.); 4.0 - 6.0 mils d.f.t.
  - 2. "Carboguard 890Series" (Carboline Co.); 4.0 - 6.0 mils d.f.t.
  - 3. "Amercoat 383 H" (Ameron Protective Coatings); 4.0 - 6.0 mils d.f.t.
  - 4. Or approved equal.
- B. Galvanizing Repair Paint: Zinc rich paint for repairing galvanized surfaces and field welds in compliance with ASTM A780. Thickness of applied galvanizing repair paint shall be not less than coating thickness required by ASTM A123 or ASTM A153 as applicable.
- C. Dielectric Separator: Cold applied, asphalt emulsion type complying with ASTM D1187, non-sagging, resistant to severe corrosion conditions; applied in two coats for an overall minimum dry film thickness of 25 mils or heavy coating of epoxy paint in minimum 2.0 mil dry film thickness.

## 2.8 FABRICATION

- A. General: Provide manufacturer's standard fabrication, accessories and finish complying with paragraphs "References" and "Performance Requirements". Units shall be reglazable without dismantling of sash framing. Provide a complete system of anchorage for glazed aluminum window units. Allow for erection tolerances and provide for movements of window units and enframing due to thermal expansion. Fabricate aluminum windows at the manufacturer's shop to the fullest extent possible and before applying finishes.
- B. Welding, Cutting, Drilling, Mitering And Fitting Of Joints: Complete the welding, cutting, drilling, mitering and fitting of joints prior to finishing. Weld with electrodes and by methods recommended by the metals manufacturer in accordance with applicable recommendations of the AWS. Use only methods which will avoid distortion or discoloration of exposed faces. Grind weld areas smooth before proceeding with other treatment.
- C. Fastenings: Conceal fastenings unless otherwise shown or specified. Fit and

assemble work in the shop insofar as practicable. Carefully fit and match work with continuity of line and design, using rigidly secured joints with hairline contact, mitered corners, unless otherwise shown. Reinforce members and joints with steel or aluminum plates, bars, rods or angles for rigidity and strength as needed to fulfill performance requirements. Use concealed stainless steel fasteners for jointing which cannot be welded.

- D. Panels and Sills: Fabricate aluminum panels and sills utilizing 3/16 in. (min. thickness) aluminum plate. Finish sills and panels to match finish of aluminum frames. Reinforce panels in concealed locations as required to meet specified performance criteria and to resist anchorage stresses. Fasteners or anchorage shall not be exposed to view on finished face of panel or sill.
- E. Weepholes: Provide weepholes and internal water passages in the glazing recess as recommended by the glass manufacturer to conduct infiltrating water to the exterior. Provide weep baffles secured to inside of frame behind weepholes to prevent water migration.
- F. Thermal Separator: Fabricate aluminum window units with an integrally concealed low conductance thermal separator, located between exterior metal material and metal material exposed on the interior in a manner that eliminates direct metal-to-metal contact.
- G. Subframes: Provide subframes with anchors for window units where shown of profile and dimensions indicated fabricated from not less than 1/8 in. (3mm) thick extruded aluminum. Miter or cope corners and weld and dress joint smooth with concealed mechanical joint fasteners. Finish to match finish specified for frames.

## 2.9 FINISHES

- A. Aluminum Finishes: Remove die markings prior to finishing operations. Perform this work in addition to the finish specified. Scratches, abrasions, dents and similar defects are unacceptable.
  - 1. Anodized Finish
    - a. Fixed and Operable Windows: Natural Anodized: AA-M12C22A41, Class I Architectural: clear film thicker than 0.7 mils with clear electro-deposition organic coat complying with AAMA 611 and AAMA 612.
    - b. Service Window: Natural Anodized: AA-M12C22A41, Class I Architectural: clear film thicker than 0.7 mils with clear coat complying with AAMA 611.
    - c. Sealing: Anodized finishes shall be fully sealed by the manufacturer or processor according to procedures recommended by the licensor of the process.

## 2.10 SHOP PAINTING FOR FERROUS METAL

- A. General: Shop paint ferrous metal work, except members or portions of members to be embedded in concrete or masonry, surfaces and edges to be field welded, unless otherwise specified.
- B. Removal Of Oil, Grease And Similar Contaminants: Remove oil, grease and

similar contaminants in accordance with SSPC SP-1 "Solvent Cleaning", prior to any additional surface preparation specified.

- C. Metal Surfaces: Clean and prepare metal surfaces before applying shop coat. Remove rust and mill scale in accordance with SSPC SP-3 "Power Tool Cleaning".
- D. Application of Primer: Immediately after surface preparation, apply primer in accordance with manufacturer's instructions. Use painting methods which will result in full coverage and dry film thickness specified.
- E. Procedures for Primer and Finish Paint: Apply one shop coat of primer to fabricated metal items, except apply 2 coats of primer to surfaces inaccessible after assembly or erection. Use thinners only as specified by the coating manufacturer. The entire coating system shall be as supplied by a single manufacturer.

## **PART 3 – EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Check carefully the provisions for anchorage and adjustment, allowances for expansion and contraction, and conditions of preset flashings and flashing connections. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Verify dimensions of openings by field measurements so that aluminum windows and related items will be accurately designed, fabricated and fitted to the structure. Tolerances for supporting structure are specified in other Sections. Furnish anchor bolts and inserts for setting in concrete formwork or masonry indicated to support aluminum windows.

### **3.3 COORDINATION AND SCHEDULING**

- A. Sequence of Installation: Schedule installation of the aluminum windows in sequence with related elements of the Work specified in other Sections to ensure that window assemblies, including flashing, trim, and joint sealers, are protected against damage from effects of weather, age, corrosion, and other causes.
- B. Coordination: Coordinate aluminum windows and related metal work with the work of other Sections and provide items to be placed during the installation of other work. Place such items, including connectors and anchors, accurately

in relation to the final location of windows

### 3.4 PREPARATION

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.

### 3.5 INSTALLATION

- A. General: Install aluminum windows supported on shims and secured in place by bolting to clip angles and similar supports anchored to supporting structure. Use only the types of equipment, wedges, spacers, shims and other items during installation which will not corrode nor stain or mar the finish surfaces.
- B. Assumed Design Temperature: Dimensions shown on Drawings are based on an assumed design temperature of 70 deg. F. Fabrication and erection procedures shall take into account the ambient temperature range at the time of the respective operations.
- C. Installation: Install aluminum windows plumb and true in alignment with established lines and grades without warp or rack of framing members. Anchor securely in place. Install components to drain water passing joints and condensation and moisture occurring or migrating within the assembly to the exterior. Lubricate operating hardware and other moving parts. Do not erect members which are warped, bowed, deformed or otherwise damaged to such extent as to impair strength or appearance. Remove and replace members damaged in the process of erection. Provide separators and isolators to prevent corrosion, electrolytic deterioration, and freeze-up of moving joints. Separate dissimilar metals with two coats of dielectric separator. Do not extend coating onto exposed or finished surfaces. Prime paint concealed ferrous metal with specified metal primer. Seal joints in a concealed manner, unless exposed sealant is shown. Comply with requirements of Section 07 92 00 "Joint Sealants". Install and demonstrate that the completed operable units are installed in a condition acceptable to the City of New York and Engineer.
- D. Cutting and Trimming: Cut and trim component parts during erection only with the approval of the manufacturer or fabricator and in accordance with his recommendations. Do not cut through reinforcing members. Restore finish completely to protect material and remove evidence of cutting and trimming. Remove and replace members where cutting and trimming has impaired strength or appearance.
- E. Welding and Soldering: Weld with electrodes and by methods recommended and in accordance with appropriate recommendations of the AWS. Use only methods which will avoid distortion or discoloration of exposed faces. Grind exposed welds smooth, using only clean wheels and compounds which are free of iron or iron compounds. Restore finish of component parts after welding and grinding. Solder only to fill or seal joints (not to form structural joints). Grind smooth and restore finish. Paint clip angles and other ferrous metal parts not exposed to view with specified rust inhibitive paint. Seal joints in a concealed manner.
- F. Erection Tolerances: Erect aluminum windows within the following tolerances:
  - 1. Variation From Plumb Or Angle Shown: 1/8 in. maximum variation in

- 10 ft. height or 10 ft. run, non-cumulative.
- 2. Variation From Level Or Slopes Shown: 1/8 in. maximum variation in 10 ft. height or 10 ft. run, non-cumulative.
- 3. Offsets: Offsets in end-to-end or edge-to-edge alignment of consecutive members:
  - a. 1/16 in. maximum offset in any alignment.

### **3.6 FIELD QUALITY CONTROL FOR EXTERIOR WINDOWS**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
  - 1. Water Penetration Test: After completion of the installation and nominal curing of sealants, and glazing compounds, and before installation of interior trim members, finishes and heating unit covers, test exterior windows for water leaks in accordance with AAMA Standard 501.2 "Specifications for Field Check of Metal Curtain Walls for Water Leakage". Provide powered scaffold, hose, radios, water supply and manpower to perform scheduled tests. Conduct tests in the presence of the Engineer. Correct deficiencies observed as a result of this test.
    - a. Test Locations: Test areas shall be at location(s) indicated by Engineer. Perform tests after completion of the installation and nominal curing of sealants, and before installation of interior trim members and heating unit covers. Conduct one successful test for each location.

### **3.7 CITY OF NEW YORK'S MONITORING ACTIVITIES**

- A. City of New York's Testing Agency: A testing agency, engaged at the City of New York's expense, will perform the following activities to monitor the Contractor's Quality Control Program. The monitoring activities do not relieve the Contractor of responsibilities under the Contract.
- B. Contractor's Assistance to the City of New York's Testing Agency: Furnish the City of New York's Testing Agency with access to the Work, materials and facilities as required by the Agency. Provide adequate notice of construction activities to allow timely inspections and observation of Contractor tests, and be available for pre- installation meetings. Furnish the City of New York's Testing Agency with on-site office facilities.
- C. City of New York's Testing and Inspection Program: Testing and inspection will be performed by an independent testing agency(s) retained by the City of New York as specified herein.
  - 1. The City of New York's shall retain a Quality Control Agent to perform testing and inspection services for the aluminum window work required for the Project including but not limited to inspection and testing of work at the project site and, if work is performed off site, inspection and testing of work in fabrication plants.
  - 2. The City of New York's Quality Control Agent shall perform full-time inspection and testing of the aluminum window work during

construction at timely occurrences to satisfy the Engineer and the quality control established for the Project by the Contract Documents.

3. The City of New York's independent testing agency work includes but is not limited to the following:
  - a. Inspection Compliance: Verification of the compliance of; or the deficiencies of the following:
    - 1) Aluminum Window Components: Verification that the framing components are properly sized and aligned, are without missing or mislocated anchoring provisions and are without structural defects. Verification that primed and painted components are provided with the specified materials.
    - 2) Connections and Anchors: Verification that anchors are properly placed, welded or bolted. Verification that correct anchoring and/or materials are used in lieu of others where there are field changes. Inspection of welding and bolting where connections are stressed to 50% or more of allowable values. Verification of the calibration of wrenches, review of bolting procedures and inspection of joint surfaces prior to bolting for bolted connections related to the aluminum windows. Verification of welder's license, qualifications and welding procedures for welds related to the aluminum windows. Verification of proper welding or bolting of reset connections.
    - 3) Joints and Sealants: Verification that movement joints have been provided, and verification that joints are free from obstructions. Confirmation that accepted sealant materials are provided. Verification that sealant joints are properly sealed, and that materials are of sufficient elongation for movement anticipated. The recording of any unanticipated movement or displacement beyond performance criteria.
    - 4) Glass and Glazing: Verification that the aluminum window glass is not defective and that the glazing gaskets meet specifications. Verification that the location and size of setting and edge blocks are suitable and meet specifications
    - 5) Flashings and Drainage: Verification that flashings are the proper materials, are properly installed and that end dams are sealed. Verification that weeps and tubes are installed and are functional
  - b. Observation Compliance of Aluminum Window Subcontractor's Testing Program
    - 1) Field Tests: Observation, as the City of New York's representative, of field testing of aluminum window

assembly, for the required Field Water Test: AAMA 501.2 as specified herein.

### **3.8 ADJUSTING**

- A. Adjustment: Adjust operating sash of operable aluminum windows to provide an even, tight fit at contact points and weather stripping for smooth operation and weather tight closure. Adjust operable aluminum windows to operate smoothly with hardware and operators functioning properly. Lubricate hardware and other moving parts. Remove and replace any defective parts.
- B. Touch-Up Painting: Field paint marred or abraded shop paint and welds after cleaning these areas. Separate dissimilar metals and metals in contact with concrete or masonry with dielectric separator or gaskets. Do not extend coatings onto exposed surfaces.
  - 1. Touch-Up to Finish System: Touch up damaged, scratched, marred or abraded exposed finishes utilizing approved air dried fluoropolymer resinous paint system in matching colors and sheen. Obtain Engineer's approval of finished touch-up.

### **3.9 CLEANING**

- A. Maintenance of Installation: Maintain the aluminum windows throughout the construction period in a clean and properly protected condition so that it will not be damaged at the time of acceptance by the City of New York. Cleaning and protective methods shall be carefully selected, applied and maintained so that finishes will not become uneven or otherwise impaired as a result of unequal exposure to light and weathering. Remove deleterious materials from surfaces of aluminum and glass immediately. Protect glass from breakage immediately upon installation. Use streamers or ribbons suitably attached to framing and held free of the glass. Do not apply warning markings directly to the glass.
- B. Cleaning: Upon completion of installation, wash exposed surfaces to leave clean and free from blemishes. Clean excess sealant or compound from glass and framing members immediately after application using solvents or cleaners recommended by manufacturers.

### **3.10 PROTECTION**

- A. Protection: Protect the Work during erection and construction to avoid non-uniformity of appearance or other defects in the Work. When requested for inspection of finishes, remove and replace temporary protection. Remove protection when no longer required.

**END OF SECTION**

**SECTION 08 71 00 – FINISH HARDWARE****PART 1 - GENERAL****1.1 GENERAL REQUIREMENTS**

- A. Work of this Section, as shown or specified, shall be in accordance with the Contract Documents.

**1.2 WORK INCLUDED**

- A. Work of this Section includes all labor, materials, equipment and services necessary to furnish all the finish hardware as shown on the drawings and specified herein.

**1.3 RELATED WORK**

- A. Hollow Metal Doors and Frames - Section 08 33 00
- B. Overhead Coiling Doors - Section 08 33 23
- C. Paints and Coatings - Section 09 90 00
- D. Fabricated Concrete Buildings - Section 13 34 70

**1.4 QUALITY ASSURANCE**

- A. Hardware shall be suitable and adapted for its required use and shall fit its designated location. Should any hardware as shown, specified or required fail to meet the intended requirements or require modification to suit or fit the designated location, determine the correction or modification necessary and notify the Engineer in ample time to avoid delay in the manufacture and delivery of hardware.
- B. For fire rated openings provide hardware complying with NFPA Standard No. 80 requirements of the NYC Building Department.
- C. Barrier Free Requirements: Local laws complying with the American Disabilities Act shall apply.
  - 1. Fire doors shall have the minimum opening force allowable by the NYC Building Department. The force for pushing or pulling open doors other than fire doors shall be as follows:
    - a. Interior hinged door: 5.0 pounds (22.2 N) maximum
    - b. Interior sliding or folding doors: 5.0 pounds (22.2 N) maximum
  - 2. These forces do not apply to the force required to retract latch bolts or disengage other devices that hold the door in a closed position.
- D. Hardware Supplier Qualifications: The Hardware Supplier shall have been regularly engaged in the sale and distribution of Finish Hardware for projects of comparable scope and size for a minimum of five (5) years. The Hardware Supplier shall have an Architectural Hardware Consultant (AHC) of the Door and Hardware Institute on staff who will be responsible for overseeing the scheduling, detailing, ordering, and coordinating of Finish Hardware, and shall be available for consultation with the Engineer, at no additional cost to the City of New York, during progress of construction. The Hardware Supplier shall be a direct factory

authorized distributor for all Finish Hardware items being furnished in accordance with this Specification.

## **1.5 SUBMITTALS**

- A. Before any finish hardware is ordered or purchased, submit catalog cuts and a complete Hardware Schedule of Finish Hardware. Each item listed in the Hardware Schedule shall be identifiable with respect to manufacture, brand, catalog number, material, and finish.
  - 1. Schedule of Finish Hardware shall be submitted in the Vertical Schedule Format per Door and Hardware Institute Sequence & Format for the Hardware Schedule (1996).
- B. Where submission differs from Schedule given herein, use different color or other means of identification to bring change to the attention of the Engineer.
- C. Samples: Submit samples as requested by Engineer. Do not proceed with installation until samples have been approved. Approved samples may be installed in the work after substantial completion of work. Samples shall include one (1) each of the following samples:
  - 1. Hinge (Each Type)
  - 2. Intermediate Pivot
  - 3. Surface Closer
  - 4. Lockset (Entrance Function)
  - 5. Floor Stop
  - 6. Push-Pull Plates
  - 7. Push-Pull Bars
  - 8. Finish Sample of all other hardware, as requested by the Engineer.

## **1.6 PRODUCT HANDLING**

- A. Pack finish hardware in approved manufacturer's containers, complete with trimmings, bolts, screws, washers, etc., as required for application and securement. Each container shall bear a suitable label which will state the quantity and kind of contents of said container, as well as identifying marks relating to the approved Hardware Schedule and its location in the project.
- B. Levers, handles, pulls and any other items of finish hardware with easily damaged finishes shall be individually wrapped before placing in containers and with sufficient sheet cloth or cotton-backed paper which shall be adequately tied with heavy strings; all as necessary to protect the finishes.
- C. Finish hardware shall be delivered, as directed, to the building site or the factories of the various fabricators of metal work to which such hardware is to be applied. Deliver hardware in the order required and in ample time to permit application at the building, or fabricators' shops, within the time required for the completion of the building.

## **1.7 JOB CONDITIONS**

- A. Field Service: The hardware supplier shall assign a competent representative, acceptable to the Engineer, to be at the jobsite each time a major shipment of

finish hardware is received. Such representative shall assist in "checking in" these shipments and shall secure a receipt covering the contents of each shipment. In addition, such representative shall be available for immediate call to the jobsite when, in the opinion of the Engineer, the representative's presence is necessary.

- B. Templates: Promptly following approval of the Hardware Schedule by the Engineer, furnish and deliver template information, to the fabricators, of items to which finish hardware is to be applied.
  - 1. Such deliveries shall be made in ample time to avoid delays in such work of said fabricators. Provide drawings, schedules and detailed information to other trades as necessary for them to accommodate and prepare their work to receive the finish hardware.
- C. Cooperation and Coordination
  - 1. Cooperate and coordinate work with that of other trades supplying materials or performing work in contact with, connecting to, underlying, or overlaying the work of this Section.
  - 2. Provide complete data of requirements for work of this Section to those other trades whose work is affected by or dependent upon the work of this Section.
  - 3. Furnish all items to be built into other work in ample time to avoid delaying the progress of such work.
  - 4. Examine all drawings covering the work of this Section and refer to all other drawings, including mechanical and electrical drawings, which may affect the work of this Section or require coordination by this trade.
- D. Existing Conditions: Hardware Supplier shall verify all existing conditions in the field to ensure compatibility with hardware specified in the Hardware Sets herein. Any discrepancies between the existing field conditions and hardware specified shall be brought to the attention of the Engineer immediately. Hardware Supplier shall not order any hardware until all discrepancies are rectified and written approval is granted by the Engineer.

## **1.8 WARRANTYS**

- A. Provide a letter from the manufacturer of surface mounted closers, warranting such closers for five (5) years.
- B. Provide a letter from manufacturer of concealed floor closers, warranting such closers for twenty-five (25) years.
- C. The hardware supplier shall provide a written one (1) year warranty for the rest of the items furnished under this Section.
- D. All warranties shall be effective beginning with the date of Substantial Completion.

## **PART 2 - PRODUCTS**

### **2.1 GENERAL**

- A. Requirements for design, grade, function, finish, size and other distinctive qualities of each type of finish hardware are indicated herein. Products are identified by using appropriate hardware designation numbers.

- B. Manufacturers are listed for each hardware type required. Provide either the product designated, or approved equal.
- C. Notwithstanding anything to the contrary in this specification or the drawings, the finish hardware shall conform to the requirements of the NYC Building Department and such requirements shall be followed as if specifically set forth in this specification.
- D. Finish hardware shall conform to the applicable requirements of the American Insurance Association, and the National Board of Fire Underwriters' Laboratories, Inc., and the NYC Building Department, and each such item shall bear a label or mark of the Underwriters' Laboratories, Inc., indicating its conformity with such requirements for use in connection with its specified location.
- E. Finish hardware shall be uniform in color and finish and free from imperfections affecting its appearance, function, operation and serviceability. Such hardware shall be suited and adapted to its required use and shall fit its respective location.
- F. Where the finished shape or size of members receiving finish hardware are such as to prevent or render unsuitable the use of the specific types or sizes of such hardware, suitable types or sizes shall be furnished, having as nearly as practicable the same function, operation and quality as the specified hardware.
- G. Bolts, screws and other fastenings required for the application of the finished hardware shall be of size and type to fit requirements and shall be of the same material and finish as the exposed parts of such hardware which they adjoin. Exposed screws and bolts shall have countersunk oval heads and bolts shall be provided with cap nuts. Countersunk part of screw and bolt holes shall be finished smoothly without sharp edges and form a firm seal for such screw and bolt heads. Full threaded wood screws shall be furnished for all wood applications. No thru bolts will be allowed. Binding Barrels (Sex-nuts) and bolts shall be provided on push/pulls, exit devices, closers, etc. when being attached to mineral core or particle core wood fire doors.

## 2.2 PRODUCTS AND MANUFACTURERS

- A. The following are approved manufacturers, unless specifically indicated in the Hardware Sets. Underlined manufacturers are those whose products are indicated in the hardware sets.
- B. Substitution requests must be made in writing to the Engineer.
  - HINGES & SPRING HINGES: Ives, McKinney, Stanley, or approved equal.
  - CONTINUOUS HINGES: ABH, Ives, Markar Products, or approved equal.
  - FLUSH BOLTS. Ives, Rockwood, Trimco, or approved equal.
  - PUSH/ PULLS: Rockwood, ABH, Trimco, or approved equal.
  - LOCKSETS, LATCHSETS & DEADLOCKS: Schlage, Falcon, Sargent, or approved equal.
  - CYLINDERS & KEYING: Per City of New York's Requirements.
  - SURFACE CLOSERS: LCN, Falcon, Stanley, or approved equal.
  - FLOOR CLOSERS: Rixson, Dorma, Jackson, or approved equal.

STOPS: Ives, Rockwood, Trimco, or approved equal.

OVERHEAD STOPS: ABH, Glynn-Johnson, Rockwood, or approved equal.

SILENCERS: Ives, Rockwood, Trimco, or approved equal.

SADDLES & GASKETING: Zero International, National Guard Products, Hagar, or approved equal.

COAT HOOKS: ABH, Rockwood, Trimco, or approved equal.

KEY CABINETS: TelKee, HPC, Lund Equipment, or approved equal.

## 2.3 SPECIFIC ITEMS

### A. Hinges

1. Minimum of three (3) hinges per door leaf up to 7'-6" high. Provide one additional hinge per 2'-6" or fraction thereof.
2. Hinges shall be of types, sizes and materials as required to suit door weights thickness and fire ratings.
3. Unless otherwise specified hinges shall be standard weight. Doors 3'-4" in width shall receive 5 x 4½ .146 gauge hinges. Doors over 3'-4" in width shall receive 5 x 4½ .190 gauge hinges.
4. Hinge sizes shall be detailed so that the least amount of projection shall be visible from the frame.
5. Unless otherwise specified hinges shall have concealed ball bearings (combination anti-friction or oil impregnated) and five (5) knuckles.
  - a. Standard doors shall have non-rising pins.
  - b. Doors exposed to the public, and other secure areas, as determined by the City of New York, shall have non-removable pins.
6. Continuous Hinges: Unless otherwise specified in the Hardware Sets, continuous hinges shall be stainless steel, steel, or aluminum with a full length Teflon coated stainless steel pin not less than ¼" in diameter.

### B. Pivots

1. Provide quantities and types of pivots (offset, intermediate, or center) as required to suit door sizes and weights.
2. Pivot sets (offset and center) shall consist of top and bottom pivots, unless otherwise indicated.
3. Provide a top pivot for each floor closer unless otherwise indicated.
4. Provide fire rated pivots on all rated doors in a labeled opening.

### C. Closers

1. Unless otherwise indicated, closers shall not be visible on the public side of doors. Closers opening into public spaces shall be provided with parallel arms and brackets to suit.
2. Closers shall be sized in accordance with the accepted manufacturer's standards to suit height, width, weight of door and draft conditions.

3. Provide a top pivot for each floor closer.
  4. Provide weather sealing compound for each exterior floor closer.
  5. Unless specified otherwise in the Hardware Sets, all floor closers shall have a built in dead stop.
- D. Locking and Latching Devices
1. Mechanical: Provide types, functions, as specified. Coordinate with City of New York's keying requirements.
    - a. Unless otherwise specified in the Hardware Sets, tubular style locksets or latchsets will not be accepted in lieu of cylindrical style sets specified.
    - b. Unless otherwise specified in the Hardware Sets, ANSI Grade 3 deadlocks will not be accepted
- E. Keys and Keying
1. Coordinate new keying requirements with requirements of City of New York's standard keying system. □
  2. Provide three (3) keys for each differently keyed lock. Indicated locks shall be keyed differently.
    - a. Locks to the following spaces shall be keyed alike:
      - 1) Mechanical Equipment Rooms, Electrical Panel Rooms, and Telephone Equipment Rooms.
      - 2) Janitor's Closets.
  3. Provide one hundred (100) key blanks.
  4. Provide three (3) Master Keys.
  5. Provide all cylinders as Construction Master Keyed with All Brass Core.
  6. Provide key control system, including key cabinet by TelKee, with capacity to store 150% of keys furnished.
  7. Final keying requirements to be determined by the City of New York.
- F. Stops: Provide stops to limit the degree of opening, helping to prevent damage to adjacent walls, columns, equipment, the door or its hardware.
1. Overhead Stops
    - a. Size overhead stops to suit door width, height, weight and draft condition.
    - b. Overhead stops shall have stainless steel tracks with built-in shock absorber with 5-7 degree compression before dead stop. The arm shall be stainless steel with finish as noted.
  2. Floor Stops: All stops to be fastened to concrete shall use expansion shields and machine screws.
- G. Pushes and Pulls: Provide concealed fasteners where practical. Where exposed fasteners are required provide flush type finished to match push or pull.
- H. Flush Bolts: Provide top and bottom extension type flush bolts, mounted twelve (12) inches and seventy-two (72) inches respectively from the bottom of each door, where

scheduled. Provide each bottom flush bolt with a dustproof strike.

- I. Silencers: Provide silencers for all non-gasketed and non-weatherstripped frames. Provide three (3) for each single swing door and two (2) for each pair of doors.
- J. Automatic Door Bottoms: Unless otherwise specified in the Hardware Sets, automatic door bottoms shall be actuated with an operating force not to exceed one and one-half (1½) pounds.

## 2.4 FINISHES

- A. Provide finish hardware with the following finishes unless otherwise shown:
  - 1. Hinges: US32D
  - 2. Pivots: US32D
  - 3. Surface Closers: 689
  - 4. Floor Closers: US26D
  - 5. Locksets and Exit Devices: US32D
  - 6. Stops: US26D
  - 7. Pushes, Pulls, Kick Plates: US32D
  - 8. Flush Bolts: US26D

## PART 3.00 - EXECUTION

### 3.1 GENERAL

- A. Make periodic checks during construction in order to ascertain that the finish hardware furnished has been installed correctly. After completion of all construction work, adjust finish hardware to work properly; test all keys and adjust as required for smooth, free operation.
- B. Provide Stainless Steel saddles by Zero International where indicated on the Door Schedule ([www.zerointernational.com](http://www.zerointernational.com)).

### 3.2 HARDWARE SETS

#### HW SET 1

1 – Ea. ¾" Offset Floor Closer Open)	SC27-180A-CWF-SEC (Automatic Hold
1 – Ea. Intermediate Pivot	M19 x Torx
1 – Ea. Mortise Lockset (Special)	L9460L-02A x XL11-886 x TORX
1 – Ea. Mortise Cylinder	To suit
1 – Ea. Floor Stop	FS18 Series
1 – Set Weather Seals	429A-SEC

**END OF SECTION**

**SECTION 08 80 00 – GLAZING****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide glazing in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Backerboards and concealed panel clips for mirror assemblies is specified in Section 06 10 0 "Rough Carpentry".
  - 2. Sealants and joint fillers are specified under Section 07 92 00 "Joint Sealants".
  - 3. Aluminum windows are specified under Section 08 51 13 "Aluminum Windows".
  - 4. Framed mirrors are specified under Section 10 28 13 "Toilet Accessories".

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. Glass Association of North America (GANA)
    - a. "Sealant Manual" and "Glazing Manual".
    - b. "Mirrors, Handle with Extreme Care, Tips for the Professional on the Care and Handling of Mirrors".
    - c. "Laminated Glazing Reference Manual".
  - 2. Glass Tempering Association (GTA): "Engineering Standards Manual".
  - 3. American Society for Testing and Materials (ASTM):
    - a. ASTM C1036, "Specification for Flat Glass".
    - b. ASTM C1048, "Specification for Heat Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass".
  - 4. Insulating Glass Manufacturer's Association (IGMA)
    - a. IGMA Publication for Insulating Glass: SIGMA TM-3000, "Glazing Guidelines for Sealed Insulating Glass Units".

5. Consumer Product Safety Commission (CPSC)
  - a. Safety Glazing Standard: Where safety glass is indicated or required by the NYC Building Department, provide type of products indicated which comply with ANSI Z97.1 and testing requirements of CPSC 16 CFR Part 1201 for category II materials. Subject to compliance with requirements and the NYC Building Department, provide safety glass with a removable certification label of Safety Glazing Certification Council (SGCC) or other certification agency acceptable to the NYC Building Department.

### 1.3 SYSTEM DESCRIPTION

- A. General: Provide glazing systems capable of withstanding normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, and installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.
  1. Wind Loading: Design, fabricate and install glazing so that the installed glazing will withstand project, ASCE-7, and New York City Building Code required inward and outward pressure.
- B. Design Criteria: Provide glass thicknesses and heat treatment (heat strengthened or fully tempered) in compliance with ASTM E1300, as required to meet specified design criteria, in-service conditions and the following:
  1. Minimum Glass Thickness for Lites: Not less than 1/4 in. for monolithic or for any lite of insulating glass units.
  2. Vertical Glass: For glass set vertically or less than 15° from vertical so as to limit the statistical probability of failure to eight (8) lites per thousand at "Wind Loading" based upon a 60 second uniform load duration.
  3. Stress Breakage: Design glass to resist project temperature stress breakage.
  4. Differential Shading: Design glass to resist thermal stresses induced by differential shading within individual glass lites.
  5. Glass Deflection: Limit the maximum center deflection, relative to glass edges at "Wind Loading" of vertical glass, exterior or interior, to not exceed 1in. and sloped glass (including glass canopies) not to exceed 1/2 in. at center point.
  6. Tempered Glass: Unless otherwise specified tempered glass intended for use on the project shall be heat soaked tested in accordance with BS EN 14179 "Glass in Building-Heat Soaked Thermally Toughened Soda Lime Silicate Safety Glass", Parts 1 and 2, for a minimum of 2 hours at 290°C +/- 10°C in order to minimize the occurrence of nickel sulfide crystals. This process shall be strictly controlled and carried out paying particular attention to temperature limits and duration of treatment for each phase.

7. Safety Glazing Labeling: Where safety glazing labeling is indicated, permanently mark glazing with certification label of certification agency acceptable to the NYC Building Department. Label shall indicate manufacturer's name, type of glass, thickness, and safety glazing standard with which glass complies.

#### 1.4 SUBMITTALS

- A. Product Data: Submit for Engineer's Action. Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work. Submit the following information from each manufacturer:
  1. Complete instructions for handling, storing, mixing, priming, installing, curing and protecting each glazing material.
  2. Sealant adhesion test reports.
  3. Mirror Product Data
    - a. Mirror mastic glass coating compatibility test reports from organic protective coating manufacturer indicating that mirror mastic has been tested for compatibility and adhesion with organic protective coating. Include organic coating manufacturers' interpretation of test results relative to performance and recommendations for use of mastics with organic protective coating.
- B. Shop Drawings of Mirror Assembly: Submit for Engineer's action. Submit shop drawings for the fabrication and installation of the mirror assembly, showing layout and dimensions of the Work and detail sections of components including anchorage and support method. Show mirror joint locations. Prepare details at not less than 3 in. = 1 ft. minimum scale.
- C. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials and assemblies scheduled. Where low 'E' coatings or other type coatings are scheduled for insertion into insulating glass units, provide samples with proposed edge deletion tolerances complete with dimensions. Compliance with other requirements is the responsibility of the Contractor.
  1. 12 in. sq. samples of each glass type and glass assembly scheduled. For Insulating glass units provide assemblies representative of final units to be used in the finish work, including scheduled glass lites, coatings, spacer, primary and secondary seals.
  2. Samples of each type of setting block, face shim, edge block, glazing sealant and gasket.
  3. Sealant samples 12 in. long installed between samples of the materials to be glazed, fully cured.
- D. Glazing Schedule: Submit for Engineer's information. Provide a glazing schedule utilizing the same designations shown on Drawings for glazed

openings listing glass types, thicknesses, composition of glass assemblies, coatings and heat treatment if any, for each size opening and location.

- E. Engineering Services: Submit for Engineer's action. Provide calculations to verify materials provided meet specified performance requirements. Calculations shall bear the seal of a Professional Engineer registered in the State of New York. Submit the following:
1. Glass manufacturer's substantiating calculations or data showing that the probability of breakage at the wind loading will not exceed the specified probability of breakage for each type, size and thickness of exterior glass.
  2. Thermal stress calculations for each type, size and thickness of exterior glass.
- F. Quality Control Submittals: Submit for Engineer's information.
1. Product Test Reports: Provide product test reports indicating the following products comply with requirements, based on comprehensive testing of current products:
    - a. Insulating glass.
    - b. Heat soak testing for tempered glass. Product test reports shall include records of number of cycles and cycle times related to each cycle.
    - c. Glazing sealants.
    - d. Glazing gaskets
  2. Certificates
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
    - b. Certification, Tempered Glass Testing: Submit certification that tempered glass intended for use on the project has been heat soaked tested in accordance with BS EN 14179 "Glass in Buildings-Heat Soaked Thermally Toughened Soda Lime Silicate Safety Glass", Parts 1 and 2.
    - c. Certification, Insulating Glass Testing: Submit certification that the insulating glass units have been granted the IGCC classification "CBA" or Associated Laboratories Inc. Classification "Level A".
      - 1) Certification, Structural Silicone Sealant Compatibility: Provide certification by the structural silicone sealant manufacturer that insulating glass

unit secondary seals are compatible with the proposed structural silicone sealant.

- 2) Certification, Insulating Glass: Provide certification that insulating glass primary and secondary seals are capable of withstanding project structural loading requirements.
- d. Certification, Structural Glazing Sealants: Submit certification of the following:
- 1) That the structural silicone sealants and accessories comply with the Contract Documents and are recommended by the sealant manufacturer for the use intended.
  - 2) That the samples tested for adhesion by the sealant manufacturer comply with their requirements for structural glazing; signed by the sealant manufacturer.
- G. Closeout Submittals: Submit, for City of New York's documentation.
1. Warranties: Special warranties specified.
  2. Maintenance Data: Furnish maintenance data for each type of glass for use during construction and for use by the City of New York after acceptance of the Work.

## 1.5 QUALITY ASSURANCE

- A. Single Source Responsibility for Glass: To ensure consistent quality of appearance and performance, and to comply with warranty requirements, provide materials produced by a single manufacturer or fabricator for each kind and condition of glass indicated and composed of primary glass obtained from a single source for each type and class required. Glass processes of fabrication including tempering, application of thermal coatings, ceramic enameled coatings and any process of lamination shall be manufactured by and fabricated into insulating units by a single source with the ability to comply with and assume specified warranty provisions.
- B. Glazier Qualifications: Engage an experienced glazier who has completed glazing similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- C. Insulating Glass Fabricator: The material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.
- D. Low 'E' Coating Producer: The fabricator/manufacturer shall must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.

- E. Details: Glazing details are for convenience of detailing only and are to be confirmed by the Contractor and glass manufacturer relative to the cited standards and final framing details.
- F. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- G. Workmanship: Comply with GANA standards, and comply with the manufacturer's instructions for the use and installation of each product. Do not use different glazing materials in the same joint system unless the manufacturer of each material has stated in writing that his material is fully compatible with the other material. Employ only tradesmen experienced in the use of the materials. The installation of each lite of glass shall be watertight and airtight, and capable of withstanding temperature changes, wind loading, and impact from operation of doors or operable sash, without failure, including loss or breakage of glass, failure of seal, exudation of sealant and excessive deterioration of glazing materials.
- H. Glass and Sealant Manufacturers' Representatives: Do not use glass or sealant produced by any manufacturer who will not agree to send a qualified technical representative to the project site, when requested, for the purpose of rendering advice concerning the proper installation of materials.
- I. Field Samples: After the required submittal and review of finish samples, prepare samples of each type glazing system at locations in the building to be designated by the Engineer. Utilize the same materials and installation methods in the samples as required for the final Work. Schedule the installations with allowance for sufficient curing time so that samples may be examined, and necessary adjustments made, at least 1 week prior to date scheduled for commencing installation of the Work. When accepted, sample areas shall serve as the standard for materials, workmanship, and appearance for such work throughout the project, and shall remain part of the final Work.
- J. Mock Ups And Testing
  - 1. Visual Mock-Up
    - a. Provide, at Project site, where directed, glass and glazing for the visual mock-up review by the Engineer, extent as shown, and representative of the finished Work. Provide features as will be used in the final Work.
    - b. Clean glass installed in mock-up with materials and techniques intended for use on the Project.
    - c. Replace unsatisfactory Work as required to obtain approval of the Engineer. The approved visual mock-up will become the standard of workmanship for the project and may be used as part of final project.

- d. The approval of the visual mock-up does not relieve the Contractor of its obligation to perform the work in accordance with the Contract Documents.
2. Preconstruction Sealant Compatibility and Adhesion Testing: Prior to testing of mock-ups, submit samples of materials that will contact or affect sealants to sealant manufacturers for compatibility and adhesion testing, as indicated below:
    - a. Perform sealant adhesion evaluation at the earliest possible time after award of the Contract.
    - b. The sealant manufacturer shall perform adhesion evaluation tests in accordance with ASTM C794 using the sealant and production run samples of the finished substrates which are to be used in the test mock-up and in the final Work.
    - c. Use test methods standard with manufacturer to determine if priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of sealants to joint substrates. Perform tests under conditions of 72 deg. F. temperature and 50% relative humidity. Manufacturer(s) of sealant(s) shall submit written recommendations when installations involve adverse temperature or humidity conditions.
    - d. Furnish to the sealant manufacturer the finished substrate samples of such size and quantity as he requires for compatibility and adhesion evaluation. The substrate metal samples shall be of the alloy and with the temper, surface treatment and preparation, primer and finish in each specified color, as are to be used in the test mock-ups and in the final Work.
    - e. Schedule sufficient time for testing and analysis of results to prevent delay in the progress of the Work.
    - f. Investigate materials failing compatibility or adhesion tests and obtain sealant manufacturer's written recommendations for corrective measures, including use of specially formulated primers.
    - g. Testing will not be required when sealant manufacturer is able to submit joint preparation data required above which is acceptable to Engineer and is based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.
  3. Preconstruction Mirror Mastic Glass Coating Compatibility Test: Submit mirror mastic products to manufacturer of protective organic coating for testing by coating manufacturer's standard test method to determine compatibility of adhesive with mirrored glass coating.

- K. Pre-Installation Meeting: Prior to the start of the Work meet at the Project site to review material selections, methods and sequence of installation, glazing procedures standard of workmanship, quality control requirements, evaluation of suitability of specified compounds and sealants for anticipated weather conditions, coordination with other trades, and other pertinent topics related to the Work.

#### **1.6 DELIVERY, STORAGE AND HANDLING**

- A. Glazing Materials: Deliver glazing materials to Project site in manufacturers' unopened containers, fully identified with trade name, color, size, hardness, type, class, and grade. Store each item in accordance with manufacturer's instructions.
- B. Delivery, Storage and Handling: Deliver, store and handle glass in accordance with manufacturer's recommendations; protected from weather, staining and damage. During storage and handling of glass provide cushions at edges to prevent impact damage. Protect glass from scratches and abrasion.

#### **1.7 PROJECT/SITE CONDITIONS**

- A. Field Glazing: Do not perform glazing when temperature is below 40 deg. F., unless the manufacturer of the glazing materials specifically recommends application of his materials at lower temperatures. If job progress or other conditions require glazing work when temperatures are below 40 deg. F. (or below the recommended minimum temperature), consult the manufacturer and establish the minimum provisions required to ensure satisfactory work. Record in writing to the manufacturer, with copy to the Engineer, the conditions under which such glazing work was performed and the provisions made to ensure satisfactory work.

#### **1.8 WARRANTIES**

- A. Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty, Insulating Glass (Vertical Application): Provide a ten (10) year written warranty, warranting glass assemblies against material obstruction of vision as a result of dust or film formation on the internal glass surfaces as a result of the failure of the hermetic seal. Upon notification of such defects, within the warrantee period make the necessary replacements at the convenience of the City of New York.
    - a. Fabricator of insulating glass assemblies which contain Low "E" coatings, metallic coating, decorative ceramic frit coatings and/or laminated glass within assemblies shall assume responsibility for coater and laminator supplier's warranties (if not performed by the fabricator) specified herein and shall issue a single source warranty for the entire insulating glass assembly.

2. Special Warranty, Laminated Glass: Provide a ten (10) year written warranty, warranting against deterioration of laminated glass. Deterioration of laminated glass is defined as the development of manufacturing defects including edge separation or delamination which materially obstructs vision through glass and blemishes exceeding those allowed by referenced laminated-glass standard. Upon notification of such defect, within the warranty period, make the necessary replacements at the convenience of the City of New York.
3. Special Warranty, Coated Glass: Provide a ten (10) year written warranty, for the coated glass against peeling, uneven color, fading cracking, and other indications of deterioration in coating. Upon notification of such defect, within the warranty period, make the necessary replacements at the convenience of the City of New York.
4. Special Warranty, Sealant: Provide a written warranty, agreeing to repair or replace silicone sealant compounds which have failed to provide airtight and watertight joints for any reason, or which appear to have failed in adhesion, cohesion, abrasion-resistance, migration-resistance, stain-resistance, general durability or other form of apparent deterioration (excluding inherent qualities and limitations clearly specified in the manufacturer's data which was submitted). Period of warranty shall be twenty (20) years, and warranty shall be signed by the Manufacturer, the installer and the Contractor. Comply with these Specifications for repair or replacement of work.
5. Special Warranty, Mirror: Provide a five (5) year written warranty, warranting against evidence of silver spoilage. Upon notification of such defects, within the warranty period, make the necessary replacements at the convenience of the City of New York.

## **PART 2 - PRODUCTS**

### **2.1 GLASS**

- A. General: Provide glass in conformance with requirements of the specified standards. The acceptable color and/or defects as defined by the specified standards shall be determined by samples of such defects and/or color. Glass which does not match the accepted sample shall be subject to rejection by the Engineer. In the event such samples are not or cannot be furnished, the Engineer will determine the acceptability of glass relative to color and/or observable defects in each case. Comply with ASTM C1036 unless otherwise specified. Type and thickness as shown or specified.
- B. Float Glass: Type I, Class 1, Quality Q3.
- C. Heat Treated Glass: Comply with ASTM C1048, unless otherwise specified. Type and thickness as shown or specified.
  1. Glass for Heat Treating
    - a. Float, Type I, Class 1, Quality Q3.

- b. Heat Absorbing, Type I, Class 2, Quality Q3, color as shown.
2. Sizes and Cutting: Prior to heat treating, cut glass to required sizes as determined by accurate measurement of openings to be glazed, making allowance for required edge clearances. Cut and process edges in accordance with glass manufacturer's recommendations. Do not cut or treat edges in the field.
  3. General: For glass which has been heat treated, maintain roller marks running horizontally in the final installation, with roller wave distortion parallel to the bottom edge of glass as installed, unless otherwise indicated. Roller wave distortion shall be in the same direction as quenching distortions, strain patterns or other distortions that may be a result of the heat treating process as referenced in ASTM C1048. For glass which has been heat treated vertically, locate tong marks along an edge which will be concealed in the glazing system.
    - a. Overall Bow and Warp Tolerances: Heat treated glass shall be examined by the glass manufacturer to detect and discard lites which exceed one half (50%) the maximum bow and warp tolerances in any direction as listed in ASTM C1048 Table 2.
    - b. Roll Ripple Tolerances: Where the heat treatment process results in essentially parallel ripples or waves, the deviation from flatness at any peak (peak to valley deviation) shall not exceed 0.005 in. or the average rollerwave distortion shall be certified not to exceed 0.002 in., with a maximum sag at the leading and trailing edge of 0.01 in.
    - c. The more stringent requirement of the bow, warp, and roll ripple tolerances will govern). A site inspection if required, for roller wave and bow tolerances should be viewed from a minimum distance of 10 ft.
  4. Fully Tempered Glass: Comply with ASTM C1048, Kind FT, and meeting the requirements of ANSI Z97.1. Strengthen by manufacturer's standard heat-treatment process so that the residual surface compression is not less than 10,000 psi or the edge compression not less than 9700 psi).
  5. Heat-Strengthened Glass: Comply with ASTM C1048, Kind HS. Strengthen by manufacturer's standard heat-treatment process so that the residual surface compression is not less than 3500 psi or greater than 7500 psi.
- D. Laminated Glass: ASTM C1172, two sheets of glass permanently factory laminated under heat and pressure with an interlayer of 0.060 in. thick clear plasticized polyvinyl butyral (PVB) or ionoplast interlayer Sentry Glass Plus (DuPont), as specified in Glass Schedule, made specifically for laminating glass.
1. Provide type and thickness of glass sheets as shown or specified. Fabricate laminated glass to produce glass free of foreign

- substances and air or glass pockets in an autoclave utilizing heat plus pressure.
2. Where scheduled, provide translucent, photographically patterned or colored, interlayer made specifically for laminating glass and matching approved sample.
  3. Prior to laminating, cut glass to required sizes and profiles as determined by accurate measurement of openings to be glazed, making allowance for required edge clearances. Grind and polish all edges and slightly ease all arises and corners.
  4. Do not cut or treat edges in the field.
- E. Low-Emissivity (Low 'E') Coated Glass: Provide low-emissivity factory applied coating complying with ASTM C1376 and resulting in a stable, uniform, nearly invisible coating which imparts average maintained insulating performance of at least  $R = 2.5$ . Comply with physical performance criteria as specified herein for each individual type of glass.
- F. Coated Glass: Provide coated glass coating complying with ASTM C1376 and as follows:
1. Sputter-Coated Float Glass: Float glass with metallic-oxide or metallic-nitride coating deposited by vacuum deposition process after manufacture and heat treatment (if any), complying with requirements specified in glass type schedules.
- G. Insulating Glass Units: ASTM E2190; Use types of glass shown in fabricating insulating glass units. Use quality of glass specified hereinbefore.
1. Provide dual edge-sealed insulating glass units which are certified for the insulating glass seal classification "CBA" by the Insulating Glass Certification Council (IGCC) or classification "Level A" by the Associated Laboratories, Inc. (ALI) Certification Program when tested in accordance with ASTM E2188, ASTM E2189 and ASTM C2190 (as sponsored by the Sealed Insulating Glass Manufacturer's Association).
    - a. Provide accurate and straight edge deletions of coatings at areas of insulating glass assemblies where Low "E" coatings, metallic coating or other decorative coatings are applied to surfaces scheduled to be in contact with the primary seal of insulating glass units.
  2. Fabrication: Fabricate units at factory with sheets of glass hermetically sealed at edges with a permanent elastomeric sealant. Dehydrate entrapped air. Glass lites shall be separated by desiccant filled stainless steel spacer marked with the appropriate classification, listed manufacturer and approval on the spacer with bent, welded or fused corners, splices or joints.
- H. Mirror Glass
1. ASTM C1036, Type 1, Class 1, Quality q<sup>1</sup> nominal thickness 1/4 in. thick unless otherwise shown or specified.

2. Provide silvering, copper backing and protective heat catalyzed paintcoating on entire back surface of mirror.
  3. Exposed edges of mirrors shall have a flat polished (eased) profile. Perform edge treatment and sealing in factory immediately after cutting to final sizes. Do not cut or treat edges in the field.
- I. Clear Low Iron Glass: ASTM C1036, Type 1, Class 1, Quality Q3, Low iron composition soda lime glass with a minimum 91% visible light transmission and a minimum solar heat gain coefficient of 0.87.

## 2.2 GLAZING MATERIALS

- A. Silicone Rubber: Complies with ASTM C920 and ASTM C1184 requirements, is compatible with system components with which it comes in contact, and is specifically formulated and tested for use as a structural sealant; class and use as best suited for the intended purpose; Provide one of the following:
1. "995 Silicone Building Sealant" (Dow Corning Corp.) for field use and "983 or 995 Silicone Building Sealant" (Dow Corning Corp.) for use in the shop.
  2. "Ultraglaze SSG4000 or Ultraglaze SSG4000AC Silicone Structural Glazing Sealant" (Momentive Performance Materials Inc.); for field use and "Ultraglaze SSG4400 Silicone Structural Glazing Sealant" (Momentive Performance Materials Inc.) for use in the shop.
  3. "Sikasil SG-18 Building Sealant" (Sika Corp.) for field use and "Sikasil SG-18 Building Sealant" or SG-500 Silicone Building Sealant" (Sika Corp.) for use in the shop.
- B. Butyl Glazing Tape Reinforced: A pre-formed, non-sagging, non-oxidizing, non-staining butyl rubber tape with core reinforcement, one of the following:
1. "Extru-Seal Butyl Rubber Tape" (Pecora Corp.).
  2. "No. 166.6 Elastic Butyl Tape" (Presstite Div.).
  3. "Tremco 440 Tape" (Tremco).
- C. Glazing Gaskets
1. Closed Cell Soft Compression Gaskets: Black, continuous extruded or molded expanded foam neoprene or EPDM with a Shore A durometer hardness and profile adequate to fulfill the overall performance requirements specified, to maintain watertight seal and complying with ASTM C509, Type II. Provide adhesive on one side.
  2. Dense Compression Solid Gaskets: Black, continuous extruded or molded neoprene, EPDM or silicone with a Shore A durometer hardness and profile as required to provide pressure adequate to fulfill the overall performance requirements specified and

complying with the applicable provisions of ASTM C864 or ASTM C1115.

3. Fully vulcanize gasket corners where compatible with installation procedures.
- D. Setting Blocks: ASTM C864; neoprene blocks, 80 to 90 Shore A durometer hardness.
  - E. Edge Blocks: ASTM C864; neoprene blocks, 60 to 70 Shore A durometer hardness.
  - F. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint- filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape where applicable.
  - G. Joint Cleaner, Primer and Sealer: The products recommended by the manufacturer. Never apply or allow primers to come into contact with glass surfaces.
  - H. Mirror Components
    1. Mirror Mastic: An adhesive setting compound, manufactured specifically for setting mirrors by spot application, certified as compatible with back of mirror coating by organic protective coating manufacturer, scheduled mirror substrate and approved by mirror manufacturer. Comply with mirror mastic manufacturer's written instructions for size, number and pattern of mastic spots required for installation. Subject to compliance with requirements, provide products by one of the following:
      - a. Gunther Mirror Mastics.
      - b. Palmer Products Corporation.
      - c. Glazers Choice, Inc.
      - d. Or approved equal.
    2. Mirror Edge Sealer: A mirror edge sealer manufactured specifically for sealing mirror edges and that has proven to be compatible with mirror coating and approved by mirrored glass manufacturer for use in protecting against silver deterioration at mirror edges; Provide one of the following:
      - a. "Seal-Kwik" (C. Gunther Co.).
      - b. "No. 209 Mirror Edge Sealant" (Sprayway, Inc.).
      - c. "Mirror Edge Sealant" (CDL).
      - d. Or approved equal.
    3. Stainless Steel Angle Mirror Support and Frame: Stainless 304; hot or cold rolled angle; 1 in. x 1 in. x 1/8 in. thick; polish edge of exposed portion of angle to bright finish.

## 2.3 FABRICATION

- A. Sizes: Fabricate glass to sizes required for glazing openings indicated, with edge clearances and tolerances complying with recommendations of glass manufacturer. Provide thicknesses indicated or, if not otherwise indicated, as recommended by glass manufacturer for application indicated.
- B. Cutting: Obtain sizes from shop drawings or by field measurement. Cut glass to fit each opening with edge clearances and bite on glass as recommended by glass manufacturer. Do not nip glass edges. Factory cut heavy heat absorbing glass 3/8 in. and above and heavy float glass (1/2 in. and above. Edges may be wheel cut or sawed and seamed at manufacturer's option. For glass to be cut at site, provide glass larger than required so as to obtain, clean-cut edges without seaming or nipping. Do not cut, seam, nip or abrade glass after heat-tempering.
- C. Edgework for Butt Glazing: Where glass is to be butt joined with silicone sealant, provide flat ground butting glass edges having a satin finished flat edge with eased arris corners.
- D. Edgework for Exposed Edges: Where edges of glass are to be exposed in the finish work, provide ground and polished edges and slightly eased arrises and eased corners.
- E. Edgework for Tempered Glazing: Grind and polish all edges and slightly ease all arrises and corners.
- F. Insulating-Glass Units: Preassembled units consisting of sealed lites of glass separated by a dehydrated interspace, and complying with ASTM E2190 and ASTM E774 for "Class CBA" (IGCC) or "Level A" (ALI) units. Dimensions indicated in the Glass Schedule are nominal and the overall thicknesses of units are measured perpendicularly from outer surfaces of glass lites at unit's edge. Fill sealed space with dry air or other dry gas with a dew point not exceeding -50 deg. F. Exclude dirt and other foreign substances. Dual seal, with polyisobutylene primary seal and silicone secondary seal unless otherwise shown or specified. Provide manufacturer's standard spacer material and construction with molecular sieve or silica gel desiccant, or blend of both.
  - 1. Space-Bar Frame: Tubular stainless steel, sealed corners and filled with desiccant, with breather ports into the sealed space; sized to provide sealed space of thickness shown. Provide spaces complying with the following requirements:
    - a. Stainless steel with black finish.
  - 2. Structural Glazed Insulating Units: Factory glaze structural silicone work. Clean the frames and glazing material surfaces with suitable solvent. Prime surfaces and install sealant according to the sealant manufacturer's recommendations. Clean excess sealant before the sealant cures. Do not transport units until sealant has cured.

- a. Provide insulating glass units with a silicone secondary seal in accordance with ASTM C1369 and complying with IGCC-certified "CBA" level or Associated Laboratories Inc. Classification "Level A" and compatible with specified structural silicone sealant glazing system.
- b. Dual Edge-Seal: Primary sealant of polyisobutylene black color. Secondary sealant of 2 component silicone black color.; specifically produced for secondary seals of insulating glass units and approved for use in structural silicone glazing systems.

## 2.4 GLASS SCHEDULE

- A. Glass ( **GL-01** ): 1 in. thick insulating glass unit comprised of a 1/2 in. thick heat strengthened, low iron glass outer lite with a high-performance low-E coating on the No. 2 surface, 1/2 in. argon filled airspace with black stainless steel spacer and
- 1/2 in. thick laminated glass consisting of one (1) lite of 1/8 in. thick, heat strengthened, low iron glass, 0.060 in. thick clear plasticized polyvinyl butyral interlayer and one (1) lite of 1/8 in. thick, heat strengthened, low-iron glass; grind and polish all edges and slightly ease all arrises and corners, match Engineer's sample. The following physical properties are the minimum properties for this glass type:
- | Physical Properties Transmittance |          |
|-----------------------------------|----------|
| Visible Light:                    | 68 %     |
| Solar Energy:                     | 30 %     |
| Ultra Violet:                     | 0.0033 % |
- | Reflectance             |      |
|-------------------------|------|
| Visible Light Exterior: | 12 % |
| Visible Light Interior: | 13 % |
| Solar Energy:           | 42 % |
- | ASHRAE U-Value       |                                   |
|----------------------|-----------------------------------|
| Winter Nighttime:    | 0.23 BTU/(hr. x sq. ft. x deg. F) |
| Summer Daytime:      | 0.20 BTU/(hr. x sq. ft. x deg F)  |
| Shading Coefficient: | 0.39                              |
| Solar Factor (SHGC): | 0.34                              |
| Relative Heat Gain:  | 81 BTU/(hr. x sq. ft. x deg. F)   |
- B. Glass ( **GL-02** ): 1/2 in. thick laminated glass consisting of one (1) lite of 1/4 in. thick, heat strengthened, low iron glass, 0.060 in. thick clear plasticized polyvinyl butyral interlayer and one (1) lite of 1/4 in. thick, heat strengthened, low-iron glass; grind and polish all edges and slightly ease all arrises and corners, match Engineer's sample.
- C. Glass ( **GL-03** ): ¼ in. low-iron mirror, with flat polished (eased) profile and safety film backing.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates, apply primers and install the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Cleaning: Clean glazing channels, stops and rabbets to receive glazing materials of obstructions and deleterious substances which might impair the work. Remove protective coatings which might interfere with bond of sealants.
- C. Priming: Prime surfaces to receive glazing compounds, except where manufacturer provides written reports of tests conducted by an independent testing agency which demonstrates that primer or sealer is not required for the conditions of use and the substrates involved. When priming, comply with manufacturer's recommendations both for materials and procedures.
- D. Inspection: Inspect each piece of glass immediately before installation. Do not install pieces which are improperly sized or have damaged edges, scratches or abrasion or other evidence of damage. Remove labels from glass immediately after installation.

### **3.4 INSTALLATION**

- A. Standards: Unless otherwise shown or specified, comply with recommendations and requirements of the GANA "Glazing Sealing Systems Manual" and "Glazing Manual".
- B. Setting Blocks: Locate setting blocks at sill one-quarter of the width in from each end of the glass, unless otherwise recommended. Use blocks of sized 1/8 in. wider than the glass thickness and 1/16 in. to 1/8 in. less than the width of the glazing channel to support the glass.
- C. Edge Blocks: Provide edge blocks, located in glazing rebate to insure against displacement of the glass and against metal to glass contact within the rebate and to ensure permanently adequate bite of the glass within the glazing system.

- D. **Setting of Glass:** Set glass in a manner which produces greatest possible degree of uniformity in appearance. Where safety glazing is scheduled or required, install glass after detaching removable safety glazing label unless otherwise required by the NYC Building Department. If local authorities require permanent labeling, install glass with permanent safety glazing label in concealed or inconspicuous locations subject to selection by the Engineer.
- E. **Glazing Materials:** Do not use 2 different glazing materials in the same joint system unless the manufacturer of each material has stated in writing that his material is fully compatible with the other material.
1. Use suitable protection to limit coverage of glazing materials to the surfaces intended for sealants.
  2. Miter-cut and seal joints of glazing gaskets to provide a continuous watertight and airtight seal at corners and other locations where joints are required. Vulcanize corner joints where compatible with installation procedure. Where wedge-shaped gaskets are driven into one side of channel to pressurize gasket on opposite side, provide adequate anchorage so gasket cannot walk out when installation is subjected to movement. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
  3. Tool exposed surfaces of glazing materials to provide a slight wash away from the glass. Install exposed tapes and gaskets with a slight protrusion above stops in the final compressed condition.
- F. **Insulating Glass Units:** Set insulating glass units with void between edge of units and glazing channel. Do not glaze insulating glass units with glazing compounds which might have a deleterious effect on the seal of the units. Completely conceal the edge binding of insulating glass units with glazing material and extend material a minimum of 1/8 in. onto glass surfaces at each edge, to provide glazing seal independent of hermetic seal.
- G. **Structural Sealant Glazed Units**
1. Provide face shims for glass structurally glazed to separate glass from stops. Locate face shims opposite each other and no farther than 24 in. apart and no closer than 12 in. to a corner. Make bite of space on glass a nominal 1/4 in. or greater.
  2. Provide continuous glazing spacers, sized and located to allow for sealant dimensions which will meet the specified Performance criteria.
  3. Where joint filler is used as backup for sealants, install filler continuously to depth and shape for proper application and performance of products. Apply joint fillers accurately to form the joint profile shown. Provide watertight and airtight corners and joints.

4. Install bond breaker in joints as shown and wherever required to prevent bond of the sealant to surfaces where such bond might impair the Work.
5. Apply sealants in continuous beads without open joints, voids or air pockets so as to provide a watertight and airtight seal for the entire joint length. Seal joints on the exterior of the building, both curtain wall-to-curtain wall joints and curtain wall-to-contiguous construction. Tool exposed surfaces of glazing sealants to provide a slight wash away from the glass.

#### H. Mirror Glazing

1. Adhesive Mounting of Mirrors
  - a. Identify and examine surfaces over which mirror is to be mounted. Comply with printed installation directions for preparation of mounting surfaces including coating surfaces with special bond coating where applicable or priming and sealing substrate as recommended.
  - b. Paint back of mirror with an additional coat of moisture-resistant paint of the type compatible with mirror mastic and substrate. Apply mirror edge sealer to edges of mirror.
  - c. Provide 1/2 in. thick fire-retardant treated plywood mirror backerboards as specified in Section 061 0 00 "Rough Carpentry". Provide 1 in. x 1 in. x 1/8 in. thick stainless steel angle frame with mitered corners and bright polished finished exposed edges. Secure angle frame to wall construction with fastening devices appropriate for substrates encountered spaced 16 in. o.c. maximum. Secure plywood backerboard to wall using fastening devices appropriate for substrates encountered spaced 12 in. o.c. maximum at perimeter 1/2 in. from corners and three rows of 3 fasteners each in the backerboard field. Countersink fasteners flush with plywood surface. Butt adjacent panels without lapping. Prepare panels for priming as required by manufacturer of mirror mastic.
  - d. Support mirror with stainless steel satin finished angle frame with bottom support designed to withstand mirror weight. Provide 1/8 in. thick by 4 in. long x 1/4 in wide setting blocks at quarter points. Apply mirror mastic utilizing special tool to assure complete and accurate coverage. Do not cover more than 25% of mirror back. Provide neoprene shims, double face tape or other type compatible material to allow for minimum clearances for mastic. Apply mirror to substrate so that areas not covered with mastic will remain open for ventilation, with minimum clearance from substrate as recommended. Provide temporary rigid support until adhesive has set.

- e. Fill 1/8 in. wide joint between stainless steel angle and face of mirror with continuous backer rod and silicone sanitary rubber sealant.
- I. Glass to Glass Glazing: Apply structural silicone sealant to abutting surfaces of glass.
- J. Completed Installation: The installation of each lite of exterior glass shall be watertight, airtight, and capable of withstanding temperature changes, wind loading and impact from operation (doors and operable sash) without failure of any kind including failure of seal, exudation of sealant and excessive deterioration of glazing materials.
- K. Glass/Visual Distraction Marks: Provide window and door distraction markings on glass surfaces, in colors, uniform patterns and spacings shown and as required to comply with the requirements specified in Paragraph "References ". Provide one of the following methods:
  - 1. Field paint glass utilizing glass preparation methods and paints to provide uniform characters with sharp edges and tightly registered patterns, free from blemishes or other defects which, in the Engineer's opinion, will impair the finished work.
  - 2. Provide decals (specifically manufactured for application to glass) applied to the glass to provide uniform characters with sharp edges and tightly registered patterns, free from blemishes or other defects which, in the Engineer's opinion, will impair the finished work.

### **3.5 CLEANING**

- A. General: Maintain glass in a reasonably clean condition during construction so that it will not become stained and will not contribute to the deterioration of glazing materials. Conduct a systematic inspection program not less than once a month for glass. Clean to meet above requirements. Clean excess sealant or compound from glass and framing members immediately after application. Wash glass on both faces not more than 4 days prior to acceptance by the City of New York.

### **3.6 PROTECTION**

- A. General: Protect glass from breakage immediately upon installation. Use streamers or ribbons suitably attached to framing and held free of the glass. Do not apply warning markings directly to the glass. Do not permit edges of glass to be exposed to standing water. Protect glass and glazing materials during the construction period so that they will be without indication of damage or deterioration at the time of acceptance by the City of New York. Cover glass to protect it from activities that might abrade the surfaces.
- B. Replacement: Replace glass during the construction period which is broken, cracked, chipped or damaged in any way and from any source, including weather, vandalism or accidents.

**END OF SECTION**

## SECTION 09 21 17 – GYPSUM BOARD SYSTEMS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide cementitious backer board systems in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Sealants and joint fillers other than specified herein installed at interface of cementitious backer board assemblies and other building components are specified under Section 07 92 00 "Joint Sealants".

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Society for Testing and Materials (ASTM):
    - a. ASTM C754, "Installation of Steel Framing Members to Receive Screw-Attached Gypsum Wallboard, Backing Board, or Water- Resistant Backing Board".
    - b. ASTM C645, "Specification for Nonstructural Steel Framing Members".
    - c. ASTM C919, "Use of Sealants in Acoustical Application".
  - 2. Steel Stud Manufacturers Association (SSMA): "Product Technical Information".

#### 1.3 DEFINITIONS

- A. Gypsum Board System Construction Terminology: Refer to ASTM C11 for definitions of terms for gypsum board system construction not defined in this Section or in other referenced standards.

#### 1.4 SYSTEM DESCRIPTION

- A. Performance Requirements: For information only. Partition schedule and locations are shown on the drawings.
  - 1. Loading Criteria, Typical Partitions: Design and install cementitious backer board system components so that the completed partition will withstand a minimum inward and outward pressure of 5 psf normal to the plane of the wall.

2. Deflection Criteria
    - a. Deflection, Support Framing Cementitious backer Board Partitions: Deflection of support framing for cementitious backer board partition systems shall be limited to 1/240 of the span in height, except as otherwise shown or specified.
  3. Temperature Criteria: Design, fabricate and install component parts scheduled for installation on the exterior, to provide for expansion and contraction over an ambient temperature range of 120 deg. F. and a surface temperature range of 180 deg. F. without buckling, sealed joint failure, undue stress on members or anchors, and other detrimental effects
  4. Movements: Design, fabricate and install cementitious backer board system Work to withstand building movements due to loading deflections, shrinkage and creep whose values are shown or specified elsewhere.
- B. Design Modifications: Make design modifications only as may be necessary to meet performance requirements and coordinate the Work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted to the Engineer for review.

## 1.5 SUBMITTALS

- A. Product Data: Submit, for Engineer's action, manufacturer's technical data for each component of cementitious backer board system, including related accessories. Furnish a material list with technical data documenting the location and primary function, quality, and performance of each material component or system to be used in the Work, or other such primary characteristics as required by the Drawings or Specifications.
- B. Shop Drawings: Submit for Engineer's action. Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum as follows:
  1. Details of unusual conditions in connection with cementitious backerboard system construction.
  2. Proposed locations of control joints that are required but not shown.
- C. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor.
  1. 12 in. long sample of each type of metal trim and control joints.

- D. Quality Control Submittals: Submit for Engineer's information.
  - 1. Certificates
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.

## 1.6 QUALITY ASSURANCE

- A. Single Source
  - 1. Single-Source Responsibility for Steel Framing: Obtain steel framing members for cementitious backer board systems from a single manufacturer acceptable to the cementitious backer board system manufacturer. Steel framing and related accessories shall be manufactured by a current member of the Steel Stud Manufacturers Association.
  - 2. Single-Source Responsibility for Panel Products: Obtain each type of cementitious backer board and other panel products from a single manufacturer.
  - 3. Single-Source Responsibility for Finishing Materials: Obtain finishing materials from either the same manufacturer that supplies cementitious backer board systems and other panel products or from a manufacturer acceptable to cementitious backer board system manufacturer.
- B. Installer Qualifications: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
  - 1. Requirements of Regulatory Agencies: Wherever a fire resistance classification is shown involving cementitious backer board systems (3-hr., 2 hr. and similar designations), provide materials, accessories and application procedures which have been listed by UL or tested according to ASTM E119 to achieve the rating required.
- D. Mock-Ups:
  - 1. Visual Mockups: After approval of samples and sample panel(s), and prior to commencement of the Work, provide a visual mock-up, of not less than 100 ft.<sup>2</sup> of each type of finish, including at least one control joint, to demonstrate aesthetic effects of finishes as

well as qualities of materials and execution. Simulate finished lighting conditions for review of in-place unit of Work. Mock-up shall be representative of the finished Work in all respects.

2. Build visual mockups to comply with the following requirements, using materials indicated for final unit of Work. Locate mockups on-site in the location and of the size indicated or, if not indicated, as directed by Engineer. Demonstrate the proposed range of aesthetic effects and workmanship. Retain and maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work. Approved mockups in an undisturbed condition at the time of Substantial Completion may become part of the completed Work.

## **1.7 DELIVERY, STORAGE AND HANDLING**

- A. Package, Shipping, Handling and Unloading: Deliver materials to project site in manufacturer's unopened bundles and containers with manufacturer's name, brand, type and grade clearly indicated thereon. Handle cementitious backer board to prevent damage to edges, ends, and surfaces. Do not bend or otherwise damage metal corner beads and trim.
- B. Storage and Protection: Store materials inside, above grade in a dry, ventilated space, under cover and in accordance with manufacturer's instructions. Protect from soiling or damage. Avoid exposure of material to the weather by using protective covers. Handle materials to avoid damage. Neatly stack cementitious backer panels flat to prevent sagging.

## **1.8 PROJECT/SITE CONDITIONS**

- A. Project Conditions: Establish and maintain project conditions for applying and finishing cementitious backer board to comply with ASTM C840 requirements or cementitious backer board manufacturer's recommendations, whichever are more stringent.
- B. Do not install panels until installation areas are enclosed and conditioned.
- C. Do not install panels that are wet, those that are moisture damaged, and those that are mold damaged. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.
- D. Temperature Limitations: Installation of board joint treatments shall not start when outside temperature is below 55 deg. F., unless building is enclosed and heated to maintain a continuous and uniform temperature of not less than 55 deg. F., from one week prior to beginning of joint treatment until joint treatment is completed and thoroughly dry. Ventilation, either natural or supplied by fans, circulators or air conditioning systems shall be provided to remove excess moisture during joint treatment. Temperature requirements may be waived only on recommendation of cementitious backer board materials manufacturer.

## 1.8 WARRANTY

- A. General: Warranties specified in this Article shall not deprive the City of other rights the City may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty, Furnish a written warranty, for a five (5) year period, signed by the Manufacturer stating that the cementitious backer board will be free of manufacturing defects that make it unsuitable for its intended use. Upon notification of such defects, within the warranty period, make the necessary repairs and replacements, at the convenience of the City. Other guarantees or warranties may not be substituted by the Contractor for the terms of this special warranty.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. General: Subject to compliance with requirements, provide cementitious backer board and steel framing products by one of the following:
  - 1. Cementitious Backer Board and Related Products
    - a. USG Corporation.
    - b. GP Gypsum Corporation.
    - c. National Gypsum Company.
    - d. CertainTeed Corp.
  - 2. Steel Framing and Furring
    - a. Clark Western Building Systems.
    - b. Dietrich Industries, Inc.
    - c. MarinoWare; Division of Ware Ind.
    - d. USG Corporation for C-H Studs Only.

### 2.2 STEEL FRAMING AND FURRING

- A. Structural Accessories: Steel framing and furring components specified herein by proprietary designation are as manufactured by Dietrich Industries, Inc. and establish the quality standards required. Equivalent products of other manufacturers will be considered provided they meet those established standards.
  - 1. Runners: ASTM C645, roll formed galvanized steel, channel or angle shape, type, size and gauge as recommended by the cementitious backer board manufacturer for the wall system indicated. Provide "Drywall (Nonstructural) Track (TR-Series)" (Dietrich Industries, Inc.).

2. Metal Studs: ASTM C645, roll-formed galvanized steel studs or dimpled steel studs, size and gauge as recommended by the cementitious backer board manufacturer for the wall system and height indicated; the following types:
  - a. "ST Series" (Dietrich Industries, Inc.), for interior partitions, ceilings and column fireproofing.
3. Furring Brackets: Serrated-arm type, adjustable, fabricated from corrosion-resistant steel sheet complying with ASTM C645, minimum thickness of base (uncoated) metal of 0.033 in., designed for screw attachment to steel studs and steel rigid furring channels used for furring.  
  
Provide "FCWB Adjustable Wall Furring Bracket" (Dietrich Industries, Inc.).
4. Metal Furring Strips: 25 gauge electrogalvanized steel members depth as required; Provide "Z-Furring Channels" (Dietrich Industries, Inc.).

### 2.3 BOARD MATERIALS

- A. Cementitious Backer Board: Provide cementitious backer units complying with ANSI A118.9, ASTM C1288 or ASTM C1325; 1/2 in. thick and in maximum lengths available to minimize end-to-end butt joints; Provide one of the following:
  1. "Durock Cement Board" (U.S. Gypsum Co.).
  2. "PermaBase" (National Gypsum Co.).
  3. "Wonder-Board" (Custom Building Products).
  4. "Util-A-Crete Concrete Backer Board" (FinPan, Inc.).

### 2.4 FASTENERS

- A. Metal Framing to Structure: Power driven fasteners providing not less than 200 lbf. pull-out strength and 700 lbf. ultimate shear strength.
- B. Steel Drill Screws for Cementitious backer Board Systems: ASTM C1002, Type G, Type S, or Type W screws, and suitable for fastening into steel not greater than 20 gauge thickness. ASTM C954, for fastening into steel of 20 gauge to 12 gauge thickness. Pan head for metal to metal connections. Bugle head for fastening cementitious backer board.
- C. Concrete and Masonry: For securing to concrete or masonry use 9 gauge case-hardened and quenched steel nails of sufficient length to provide permanent fastening.
- D. Other Applications: For other applications involving cementitious backer board comply with cementitious backer board manufacturer's printed recommendations.

- E. Fasteners for Cementitious Board: For fastening cementitious backer units use corrosion resistant coated steel drill screws of size and type recommended by board manufacturer.

## **2.5 AUXILIARY MATERIALS**

- A. Joint Treatment Materials: Provide joint treatment materials complying with ASTM C475 and the recommendations of both the manufacturers of sheet products and of joint treatment materials for each application shown.
- B. Water: Clean and free of deleterious material.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.

### **3.4 INSTALLATION, GENERAL**

- A. Application Requirements
  1. Cementitious backer Board: Install cementitious backer board and accessories in accordance with ASTM C840, unless otherwise shown or specified. Install cementitious backer panels with face side out. Do not install imperfect, damaged, or damp panels.
  2. Metal Stud: Install metal stud components in accordance with ASTM C754, unless otherwise shown or specified. Space metal studs maximum of 16 in. o.c., unless otherwise shown. Install steel studs so flanges point in the same direction and leading edge or end of each cementitious backer board panel can be attached to open (unsupported) edges of stud flanges first.

## B. Framing

1. Isolate framing from building structure to prevent transfer of loading imposed by structural movement both horizontally and vertically, at the following locations:
  - a. Where edges of suspended ceilings abut building structure horizontally at ceiling perimeters or penetration of structural elements.
  - b. Where partition and wall framing abuts overhead structure. Provide slip or cushioned type joints to attain lateral support and avoid axial loading.
2. Do not bridge building expansion and control joints with steel framing or furring members; independently frame both sides of joints with framing or furring members.
3. Install runner tracks at floors, ceilings and structural walls and columns where stud system abuts other work, except as otherwise indicated. Install fasteners a maximum of 2 in. from each corner and end of tracks. Terminate partition stud system at structure above except where otherwise indicated.
4. Provide steel studs at door openings in accordance with the following:
  - a. Two 20 gauge (minimum unless project conditions required heavier gauge) studs at each jamb and one additional stud no more than 6 in. from jamb studs schedule:
  - b. Provide runner track and typical studs above door openings with studs spaced not more than 16 in. o.c.
  - c. At welded frames with fixed anchor clips secure stud reinforcing to jamb anchor clips with not less than two self tapping screws per clip.
  - d. Provide additional framing, reinforcing and bracing at door head locations as required to provide a rigid installation. Bracing shall be attached to structural elements, beams, slabs, etc. Attachment to mechanical or electrical components will not be permitted
5. Provide additional framing, reinforcing and blocking as required to support cementitious backer board at openings and cutouts and to support built-in anchorage, support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction and attachment devices for other work.

### 3.5 CEMENTITIOUS BACKER BOARD INSTALLATION

- A. Use as substrate for ceramic tile and elsewhere as shown.
- B. Pre-cut board to required sizes, making necessary cut-outs. Fasten boards to studs with screws spaced not more than 8 in. center to center. Apply 2 in. wide fiberglass reinforcement tape over joints and corners; embed with mortar or adhesive used to set tile.

### 3.6 INSTALLATION OF CHASES

- A. Align two parallel rows of floor and ceiling runners and secure as hereinbefore specified for partitions. Position metal studs vertically in runners, 16 in. o.c. and secure to runners with screws. Brace studs with 2-1/2 in. metal studs installed horizontally at 48 in. o.c. Install cementitious backer board as specified for partitions.

### 3.7 GENERAL FINISHING REQUIREMENTS

- A. Level 2 Finish for Cementitious Backer Board Utilized as Substrate for Ceramic Tile or Other Tile Like Finishes: In areas scheduled for installation of ceramic tile or other tile like finishes, finish Cementitious Backer board in accordance with ASTM C840, Level 2, unless otherwise shown or specified. Level 2 consists of embedding the tape in joint compound at joints and angles and applying (1) one separate coat of joint compound over joints, angles, fastener heads, and flanges of trim accessories. Panel surfaces and joint compound must be smooth and free of tool marks and ridges.
  - 1. For Cementitious backer board to receive paint finish only, provide additional, continuous skim coat of joint compound over all exposed surfaces.
- B. Acoustical Sealant: Fill openings around cutouts, penetrations and other openings with acoustical sealant.
- C. Reinforcement: Reinforce joints at tapered edges and interior corners with joint reinforcing tape set in joint compound in accordance ASTM C840, levels of finish as specified.
- D. Installation of Metal Trim: For trim accessories with back flanges, fasten to framing with the same fasteners used to fasten cementitious backer board.

### 3.8 FIELD QUALITY CONTROL

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. Tolerances
  - 1. Lightgauge framing within 1/8 in. in 10 ft. (non-cumulative) for plumbness and level, +/- 1/8 in. for fastening surfaces of adjacent framing members and for deviation from specified spacing.
  - 2. Finish board surfaces within 1/4 in. in 10 ft. (non-cumulative) for plumb, level, warp and bow.
  - 3. Finish board surfaces within +/- 1/4 in. from plan location.
  - 4. Finish board surfaces within 1/16 in. between planes of board faces.
- C. Testing for STC Ratings: Conduct Sound Transmission Class field ratings tests in accordance with ASTM E336 for partitions in sound controlled spaces where shown. The Engineer may designate similar sized spaces, in lieu of those shown, for conducting STC testing.

**3.9 CLEANING**

- A. Clean-Up: Remove cementitious backer board debris and leave floors broomclean. Excess material, scaffolding, tools and other equipment are to be removed upon completion of the Work.

**3.10 PROTECTION**

- A. General: Protect fixtures, frames, inserts and other contiguous work from rusting, soiling or clogging due to cementitious backer board installation. Protect and maintain the work through the construction period so that it will be without indication of damage at the time of acceptance by the Engineer.
- B. Remove and replace panels that are wet, moisture damaged, and mold damaged.
  - 1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
  - 2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

**END OF SECTION**

**SECTION 09 67 00 – FLUID APPLIED FLOORING****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide fluid applied flooring in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Sealants and joint fillers installed at interface of fluid applied flooring are specified under Section 07 92 50 "Joint Sealants".

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the references, except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern
  - 1. American Society for Testing and Materials (ASTM): ASTM C811 "Standard Practice for Surface Preparation of Concrete for Application of Chemical- Resistant Resin Monolithic Surfacing"

**1.3 SUBMITTALS**

- A. Product Data: Provide manufacturer's data sheets or equivalent printed literature, specifications, substrate preparation, installation instructions and other data indicating product information correlated to specified requirements and as may be required to show compliance with the Contract Documents.
- B. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Submit samples of each type of fluid applied flooring specified in colors as selected. Samples shall be 12 in. square, on plywood and shall show the various stages of installation.
- C. Quality Control Submittals: Submit the following:
  - 1. Test Reports
    - a. Material Test Reports: Material test reports for each fluid applied flooring system and component showing compliance with Contract Documents.
- D. Closeout Submittals: Submit the following:
  - 1. Warranties: Special warranties as specified.

2. Maintenance Instructions: Provide two (2) copies of manufacturer's written instructions and recommendations for maintenance and cleaning of each type of fluid applied flooring system.

#### **1.4 QUALITY ASSURANCE**

- A. Single Source Responsibility: Obtain primary fluid applied flooring materials including primers, resins, waterproofing membranes, hardening agents, finish or sealing coats from a single manufacturer with not less than five (5) years of successful experience in supplying principal materials for work of type and extent shown and described in this section. Provide secondary materials only of type and from source recommended by manufacturer of primary materials.
- B. Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work. Only persons trained by resinous flooring manufacturer for applying specified systems indicated may be used.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Mock-Up(s): Following approval of samples, construct visual mock-ups, extent as shown or if not shown, a minimum of 100 ft<sup>2</sup>, consisting of specified fluid applied flooring system(s) to simulate final conditions. Alter or revise mock-up(s) as directed, to the complete satisfaction of the City of New York, at which time they shall remain as the standard of workmanship for the Project. Mock-up(s), if approved, may be utilized in the final work.
- E. Pre-Installation Meeting: Prior to the installation, meet at the project site to review the material selections, substrate preparations, installation procedures, substrate compliance with manufacturer's requirements for moisture vapor transmission, coordination with other trades, special details and conditions, standard of workmanship, and other pertinent topics related to the Work.

#### **1.5 DELIVERY, STORAGE AND HANDLING**

- A. Packing, Shipping, Handling, and Unloading: Deliver materials in manufacturer's standard unopened packaging, fully identified.
- B. Storage: Store materials above grade and protected from the weather, soiling or damage. Store in accordance with manufacturer's instructions.

#### **1.6 PROJECT/SITE CONDITIONS**

- A. Requirements: Comply with resinous flooring manufacturer's directions for maintenance of substrate temperatures, ventilation, and other conditions required to execute and protect work. Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions

during fluid applied flooring application. Close spaces to traffic during fluid applied flooring application and for not less than 24 hours after application, unless manufacturer recommends a longer period

## 1.7 WARRANTY

- A. Warranty specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty: Upon completion of the fluid applied work, provide, manufacturer's and Contractors written extended warranty stating that the fluid applied flooring systems installed will be waterproof and free from defects including but not limited to delamination and wear through for a period of not less than two (2) years from date of final acceptance and that in the event that defects or leaks occur within the period stipulated, the Contractor shall, at the convenience of the City of New York, effect repairs and replacements necessary to remedy defects.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Fluid Applied Flooring ( **RMX-01** ): A seamless multi-component flooring system consisting of a primer, a reinforced waterproof membrane, a trowel applied cementitious body coat, fillers and a finish color sealer topcoat complete with troweled-in graded aggregate. Minimum total thickness: 3/16 in. Color: LIGHT Grey. Provide one of the following:
  - 1. "Permalith MER with Epo-Flex Waterproofing Membrane" (General Polymers).
  - 2. "Traffic Membrane I with Waterproofing Membrane " (Selby Ucrete, Division of Degussa Building Systems).
  - 3. "Dex-O-TeX, M-E Floor with Waterproofing Membrane " (Crossfield Products Corp.).
  - 4. or approved equal.
- B. Metal Edge Strips: Mill finished stainless steel, AISI Type 302, of standard design. Provide concealed anchorage type unless otherwise shown.
- C. Color: Colors of each type of fluid applied flooring shall be custom to match Engineer's sample.

## PART 3 - EXECUTION

### 3.1 GENERAL

- A. Manufacturer's Instructions: Prepare substrates, apply primers and apply the work of this Section, including components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project

conditions require extra precautions or provisions to ensure satisfactory performance of the Work

### 3.2 EXAMINATION

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected
- B. Repair: Repair damaged and deteriorated concrete and verify that concrete substrates are dry.

### 3.3 PREPARATION

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Concrete Surfaces: Comply with ASTM C811 "Standard Practice for Surface Preparation of Concrete for Application of Chemical-Resistant Resin Monolithic Surfacing".
  - 1. Concrete Preparation: Clean and prepare the substrate so that it is free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with resinous flooring. Grind and fill concrete surfaces as required to meet pre-installation tolerances. Mechanically scarify concrete substrate by sandblasting, grinding or portable shot blast cleaning system as may be required to provide a proper surface or to remove curing compounds or other surface contaminants that would interfere with proper bond of system.
  - 2. Concrete Testing: Verify that concrete substrates are dry. Perform moisture in concrete test in accordance with ASTM F1869, "Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride Moisture Emissions Test." Proceed with application only after testing indicates moisture vapor transmission levels are in accordance with manufacturer's recommendations. Proceed with application only after substrates pass testing.
  - 3. Ph Testing: Verify that concrete substrates have neutral Ph and that resinous flooring will adhere to them. Perform tests recommended by manufacturer. Proceed with application only after substrates pass testing
- C. Primer: Apply primer and bonding agent to substrates. Coordinate timing of primer application with application of topping mix to insure optimum adhesion between resinous flooring materials and substrate.
- D. Coordination: Coordinate the installation of fluid applied flooring with floor drains, equipment bases, curbs and other adjacent work. Mask adjacent work to prevent soil marks.

### 3.4 INSTALLATION

- A. General: The mixing, placing, finishing and curing of the fluid applied flooring shall produce a uniform monolithic wearing surface of thickness required, uninterrupted except at divider strips, sawn joints or other types of joints (if any), indicated or required. Treat control joints and other nonmoving substrate cracks to prevent cracks from reflecting through fluid applied flooring. Coordinate application of components to provide optimum adhesion of resinous flooring system to substrate, and optimum intercoat adhesion
- B. Waterproof Membrane: Where indicated or required, apply monolithic reinforced waterproof membrane on entire floor and vertically on walls or curb to form minimum 4 in. high room perimeter.
- C. Troweled Application of Topping Mix: Trowel-apply topping mix including fine aggregates or fillers over freshly applied primer in number of coats and at spreading rates required to produce minimum thickness required. Check thickness at frequent and regular intervals. Perform finish troweling as work proceeds. Remove trowel marks by power sanding.
- D. Grout Coat: If required, after topping mix has cured sufficiently, apply grout coat of type required to fill topping mix in number of coats and spreading rates to produce a uniform surface.
- E. Finish or Sealing Coat: Apply finish or sealing coats of type required to produce non-slip finish.
- F. Cove Base: Apply floor system to wall surfaces at locations shown to form base with cove or radius shown and a height of 4 in. unless otherwise indicated. Apply prior to installation of floor surfaces. Round interior and external corners.
- G. Edge Strip Installation: Install metal edge strips in continuous lengths at edges of fluid applied flooring and bases, unless otherwise shown. Anchor strips solidly to substrate with countersunk non-magnetic stainless steel screws; space anchors 1 in. from each end and not more than 9 in. on centers at intermediate points. Install strips before priming substrate.
- H. Extend flooring into recesses, floor drain, over mechanical equipment bases, and under equipment in the spaces shown to receive fluid applied flooring. Include integral cove bases, raised bases and depressions to form a complete monolithic covering without interruptions or seams. Place and finish flooring neatly around obstructions, in a manner that will achieve uniform color and texture throughout.
- I. Patch fluid applied flooring applied over equipment boxes following equipment installation, as required to maintain monolithic waterproof integrity.
- J. Provide non-slip textures where indicated. Provide colors and textures as selected by the Engineer.
- K. Curing: Cure resinous flooring materials taking care to prevent contamination during stages of application and prior to completion of curing process.

**3.5 FIELD QUALITY CONTROL**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. Core Sampling: When directed at locations designated, take 1 core sample per 1000 ft.<sup>2</sup> of resinous flooring, or portion of, to verify thickness. For each sample that fails to comply with requirements, take two additional samples. Repair damage caused by coring and correct deficiencies.

**3.6 CLEANING**

- A. After curing, but not more than 4 days before acceptance or occupancy by the City of New York, clean flooring as recommended by the manufacturer. Remove masking and soiling from adjacent work.

**3.7 PROTECTION**

- A. Protect fluid applied flooring throughout the construction period so that it will be without indication of use or damage at the time of acceptance by the City of New York.

**END OF SECTION**

## SECTION 09 90 00 – PAINTS AND COATINGS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide paints and coatings in accordance with requirements of the Contract Documents.
  - 1. Examine the requirements of the other technical Sections as to the location, extent and nature of painting work specified therein and include such items to be painted under this Section as are not included in the other Sections.
  - 2. In general, paint exposed surfaces except surfaces noted as pre-finished or not to be painted. Where items or surfaces are not specifically mentioned, paint the same as adjacent materials or areas. Specifically, "Paint" includes substrate preparation, coating systems materials, primers, emulsions, enamels, stains, sealers and fillers, and other applied materials whether used as prime, intermediate, or finish coats.
- B. Related Work Specified Elsewhere
  - 1. Factory finished items and equipment.
  - 2. Shop prime painting of miscellaneous metals fabrications is specified under Section 05 50 00 "Metal Fabrications".
  - 3. Shop prime painting of steel doors and frames is provided under Section 08 11 13 "Hollow Metal Doors and Frames". Finish painting is provided under this Section.
  - 4. Mechanical and electrical components and assemblies are provided under Divisions 21, 22, 23 and Divisions 26, 27, 28 respectively. Finish painting of mechanical and electrical components and assemblies is provided under this Section.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. The Society for Protective Coatings (SSPC)
    - a. SSPC Volume 1 "Good Painting Practice".
    - b. SSPC Volume 2 "Systems and Specifications".
  - 2. The Painting and Decorating Contractors of America (PDCA): PDCA "Specification Manual".

3. American Society for Testing and Materials (ASTM):
  - a. ASTM D4261 "Practice for Surface Cleaning Unit Masonry for Coating".
  - b. ASTM D523: "Test Method for Specular Gloss".
4. Code of Federal Regulations: "40 CFR 59, Subpart D-2002: National Volatile Organic Compound Emission Standards for Architectural Coatings".

### 1.3 DEFINITIONS

- A. General: Standard Coating Terms and Specular Gloss Range: Standard coating terms and gloss ranges are defined as follows:
  1. Flat refers to a lusterless or matte finish with a gloss range below 15 when measured at an 85-degree meter.
  2. Eggshell refers to low-sheen finish with a gloss range between 20 and 35 when measured at a 60-degree meter.
  3. Semigloss refers to medium-sheen finish with a gloss range between 35 and 70 when measured at a 60-degree meter.
  4. Full gloss refers to high-sheen finish with a gloss range more than 70 when measured at a 60-degree meter.

### 1.4 SUBMITTALS

- A. Product Data: Submit for Engineer's action. Submit manufacturer's data for each paint system specified, including block fillers and primers indicating product information correlated to specified requirements. Provide the manufacturer's technical information including label analysis and instructions for handling, storage, and application of each material proposed for use. List each material and cross-reference the specific coating, finish system, and application. Identify each material by either by the actual formula or the manufacturer's catalog and/or code number and general classification as suitable for duplication and replacement purposes.
- B. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide two (2) 12 in. x 12 in. samples on hardboard substrate, for each color, sheen and texture duplicated to simulate final conditions. Show various stages of finish on displays.
- C. Detailed Painting Schedule: Submit for Engineer's information. Prepare a "Detailed Painting Schedule" on the basis of the surfaces, types of paint materials, number of coats required, and list the brand name of the product of the manufacturer proposed for each use. Use same designations indicated on Drawings and in schedules. Indicate each material and cross-reference specific coating, finish system, and application with identification related by manufacturer's catalog number and general classification.

- D. Quality Control Submittals: Submit for Engineer's information.
  - 1. Certificates
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
- E. Closeout Submittals: Submit for City of New York's documentation.
  - 1. Maintenance Manuals: Two (2) copies of maintenance manuals describing the materials, devices and procedures to be followed in cleaning and maintaining the various paint and coating systems including specific precautions.
  - 2. Color Formula List: Submit a list of each finish color and paint system type for coatings applied on exposed surfaces in the Work. Identify each color either by the actual formula or by manufacturer's code number, as suitable for duplication and replacement purposes.

## 1.5 QUALITY ASSURANCE

- A. Applicator Qualifications: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Paint Manufacturer Single-Source Responsibility: Provide primers, fillers and undercoat paint produced by the same manufacturer as the finish coats.
  - 1. Material Quality: Provide the manufacturer's best quality trade sale paint material of the various coating types specified. Paint material containers not displaying manufacturer's product identification will not be acceptable. Proprietary names used to designate colors or materials are not intended to imply that products named are required or to exclude equal products of other manufacturers.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Mock-Up(s) (Benchmark Samples)
  - 1. Provide mock-up(s) consisting of full-coat benchmark finishes for each type of coating and substrate required after approval of paint samples, totaling approximately 100 ft.<sup>2</sup> each in spaces designated by the Engineer for final review. Duplicate finish of approved sample Submittals.

2. Apply benchmark finishes, according to requirements for the completed Work, after permanent lighting and other environmental services have been activated. Provide required sheen, color, and texture on each surface. After finishes are accepted, Engineer will use the room or surface to evaluate coating systems of a similar nature.
- E. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review methods and sequence of Work, special details and conditions, standard of workmanship, and other pertinent topics related to the Work. Review other areas of the Work in which primers are provided to ensure compatibility of the total systems for various substrates.

## **1.6 DELIVERY, STORAGE, AND HANDLING**

- A. Packing, Shipping, Handling and Unloading: Deliver paint materials to the job site in original containers and packages, bearing the manufacturer's labels, indicating name, type, brand, color name and number, application instructions, contents by volume, for pigment, vehicle and volatile constituents. Unless otherwise directed, deliver paints ready-mixed. Order in advance in large enough quantities and in ample time to facilitate the Work.
- B. Storage and Protection: Store materials and equipment in a designated storage space on the site. Protect paint and associated materials from freezing. Keep storage space neat, clean and accessible at all times. Protect floors from paint spillage. Remove oily rags and waste daily. Take necessary measures to ensure that workers and work areas are protected from fire and health hazards resulting from handling, mixing, and application.

## **1.7 PROJECT/SITE CONDITIONS**

- A. Requirements
1. Do not paint when the air is dust-laden nor when weather and temperature conditions are unsuitable. Maintain temperatures within the building at a minimum of 60 deg. F. during the painting and drying periods.
  2. Apply paint only when the temperature of surfaces to be painted and surrounding air temperatures are between 50 deg. F. and 90 deg. F. Comply with manufacturer's recommendation when they are more stringent with respect to application temperatures.
  3. Do not apply paint in snow, rain, fog, or mist; or when the relative humidity exceeds 85%; or at temperatures less than 5 deg. above the dew point; or to damp or wet surfaces. Comply with manufacturer's recommendation when they are more stringent with respect to application temperatures.
  4. Painting may continue during inclement weather if surfaces and areas to be painted are enclosed and heated within temperature limits specified by the manufacturer during application and drying periods.

**PART 2 - PRODUCTS****2.1 MATERIALS**

- A. Material Compatibility: Provide block fillers, primers, finish coat materials, and related materials that are compatible with one another and the substrates indicated under conditions of service and application, as demonstrated by the manufacturer based on testing and field experience.
- B. Paint Materials: Subject to compliance with requirements, provide materials of the following manufacturers or approved equal:

## Exterior

Carboline Co.  
Tnemec  
Ameron  
DuPont  
Akzo Nobel (ICI Paints)

## Interior

Benjamin Moore  
PPG  
Sherwin-Williams  
Glidden Pro  
MAB Paints  
Akzo Nobel (ICI Paints)  
Martin Senour Paints  
Pratt & Lambert

- C. Use products of the same manufacturer for succeeding coats. Where primer is shop applied to steel, subsequent coats may be the product of another manufacturer provided the coatings are mutually compatible. Review other sections in which primers are provided to ensure compatibility of the total systems for various substrates.
- D. Chemical Components of Field-Applied Interior Painting: Provide products that comply with the following limits for VOC content, exclusive of colorants added to a tint base, when calculated according to 40 CFR 59, Subpart D (EPA Method 24) and the following chemical restrictions; these requirements do not apply to primers or finishes that are applied in a fabrication or finishing shop:
  - 1. Flat Paints and Coatings: VOC content of not more than 50 g/L.
  - 2. Nonflat Paints and Coatings: VOC content of not more than 150 g/L.
  - 3. Primers, Sealers and Undercoaters: VOC content of not more than 200 g/L.
  - 4. Anticorrosive Coatings: VOC content of not more than 250 g/L.

5. Zinc Rich Industrial Maintenance Primers: VOC content of not more than 340 g/L.
6. Pretreatment Wash Primers: VOC content of not more than 420 g/L.
7. Floor Coatings: VOC content of not more than 100 g/L.
8. Aromatic Compounds: Paints and coatings shall not contain more than 1.0 percent by weight of total aromatic compounds (hydrocarbon compounds containing one or more benzene rings).
9. Restricted Components: Paints and coatings shall not contain any of the following chemicals nor other restricted components and/or chemicals not in compliance with governing authorities:
  - a. Acrolein.
  - b. Acrylonitrile.
  - c. Antimony.
  - d. Benzene.
  - e. Butyl benzyl phthalate.
  - f. Cadmium.
  - g. Di (2-ethylhexyl) phthalate.
  - h. Di-n-butyl phthalate.
  - i. Di-n-octyl phthalate.
  - j. 1,2-dichlorobenzene.
  - k. Diethyl phthalate.
  - l. Dimethyl phthalate.
  - m. Ethylbenzene.
  - n. Formaldehyde.
  - o. Hexavalent chromium.
  - p. Isophorone.
  - q. Lead.
  - r. Mercury.
  - s. Methyl ethyl ketone.
  - t. Methyl isobutyl ketone.
  - u. Methylene chloride.
  - v. Naphthalene.
  - w. Toluene (methylbenzene).
  - x. 1,1,1-trichloroethane.
  - y. Vinyl chloride.

- E. Colors, textures and degree of luster will be as selected by the Engineer. Tint prime and undercoats approximately to the shade of the final coat but with sufficient variation to distinguish them from the preceding coat. Proprietary names used to designate colors or materials are not intended to imply that products named are required or to exclude equal products of other manufacturers.
- F. In locations where ambient temperature-humidity conditions encourage the ready formation of mildew, use paints with additional mildew inhibitive agent incorporated during the manufacturing process, of type and in concentration recommended by the paint manufacturer to withstand such mildew formation.

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates, apply primers and apply the work of this Section, including equipment, components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

#### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected

#### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Surface Preparation, General
  1. Prepare surfaces to receive paint; thoroughly clean of grime, grease, dirt, loose material and other substances that may interfere with proper adhesion of paint. Provide barrier coats over incompatible primers or remove and reprime. Paint dry surfaces only.
  2. Remove or protect hardware, hardware accessories, plates, signs, trim for mechanical work, machined surfaces, lighting fixtures and similar items in place and not to be finish painted. Disconnect and move equipment adjacent to areas scheduled to be painted. Reposition and reconnect items and remove protection upon completion of each space.
  3. Cleaning: Before applying paint or other surface treatments, clean the substrates of substances that could impair the bond of the various coatings. Remove oil and grease prior to cleaning. Schedule cleaning and painting so dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.

4. Fill dents, cracks, hollow places, open joints and other irregularities with a filler suitable for the purpose and, after setting, sand to a smooth finish.
5. Prime surfaces not more than 8 hours after cleaning except as otherwise specified by the prime paint manufacturer.

C. Metals, Surface Preparation

1. General: Clean bare metal surfaces thoroughly of foreign matter such as mortar, plaster, grease, rust, scale and dirt before priming coat is applied. Remove oil, grease and similar contaminants in accordance with SSPC SP-1 "Solvent Cleaning", prior to additional surface preparation specified. Remove rust and mill scale in accordance with SSPC SP-3 "Power Tool Cleaning". Where solder flux has been used, clean surface with solvent, or use mechanical tools to remove. Immediately after surface preparation, apply primer in accordance with manufacturer's instructions. Use painting methods which will result in full coverage and dry film thickness specified. After erection is completed, touch-up heads of bolts, welded surfaces and other field connections with specified primer.
2. Shop Primed Ferrous Metal Surfaces: Remove grease and oil with a cleaner recommended for the purpose.
  - a. For exterior exposed steel, follow cleaning by abrading all epoxy shop coated surfaces as recommended by manufacturer to provide a proper bonding surface for finish coat. Exercise care to prevent damage to shop coat. Touch-up abraded or marred shop coats with paint used for priming or "universal primer" compatible with primer, topcoat, and field surface preparation.
3. Zinc Coated (Galvanized), Aluminum and Stainless Steel Surfaces: Remove grease and oil with a cleaner recommended for the purpose. Treat and roughen surfaces using either mechanical or chemical means. When chemical compound is used rinse the chemical compound completely with clean, fresh water.

D. Concrete and Masonry Surface Preparations: Delay painting on concrete or masonry surfaces as long as practicable within the limits of the Contract. Test surfaces for presence of alkali and neutralize as required. Test surfaces for moisture content and do not paint surfaces which exceed manufacture's printed instructions. Remove grease, oil, form release agents and efflorescence. Patch cracks and other blemishes to be covered by paint. Neutralize concrete surfaces which have received capillary waterproofing, utilizing materials and methods as recommended by the manufacturer and applicator of the capillary waterproofing.

1. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled in accordance with manufacturer's instructions.

2. Clean concrete floors to be painted with a 5% solution of muriatic acid or other etching cleaner. Flush the floor with clean water to remove acid, neutralize with ammonia, rinse, allow to dry, and vacuum before painting.
- E. Pipe Covering and Insulation, Surface Preparation: Clean surfaces of pipe, duct and equipment insulation (such as canvas jackets and troweled-on insulation), of loose, foreign and objectionable material prior to priming or sealing.

### 3.4 WORKMANSHIP

- A. General: Use applicator and techniques best suited for substrates and type of material being applied. Apply materials at not less than recommended spreading rate to establish a total dry film thickness as indicated or, if not indicated, as recommended.
- B. Mix materials thoroughly before application to produce a mixture of uniform density; strain if necessary, before using. Do not mix surface film into material. If necessary, remove surface film and re-strain material before using. Do not adulterate ready-mixed materials except in accordance with the manufacturer's printed instructions. If no printed instructions appear on the container, obtain this information in writing from the manufacturer. Use only approved thinners and only within recommended limits.
- C. Tinting: Tint each undercoat a lighter shade to facilitate identification of each coat where multiple coats of the same material are applied. Tint undercoats to match the color of the finish coat, but provide sufficient differences in shade of undercoats to distinguish each separate coat.
- D. Apply materials with care to a uniform and proper film thickness, showing no runs, holidays, sags, crawls or other defects. Apply with a minimum of brush marks. Finish surfaces shall be uniform in sheen, color and texture.
- E. Application Procedures: Apply paints and coatings by brush, roller, spray, or other applicators as follows:
1. Brushes: Use brushes best suited for the material applied.
  2. Rollers: Use rollers of carpet, velvet back, or high-pile sheep's wool for the material and texture required.
  3. Spray Equipment: Use airless spray equipment with orifice size for the material and texture required.
- F. The number of coats and the film thickness required are the same regardless of the application method. Do not apply succeeding coats until the previous coat has cured as recommended by the manufacturer. Sand between applications where sanding is required to produce a smooth even surface. Apply additional coats if undercoats, stains, or other conditions show through final coat of paint until paint film is of uniform finish, color, and appearance. Give special attention to ensure that surfaces, including edges, corners, crevices, welds, and exposed fasteners, receive a dry film thickness equivalent to that of flat surfaces.

- G. Apply two thin coats of paint to bare wood surfaces in sliding contact so as not to interfere with proper operation. Do not paint other materials in sliding contact. Remove paint applied to such surfaces.
- H. Paint access doors, plates, panel boxes, steel grilles, louvers, convactor covers, registers, exposed prime painted hardware and the like in colors as selected. Paint back sides of access panels and removable or hinged covers to match exposed surfaces. Paint interior surfaces of ducts or piping where visible through registers or grilles with a flat, non-specular paint type appropriate to surface to be painted. Finish paint doors on tops, bottoms, and side edges the same as exterior faces. Do not paint nameplates on equipment or over Underwriter's Laboratories, Factory Mutual or other code-required labels or equipment name, identification, performance rating, or nomenclature plates.
- I. Do not paint heating elements and pipes while they contain heat. Keep them cold until after the final coat has thoroughly dried.
- J. Mechanical and Electrical Work: Painting of mechanical and electrical work is limited to items exposed in equipment rooms and occupied spaces.
  - 1. Mechanical items to be painted include, but are not limited to uninsulated metal piping, uninsulated plastic piping, pipe hangers and supports, tanks that do not have factory-applied final finishes, visible portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets, duct, equipment, and pipe insulation having "all-service jacket" or other paintable jacket material, and mechanical equipment that is indicated to have a factory-primed finish for field painting.
  - 2. Electrical items to be painted include, but are not limited to, switchgear, panelboards and electrical equipment that is indicated to have a factory-primed finish for field painting.
- K. Allow coats to dry and cure thoroughly before succeeding coats are applied; allow a minimum of 24 hours between applications on any one surface unless otherwise specified by the manufacturer.
- L. Sandpaper undercoats on interior metal thoroughly and uniformly to provide a smooth, even surface for finish coats.
- M. Surfaces given a prime or body coat of paint under other sections of these specifications will not require such coats of paint under this specification section. Repair existing prime coatings with same primer or undercoat unless otherwise specified.
- N. Furnish competent technical assistance by the paint manufacturer on the job to ensure proper application of his material.
- O. When using paint with additional mildew inhibitive formulation, observe the procedures and precautions in the paint manufacturer's printed instructions for the use of this product.

### 3.5 SCHEDULE OF EXTERIOR PAINTS AND COATINGS

A. General: Paint exterior surfaces exposed to view in accordance with this Schedule of Exterior Paints and Coatings, except as specifically shown or specified.

B. Metals

1. Ferrous Metal

a. With Zinc Rich Primer: Compatible with, and of the same manufacturer as, the primer. Provide the respective dry film thickness specified; satin gloss finish coat; one of the following:

1st coat

"Hi-Build Epoxoline II Series N69" (Tnemec Co. Inc.); 4.0 - 6.0 mils (100µm - 150µm) d.f.t.

"Carboguard 888 Series" (Carboline Co.); 4.0 - 6.0 mils (100µm - 150µm) d.f.t.

"Interseal 670HS (International Paint), 4.0- 8.0 mils min d.f.t.

Or approved equal.

2nd coat

"Carbothane 133 Series/833" (Carboline Co.). 3.0 - 5.0 mils d.f.t.

"Endura-Shield II 1075" (Tnemec Co. Inc.); 3.0 - 5.0 mils d.f.t.

"Interthane 870UHS" (International Paint), 5.0- 8.0 mils min d.f.t.

Or approved equal.

Clear top coat

Tnemec Co. Inc. "Enviro-glaze Series 297" clear coating as basis of design but not intended to imply a preference for a specific product.

Or as manufactured by Carboline Co. or International Paint.

Or approved equal.

b. Shop-Primed: Apply two coats with the manufacturer recommended dry film thickness for each coat; semi-gloss finish coats; Provide one of the following, compatible with primer:

"Endura-Shield II 1075" (Tnemec Co. Inc.); 3.0 - 5.0 mils d.f.t.  
 "Carbothane 133 Series/833" (Carboline Co.). 3.0 - 5.0 mils d.f.t.

"Interthane 870UHS" (International Paint), 5.0- 8.0 mils min d.f.t. Or approved equal.

2. Aluminum: Compatible with the surface preparer. Provide the manufacturer recommended dry film thickness for each coat; semi-gloss finish coats, unless otherwise specified to receive Architectural Finish (AMAA 2605);

1st coat - Epoxy Primer

2nd coat - Alkyd Semi Gloss

3. Stainless Steel: Compatible with the surface preparer. Provide the manufacturer recommended dry film thickness for each coat; semi-gloss finish coats;

1st coat - Epoxy Primer

2nd coat - High Build Aliphatic Polyurethane; 3.0 - 5.0 mils d.f.t.

- C. Concrete, Concrete Masonry Units

1st coat - Latex Block Filler

2nd coat - Elastomeric Acrylic Latex 3rd coat - Elastomeric Acrylic Latex

### 3.6 SCHEDULE OF INTERIOR PAINTS AND COATINGS

- A. General: Paint interior surfaces exposed to view in accordance with this Schedule of Interior Paints and Coatings, except as specifically shown or specified.

- B. Ferrous Metal

1. Metals, Shop-Primed

1st coat - Alkyd Undercoater

2nd coat - Alkyd Eggshell Enamel

2. Galvanized

1st coat - Water Based Acrylic Primer 2nd coat - Alkyd Eggshell Enamel

3. Semi-Gloss Epoxy Finish: One of the following systems: Pittsburgh Paints

1st coat - "Speedhide Primer 6-212"; 2.0 mils d.f.t.

2nd coat - "Pitt-Glaze Acrylic Epoxy"; 3.0 - 4.0 mils d.f.t. 3rd coat - "Pitt-Glaze Acrylic Epoxy"; 3.0 - 4.0 mils d.f.t.

DuPont Company

1st coat - "Tufcote 1.9 HG-D"; 2.0 - 3.0 mils d.f.t. 2nd coat - "Corlar 76P"; 2.0 - 3.0 mils d.f.t.

3rd coat - "Corlar 76P"; 2.0 - 3.0 mils d.f.t. Devoe Paints

1st coat - "Mirrolac No. 13101 "; 2.0 - 2.5 mils d.f.t.

2nd coat - "Gardcote-WB No. 25U8xx "; 2.0 - 3.0 mils d.f.t. 3rd coat - "Gardcote-WB No. 25U8xx "; 2.0 - 3.0 mils d.f.t.

Ameron

1<sup>st</sup> coat - "Amercoat A148"; 2.0 – 3.0 mils d.f.t. 2<sup>nd</sup> coat - "Amercoat A335"; 2.0 – 3.0 mils d.f.t. 3<sup>rd</sup> coat - "Amercoat A335"; 2.0 – 3.0 mils d.f.t.

Or approved equal.

C. Concrete, Concrete Masonry Units:

1. Enamel Finish

1st coat - Latex Block Filler 2nd coat - Enamel Undercoater

3rd coat - Alkyd Eggshell Enamel

2. Epoxy Finish

Pittsburgh Paints

1st coat - "Pitt-Glaze Latex Block Filler 16-90"; 12.5 mils d.f.t. 2nd coat - "Pitt-Glaze Acrylic Epoxy"; 3.0 - 4.0 mils d.f.t.

3rd coat - "Pitt-Glaze Acrylic Epoxy"; 3.0 - 4.0 mils d.f.t. DuPont Company

1st coat - "300P Acrylic Block Filler"; Apply to fill 2nd coat - "Corlar 76P"; 2.0 - 3.0 mils d.f.t.

3rd coat - "Corlar 76P"; 2.0 - 3.0 mils d.f.t. Devoe Paints

1<sup>st</sup> coat - "Blocktex Block Filler 89301"; Apply to fill

2nd coat - "Gardcote-WB No. 25U8xx"; 2.0 - 3.0 mils d.f.t. 3rd coat - "Gardcote-WB No. 25U8xx"; 2.0 - 3.0 mils d.f.t. Or approved equal.

D. Piping and Mechanical Equipment: Paint piping, pipe hangers and supports, heat exchangers, tanks, ductwork, insulation, motors, electrical conduits, switchgear and other mechanical and electrical equipment except equipment which is non-ferrous metal, plated, finished by manufacturers, permanently concealed or noted to be painted under this section. Properly clean, prepare and finish as specified. Paint materials shall be heat-resisting type when applied to heating lines and equipment.

1. Uninsulated Piping Ductwork, Fittings and Equipment 1st coat - Enamel Undercoater

2nd coat - Alkyd Eggshell Enamel

2. Insulated Piping, Ductwork, Fittings and Equipment 1st coat - Latex Flat  
2nd coat - Alkyd Semi Gloss
3. Machinery and Equipment  
1st coat - Epoxy Type Machinery Enamel 2nd coat - Epoxy Type Machinery Enamel
4. Pipe Identification
  - a. Comply with ANSI A13.1 "Scheme for the Identification of Piping Systems".
  - b. Provide plastic coated fabric pipe markers, all-temperature labels. Indicate the pipe contents in printed, block letters. Provide labels of such length as to completely circumscribe the pipe and overlap not less than 1 in. upon one edge.
  - c. Provide flow markers consisting of labels similar to the pipe markers with a large black arrow printed on the same background color to indicate the direction of flow of material in the pipe.
  - d. On each side of walls or floors through which pipes pass, place a pipe marker and a flow marker on each pipe Place markers adjacent to valves and fittings. For exposed piping locate markers to be clearly visible to a person standing on the floor.
  - e. On pipes or covering 1 in. and smaller in diameter requiring identifying markings, attach metal tag of not less than 1 in. in diameter, with lettering etched and filled with enamel, in lieu of stencils.

### 3.7 PAINT COLOR TYPES

- A. The Engineer's selection of paint colors are indicated by color type; designated "PT- ". Reference to a particular manufacturer's number or color name is used only as a convenience for the Engineer in order to establish the Project color requirements. These references are not intended to describe the required generic paint systems. For generic paint systems requirements, refer to the "Finish Schedule" as applicable to the respective conditions of use.
- B. Reference to a particular manufacturer's number or color name is used only as a convenience for the Engineer in order to establish the Project color requirements. These references are not intended to describe the required generic paint systems. For generic paint systems requirements, refer to the "Finish Schedule" as applicable to the respective conditions of use.
- C. Except as otherwise noted, use flat finish on ceilings and soffits, eggshell finish on walls and fascias, satin or semi-gloss finish on doors and frames, semi-gloss finish on convactor covers and metal trim, and epoxy finish on ceilings and walls in wet spaces where shown or specified.

- D. Samples showing color and sheen selected by the Engineer for specific items or areas specified to receive paint finishes are available for examination in the Engineer's office.
- E. Color Schedule: The following schedule shall be considered as a guide only to color and sheen requirements, subject to the Engineer's modification or approval:
  - 1. Paint Type ( **PT-01** through **PT-20** ): Color and Sheen as indicated on drawings "Finish Schedule".

### **3.8 CITY OF NEW YORK'S MONITORING ACTIVITIES**

- A. City of New York's Testing Agency: A testing agency, engaged at the City of New York's expense, will perform the following activities to monitor the Contractor's Quality Control Program. The monitoring activities do not relieve the Contractor of responsibilities under the Contract.
- B. The City of New York reserves the right to invoke the following test procedure at any time and as often as the City of New York deems necessary during the period when paint is being applied. Samples of material delivered to the Project will be taken, identified, sealed, and certified in the presence of the Contractor.
- C. The testing agency will perform appropriate tests for the following characteristics as required by the City of New York:
  - 1. Quantitative materials analysis.
  - 2. Abrasion resistance.
  - 3. Apparent reflectivity.
  - 4. Flexibility.
  - 5. Washability.
  - 6. Absorption.
  - 7. Accelerated weathering.
  - 8. Dry opacity.
  - 9. Accelerated yellowness.
  - 10. Recoating.
  - 11. Skinning.
  - 12. Color retention.
  - 13. Alkali and mildew resistance.
- D. If test results show material being used does not comply with specified requirements, the Contractor may be directed to stop painting, remove noncomplying paint, pay for testing, repaint surfaces coated with rejected paint, and remove rejected paint from previously painted surfaces if, upon repainting with specified paint, the two coatings are incompatible.
- E. Contractor's Assistance to the City of New York's Testing Agency: Furnish the City of New York's Testing Agency with access to the Work, materials

and facilities as required by the Agency. Provide adequate notice of construction activities to allow timely inspections and observation of Contractor tests, and be available for pre- installation meetings. Furnish the City of New York's Testing Agency with on-site office facilities.

### **3.9 CLEANING**

- A. At the end of each work day, remove empty cans, rags, rubbish, and other discarded paint materials from the site. Remove paint spots, oil or stains upon adjacent surfaces not requiring painting and leave entire job clean.
- B. Upon completion of painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping, using care not to scratch or damage adjacent finished surfaces.

### **3.10 PROTECTION**

- A. Place paint or solvent soaked rags, waste or other materials which might constitute a fire hazard in metal containers and remove from premises at the close of each day's work. Take every precaution to avoid damage by fire.
- B. Provide suitable coverings to protect surfaces not requiring painting. Protect work of other trades, whether to be painted or not, against damage by painting operations. Correct damage by cleaning, repairing or replacing, and repainting, as required and acceptable to City of New York.
- C. Remove or protect items such as hardware, hardware accessories, plates, lighting fixtures and similar items placed prior to painting. Reposition or remove protection upon completion of each space. Disconnect equipment adjacent to walls by workmen skilled in these trades to permit painting of wall surfaces; replace and reconnect after completion of painting.
- D. Maintain wrappings or other factory applied protection furnished with finish hardware (or other items provided by other trades) installed in areas where painting is required. If such protection is displaced or removed, replace before painting work continues and maintain for the duration of painting and coating work.
- E. Provide "wet paint" signs to protect newly painted finishes. Remove temporary protective wrappings provided by others for protection of their work after completion of painting operations. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

**END OF SECTION**

**SECTION 10 14 00 – SIGNAGE****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide signage in accordance with requirements of the Contract Documents and as required by New York City Building Department.

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  1. American Welding Society (AWI): AWS D1.2 "Structural Welding Code - Aluminum".
  2. National Association of Architectural Metal Manufacturers (NAAMM): NAAMM "Metal Finishes Manual".
  3. Industrial Fasteners Institute (IFI): "Fastener Standards Book."
  4. ICC ANSI A117.1 - 2009

**1.3 SYSTEM DESCRIPTION**

- A. Performance Criteria for Exterior Signage
  1. Wind Loading Requirements: Design, fabricate and install component parts of exterior signage (either freestanding or mounted to exterior of building) so that the completed signage will withstand the inward and outward pressures normal to the plane of the sign as shown on Drawings.
  2. Temperature Requirements: Design, fabricate and install exterior signage component parts to provide for expansion and contraction of the over an ambient exterior temperature range and exterior metal surface temperature of  
–10 deg. F. through +180 deg. F. without buckling, sealed joint failure, component breakage, undue stress on members or anchors, and other detrimental effects
  3. Anchorage Disengagement: Anchorage disengagement or breakage shall not occur when an installed exterior signage unit is subjected to a force equal to 2.5 times the design load.
- B. Design Modifications: Make design modifications of work shown only as may be necessary to meet performance requirements and coordinate the Work. Variations in details and materials which do not adversely affect appearance, durability or strength shall be submitted for review. Maintain the general design concept without altering profiles and alignments shown.

## 1.4 SUBMITTALS

- A. Product Data: Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work
- B. Shop Drawings: Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum scale. Submit shop drawings showing component details, general arrangement, methods of anchoring, finishing details, and all other pertinent information. Include anchors, grounds, reinforcement, accessories, layout, and installation details.
  - 1. Provide message list for each sign required, including large scale details of wording and layout of lettering.
  - 2. For signage supported by or anchored to permanent construction, provide setting drawings, templates, and directions for installation of anchor bolts and other anchors to be installed as a unit of Work in other Sections.
  - 3. Furnish full size spacing templates for individually mounted dimensional letters and numbers.
- C. Samples: Submit and label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Submit the following:
  - 1. Provide a sample not less than 12 in. x 12 in. x scheduled thickness for each material shown or specified in schedule. Include a sample for each color, texture, and pattern required. On each panel include a representative sample of the graphic image process required, showing graphic style, and colors and finishes of letters, numbers, and other graphic devices.
  - 2. Dimensional Letters: Provide full-size representative samples of each dimensional letter type required, showing letter style, color, and material finish and method of attachment.
- D. Quality Control Submittals: Submit for Engineer's information.
  - 1. Test Reports
    - a. Submit copies of the following laboratory test reports:
      - 1) ASTM B137 - Anodic Coating Weight
      - 2) ASTM B244 - Anodic Coating Thickness
      - 3) ASTM B136 - Stain Test
  - 2. Certificates
    - a. Submit manufacturer's and fabricator's certification indicating that anodic coating complies with the Contract Documents.

- E. Closeout Submittals: Submit for City of New York's Documentation.
  - 1. Warranties: Special warranties as specified
  - 2. Maintenance Manual: two (2) copies of a bound maintenance manual, describing the materials, and procedures for cleaning and maintaining each type sign and accessory item or assembly. Include manufacturer's data describing the materials and finishes used in the work.

## 1.5 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain signage from one source of a single manufacturer for the entire project. Obtain accessory products used in conjunction with the work from the signage manufacturer or from sources acceptable to the signage manufacturer.
- C. The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- D. The signage shall be subject to examination by the City of New York to determine compliance with the Contract Documents. Examination may be made at the factory, upon delivery to the Project site and after installation.
- E. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- F. Mock-Ups
  - 1. Visual Mock-Up(s): After approval of samples, provide full size visual mock-ups for each type of signage and support, assembled to simulate final conditions in a locations in or on the building where directed. Mock-up shall be representative of the finished Work in all respects. Retain and maintain mockups during construction in an undisturbed condition as a standard for judging the completed signage Work.
  - 2. Obtain City of New York's acceptance of mock-ups prior to start of Work. Modify mock-ups as directed until acceptance is given. After acceptance, mock-ups may be utilized in the finished Work.
- G. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review material selections, methods and sequence of installation, special details and conditions, standard of workmanship, quality control requirements, job organization, coordination with other trades, and other pertinent topics related to the Work.

## 1.6 DELIVERY, STORAGE AND HANDLING

- A. Packing, Shipping, Handling and Unloading: Deliver signage and components fully identified for installation complete with fastenings and accessories and protected from damage from any source. Handle signage carefully to prevent breakage, surface abrasion, denting, soiling, and other defects. Comply with the manufacturer's handling instructions for unloading components subject to damage.
- B. Acceptance at Site: Inspect sign components for damage upon delivery. Do not install damaged sign components. Repair minor damage to signage, provided the finished repair is equal in all respects to the original work and is acceptable to the Engineer; otherwise remove and replace damaged sign components.
- C. Storage and Protection: Protect units from damage during transit, storage and installation. Store material indoors in a dry location, off the ground. Tool marks, rust, blemishes and any other damage on exposed surfaces will not be acceptable.

## 1.7 WARRANTIES

- A. General: Warranties and guaranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties and guaranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Signage Warranty: Provide a written signage warranty, for a five (5) year period, against defects of materials or workmanship. Upon notification of such defects, within the warranty period, make the necessary repairs and replacements, at the convenience of the City of New York. Failures, include but are not limited to:
    - a. Failure of the system to meet specified requirements.
    - b. Deterioration of metals, metal finishes coatings and other materials beyond normal weathering.
  - 2. Special Warranty, Anodized Coatings: Provide a written Warranty, for a period of (5) five warranting that the anodized aluminum will not develop excessive fading or excessive non-uniformity of color or shade, and will not crack, peel, pit, or corrode; all within limits defined as follows:
    - a. "Excessive fading": means a change in appearance which is perceptible and objectionable as determined by the Engineer when viewed visually in comparison with the original color range standards.
    - b. "Excessive non-uniformity": means non-uniform fading during the period of the Warranty to the extent that adjacent panels have a color difference greater than the original acceptable color range.

- c. "Will not crack, peel, pit or corrode": means there shall be no cracking, peeling, pitting or other type of corrosion discernible from a distance of 10 ft., resulting from the natural elements in the atmosphere.
- d. Upon notification of such defects, within the warranty period, make the necessary replacements at the convenience of the City of New York.

## **PART 2 - PRODUCTS**

### **2.1 METAL MATERIALS**

- A. Stainless Steel
  - 1. ASTM A240; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide 316 and 316L for components to be welded, unless otherwise noted.
- B. General Requirements
  - 1. Raised Copy: Signs shall be on one piece construction from matte-finish opaque sheet forming sign panel face. Produce precisely formed characters with square cut edges free from burrs and cut marks by rear embossing.
    - a. Raised Copy Thickness: Tactile characters/symbols shall be raised 1/32 in. from sign plate face. Signs shall be of one-piece construction; added-on and/or engraved characters are unacceptable. Text shall be accompanied by Grade 2 Braille.

### **2.2 FASTENERS, ANCHORS AND ADHESIVES**

- A. Adhesives: Types best suited for the purpose, waterproof for exterior use.
- B. Pressure Sensitive Tape: Double faced tape, warrantied not to delaminate under conditions of use indicated.
- C. Anchors and Inserts: Use nonferrous metal anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use toothed steel or lead expansion bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into concrete or masonry work.
- D. Fasteners: Type best suited for the purpose intended, compatible with materials being fastened, concealed wherever possible. Where exposed in finished surfaces, color and finish to match adjacent surfaces.

### **2.3 FINISHES**

- A. General: As shown for the respective units and matching the reviewed samples. Remove scratches, abrasions, dents, die markings and other defects prior to finishing operations. Perform this work in addition to finish treatment specified. Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations unless otherwise specified.
- B. Stainless Steel

1. ASTM A240; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide 316 and 316L for components to be welded, unless otherwise noted.
  - a. Plate and Sheet: ASTM A480, Stretcher level sheets.
2. Stainless Steel Finishes
  - a. No. 6 (satin directional polish).

## 2.4 FABRICATION

- A. Field Measurements: Prior to preparation of shop drawings and starting fabrication, take field measurements to ensure proper fitting. Show recorded measurements on final shop drawings. Coordinate fabrication schedule with the work of other trades and the construction progress to avoid delay.
- B. Fabricate in accordance with standard trade practices and in accordance with final shop drawings. Materials shall be single piece for each location wherever possible. Fabricate units in largest practicable sections. Assemble in the shop for trial fit, disassemble for shipment and reassemble with concealed fasteners. If design or material limitations require seaming or jointing, locate joints or seams on shop drawings for review by Engineer.
- C. Reinforcing shown is minimum. Provide additional reinforcing as required to ensure a rigid assembly. Exposed surfaces shall be free from dents, tool marks, warpage, buckle, glue and open joints, or other defects affecting serviceability or appearance. Accurately fit all joints, corners and miters. Conceal all fasteners. Make threaded connections up tight so that threads are entirely concealed.
- D. Lettering shall be neatly cut and applied in a straight line with uniform borders as shown. Lettering shall be properly spaced and in accordance with final shop drawings.
- E. Metal Work
  1. Forming: Form work to true shapes, without distortion, with accurate surfaces and edges. Unless otherwise shown, form metal corners by bending to smallest radius possible without impairing the work. Machine cut or saw material for butt jointed or square corners.
  2. Assembly: Carefully fit and assemble all work with continuity of line and design, using rigidly secured joints with hairline contact, unless otherwise shown. Form butt hairline joints with roll-over edge exposed. Grind off roll-over edge flush with and matching of adjacent metal. Shop assemble all work. Disassemble units too large for shipment and provide them with alignment and splice plates for accurate field fit.
  3. Welding: Weld with electrodes and by methods recommended by the base metal manufacturer, and in accordance with applicable recommendations of the AWS, to avoid distortion or discoloration of exposed faces. Make welds continuous unless otherwise

shown. Grind exposed welds flush, to match adjacent metal. Bevel cut base metal before welding to maintain continuity of line at joints.

- F. Factory finish all items where possible. Defer final touch-up, cleaning and polishing after delivery and installation.

## **2.5 PANEL SIGN FABRICATION**

- A. Panel Signs: Comply with requirements shown for materials, thicknesses, finishes, colors, designs, shapes, sizes, and details of construction. Produce smooth, even, level sign panel surfaces, constructed to remain flat under installed conditions within a tolerance of plus or minus 1/16 in. measured diagonally.
- B. Unframed Panel Signs: Fabricate signs with edges mechanically and smoothly finished to conform with the following requirements:
  - 1. Edge Condition: Square cut.
  - 2. Corner Condition: Square corners.
- C. Graphic Content and Style: Provide sign copy that complies with the requirements (including ADA requirements) shown for size, style, spacing, content, position, material, finishes, and colors of letters, numbers, and other graphic devices.

## **2.6 DIMENSIONAL LETTERS AND NUMBERS FABRICATION**

- A. Fabricated Letters and Numbers: Fabricate letters and numbers to required sizes and styles, using metals and thicknesses shown. Form exposed faces and sides of characters to produce surfaces free from warp and distortion. Include internal bracing for stability and attachment of mounting accessories. Comply with requirements shown for finish, style, and size.
  - 1. Stainless Steel Sheet: Not less than 0.090 in. thick. Fabricate by the heliarc welding process.

## **2.7 GRAPHICS**

- A. Graphic Content and Style: Provide sign copy to comply with the requirements shown for sizes, styles, spacing, content, positions, materials, finishes, and colors of letters, numbers, symbols, and other graphic devices.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory

performance of the Work.

### 3.2 EXAMINATION

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

### 3.3 PREPARATION

- A. Substrate Acceptability: Inspect areas and accept surfaces designated to receive signage, as satisfactory for the reception of the Work specified in this Section, without conflict with "Warranty" requirements. Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Verify dimensions before proceeding and obtain measurements at the job site for work required to be accurately fitted. Locate all signage for City of New York's and Engineer's review prior to installation. Make adjustments to final position as directed.
- C. Coordination: Coordinate work with the adjacent work of other sections. Provide items to be placed during the installation of other work at the proper time to avoid delays. Coordinate placement of such items, including inserts and anchors, accurately in relation to the final location of signage.
- D. Clean and prepare substrate as required to insure proper adhesion of signage to the surface.

### 3.4 INSTALLATION

- A. Signage shall be installed level and plumb, secured as shown on the Drawings and final shop drawings and in compliance with the manufacturer's instructions and with sign surfaces free from distortion or other defects in appearance. Cutting, trimming, fitting and matching of prefinished work will not be permitted.
- B. Wall Mounted Panel Signage: Attach panel signage to wall surfaces using the methods shown below:
  - 1. Silicone-Adhesive Mounting: Use liquid silicone adhesive recommended by the sign manufacturer to attach sign units to irregular, porous, or vinyl-covered surfaces. Use double-sided vinyl tape where recommended by the sign manufacturer to hold the sign in place until the adhesive has fully cured.
    - a. Vinyl-Tape Mounting (Temporary): Use double-sided foam tape, of thickness shown, to mount signage to smooth, nonporous surfaces. Do not use this method for vinyl-covered or rough surfaces.
- C. Dimensional Letters and Numbers: Mount letters and numbers using standard fastening methods recommended by the manufacturer for letter form, type of mounting, wall construction, and condition of exposure shown. Provide heavy paper template to establish letter spacing and to

locate holes for fasteners.

1. Projected Mounting: Mount letters at the projection distance from the wall surface shown.

### **3.5 CLEANING**

- A. Maintenance of Installation: Maintain the signage throughout the construction period in a clean and properly protected condition so that it will not be damaged at the time of acceptance by the City of New York. Cleaning and protective methods shall be carefully selected, applied and maintained so that finishes will not become uneven or otherwise impaired as a result of unequal exposure to light and weathering. Immediately remove any deleterious material from finished surfaces.
- B. Cleaning: Upon completion of installation, wash exposed surfaces using methods as recommended by manufacturer to leave clean and free from blemishes. Protect the Work during construction period so that it will be without indication of deterioration, use or damage at time of acceptance

### **3.6 PROTECTION**

- A. Protection: Protect the Work during erection and construction to avoid non-uniformity of appearance or other defects in the Work. When requested for inspection of finishes, remove and replace temporary protection. Remove protection when no longer required. Protect the work during shipment, storage, erection and construction so as to avoid development of non-uniformity of appearance or other deleterious effects in the Work. Remove protection when requested by City of New York for inspection of finishes and replace. Remove protection when no longer required. Immediately remove mortar,

**END OF SECTION**

## SECTION 10 16 00 – TOILET COMPARTMENTS

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide toilet compartments in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Framing for toilet compartments is specified in Section 05 50 00 "Metal Fabrications".
  - 2. Wood blocking is specified in Section 06 10 00 "Rough Carpentry".
  - 3. Toilet accessories are specified in Section 10 28 13 "Toilet Accessories".

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. American Welding Society (AWI)
    - a. AWS D1.1 "Structural Welding Code - Steel".
    - b. AWS D1.3 "Structural Welding Code - Sheet Steel".
  - 2. National Association of Architectural Metal Manufacturers (NAAMM): NAAMM "Metal Finishes Manual".
  - 3. Industrial Fasteners Institute (IFI): "Fastener Standards Book."
  - 4. ICC ANSI A117.1 - 2009

#### 1.4 SUBMITTALS

- A. Product Data: Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work including catalog cuts of anchors, hardware, fastenings, and accessories.
- B. Shop Drawings: Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft. minimum scale showing layout, elevations, and dimensions of all panels, pilasters, and doors. Show cutouts and anchorage for other work as required. Show locations of reinforcement and cutouts for compartment-mounted toilet accessories coordinated with approved toilet accessory manufacturer and model number. Revise shop drawings to adjust to field measurements.

- C. Setting Drawings: Provide setting drawings and templates for the location of metal anchorage items that are to be embedded in or anchored to concrete, masonry or anchored to gypsum wallboard including location of partition reinforcing.
- D. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide the following:
  - 1. Metal Finishes: Sample of each type of metal and finish required for units, prepared on 6 in. square of same gauge, alloy, thickness and material indicated to be used in the final Work.
  - 2. Hardware: One of each type.
- E. Quality Control Submittals:
  - 1. Test Reports: Submit independent laboratory test results showing compliance with the following:
    - a. Fire test reports based on specified assembled panel partition performed by a qualified independent testing agency showing that the materials furnished comply with specified requirements
- F. Closeout Submittals: Submit the following:
  - 1. Warranties: Special warranties as specified.
  - 2. Maintenance Manuals: Two (2) copies of bound maintenance manuals, describing the materials, and procedures for cleaning and maintaining the toilet partitions Include manufacturer's data describing the materials and finishes used in the work. Include precautions for cleaning toilet partition materials and methods that could be detrimental to finishes and performance. Include cleaning and stain-removal products and procedures.

## 1.5 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain toilet compartment from one source of a single manufacturer for the entire project. Obtain accessory products used in conjunction with toilet compartment from the toilet compartment manufacturer or from sources acceptable to the toilet compartment manufacturer. The manufacturer providing material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.

- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Size Variations: Obtain acceptance of manufacturer's standard size units, which may vary slightly from sizes indicated.

## **1.6 DELIVERY, STORAGE AND HANDLING**

- A. Deliver partition units fully identified for installation complete with fastenings and accessories and protected from damage from any source.
- B. Protect units from damage during transit, storage and installation. Tool marks, rust, blemishes and any other damage on exposed surfaces will not be acceptable. Store material indoors in a dry location, off the ground.
- C. Protect units during construction period so that they will be without any indication of deterioration, use or damage at time of substantial completion.

## **1.7 WARRANTIES**

- A. General: Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents. □
  - 1. Special Warranty: Provide a written warranty for a period of (10) ten years, warranting that the toilet partition will be free of defects in material or workmanship and free of operating defects during the warranty period. Warranty shall be signed by the Contractor and the firm awarded the work. Failures, include but are not limited to:
    - a. Failure of the system to meet performance requirements including but not limited to excessive deflection, racking and warpage.
    - b. Faulty operations of doors and hardware.
    - c. Deterioration of finishes and other materials beyond normal weathering.
    - d. Upon notification of such defect, within the warranty period, make the necessary repairs at the convenience of the City of New York.

## **PART 2 - PRODUCTS**

### **2.1 MANUFACTURERS**

- A. Provide toilet compartments and urinal screens complete with all required accessories as produced by one manufacturer. Products specified herein by proprietary designation are as manufactured by Hadrian and establish the quality standards required. Similar and equivalent products by other

manufacturers will be considered provided they meet the above established standards, comply with the Contract Documents and is acceptable to and approved by the Engineer. Provide the following system or approved equal by Engineer:

1. Toilet Compartments ( **TC-01** ): "Elite Plus Series" (Hadrian) with embossed stainless steel finish as basis of design but not intended to imply a preference for a specific product or the following:
  - a. Knickerbocker Partition Corporation.
  - b. Metpar Corp.
  - c. Or approved equal.
2. Panel and Door Height: 72 ins.
3. Installation: Floor mounted, headrail braced, 9 ins. A.F.F.

## 2.1 MATERIALS

- A. General: Provide materials which have been selected for surface flatness and smoothness. Exposed surfaces which exhibit pitting, marks, distortions, stains, discolorations, or other imperfections on finished units are not acceptable.
- B. Stainless Steel: ASTM A240; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide Type 304 and low carbon Type 304L for components to be welded, unless otherwise noted. , Provide minimum gauges as follows:
  1. Doors: 22 gauge.
  2. Panels: 20 gauge.
  3. Pilasters: 20 gauge.
  4. Concealed Reinforcement: 14 gauge for tapping, 12 gauge for anchoring devices.
  5. Urinal Screens: 20 gauge.
- C. Brackets: Stainless steel of manufacturer's standard, plain bent plate design.
- D. Pilaster Shoes: Stainless steel sheet, minimum 20 gauge, formed to manufacturer's standard design, not less than 3 in. high.
- E. Core Filler: Manufacturer's standard rot-proof and vermin-proof, resin impregnated sound deadened, corrugated or honeycomb type core material.
- F. Adhesive: Manufacturer recommended adhesive.

## 2.2 FABRICATION

- A. Metal Doors: 1 in. thick; fabricate as specified for panels. Strengthen doors against torsional stresses by tack or spot welding faceplates together under edge moldings or plug welding faceplate edges through edge molding; space welds not over 18 in. apart. Make doors 24 in. wide, unless otherwise shown. Unless otherwise shown, furnish 24 in. wide

inswinging doors for ordinary toilet stalls and 32 in. wide (clear opening) outswinging doors at stalls equipped for use by handicapped.

- B. Metal Pilasters: 1-1/4 in. thick; same construction as specified for doors. Provide each connecting end with an anchoring device consisting of a reinforced galvanized steel cross-bar internally welded to faceplates. Device to provide adjustment for leveling, plumbing and tightening of installation.
- C. Metal Urinal Screens
  - 1. Same thickness and type construction specified for panels with an additional 4 in. wide steel bar or plate internal reinforcement extending along both vertical edges.
- D. Entrance Screens: Same thickness, height and type of construction specified for panels and pilasters, unless otherwise shown.
- E. Drilling and Tapping
  - 1. General: Provide factory drilling to receive fittings, hardware and other accessories attached to toilet compartments; tap holes for machine screw fastenings.
  - 2. Toilet Accessories: Obtain templates to drill holes to receive toilet accessories: templates furnished to partition manufacturer under Section 10 28 13 "Toilet Accessories". All cutting, drilling, tapping and internal reinforcement required for partition mounted toilet accessories shall be performed in the shop. No field cutting of toilet compartments will be permitted, unless approved by the manufacturer and the Engineer.

### 2.3 TOILET PARTITION HARDWARE

- A. Hardware: Provide manufacturer's standard heavy duty operating hardware and accessories fabricated from Type 304 stainless steel. All stainless steel hardware shall receive a #4 satin finish and shall match each other.
  - 1. Hinges: Manufacturer's standard cutout inset type, gravity type or spring tension cam type hinges, fully adjustable to bring door to rest in any position, with all moving parts self-lubricating.
  - 2. Latch and Keeper: Manufacturer's standard concealed slide latch mounting unit, with rubber bumper on keeper designed for emergency access, one unit required on each door at mid-point. Provide latch and keeper units that comply with accessibility requirements of the NYC Building Department at compartments indicated to be accessible to people with disabilities.
  - 3. Door Pulls: Manufacturer's standard unit for outswinging doors.
  - 4. Door Bumpers: Manufacturer's standard rubber tipped bumper for outswinging doors.
  - 5. Combination Coat Hook and Bumper: Manufacturer's standard hook and pin with rubber bumper, one unit required on each door,

mounted 3 in. from top at center of door, except as otherwise shown..

## **2.4 FASTENERS, ANCHORAGE, REINFORCEMENT AND SUPPORTS**

- A. Fastening Devices: Stainless steel or brass machine screws, sex bolts and stud bolts with exposed finish to match hardware. Use manufacturer's standard fastening devices except use only 1-way or spanner type heads and nuts for exposed screws and bolts.
- B. Drilling and Tapping
  - 1. General: Provide factory drilling to receive fittings, hardware and other accessories attached to toilet compartments; tap holes for machine screw fastenings.
  - 2. Toilet Accessories: Obtain templates to drill holes to receive toilet accessories: templates furnished to partition manufacturer under Section 10 28 13 "Toilet Accessories". All cutting, drilling, tapping and internal reinforcement required for partition mounted toilet accessories shall be performed in the shop. No field cutting of toilet compartments will be permitted, unless approved by the manufacturer and the City of New York.

## **2.5 FINISHES**

- A. General: As shown for the respective units and matching the reviewed samples. Remove scratches, abrasions, dents, die markings and other defects prior to finishing operations. Perform this work in addition to finish treatment specified. Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations unless otherwise specified.
- B. Aluminum: Natural Anodized, AA-M12C22A41, Class I Architectural: clear film thicker than 0.7 mils complying with AAMA 611.
- C. Stainless Steel: No. 4 satin finish. Apply finished exposed stainless steel with texture aligned in same direction for all components.
- D. Other Exposed Metal for Hardware: US26 polished chromium finish.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### 3.2 EXAMINATION

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Coordination: Furnish inserts and anchorages which must be built into other work for installation of toilet compartments and related work; coordinate delivery with other work to avoid delay.

### 3.3 PREPARATION

- A. Substrate Acceptability: Inspect areas and accept surfaces designated to receive toilet compartments, as satisfactory for the reception of the Work specified in this Section. Commencement of installation shall constitute acceptance of substrate conditions by the Installer

### 3.4 INSTALLATION

- A. Verify all measurements and dimensions at the Project site and coordinate the Work with the work of other trades. Allow for adjustments within specified clearances where ever taking field measurements before fabrication might delay work. Erect work rigidly; straight, plumb and level. Conceal field drilling, cutting and fitting into the finished work. Adjust hardware for proper operation and leave in good working condition.
  - 1. Maximum Clearances:
    - a. Pilasters and Panels: 1/2 in.
    - b. Panels and Walls: 1 in.
- B. Comply with manufacturer's recommended procedures and installation sequence. Install compartments rigid, straight, plumb, and level. Locate wall brackets so that holes for wall anchorages occur in masonry or tile joints. Secure panels to pilasters with not less than two stirrup brackets located to align with stirrup brackets at wall. Secure panels in position with manufacturer's recommended anchoring devices.
- C. Overhead-Braced Units: Secure pilasters to floor and level, plumb, and tighten. Secure continuous head rail to each pilaster with not less than two fasteners. Hang doors to align tops of doors with tops of panels and adjust so tops of doors are parallel with overhead brace when doors are in closed position.
- D. Pilasters
  - 1. General: Fasten each pilaster directly to structure or an anchor plate with 2 stud bolts integrally welded thereto per manufacturer's recommendations. Rigidly secure pilasters to stud bolts by means of the anchoring device with face washers and leveling nuts so as to transmit strain of lateral thrust and pull to structure.
  - 2. Pilasters Adjacent to Walls: Install as specified hereinbefore; provide with one stud bolt. Fasten each pilaster to walls at same

number of points specified for panels. Provide single-wing type brackets; align with panel brackets; secure each bracket to walls with 2 bolts of appropriate type and secure pilasters to each bracket with one sex bolt. Clearance between pilasters and walls shall be between 1/2 in. and 1 in. maximum.

3. Pilaster Shoes: Conceal pilaster anchors with a pilaster shoe secured by concealed clips or machine screws.
- E. Panels: Fasten to walls and pilasters at not less than 2 points. Provide U-type brackets for fastening to pilasters and double-wing type brackets for fastening to walls. Secure each bracket to pilasters with 2 machine screws, to walls with 2 bolts of appropriate type; secure panels to each bracket with one sex bolt. Clearance between panels and pilasters shall be 1/2 in. maximum; between panels and walls shall be between 1/2 in. and 1 in. maximum.
- F. Doors: Hang doors on hinges, located per manufacturer's standard, with working parts concealed in door. Set compartment door hinges to bring door to rest at approximately 30 deg. position from closed position when unlatched. Set hinges on outswinging doors to return to fully closed position. Coordinate location of bumpers on outswinging doors with counters, partition or other obstructions.
- G. Urinal Screens
  1. Wall Hung; Bracket Supported Type: Fasten to walls at not less than two points with extra heavy double-wing type brackets. Provide clearance and secure to walls as specified for panels.

### **3.5 ADJUSTMENT**

- A. Adjust and lubricate hardware for proper operation. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors (and doors in entrance screens) to return doors to fully closed position.

### **3.6 CLEANING**

- A. Clean surfaces and leave free from smears. Repair minor scratches and other finish imperfections. Replace damaged work. Provide protection as necessary to prevent damage during remainder of construction period.

**END OF SECTION**

## SECTION 10 28 13 – TOILET ACCESSORIES

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. General: Provide toilet accessories in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Wood blocking is specified in Section 06 10 00 "Rough Carpentry".
  - 2. Mirrors not designated as toilet accessories are specified in Section 08 80 00 "Glazing".
  - 3. All necessary roughing-in of mechanical and electrical connections required for the equipment complete with final connections, including electrical, communications and other utility line connections required to properly operate the equipment specified herein.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. National Association of Architectural Metal Manufacturers (NAAMM): NAAMM "Metal Finishes Manual".
  - 2. Industrial Fasteners Institute (IFI): "Fastener Standards Book."
  - 3. National Electric Code (NEC): NFPA 70: National Electrical Code
  - 4. National Electrical Manufacturers Association (NEMA).
    - a. NEMA ICS 1: Industrial Control and Systems General Requirements
    - b. NEMA MG 1(Revision No. 2): Motors and Generators
  - 5. ICC ANSI A117.1 - 2009

#### 1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work.
- B. Setting Drawings: Submit setting drawings for toilet accessory cutouts required in other work; include templates, substrate preparation instructions, and directions for preparing cutouts and installing anchoring devices.

- C. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Compliance with other requirements is the responsibility of the Contractor.
  - 1. Submit full size samples of each toilet accessory specified, as requested. Accepted samples may be used in the final installation.
- D. Schedule: Submit a toilet accessory schedule indicating types, quantities, sizes and installation locations by room for each toilet accessory item specified. Use designations indicated in the Schedule of Accessories specified herein and room designations indicated on Drawings in product schedule.
- E. Closeout Submittals: Submit the following:
  - 1. Warranties: Special warranties as specified.
  - 2. Maintenance Data: Two (2) copies of the manufacturer's operating and maintenance manuals, including parts lists for the electrical toilet accessories.

#### **1.4 QUALITY ASSURANCE**

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain toilet accessories from one source of a single manufacturer for the entire project. Obtain accessory products used in conjunction with toilet accessory from the toilet accessory manufacturer or from sources acceptable to the manufacturer. The manufacturer shall furnish evidence that the specified materials have been manufactured by the same source and successfully utilized on a yearly basis for a minimum of 5 years on projects of a similar scope to that shown and specified for this Project.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to the NYC Building Department, and marked for intended use.

#### **1.5 DELIVERY, STORAGE AND HANDLING**

- A. Packing, Shipping, Handling, and Unloading: Pack, ship and handle components in accordance with manufacturer's instructions. Protect toilet accessories during transit, delivery, storage, and handling to prevent damage, soilage, and deterioration. Cover and keep covered with non-staining protective wrapping. Do not deliver accessories until operations that could damage, soil, or deteriorate panels have been completed in installation areas.

- B. Storage of Materials: Store materials in unopened containers. Store off the ground and under cover, protected from damage by the elements.

## 1.6 WARRANTIES

- A. Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty: Provide a written warranty, for a period of five (5) years, for toilet accessory mirrors against visible silver spoilage defects. Upon notification of such defects, make necessary replacements at the convenience of the City of New York.
  - 2. Special Warranty, Electric Hand Dryers: Provide a written warranty for a period of ten (10) years for the electric hand dryers against defects. Upon notification of such defects, make necessary replacements at the convenience of the City of New York.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Stainless Steel: ASTM A666, Type 304 0.03 in. minimum nominal thickness with No. 4 finish, for all toilet accessories unless otherwise specified.
- B. Sheet Steel: ASTM A1008, Designation CS (cold rolled, commercial quality steel),  
0.04 in. minimum nominal thickness unless otherwise shown or specified, surface preparation and metal pretreatment as required for applied finish.
- C. Galvanized Sheet Steel: ASTM A653, with Grade G60 hot dipped coating.
- D. Chrome Plating: ASTM B456, Service Condition No. SC2; US26D finish. On brass, nickel coating applied either directly to the base metal or over a coating of copper. On steel, nickel coating applied over a coating of copper.
- E. Mirrors: ASTM C1036, Type 1, Class 1, Quality q<sup>1</sup>, 1/4 in. thick unless otherwise specified. Mirrors shall have a uniform coating of silver, protected by a film of electrolytically deposited copper and a protective organic coating.
- F. Galvanized Steel Mounting Devices: ASTM A153, hot dip galvanized after fabrication.
- G. Fastening Devices: Stainless steel or cadmium plated steel, concealed in the finished work wherever possible. Exposed screws shall be theft-proof, flat head, countersunk, finished to match the accessory where exposed. Furnish two (2) special tools per floor.
- H. All Other Materials: Manufacturer's standard for the items required or type best suited for the intended use.

### 2.2 FABRICATION

- A. Recessed Units: Except where otherwise shown, fabricate units of all welded construction, without mitered corners. Hang doors or access panels with full length stainless steel piano hinge. Provide fasteners and anchorage that are fully concealed when unit is in the closed position.
- B. Surface Mounted Units: Except where otherwise shown, fabricate units with tight seams and joints and all edges rolled. Hang doors or access panels with full length stainless steel piano hinge. Provide fasteners and anchorage that are fully concealed when unit is in the closed position.
- C. Manufacturer's nameplates on exposed faces of units will not be permitted. Provide identification of each accessory item indicating manufacturer's name and product model number either on the back of the accessory or on a surface not exposed to view utilizing printed, waterproof label or stamped nameplate indicating manufacturer's name and product model number.
- D. Keys: Unless otherwise indicated, provide universal keys for access to toilet accessory units requiring internal access for servicing, resupply, etc. Provide minimum of six (6) keys to City of New York's representative and obtain receipt.

### **2.3 MANUFACTURER**

- A. Specified product designations are from the current catalog of Bobrick Washroom Equipment, Inc., unless otherwise specified, and establish the minimum standards of design, dimension and quality but not intended to imply a preference for a specific product. Accessories manufactured by the following will be considered:
  - 1. A & J Washroom Accessories.
  - 2. American Specialties.
  - 3. Bradley Corp.
  - 4. Or approved equal.

### **2.4 SCHEDULE OF ACCESSORIES**

- A. General: Provide products of the same manufacturer for each type of accessory unit and for units exposed in the same areas, unless otherwise acceptable to the City of New York.
  - 1. Provide Accessories as indicated on drawings, "Toilet Accessories Schedule".

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

**3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

**3.3 PREPARATION**

- A. Substrate Acceptability: Inspect areas and accept surfaces designated to receive toilet accessories, as satisfactory for the reception of the Work specified in this Section. Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Verify all measurements and dimensions at the Project site and coordinate the Work with the work of other trades. Where toilet accessories are scheduled for installation on metal toilet partitions, verify that concealed reinforcing is accurately and securely located.

**3.4 COORDINATION**

- A. Coordinate toilet accessory locations, installation, and sequencing with other work to avoid interference with and ensure proper installation, operation, adjustment, cleaning, and servicing of toilet accessory items.
- B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

**3.5 INSTALLATION**

- A. Templates and Instructions: Furnish templates of accessories for drilling, tapping and cutouts. Furnish directions for preparing cutouts, installation of anchorage devices, substrate preparations and any other installation information required for work by other trades.
- B. Install accessories where shown, in accordance with manufacturer's written instructions. Utilize fasteners suitable for the substrate; rigidly secured and in accurate alignment with other fixtures. Provide concealed reinforcement and anchor plates as required to support units. Install accessories plumb and level.
- C. Do not through bolt toilet accessories mounted on toilet partitions. Drill and tap partition reinforcement for accessory bolts.

**3.6 ADJUSTMENT AND CLEANING**

- A. After review of the installation by the City of New York, remove protection, labels, smears and stains. Clean and polish each accessory in accordance with manufacturer's written recommendations and instructions.
- B. Adjust accessories for proper operation and verify that mechanisms function smoothly. Replace damaged or defective items.

**END OF SECTION**

**SECTION 10 44 00 – FIRE EXTINGUISHERS AND ACCESSORIES****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide fire extinguishers and accessories in accordance with requirements of the Contract Documents.
- B. Related Work Specified Elsewhere
  - 1. Sealants and joint fillers other than specified herein installed at interface of contiguous assemblies and other building components are specified under Section 07 92 00 "Joint Sealants".

**1.2 REFERENCES**

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  - 1. National Fire Protection Association (NFPA): NFPA 10 "Portable Fire Extinguishers".
  - 2. National Association of Architectural Metal Manufacturers (NAAMM) NAAMM "Metal Finishes Manual".
  - 3. New York City Building Code, latest edition.

**1.3 SUBMITTALS**

- A. Product Data: Submit for Engineer's action. Provide manufacturer's literature and specifications describing the general properties of each fire extinguishers and accessories to be used in the Work including a material list with technical data documenting the location and primary function, quality, and performance of each material component or system to be used in the Work or other primary characteristics as required by the Contract Documents..
- B. Shop Drawings: Submit for action Provide shop drawings detailing fabrication and installation of each fire extinguishers and accessories, including dimensioned plans, elevations and details of sections, connections, anchorage and accessory items, drawn at a minimum scale of 3"=1'-0". Provide templates for anchors and bolts specified for installation under other Sections.
  - 1. Include roughing-in dimensions, details showing mounting methods, relationships to surrounding construction and door hardware

2. Setting Drawings: Provide setting drawings and templates for the location of fire extinguishers and accessories items that are to be embedded in or anchored to concrete or masonry.
- C. Schedules: Submit for Engineer's action. Submit a fire extinguishers and accessories schedule indicating types, quantities, sizes and installation locations by room for each fire extinguishers and accessories item specified. Use designations indicated in the Schedule of Accessories specified herein and room designations indicated on Drawings in product schedule.
1. Provide a schedule noting quantities of each type fire extinguisher, locations and relationship to requirements to NFPA 10.
  2. Provide a schedule noting quantities of each type fire extinguisher and accessory noting locations.
- D. Samples: Submit for Engineer's action. Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Submit the following:
1. Each finish of each metal on the gauge and alloy to be used in the final work, 6 in. square
  2. Other specified items as requested.
- E. Quality Control Submittals: Submit for information.
1. Certifications
    - a. Manufacturer's and fabricator's certification indicating that pigmented organic coating complies with the Contract Documents and AAMA 2603.
- F. Closeout Submittals: Submit for documentation.
1. Warranties: Special warranties as specified.
  2. Maintenance Manual: Submit two (2) copies of a bound maintenance manual, describing the materials, and procedures for cleaning and maintaining each metal type. Include manufacturer's data describing the materials and finishes used in the work.

#### 1.4 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Single Source Responsibility: Obtain fire extinguishers and accessories from one source of a single manufacturer. Obtain accessory products used in conjunction with fire extinguishers and accessories from the fire extinguishers and accessories manufacturer or from sources acceptable to the manufacturer. The manufacturer shall furnish

evidence that the specified materials have been manufactured by the same source and successfully utilized on a yearly basis for a minimum of 5 years on projects of a similar scope to that shown and specified for this Project.

- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.
  - 1. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."
  - 2. All fire extinguishers shall be FM Approved.
- D. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review methods and sequence of Work, special details and conditions, standard of workmanship, and other pertinent topics related to the Work.

## **1.5 DELIVERY, STORAGE AND HANDLING**

- A. Packing, Shipping, Handling, and Unloading: Deliver fire extinguishers and accessories work fully sealed and identified.
- B. Storage of Materials: Store indoors, above the floor, protected from construction activities and other sources of damage. Protect from damage from any source. Provide removable protection as required.

## **PART 2 - PRODUCTS**

### **2.1 MANUFACTURERS**

- A. Manufacturers: Products specified herein by proprietary designation are as manufactured by Larsen's Manufacturing Company and establish the quality standards required. Equivalent products of the following manufacturers will be considered provided they meet those established standards.
  - 1. J.L. Industries.
  - 2. Potter-Roemer Company
  - 3. Walter Kidde, Division of Kidde, Inc.
  - 4. Or approved equal.

### **2.2 MATERIALS**

- A. Cold-Rolled Sheet Steel: ASTM A1008, Designation CS (cold rolled, commercial quality steel), 0.04 in. minimum nominal thickness unless otherwise shown or specified, surface preparation and metal pretreatment as required for applied finish.
- B. Galvanized Steel Mounting Devices: ASTM A153, hot dip galvanized after fabrication.
- C. Stainless Steel
  - 1. ASTM A240 ; Provide the most suitable austenitic alloy, form and finish required to produce the Work. Provide Type 304 and low

carbon Type 304L for components to be welded, unless otherwise noted.

- a. Plate and Sheet: ASTM A480 , Stretcher level sheets.
  - b. Bar Stock and Shapes: ASTM A276.
- D. All Other Materials: Manufacturer's standard for the items required or type best suited for the intended use.

### 2.3 FIRE EXTINGUISHER ACCESSORIES

- A. Identify bracket-mounted extinguishers with red letter decals spelling "FIRE EXTINGUISHER" applied to wall surface. Letter size, style, and location as selected.

### 2.4 FINISHES, GENERAL

- A. Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- B. Surface Preparation: Solvent clean surfaces in compliance with SSPS-SP 1 to remove dirt, oil, grease, and other contaminants that could impair paint bond. Remove mill scale and rust, if present, from uncoated steel in compliance with SSPC-SP 5 (White Metal Blast Cleaning) or SSPC-SP 8 (Pickling).
- C. Baked Enamel Finish: Immediately after cleaning and pretreatment, apply manufacturer's standard 2 coat baked enamel finish consisting of prime coat and thermosetting topcoat. Custom color as approved by Engineer. Comply with paint manufacturer's instructions for application and baking to achieve a min. dry film thickness of 2.0 mils.
- D. Protect mechanical finishes on exposed surfaces from damage by application of strippable, temporary protective covering prior to shipment.

### 2.5 FIRE EXTINGUISHERS

- A. General: Provide fire extinguishers for each extinguisher bracket and other locations indicated, in colors and finishes selected by the Engineer from manufacturer's standard, which comply with requirements of the NYC Building Department.
- B. 2A Fire Extinguishers: Provide UL-rated 2A, 2-1/2 gallon nominal capacity, water mist type in manufacturer's standard enameled steel container. Provide "WM Series" (Larsen's Manuf. Co.) as basis of design but not intended to imply a preference for a specific product.
  - 1. Equivalent products of the following manufacturers will be considered provided they meet those established standards.
    - a. J.L. Industries.
    - b. Potter-Roemer Company
    - c. Walter Kidde, Division of Kidde, Inc.

- d. Or approved equal.
- C. B:C Fire Extinguishers: Provide UL-rated B:C, 10 lbs. nominal capacity, carbon dioxide type in manufacturer's standard enameled aluminum container. Provide "CD Series" (Larsen's Manuf. Co.) as basis of design but not intended to imply a preference for a specific product.
  - 1. Equivalent products of the following manufacturers will be considered provided they meet those established standards.
    - a. J.L. Industries.
    - b. Potter-Roemer Company
    - c. Walter Kidde, Division of Kidde, Inc.
    - d. Or approved equal.
- D. 2A: 20B:C Multipurpose Dry-Chemical Fire Extinguisher: Provide Monoammonium phosphate-based dry chemical or equivalent Enameled-steel container. Include pictorial marking system complying with NFPA 10, Appendix B instructional labels. Include manufacturer standard valves, handles, levels and pressure gauges.
- E. D Combustible Metal Fire Extinguisher: Sodium Chloride based chemical or equivalent, 13.6 kg nominal capacity Enameled-steel container. Include pictorial marking system complying with NFPA 10, Appendix B instructional labels. Include manufacturer standard valves, handles, levels and pressure gauges.

## 2.6 FIRE EXTINGUISHER MOUNTING BRACKETS

- A. Provide brackets designed to prevent accidental dislodgement of extinguisher, of sizes required for type and capacity of extinguisher indicated in plated finish.
- B. Mounting Brackets For A:B:C: and D Extinguishers Not Located In Cabinets: Provide red brackets for extinguishers not located in cabinets, where shown or required. Provide "862" (Larsen's Manuf. Co.) as basis of design but not intended to imply a preference for a specific product.
  - 1. Equivalent products of the following manufacturers will be considered provided they meet those established standards.
    - a. J.L. Industries.
    - b. Potter-Roemer Company
    - c. Walter Kidde, Division of Kidde, Inc.
    - d. Or approved equal.
  - 2. Identify bracket mounted extinguishers with red letter decals complying with the NYC Building Department and spelling "FIRE EXTINGUISHER" applied to wall surface. Letter size, style, and location as selected by Engineer.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including, components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Contractor shall remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Examine walls and partitions for suitable framing depth and blocking where brackets will be installed.
- C. Inspect fire extinguisher hose for tears and that pull pin is still intact.
- D. Inspect fire extinguisher pressure gauge to ensure that the pressure is within the manufacturer's specified range.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.3 PREPARATION**

- A. Substrate Acceptability: Inspect areas and accept surfaces designated to receive fire extinguishers and accessories, as satisfactory for the reception of the work specified in this Section. Commencement of installation shall constitute acceptance of substrate conditions by the Installer.
- B. Coordinate setting drawings, diagrams, templates, instructions and directions for installation of anchorages which are to be embedded in concrete or masonry construction at the proper time to avoid delays in the work. Place such items, including inserts and anchors, accurately in relation to the final location of louver components.

### **3.4 INSTALLATION**

- A. Install items included in this section in locations and at mounting heights indicated, or if not indicated, at heights to comply with the NYC Building Department.
  - 1. Securely fasten mounting brackets for fire extinguisher to structure, square and plumb, to comply with manufacturer's instructions.
- B. Install A:B:C and D fire extinguishers in accordance with drawing  $\pm$  2 feet.
  - 1. If positioned on wall support beam, use the wall system vendor's approved fastener.
  - 2. If positioned on a column or concrete wall, use appropriate hardware that can support the weight of the fire extinguisher.

3. For all other locations, a unistrut rack must be built and anchored to the floor to support the fire extinguisher(s).
  4. The top of class ABC fire extinguishers must be 36 inches to 42 inches above the finished floor.
  5. The bottom of a class D fire extinguisher must be a minimum of 4 inches above the finished floor.
  6. All fire extinguisher signs must be a minimum of 84 inches above the finished floor.
- C. Notify appropriate authority when items are installed so they can inspect and tag fire extinguishers.

### **3.5 PROTECTION**

- A. Restore finishes damaged during installation and construction period so that no evidence remains of correction work. Return items which cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units as required.
- B. Protect finishes of work from damage during construction period by use of temporary protective coverings approved by manufacturer. Remove protective covering at time issuance of Substantial Completion.

**END OF SECTION**

## SECTION 10 51 13 – METAL LOCKERS AND ACCESSORIES

### PART 1 - GENERAL

#### 1.1 SUMMARY

- A. Provide lockers and benches in accordance with requirements of the Contract Documents.

#### 1.2 REFERENCES

- A. General: Comply with the applicable provisions of the referenced standards except as modified by governing codes and the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern
  1. National Association of Architectural Metal Manufacturers (NAAMM): NAAMM "Metal Finishes Manual".
  2. American Welding Society (AWS)
    - a. AWS D1.1 "Structural Welding Code - Steel".
    - b. AWS D1.2 "Structural Welding Code - Aluminum".
    - c. AWS D1.3 "Structural Welding Code - Sheet Steel".
  3. Industrial Fasteners Institute (IFI): "Fastener Standards Book."

#### 1.3 PERFORMANCE CRITERIA

- A. Uniformity: Provide metal lockers, with interchangeable like parts. Include necessary hardware, mounting accessories, trim, fittings, and fastenings.
- B. Performance Requirements: When doors are locked and the locker inverted, doors shall withstand a drop of not less than 6 in. without the slide latches disengaging.

#### 1.4 SUBMITTALS

- A. Product Data: Submit manufacturer's literature, specifications and installation instructions describing the general properties of each material and accessory to be used in the Work for each type of locker and bench assembly, including instructions, and directions for installation of anchorage devices.
- B. Shop Drawings: Submit shop drawings for the fabrication and installation of the Work including layout, elevations, trim, dimensions and details of each locker and bench type, anchorage system and accessory items. Prepare details at not less than 3 in. = 1 ft. minimum scale.
  1. Locker Door Schedule: Submit, a complete locker schedule, including types, general locations, sizes, locker numbering and identification system, contiguous construction details, finishes,

latching or locking provisions, and other data pertinent to installation.

- C. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished work. Compliance with other requirements is the responsibility of the Contractor. Provide sample for each locker and bench finish as follows:
  - 1. Locker Metal and Wood Bench Material: 6 in. x 6 in. in size, of each color and finish.
- D. Closeout Submittals:
  - 1. Warranties: Special warranties as specified.
  - 2. Two (2) copies of bound maintenance manuals, describing the materials, and procedures for cleaning and maintaining lockers and benches. Include manufacturer's data describing the materials and finishes used in the work.

## 1.5 QUALITY ASSURANCE

- A. Qualified Installer: The entity performing the work of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work.
- B. Manufacturer Qualifications: The manufacturer shall furnish evidence that the specified materials have been manufactured by the same source and successfully utilized on a yearly basis for a minimum of 5 years on projects of a similar scope to that shown and specified for this Project. Fabricate lockers as a single integral unit with frame, anchors, hardware, accessory parts, fittings and fastenings. Units are to be the standard products, or modifications if required, of one of the listed manufacturers.
  - 1. Single-Source Responsibility: Obtain each type of locker and bench for the entire project through one source from a single manufacturer.
  - 2. Size Variations: Obtain acceptance of manufacturer's standard size units, which may vary slightly from sizes indicated.
- C. Requirements of Regulatory Agencies: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.

## 1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packing, Shipping, Handling, and Unloading: Pack, ship and handle components in accordance with manufacturer's instructions. Protect locker and bench components during transit, delivery, storage, and handling to prevent damage, soilage, and deterioration. Cover and keep covered with non-staining protective wrapping. Do not deliver lockers and benches until painting, wet work, grinding, and similar operations that

could damage, soil, or deteriorate materials have been completed in installation areas.

- B. Storage and Protection: Store components in a dry, well ventilated space, off the ground and covered with non-staining protective wrapping. Cover and keep covered with non-staining protective wrapping.

## 1.7 WARRANTIES

- A. General: Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty: Provide a written warranty for a period of (2) two years, warranting that the lockers and benches will be free of defects in material or workmanship and free of operating defects during the warranty period. Warranty shall be signed by the Contractor and the firm awarded the work. Failures, include but are not limited to:
    - a. Structural failures.
    - b. Faulty operation of latches and other door hardware.
    - c. Deterioration of metals, metal finishes and other materials beyond normal weathering.
    - d. Upon notification of such defect, within the warranty period, make the necessary repairs at the convenience of the City of New York.

## 1.8 SITE INVENTORY

- A. Furnish site inventory that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Full-size units of the following metal locker hardware items equal to 5 percent of amount installed for each type and finish installed, but no fewer than three units:
    - a. Locks.
    - b. Identification plates.
    - c. Hooks.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Metal Surfaces, General: For fabrication of locker and bench metal work which will be exposed to view in the finished work, use only materials which are smooth and free of surface blemishes including pitting, seam marks, roller marks, rolled trade names and roughness. Remove such blemishes by grinding, or by welding and grinding, prior to cleaning, treating, and applying surface finishes.

1. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B, suitable for exposed applications.
  2. Steel Tube: ASTM A 500, cold rolled.
  3. Fasteners: Zinc- or nickel-plated steel, slot-less-type, exposed bolt heads; with self-locking nuts or lock washers for nuts on moving parts.
  4. Anchors: Material, type, and size required for secure anchorage to each substrate.
- B. Wood for benches: Provide clear, laminated northern hardwood, 1 1/4 inch thick.
- C. Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls, and elsewhere as indicated, for corrosion resistance.
1. Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.

## 2.2 ACCEPTABLE MANUFACTURERS:

- A. General: Provide metal lockers ( **LKR-01** ) as produced by one manufacturer. Layout/configuration as indicated on the drawings.
1. "Building Block 15W Modular Lockers" as manufactured by Heartwork USA.
  2. No substitutions allowed.
- B. General: Provide benches ( **BCH-01** and **BCH-02** ) as produced by one manufacturer.
1. Standard and ADA compliant benches as manufactured by ASI Storage Solutions (Bench Top and stainless steel Pedestal) to establish the basis of design and quality standards required but not intended to imply a preference for a specific product.
  2. Products of the following manufacturers will be acceptable provided they meet those established standards:
    - a. Heartwork USA
    - b. List Industries.
    - c. Penco Products, Inc.
    - d. Republic Storage Systems, Inc.
    - e. Or approved equal.

## 2.3 FABRICATION, GENERAL

- A. General: Provide each locker and bench assembly manufactured as an integral unit, complete with components, accessories and fasteners ready for installation.

- B. Forming: Form exposed surfaces free from warp, wave and buckle, with corners square, unless otherwise shown. Form molded members straight and true, with welded joints coped or mitered, well formed, and in true alignment. Dress welded joints on exposed surfaces smooth so they are invisible after finishing and flush with adjacent surfaces. Provide attachment devices and fasteners of type required to secure access doors and frames to contiguous support construction.
- C. Reinforcing: Reinforce members and joints with structural shapes and plates in concealed locations, as necessary for adequate strength and rigidity. Provide concealed fastenings unless otherwise shown. Locate necessary exposed fastenings in an orderly pattern, in accordance with reviewed shop drawings. Separate dissimilar metals with dielectric separator to prevent galvanic action. Do not extend coatings onto exposed surfaces
- D. Construction: Square, rigid, without warp, exposed edges safe to touch. Frames welded together; other joints welded, bolted, or riveted as standard with manufacturer. Grind exposed welds flush. Do not expose bolts or rivet heads on fronts of locker doors or frames.

## 2.4 LOCKERS

- A. Fabrication General: Each locker shall have an individual door and frame, individual top, bottom, back and shelves with common intermediate uprights separating compartments. Lockers shall be fabricated square, rigid and without warp. Doors shall be flat and free of distortion.
- B. Door Frame: Door frame members to be not less than 18 gauge formed to a channel shape.
- C. Body: Bolt spacing in locker body construction not to exceed 9 in. o.c. Locker body components shall be made of cold rolled steel specially formed for added strength and rigidity and to ensure tight joints at fastening points.
- D. Doors: Doors shall be formed from one piece 18 gauge cold rolled sheet steel.
- E. Door Handle: Integrated door, handle and lock design.
- F. Hinges: Heavy-duty concealed hinges. Doors over 48 in. high shall have three hinges, all other doors shall have two hinges.
- G. Number Plates: Each locker to be supplied with a polished aluminum number plate.
- H. Interior Equipment: As indicated on drawings or as follows: Single-tier lockers 48-1/2 in. or higher shall have a hat shelf located approximately 9 in. below the top of locker; if less than 18 in. deep, locker shall have three single-prong hooks and one double-prong ceiling hook. Single tier lockers 18 in. or more in depth shall have a coat rod instead of a ceiling hook. 30 in. & 36 in. high lockers shall have three single-prong wall hooks and one double-prong ceiling hook. Hooks to be attached with two bolts per hook. 20 in. & 24 in. high lockers to have three wall hooks for 12 in. wide, and four wall hooks for 15 in. wide and wider.

- I. ADA. Compliant Lockers: ADA. compliant lockers shall have recessed handles and shall be single tier or the lower opening of a double tier locker. Locker bottom shall be a minimum of 9 in. off the floor, or an extra shelf placed 9 in. off the floor. Single tier lockers shall have a shelf 48 in. off the floor. Doors assigned for handicapped use shall have an appropriate symbol sign.

## 2.5 BENCHES

- A. Provide bench units with overall assembly height of 17-1/2 in.
- B. Bench Tops: Manufacturer's one-piece units, with straight corners and edges.
- C. Size: Minimum 9-1/2 in. wide (plus ADA compliant unit) by 1-1/4 in. thick.
- D. Laminated clear maple hardwood with clear lacquer finish.
- E. Fixed Pedestals: Manufacturer's stainless steel pedestal supports, with predrilled fastener holes for attaching bench top and anchoring to floor, complete with fasteners and anchors.
  - 1. Powder coat finish matching color of lockers.

## 2.6 LOCKER ACCESSORIES:

- A. Continuous Metal Base: 18-gage stainless steel, fabricated in lengths as long as practicable to enclose base of lockers without additional fastening devices. Factory- finish metal base to match lockers.
  - 1. Color: Custom color as selected by Engineer.

## 2.7 FINISHES

- A. Finish for Metal Lockers and Other Metal Components: Manufacturer's standard shop preparation primer compatible with finish paint coats.
  - 1. Thermoset Powder Coat Finish: Provide thermoset powder coat heat catalyzed organic polyester or urethane powder coat finish applied over conversion coat providing a smooth, uniform and durable finish.
  - 2. Application: Entire system be shop applied to exposed surfaces, under suitable conditions as approved by the powder paint manufacturer, so that finished paint surface is smooth, unbroken, free of pinholes, orange peel, sags or runs.
  - 3. Touch-up: Finish paint shall have the capability to be touched-up in the field without noticeable difference in color, texture, specular gloss or dry film thickness.
  - 4. Color: Custom color as selected by Engineer.
- B. Finish for Wood Benches:
  - 1. Finish: One coat, deep-penetrating sealer, and two coats of heavy body, high- impact resistant lacquer.

## **PART 3 - EXECUTION**

### **3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and install the work of this Section, including, components, and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

### **3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected.

### **3.3 PREPARATION**

- A. Substrate Acceptability: Commencement of installation shall constitute acceptance of substrate conditions by the Installer
- B. Deliver items which are to be built into the work of other sections in time so as not to delay the progress of the Work.

### **3.4 COORDINATION**

- A. Coordinate sizes and locations of concrete bases for metal lockers.
- B. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of work specified in other Sections to ensure that metal lockers can be supported and installed as indicated.

### **3.5 INSTALLATION**

- A. Install metal lockers at locations shown in accordance with manufacturer's written instructions so that completed installation is plumb, level, rigid, and flush installation in perfect operating condition.
- B. Space fastenings about 60" o.c., unless otherwise recommended by manufacturer, and apply through back-up reinforcing plates where necessary to avoid metal distortion; conceal fasteners insofar as possible.
- C. Install metal base, trim, fillers and sloping tops where indicated, using concealed fasteners.
- D. Do not erect members which are warped, bowed, deformed or otherwise damaged to such extent as to impair strength or appearance. Remove and replace members damaged in the process of erection.

- E. Fixed Locker Benches: Provide no fewer than two pedestals for each bench, uniformly spaced not more than 72 in. apart. Securely fasten tops of pedestals to undersides of bench tops, and securely anchor bases to floor. Provide stainless steel hardware.
- F. Dielectric Separator: Separate dissimilar metals and metals in contact with concrete or masonry with a dielectric separator.
- G. Upon completion of installation, lubricate and adjust doors to operate easily free from warp, twist or distortion and fitting tightly for entire perimeter.

### **3.6 CLEANING**

- A. Cleaning: Upon completion of installation of metal lockers and benches and adjacent finishes, clean exposed metal surfaces as recommended by the manufacturer.

### **3.7 PROTECTION**

- A. Protect the Work from damage during the construction period so that it will be without indication of wear or damage at the time of acceptance.

**END OF SECTION**

**SECTION 13 34 70 – FABRICATED CONCRETE BUILDINGS****PART 1 - GENERAL****1.1 SUMMARY**

- A. General: Provide fabricated concrete building in accordance with requirements of the Contract Documents.
- B. Related Work:
  - 1. Foundation and slab-on-grade for fabricated concrete buildings is furnished and installed under this Section per the requirements of the Cast-in-Place Concrete work specifications.
  - 2. Architectural Concrete Textured Finishes for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 03 33 00 "Architectural Concrete Textured Finishes".
  - 3. Miscellaneous steel lintels, relieving angles, other support steel and accessories for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 05 50 00 "Metal Fabrications".
  - 4. Sheet waterproofing and underslab vapor retarder for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 07 13 00 "Sheet Waterproofing".
  - 5. Building insulation for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 07 23 00 "Building Insulation".
  - 6. Fluid-applied roofing for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 07 55 56 "Fluid- Applied Membrane Roofing".
  - 7. Sheet metal flashing and trim for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 07 62 00 "Sheet Metal Flashing and Trim".
  - 8. Sealants and joint fillers for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 07 92 50 "Joint Sealants".
  - 9. Steel doors and frames for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 08 33 00 "Hollow Metal Doors and Frames".
  - 10. Overhead coiling doors and frames for fabricated concrete buildings are furnished and installed under this Section per the requirements of Section 08 33 23 "Overhead Coiling Doors".
  - 11. Finish Hardware for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 08 71 00 "Finish Hardware".

12. Paints and Coatings for fabricated concrete buildings is furnished and installed under this Section per the requirements of Section 09 90 00 "Paints and Coatings".

## 1.2 SYSTEM DESCRIPTION

- A. Roof: Roof panel shall have a minimum of 6" slope from peak to edge. The roof shall extend 4" beyond the wall panel and have a turndown design which extends ½" minimum below the top edge of the wall panels to prevent water migration into the building along top of wall panels. Roof shall also have an integral architectural ribbed edge.
- B. Roof to Wall Joint Keyway: Grout in keyways shall be a magnesium phosphate material or equal, prepared and placed per the manufacturer's recommendations. Apply a polysulfide, elastomeric joint sealant to the top of the grouted keyway, installed per manufacture's recommendations.
- C. Walls: Wall panels as indicated on drawings.
- D. Cast-in-place slab must have a ½" step-down around the entire perimeter to prevent water migration into the building along the bottom of wall panels.

## 1.3 PERFORMANCE REQUIREMENTS

- A. Structural requirements for these fabricated concrete buildings shall be per structural requirements of "Tennis Building" and "Track Building" of project Contract Number: SANDRESM1.

## 1.4 REFERENCES

- A. General: Comply with the applicable provisions and recommendations of the referenced standards except as modified by governing codes and by the Contract Documents. Where a recommendation or suggestion occurs in the referenced standards, such recommendation or suggestion shall be considered mandatory. In the event of conflict between referenced standards, this specification or within themselves, the more stringent standard or requirement shall govern.
  1. ACI-318-11: Building Code Requirements for Structural Concrete and Commentary
  2. ASCE/SEI 7-10: Minimum Design Loads for Buildings and Other Structures
  3. New York City Building Code.
  4. PCI Design Handbook, 7th Edition
  5. Concrete Reinforcing Institute, Manual of Standard Practice

## 1.5 SUBMITTALS

- A. Product Data: Submit manufacturer's literature and specifications describing the general properties of each material and accessory to be used in the Work.

- B. Shop Drawings: Submit shop drawings for the fabrication and installation of the Work. Prepare details at not less than 3 in. = 1 ft.-0 in. minimum scale.
1. Submit shop drawings for fabricated concrete buildings. Submit shop drawings for fabrication, bending and placement of reinforcement bars and details for reinforced concrete. Shop drawings shall bear the seal of a Professional Engineer licensed in the State of New York.
  2. Submit shop drawings for corners and other special conditions.
- C. Manufacturers' product literature shall be provided for any plumbing, electrical, and miscellaneous installed fixtures demonstrating compliance with these specifications.
- D. Samples: Label samples to indicate product, characteristics, and location in the Work. Samples will be reviewed for color and appearance only. Furnish sufficient samples to establish the full range of colors and textures for materials exposed in the finished Work. Compliance with other requirements is the responsibility of the Contractor.
1. Provide (2) 24 in. sq. samples of each type precast unit.
  2. Anti-Graffiti Coatings: Coat half of each sample block with the anti-graffiti coating as specified herein.
- E. Engineering Services: Submit for Engineer's action. Provide calculations to verify fabricated concrete buildings provided meet specified performance requirements. Calculations shall bear the seal of a Professional Engineer licensed in the State of New York.
- F. List of Materials Used in Constructing Mockups: Submit a list of generic product names together with manufacturers, manufacturers' product names, model numbers, lot numbers, batch numbers, source of supply, and other information as required to identify materials used. Include mix proportions for concrete. Submittal is for information only. Neither receipt of list nor approval of mockup constitutes approval of deviations from the Contract Documents, unless such deviations are specifically approved in writing.
- G. Quality Control Submittals: Submit the following:
1. Test Reports:
    - a. Preconstruction and field test reports for mortar indicating conformance of mortar materials to property specifications of ASTM C270.
    - b. Test reports, per ASTM C780, for mortar mixes required to comply with property specification.
    - c. Preconstruction and field test reports of grout in conformance with ASTM C1019.
    - d. Certified test reports indicating compliance with requirements for the "anti-graffiti" coating. In addition, provide manufacturer's field reports for "anti-graffiti" coating.

2. Certificates:
    - a. Document Review: Before commencing work, submit a written statement signed by the Contractor and the Applicator certifying that the Contract Documents, shop drawings and product data have been reviewed with material manufacturers' qualified technical representatives and that they agree the selected materials are proper, compatible with contiguous materials and adequate for the application shown.
  3. Procedures: Submit, for Engineer's information, hot and cold-weather construction procedures evidencing compliance with applicable requirements.
- H. Closeout Submittals: Submit the following:
1. Warranties: Special warranties as specified.
  2. Maintenance Data: Two (2) copies of an assembled and bound maintenance manual, describing the materials and procedures to be followed in cleaning and maintaining the "anti-graffiti" coating. Include manufacturer's brochures describing the actual materials used in the work.

## 1.6 QUALITY ASSURANCE

- A. The precast concrete building producer shall be a plant-certified by either the National Precast Concrete Association (NPCA) or The Precast/Prestressed Concrete Institute (PCI).
- B. Single Source Responsibility:
  1. Single Source Responsibility: Obtain precast concrete building from one source of a single manufacturer. Obtain accessory products used in conjunction with precast concrete building from the Precast concrete building manufacturer, from sources acceptable to the manufacturer, and as specified. The manufacturer shall furnish evidence that the specified materials have been manufactured by the same source and successfully utilized on a yearly basis for a minimum of 5 years on projects of a similar scope to that shown and specified for this Project.
  2. Single Source Responsibility Anti-Graffiti Coating: Obtain anti-graffiti coating from one source of a single manufacturer for the entire project. Obtain accessory products used in conjunction with anti-graffiti coating from the anti-graffiti coating manufacturer or from sources acceptable to the manufacturer. The manufacturer shall furnish evidence that the specified materials have been manufactured by the same source and successfully utilized on a yearly basis for a minimum of 5 years on projects of a similar scope to that shown and specified for this Project.
- C. Regulatory Requirements: Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities. Obtain necessary approvals from the NYC Building Department.

1. Requirements for fire-rated or lateral support conditions are not necessarily fully defined on the Drawings or specified; comply with applicable regulations.
- D. Qualified Applicator: The entity performing the anti-graffiti coating of this section must, within the last five (5) consecutive years prior to the bid opening have successfully completed in a timely fashion at least three (3) projects similar in scope, size and type to the required work. In addition, the entity must be approved, or certified, or authorized by the manufacturer, and must be eligible to receive the manufacturer's warranty.
- E. Mock-Up(s):
1. Sample Wall:
    - a. Build sample full height wall(s) as detailed on contract documents, provide 4 foot wide wall and roof return min. unless otherwise shown. The Work of this Project shall be constructed on approval of workmanship, joint sizes, construction and control joints, vertical alignment, parapet conditions, door head and sills, flashing installation, door installation and colors of the sample wall.
      - 1) An initial 4 ft. x 4 ft. x full depth wall showing exterior and interior face shall be constructed before authorization to complete the sample wall.
    - b. Clean mock-ups with materials and techniques intended for use on the Project.
    - c. Apply "anti-graffiti" coating to mockup entire exterior face. Demonstrate "anti-graffiti" qualities by utilizing 5 standard graffiti marking mediums and removing graffiti.
    - d. Obtain acceptance of visual qualities of each sample panel before proceeding with the final work.
- F. Pre-Installation Meeting: Prior to the start of the Work, meet at the Project site to review methods and sequence of construction, special details and conditions, standard of work, testing and quality control requirements, job organization and other pertinent topics related to the Work.

## 1.7 DELIVERY, STORAGE AND HANDLING

- A. Packing, Shipping, Handling, and Unloading: Deliver materials, other than bulk materials to Project site in manufacturer's unopened containers, bundles, pallets or other standard packaging devices; fully identified with name, type, grade, color and size.
- B. Storage and Protection: Store on platforms off the ground, in a dry location and protect from weather, soiling and damage. Store aggregates where grading and other required characteristics can be maintained and contamination avoided. Store accessories including metal items to prevent corrosion and accumulation of dirt and oil.

- C. Metal Materials: Do not use metal reinforcing, ties, or other components which are coated with loose rust or other deleterious matter that will reduce or destroy bond with mortar and grout.

## 1.8 PROJECT/SITE CONDITIONS

- A. Installation Requirements
  - 1. Cold Weather Conditions: Do not erect work when the temperature is below 40 deg. F. unless provisions for heating and drying the materials and protecting the completed work. Do not build upon frozen work. Do not lay units having a film of water or frost on their surfaces.
  - 2. Hot Weather Conditions: Do not erect work when the temperature is above 100 deg. F. or 90 deg. F with a wind velocity greater than 8 mph.
- B. "Anti-Graffiti" Coating Application Conditions: Maintain ambient temperature above 40 degrees F during and 24 hours after installation. Do not proceed with application on materials if ice or frost is covering the substrate. Do not proceed with application if ambient temperature of surface exceeds 100 degree F. Do not proceed with the application of materials in rainy conditions or if heavy rain is anticipated with 4 hours after application.

## 1.9 WARRANTIES

- A. Warranties specified in this Article shall not deprive the City of New York of other rights the City of New York may have under other provisions of the Contract Documents and are in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.
  - 1. Special Warranty, Anti-Graffiti Coating: Provide a single source manufacturer's labor and material performance warranty, for a period for two (2) years stating that the anti-graffiti coating will be free of defects related to workmanship or material deficiency. Defective areas, (where anti-graffiti coating effectiveness does not meet the specified limits.) in the opinion of the City of New York, shall be retreated by the system manufacture Upon notification of defects, within the warranty period, reseal areas at the convenience of the City of New York.

## PART 2 – PRODUCTS

### 2.1 MANUFACTURER

- A. Fabricated Concrete Building Manufacturers:
  - 1. Fabricated concrete building, "Model 4422", customized as indicated on drawings and as manufactured by Easi-Span shall be considered to be the basis of design but not intended to imply

a preference for a specific product. Other manufacturers making equivalent products to be considered may include the following:

- a. Oldcastle Precast.
- b. Smith-Midland.
- c. Shea Concrete Products.
- d. Or approved equal.

## 2.2 MATERIALS

- A. Concrete: Steel-reinforced, 5000 PSI minimum 28-day compressive strength, air- entrained (ASTM C260).
- B. Reinforcing Steel: ASTM A615, grade 60 unless otherwise specified.
- C. Welded Wire Fabric: ASTM 185, Grade 65
- D. Post-tensioning Strand: Roof sections shall be post-tensioned in the field after grout keyway is filled and has cured to the required PSI strength. Post-tensioning strand shall be 41K Polystrand CP50, ½" 270 KSI Seven-Wire strand, enclosed within a greased plastic sheath (ASTM A416). There will be a minimum of three transverse post-tensioning cables connecting roof and floor (if provided) sections together to provide a watertight joint. To ensure a watertight design, no alternate methods shall be substituted for the post-tensioning.
- E. Caulking: All joints between panels shall be caulked on the exterior and interior surface of the joints. Exterior caulk reveal to be 3/8" x 3/4" deep so that sides of joint are parallel for proper caulk adhesion. Back of the joint to be taped with bond breaking tape to ensure adhesion of caulk to parallel sides of joint and not the back.
  1. Caulking shall be "756 SMS Building Sealant" (Dow Corning Corp.) or the following:
    - a. "SilPruf NB SCS9000 " (Momentive Performance Materials Inc.).
    - b. "Non-Staining Silicone Rubber Sealant" (Sika Corp).
    - c. Or approved equal.
- F. Panel Connections: All panels shall be securely fastened together with 3/8" thick steel brackets. Steel is to be of structural quality, hot-rolled carbon complying with ASTM A36 and hot dipped galvanized after fabrication. All fasteners to be ½" diameter bolts complying with ASTM A325 for carbon steel bolts. All inserts for corner connections must be secured directly to form before casting panels. No floating-in of connection inserts shall be allowed. Wall panels shall be connected to cast-in-place floor slab using expansion anchors providing adequate embedment by manufacturer.
  1. Cast-in anchors used for panel connections to be Dayton-Superior F-63 coil inserts or the following:
    - a. CI-63 by ALP Supply

- b. Equal from Meadow Burke
- c. Or approved equal.

### 2.3 ACCESSORIES

- A. Doors and Frames: Shall comply with Steel Door Institute "Recommended Specifications for Standard Steel Doors and Frames" (SDI-100) and as herein specified. All door and frame galvanizing shall be in accordance with ASTM A924 and A653, A60 minimum coating thickness.
  - 1. The buildings shall be equipped with 3'-0" x 6'-8" x 1-3/4" thick insulated, 18 gauge, metal doors with 16-gauge frames (to meet wall thickness). Doors to have flush top cap. Doors and frames shall be factory bonderized and painted with one coat of rust inhibitive primer and one finish coat of enamel paint.
  - 2. Doors and frames shall meet SDI standard Level 2, 1¾" heavy duty.
  - 3. Approved manufacturers: Republic, Steelcraft, Ceco, Black Mountain, Pioneer, Curries, Mesker, MPI, Door components or equal
  - 4. Approved distributor: Integrated Entry Systems
- B. Door Hardware:
  - 1. See Section 08 71 00 "Finish Hardware" for specified hardware to be furnished and installed under this Section.
- C. Overhead Coiling Doors:
  - 1. See Section 08 33 23 "Overhead Coiling Doors" for specified overhead coiling doors to be furnished and installed under this Section.

### 2.4 FINISHES

- A. Interior of Building: Smooth form finish on all interior panel surfaces unless exterior finish is produced using a form liner, then smooth hand-troweled.
- B. Exterior of Building: Custom Architectural precast concrete finish: As indicated on drawings and matching approved samples and mock-up.
  - 1. See Section 03 33 00 "Architectural Concrete Textured Finishes".

### 2.5 FLUID-APPLIED ROOFING

- A. See Section 07 55 56 "Fluid-Applied Membrane Roofing" for fluid-applied membrane roofing to be furnished and installed under this Section.

**2.6 ANTI-GRAFFITI COATING**

- A. Concrete Anti-Graffiti Coating at exterior face (public side): Provide non-sacrificial, water borne, breathable, non-yellowing, UV stable, VOC compliant, anti-graffiti coating. Provide NYSDOT item number 559.90010011.

**2.7 SOURCE QUALITY CONTROL**

- A. Contractor's Quality Control Responsibilities: Contractor is solely responsible for quality control of the Work.
- B. General: Provide and maintain an effective Quality Control program and perform sufficient inspections, surveys and tests of the Work, including those of other trades, to ensure compliance with the Contract Documents. Furnish appropriate facilities, accurately calibrated instruments and testing devices required to perform the quality control operations and with sufficient work forces to cover the construction operations within the actual construction sequences. Coordinate this work with the quality control requirements of other technical Sections of the Specifications and with requirements of the City of New York and the NYC Building Department.

**PART 3 - EXECUTION****3.1 GENERAL**

- A. Manufacturer's Instructions: Prepare substrates and erect the work of this Section, including components and accessories in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.

**3.2 EXAMINATION**

- A. Verification of Conditions: Examine the areas to receive the Work and the conditions under which the Work would be performed. Remedy conditions detrimental to the proper and timely completion of the Work. Do not proceed until unsatisfactory conditions have been corrected. Examine rough-in and built-in construction to verify actual locations of piping and other connections prior to installation.

**3.3 SITE PREPARATION**

- A. Slab on grade to be minimum 6" thick and 4,000 psi steel reinforced concrete and as required by project conditions. Slab to be level within 1/8" in both directions and capable of supporting loads imposed by the structure. Floor slab must have a 1/2" step-down around the entire perimeter to prevent water migration into the building along the bottom of wall panels.

### 3.4 INSTALLATION

- A. Surface Preparation: Clean surfaces before installation to remove dirt, dust, debris, loose material and other foreign matter detrimental to proper bonding.
- B. Lay Out of Walls: Lay out walls in advance for accuracy with uniform joint widths and for accurate locating of openings, movement-type joints, returns, and offsets. Field cutting of whole panels is not permitted.
- C. Lay Out and Maintenance of Plumb: Lay panels plumb, true to line with level, plumb and true; except as may be otherwise indicated or specified. Comply with tolerances as specified in "References" and the following:
  - a. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/4 in. in 20 ft., or 1/2 in. maximum.
  - b. For conspicuous horizontal lines, do not vary from level by more than 1/4 in., in 20 ft., or 1/2 in. maximum.
- D. Anchor, tie, reinforce and bond panels at corners and intersections in accordance with the applicable requirements of the NYC Building Department.
- E. Leave openings for equipment to be installed before completion. After installation of equipment, complete work to match construction immediately adjacent to the opening.
- F. Cutting, patching and repairing in connection with work as required to accommodate the work of other trades shall be performed under this Section.
- G. Use of Motor Driven Diamond Saw: Use motor driven diamond saw designed to cut units with clean sharp corners. Cut units as required to provide pattern shown and to fit adjoining work neatly. Use full units without cutting wherever possible. Avoid the use of less than half-size units at corners, jambs and at other locations.
- H. Joints: Tool exposed joints slightly concave unless otherwise shown. Lay unit with uniform joint widths.
- I. Built-In Work: Build in frames, struts, hangers, miscellaneous metal and other items of work furnished under other Sections. Prepare for, build in and protect flashings, reglets, anchors and other similar items occurring in connection with work of this Section. Set and grout loose lintels. Build in anchors, furnishing such as may be required exclusively by reason of work under this Section.
  - a. Access Doors, Frames and Access Panels: Install access doors, frames and access panels occurring in construction where shown and required for access to mechanical and electrical installations and equipment.
  - b. Chases, Slots, Reglets or Openings: Chases, slots, reglets or openings necessary for the proper installation of work of other trades shall be formed as required. Keep chases and reglets free from mortar or other debris.

### 3.5 LAYING WALL AND ROOF UNITS

- A. Install wall and roof panels in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.
- B. Control Joints: Construct continuous control joints to provide an unbroken vertical separation through the entire thickness of walls, in the manner shown by the details, complying with referenced standards and at locations shown. Locations of control joints not shown shall be approved by the Engineer prior to the start of construction. Where locations are not shown, construct control joints throughout the unbroken length of walls as follows:
  - 1. Not to exceed twenty 25 ft. on center in same plane as wall unless otherwise shown.
  - 2. Where a change occurs in wall height or thickness, and at chases and recesses in the wall.

### 3.6 FLUID-APPLIED ROOFING APPLICATION

- A. Manufacturer's Instructions: Prepare substrates and proceed with the work of this Section in accordance with the manufacturer's instructions, except where more stringent requirements are shown or specified, and where project conditions require extra precautions or provisions to ensure satisfactory performance of the Work.
- B. Manufacturer's Technical Representative: At the start of the installation and periodically as work progresses provide the services of the fluid-applied roofing membrane manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.

### 3.7 ANTI-GRAFFITI COATING APPLICATION

- A. Manufacturer's Technical Representative: At the start of the installation and periodically as work progresses provide the services of the anti-graffiti manufacturer's technical representative at the job site as often as deemed necessary by the manufacturer to advise on phases of this work.
- B. Surface Preparation: CMU surfaces to receive sealer shall be cleaned of dirt, oil, graffiti, grease, laitance, and other contaminants. All other surfaces shall be cleaned by mid-pressure water (1500 psi). Pressure wash all surfaces scheduled to receive anti-graffiti coating unless manufacturer recommends other acceptable method of cleaning. Remove dirt, dust and materials that will interfere with the proper and effective application of the anti-graffiti coating. Check the compatibility of all sealants and other material contiguous to or scheduled to be used with the anti-graffiti coating. Protect glass, metal, plastic and other non-porous substrates from overspray
- C. Application
  - 1. Anti-graffiti coating shall be applied as per manufacturer's written

application instructions and recommendations. Apply as a minimum 2 full coats (depending on porosity of CMU) allowing first coat to dry as per manufacturer's requirements.

2. Apply at temperature and weather conditions recommended by the manufacture or written in this specification. Surface residue shall be brushed out thoroughly until they completely penetrate into the surface. Protect treated areas from rain and other surface water for a period of not less than four hours after application.

### **3.8 CITY OF NEW YORK'S MONITORING ACTIVITIES**

- A. City of New York's Testing and Inspection Program: Testing and inspection will be performed, at any time during the progress of the Work, by an independent testing agency retained by the City of New York. Furnish materials and access to the Work as required by the City of New York's Testing Agency.

### **3.9 ADJUSTING**

- A. Remove and replace defective materials; correct defective workmanship; leave work clean.

### **3.10 CLEANING**

- A. Removal of Excess Materials: Execute work in as clean a manner as possible, removing excess materials and mortar droppings daily. Remove mortar droppings on connecting or adjoining work before it has attained final set

### **3.11 PROTECTION**

- A. General: Protect work from rain and snow until the work is complete.
- B. Stain Prevention: Prevent staining the face of work to be left exposed or painted. Remove immediately any grout, mortar, and soil that come in contact with work. Protect base of walls from rain-splashed mud splatter by means of coverings spread on ground and over wall surface. Protect sills, ledges, and projections. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes.

**END OF SECTION**

**SECTION 21 13 00 – SPRINKLER SYSTEM****PART 1 - GENERAL****1.01 DESCRIPTION OF WORK**

- A. Provide a wet pipe automatic sprinkler system as specified herein, as shown on the Drawings and as needed for a complete and proper installation. Product specific requirements are contained herein; Section 15301, General Provisions for Fire Protection Systems Work, shall be referred to for general requirements.

**1.02 RELATED SECTIONS**

- A. Division 9 Sections
- B. Division 15 Sections
- C. Division 16 Sections

**1.03 DESIGN REQUIREMENTS**

- A. Based on the fire protection (sprinkler) drawings provided in the Contract Documents, a third party professional engineer licensed in NY State having 5 years experience in the design and installation of fire protection systems shall be engaged by the Contractor to provide hydraulic calculations and Drawings meeting the design parameters indicated in paragraph 1.03C below. The Drawings shall comply with applicable codes and incorporate the final pipe sizes, pipe locations, and sprinkler head locations for the fire protection system after coordination with the other trades. The prepared Drawings and calculations will be reviewed and approved the Engineer.
- B. The Contractor's engineer is responsible for filing all subsequent revisions/amendments and incorporating as-built conditions into filed plans prior to inspection by the Engineer. These revisions/amendments must be filed in a timely manner to allow for full inspection of the system. Installed conditions that do not match the filed documents will be rejected. The Contractor is also responsible for securing inspection for final acceptance of the installed sprinkler system. Filed and approved Drawings must be available for the field inspection and the filing shall have been completed in sufficient time to allow for the inspection to take place while all piping is exposed.
- C. Design Parameters
  - 1. Sizes of risers, mains, sub-mains, and the originally selected pump(s) are not to be changed from those shown on the Contract Drawings unless shown to be inadequate. To make changes to these items, the Contractor's engineer must document design flaws in the original system design with hydraulic calculations prepared following the guidelines outlined in Chapter 11 of NFPA 13-07 as amended in Appendix Q102 of the 2014 NYC Building Code. Locations of risers shown on the Contract Drawings shall not be revised without approval of the Engineer. Deviations will be allowed for sizing of branch piping and the number of sprinkler heads per branch line contingent upon availability of water supply and compliance with the sizing guidelines outlined in Section 14.5 of NFPA 13-07 for Light Hazard, Ordinary Hazard and Extra Hazard Occupancies. Use of the "Pipe Schedule Method" in sizing piping of the system design is not permitted.

2. Hydraulic calculations submitted for plan approval and in support of revisions to size of branch piping and relocation and/or revision of number of sprinkler heads shall take into account and maintain a minimum safety factor of 10 psi, which is part of the original design. The 10 psi safety factor is to be applied to the street pressure as indicated by the hydrant flow test, i.e. the available street pressure as indicated by the hydrant flow test is to be reduced by 10 psi and the resulting reduced street pressure together with the pump pressure rise shall be shown to be capable to adequately supply the Contractor's sprinkler system.
3. If extended coverage quick-response sprinklers are employed with the intent of reducing the system area of operation, the density for 1500 sq. ft shall be used. In addition, the number of sprinklers in the design area shall never be less than five (5).
4. The capacity of the originally selected pump shall be verified to be adequate to supply the water demand for the system as revised by the Contractor's engineer. If inadequate, the Contractor's engineer shall resize the pumps as required and reflect the resizing on the amended Drawings.

#### **1.04 SUPPLEMENTAL SUBMITTALS**

- A. Product Data: Certificate for Hose Threads: Verify that the hose threads on Fire Department connections match the threads on equipment used by the New York City Fire Department.
- B. Submit copies of all permits and approved drawings issued by the New York City Building Department.
- C. Shop Drawings
  1. Complete sprinkler system layout indicating the locations of sprinkler heads, devices, and accessories. Include separate details of special or not easily visualized piping arrangements and inspector's test valves and connections.
  2. Hydraulic calculations shall be complete and cross referenced to the appropriate drawing sheets.
  3. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
- D. Test Reports as specified in the Field Quality Control Article.
- E. Certification of Installation: Submit certificate upon completion of sprinkler work, which indicates that work has been tested in accordance with NFPA 13-07, as amended by the NY City Building Code, and also that system is operational, complete and has no defects.
- F. Certificate of Completion of Piping Painting.
- G. Certificates of Calibration for all test equipment.
- H. Maintenance data: Include an instruction manual describing the operation and maintenance of the system in the maintenance manual.
- I. Maintenance materials: Sprinkler heads, steel cabinet, wrench, caps and chains

**1.05 SUPPLEMENTAL QUALITY ASSURANCE**

- A. Codes and Standards
  - 1. NFPA Compliance: Install fire protection systems in accordance with NFPA 13-07: Standard for the Installation of Sprinkler Systems.
  - 2. UL Compliance: Provide sprinkler products in accordance with UL standards; provide UL label on each product.
  - 3. New York City Building Code: Comply with the requirements of the 2014 NYC Building Code and with the Rules and Regulations of the Building Department, The Board of Standards and Appeals, and The Division of Fire Prevention of the Fire Department.
  - 4. Fire Department/Marshal Compliance: Install sprinkler systems in accordance with local regulations of Fire Department or Fire Marshal.
  - 5. Screw Thread Connections: Comply with local Fire Department/Marshal regulations for sizes, threading and arrangement of connections for fire department equipment to Fire Department connections.
- B. All gauges, instruments and test devices shall be provided with a certificate of calibration and calibration curve or letter indicating that a minimum of five (5) test points have been calibrated. The certificate and letter must show the date of last calibration. The calibration date must be within a year of the testing date.

**1.06 EXTRA MATERIALS**

- A. Heads: For each style and temperature range required, furnish additional sprinkler heads, amounting to six heads when fewer than 300 heads are installed and twelve heads when between 300 and 1200 heads are installed. All the spare heads will be enclosed in a steel cabinet with a special sprinkler wrench to be delivered to the Authority. Obtain a receipt.
- B. Deliver also two spare caps and chains for each Fire Department connection. Obtain a receipt.

**PART 2 - PRODUCTS****2.01 MATERIALS AND MANUFACTURERS**

- A. General:
  - 1. Provide piping materials and factory fabricated piping products of sizes, types, pressure and temperature ratings, and capacities as indicated on the final approved Drawings and these specifications. Sizes of risers, mains, and sub-mains are not to be changed from those shown on the Contract Drawings, except as indicated in paragraph 1.03D above.
  - 2. Provide fittings of materials that match pipe materials used in the sprinkler systems.
- B. Identification: Provide identification complying with the following listing:
  - 1. Fire Protection Piping: Plastic pipe markers (color identification: red).
  - 2. Fire Protection Valves: Plastic valve tags: (valves painted green)

3. Fire Protection Signs: Provide the following signs:
    - a. At each sprinkler valve, sign indicating what portion of system valve controls.
    - b. At each outside alarm device, sign indicating whom to call if device is activated.
- C. Piping: All sprinkler piping shall be UL Listed and FM approved. Provide pipes, fittings, specialties, supports and anchors as shown on the Drawings, and complying with the following listing:
1. Aboveground Pipe, Within the Building
    - a. In buildings not exceeding 300 ft in height above grade and for pressure up to 300 psi, pipe shall be schedule 10 or 40 standard black steel as per ASTM A53, A135, A795. Pipe wall thickness for roll-grooved or welded shall be 0.134" minimum for pipe sizes up to 6" and 0.188" minimum for pipe diameters 8" and 10".
      - 1) Pipe sizes 2½" and above
        - a) Schedule 40 piping with threaded ends, roll-grooving, or welded joints and fittings.
        - b) Schedule 10 piping shall only be permitted when joined with either roll-grooved end fittings or welded joints and fittings.
      - 2) Pipe sizes 2" and below
        - a) Schedule 40 piping with threaded ends, roll-grooving, or welded joints and fittings.
        - b) Schedule 10 with welded joints and fittings.
    - b. Not Used.
    - c. Fittings shall be black, threaded malleable cast iron or flanged cast steel and shall have a pressure rating of 350 psi water working pressure. Pressure ratings shall be cast in or on the fittings.
  2. Mechanical Coupling Type Fittings:
    - a. The use of mechanical coupling type fittings on sprinkler system in lieu of threaded fittings or flanged fittings or grooved fittings is acceptable in sizes 2" to 8" inclusive. The mechanical couplings shall be self-centering and shall engage and lock the grooved pipe and/or fittings in a positive couple while allowing for some degree of angular pipe deflection, contraction and expansion. Each coupling shall consist of a malleable iron or ductile iron housing in two or more segments, a single molded composition sealing gasket, and two or more steel oval neck track bolts with hex nuts.
    - b. Flexible couplings shall be Style-77 as manufactured by Victaulic Company of America, Gruvlok Fig. 7001 by Anvil, Shurjoint #7707 by Shurjoint Piping Products or approved equal. Entire coupling installation including pipe grooving shall be performed in accordance with the manufacturer's instructions. Only couplings,

together with their respective grooved end pipe fittings having fire department approval will be accepted.

3. Not Used.
- D. Hangers & Supports: Adjustable steel clevis hangers, adjustable steel band hangers or adjustable band hangers for horizontal-piping hangers and supports.
  1. Two-bolt riser clamps for vertical piping supports.
  2. Steel turnbuckles and malleable iron sockets for hanger-rod attachments.
  3. Concrete inserts, top-beam C-clamps, side beam or channel clamps or center beam clamps for building attachments. C-type clamps used to attach hangers to the building structure in areas subject to earthquakes shall be equipped with a retaining strap or safety hook to prevent movement. See Figure 7-7 of ASHRAE Practical Guide to Seismic Restraint, 1999. C-type clamps, with or without retaining straps, shall not be used to attach braces to the building structure.
  4. Not Used.
- E. Valves: All sprinkler valves shall be UL/FM approved. Provide valves shown on the Drawings, needed for a proper installation, and complying with the following:
  1. Gate Valves: 300 psi WWP: 3/4" to 2", bronze body, OS&Y indicating type; double or wedge disc with threaded ends. 2½" and up: IBBM, OS&Y or indicating type; double or wedge disc with end connections as required to suit the piping system.
  2. Butterfly Valves: ductile iron body; double seal or encapsulated ductile iron disc design for bubble tight shut off; stainless steel stems, gear operated; valve operation: integral indicating device.
  3. Valve Locking Devices: chain: 3/16" galvanized steel, welded link; padlock; key tags: 1½" dia. Brass, stamped with valve number and service; "S" hooks: brass, for securing keys to key tags.
  4. Check Valves: IBBM, single clapper swing check with metal to metal or rubber faced checks, suitable for horizontal and vertical installation; end connections as required to suit the piping system; 300 psi.
- F. Not Used.
- G. Special Valves
  1. Provide valves, UL listed, in accordance with the following listing. Provide sizes and types that mate and match piping and equipment connections.
    - a. Alarm Check Valve: Provide alarm check valve, model # Victaulic Series 751 or TYCO Fire Products AV-1, with a water trim by-pass line and a retard chamber that allow for containment of pressure surges and avoidance of false alarms that are caused by intermittent pressure variations. Alarm check valve shall be of ductile construction body and capable of operating in 300 psi working water pressure.
      - 1) The retard chamber shall be constructed of ductile iron body and be coated in the interior as well as in the exterior with a

corrosion resistant painting or material. Retard chamber shall be similar to Victaulic Series 752 or other approved equal.

- 2) Other accessories for alarm check valve include Alarm Pressure Switch and a Retard Vent Kit. The Alarm pressure switch actuates an alarm and sends a signal to the fire alarm panel. Approved model#: Victaulic, EPS10-1 or EPS10-2 or other approved equal.
  - 3) Retard Vent Kit shall be similar to Victaulic Series 752 V or other approved equal.
- b. Water Flow Detector: Provide a paddle or vane-type water flow detector in the sprinkler supply piping in the location indicated on the Drawings. Detector shall be so constructed and installed that any flow of water from the system equal to or greater than that from a single automatic sprinkler of the smallest orifice size installed on the system will result in an audible alarm on the premises within 5 minutes after such flow begins and until such flow stops. The delay mechanism shall be a sealed mechanical pneumatic unit with visual indication of actuation. The actuation mechanism shall include a corrosion paddle or vane inserted through a hole in the pipe and connected by a mechanical linkage to the delay mechanism. Unless noted, enclosures shall be NEMA 4 listed by UL. Listed paddle or vane-type water flow detector does not require approval number from NYC Office of Technical Certification and Research (OTCR).

Manufacturer and Model Number: System Sensor WFD Series

- c. Pressure Reducing Valves: Provide listed pressure-reducing valves that are intended to keep the maximum outlet pressure to 165 psi at any point in the system. Valves shall be rated for maximum inlet pressure of 250 psi and be suitable for field outlet" set pressure" ranging from 80 to 150 psi. Valves shall be similar to PRV-1 as manufactured by TYCO.
  - 1) Pressure gauges shall be provided on the inlet and outlet sides of each pressure-reducing valve.
  - 2) A relief valve shall be installed on the discharge side of the pressure-reducing valve
2. Electrical Subcontractor shall provide the sprinkler electric alarm equipment including the control panel, bells, signs, wiring, etc. All equipment for the Sprinkler Alarm system which is not specifically called for to be provided by any other contractors and/or subcontractors shall be provided by the Master Fire Suppression Piping Contractor.
3. Approved Manufacturers:
  - Anvil International/Anvil Star
  - Firematic Sprinkler Devices
  - Reliable Automatic Sprinkler Co.

Victaulic Co. of America.  
 Tyco Fire Suppression & Building Products  
 Potter Electric Signal Company  
 Globe Fire Sprinkler Corporation  
 Shurjoint Piping Products

- H. Gauges: Provide gauges shown on the Drawings and complying with the following:
1. Provide pressure gauges of materials, capacities and ranges, designed and constructed for use in service as required:
    - a. Type: General use, 1% accuracy, ANSI B40.1
    - b. Case: drawn steel or brass, cast aluminum, shatterproof glass lens, 4½" diameter.
    - c. Connector: brass with 1/4" male NPT.
    - d. Scale: white coated aluminum, with permanently etched markings.
    - e. Range: conform to the following:
      - 1) Vacuum: 30" Hg - 15 psi
      - 2) Water: 0 – 300 psi
  2. Acceptable Manufacturers:
 

Ametek/US Gauge  
 Ernst Flow Industries  
 Marsh Bellofram  
 Miljoco Corporatjuion  
 Trerice (H.O) Co.  
 Weiss Instruments, Inc.  
 Wesler Instruments
- I. Pressure Gauge Cocks:
1. Provide pressure gauge cocks between pressure gauges and gauge tees on piping systems. Construct gauge cock of brass with 1/4" female NPT on each end, and "T" handle brass plug.
    - a. Syphon: 1/4" straight coil constructed of brass tubing or loop-shaped section of brass, stainless-steel or steel pipe with 1/4" male NPT on each end.
    - b. Snubber: 1/4" brass bushing with corrosion resistant porous metal disc, through which pressure fluid is filtered. Select disc material for fluid served or pressure rating.
  2. Manufacturers: same as for pressure gauges

- J. Pressure and/or Temperature Gauge Connector Plugs:
1. Provide gauge connector plugs rated for 500 psi at 200°F. Construct of brass and finish in nickel–plate equipped with 1/4" or 1/2" NPS fitting, with self-sealing valve core type neoprene gasketed orifice suitable inserting 1/8" OD probe assembly from dial type insertion pressure and/or temperature gauge. Equip orifice with gasketed screw cap and chain.
  2. Approved manufacturers:
    - Miljoco Corporation
    - MG Piping Products Co.
    - Peterson Equipment Co.
    - Sisco, A Spedco, Inc. Co.
    - Trerice (H.O) Co.
    - Watts Regulator Co.
- K. Sprinkler Head
1. Provide sprinkler head of type indicated on Drawings, and in accordance with the following listing. Provide fusible links for 165°F or heat responsive, frangible glass bulb design rated at 155°F unless otherwise indicated on the Drawings. Wet or dry sprinklers that utilize O-rings as seals are not to be used on projects. O-ring sprinklers can degrade over time. These sprinkler heads can corrode, or minerals, salts, and other contaminants in water can affect the polymeric rubber O-ring seals. These factors could cause the sprinkler heads to not activate in a fire. Heads that use Teflon coated Belleville metallic seals rather than a rubber O-ring are to be used.
    - Concealed Including Cover Plate
      - a. Not Used.
      - b. Sprinkler Cabinet and Wrench: Provide steel, baked red enameled, sprinkler box with capacity to store sprinkler heads and wrench.
      - c. In light hazard occupancy only, quick-response extended coverage (QREC) sprinklers shall be installed in accordance with their listing. To reduce branch piping as well as the number of heads that are provided, quick-response extended coverage sprinklers shall be installed where indicated in drawings. Typically, gymnasium or other similar fire hazard classifications are ideal for maximizing the protection area by using sidewall horizontal quick-response extended coverage sprinklers.
  2. Approved Manufacturers:
    - Firematic Sprinkler Devices, Inc.
    - Anvil International/Anvil Star
    - Viking Corp.
    - Reliable Automatic Sprinkler Co.
    - Victaulic Co. of America.

Tyco Fire Suppression & Building Products  
Globe Fire Sprinkler Corporation

L. Fire Department Connections

1. Flush type shall be of the size indicated on drawings. Fire Department connections shall be polished brass with two individual drop clapper valves and cast iron plugs painted yellow with brass chain and with polished plate lettered "AUTOMATIC SPRINKLER" and "PART SPRINKLERED". The letter inscription shall be either an integral part of the plate or on a separate nameplate securely fastened to or above the Fire Department connection. Flush type shall be Potter Roemer Fig. 5020G Series (THREADS: N.Y.F.D.), or Croker Corp. Fig. 6030 Series (3" NYCFD inlets). Threads shall be to NYC Fire Department specifications.
2. Exposed type shall be of the size indicated on the drawings. Fire Department connections shall be polished brass with two individual drop clapper valves, pin lug swivels, plugs and chains and with polished brass wall plate lettered "AUTOMATIC SPRINKLER" and "PART SPRINKLERED". The letter inscription shall be either an integral part of the plate or on a separate nameplate securely fastened to or above the Fire Department connection. Exposed type shall be Potter- Roemer, Fig. 5750 Series (THREADS: N.Y.F.D.) or Croker Corp. Fig 6430 Series (3" NYCFD inlets). Threads shall be to NYC Fire Department specifications.
3. Sidewalk type shall be of the size indicated on drawings. It shall be polished brass, complete with 18" sleeve, cast brass plugs and chains, and floor plate lettered "AUTOMATIC SPRINKLER" and "PART SPRINKLERED". The letter inscription shall be either an integral part of the plate or on a separate nameplate securely fastened to or above the Fire Department connection Sidewalk type shall be Potter Roemer 5760 Series (THREADS: N.Y.F.D.) or Croker Corp. Fig. 6513 (3" NYCFD inlets). Sidewalk Fire Department connection risers shall be made of red brass.
  - a. Where a fence encloses a portion of the building containing a Fire Department connection, Contractor shall provide and secure to the fence directly opposite the Fire Department connection a steel sign containing the following wording: "F.D. Fire Department Connection located...Feet behind Sign." Sign shall be finished in porcelain enamel with one inch red letters on white background.
4. Acceptable Manufacturers:  
Elkhart Brass Mfg. Co., Inc.  
Croker  
Potter Roemer

- M. Ladders: Provide permanent heavy steel ladders to provide access to valves in accordance with the code requirements. Ladders shall be of width and height required, shall be made of heavy steel bars and heavy rungs and shall be permanently fastened at location. Where the shut-off valve adjacent to the sprinkler alarm valve is located higher than 7' above the floor, ladder shall be provided where directed.

N. Pipe Escutcheons

1. Pipe escutcheons shall have inside diameter closely fitting pipe outside diameter or outside of pipe insulation where pipe is insulated. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, walls, or ceilings; and pipe sleeve extension, if any. Escutcheons shall be cast or sheet brass, solid or split-hinged, with brass set screw. Provide chrome finish for occupied areas exposed to view.
2. Manufacturers:  
Zurn Industries, Inc.  
McGuire Mfg. Co.

O. Pipe Sleeves: Provide pipe sleeves of one of the following. Pipe sleeve must be appropriate type and thickness for the UL firestopping assembly selected:

1. Sheet-Metal: Fabricate from galvanized sheet metal; round tube closed with snaplock joint, welded spiral seams, or welded longitudinal joint. Fabricate from the following gauges: 3" and smaller, 20 gage minimum; 4" to 6", 16 gage; over 6", 14 gage minimum.
2. Steel-Pipe: Fabricate from Schedule 40 galvanized steel pipe; remove burrs.
3. Iron-Pipe: Fabricate from cast-iron or ductile-iron pipe; remove burrs.
4. Firestop penetration materials for sealing sleeves shall be listed by Underwriters Laboratories and if not listed have MEA or OTCR approval. The materials shall be as specified in Section 07270. For pipes passing through fire-rated floor, cast-in place firestop device with Underwriters Laboratories listing, and if not listed have MEA or OTCR approval, is permitted as an acceptable sleeve alternative to a metallic sleeve with firestopping material. The cast-in place device is a one-step firestopping process that does not require additional firestop penetration materials for sealing the sleeves. The device shall be installed where required for sleeving purposes. The cast-in place firestop device shall not be used for wall applications.
5. Materials for sealing space between each pipe and sleeve through non-rated interior walls shall consist of mineral wool and sealant.

## 2.02 PAINTING

A. Paints used on dedicated sprinkler piping shall not:

1. Exceed the VOC content limits established in the Green Seal Standard GS-11 Paints, first edition, May 20, 1993.
2. Exceed the VOC content limit of 250 g/L established in the Green Seal Standard GC-03, Anti-Corrosive paints, second edition, January 7, 1997.

B. Provide colors indicated in Paragraph 3.03.C

1. First (1<sup>st</sup>) coat – Alkyd Vinyl Acrylic – Latex Primer – 1.2 Mills DFT
2. Second (2<sup>nd</sup>) coat – Semi-Gloss Vinyl Acrylic Latex – Enamel – 1.3 Mills DFT

**PART 3 - EXECUTION****3.01 INSTALLATION**

- A. Approval of Sprinkler System: All necessary permits for work in connection with the installation of the sprinkler system shall be obtained by the Contractor before commencing any of the sprinkler work. The Engineer will prepare and submit plans to the Building Department and obtain approval of the sprinkler system.
- B. Installation of Identification
  - 1. Install fire protection signs on sprinkler system in accordance with NYC Building Code, NFPA 13 requirements.
  - 2. Each valve in the sprinkler system shall be tagged in accordance with the requirements of The New York City Building Code.
- C. Piping Installation
  - 1. Install pipes and pipe fittings in accordance with Article 2.01.C.
  - 2. Comply with requirements of NFPA 13 for installation of sprinkler piping materials. Install piping products where indicated, in accordance with manufacturer's written instructions and in accordance with recognized industry practices to ensure that piping systems comply with requirements and serve intended purposes.
  - 3. Coordinate with other work including plumbing piping, as necessary to interface components of sprinkler piping properly with other work.
  - 4. Install drain piping at low points of piping systems and at the alarm valve, a valve drain connection that will be carried down to the floor to discharge into the nearest floor drain, unless otherwise shown on the Drawings. Low points of sprinkler piping that cannot be drained through the alarm valve drain or when there is no alarm valve shall also be provided with drains as may be shown on the Drawings or as required.
  - 5. Install valved hose connections of sizes indicated, or 3/4" size if not otherwise indicated, on sprinkler at ends of branch lines and cross mains at locations where indicated on the Drawings.
  - 6. Install Inspector's test connection where indicated, or at most remote point from riser.
  - 7. All parts of the sprinkler system that may be exposed to frost shall be protected from freezing by any of the following methods:
    - a. The piping shall be frost-proofed with insulation having a thermal conductance of 0.1 Btu/hr per square foot of surface per degree F at a mean temperature of 70°F to 75°F (21°C to 24°C). Insulation shall be protected to prevent water infiltration, and when exposed to the weather the insulation shall be covered with a 45 pound (20kg) roofing felt jacket or equivalent.
    - b. Electric tracers may be used in conjunction with the insulation.

- D. Installation of Valves
  - 1. Install alarm valves and water flow detectors where indicated on the Drawings.
  - 2. Valves shall have built-in tamper switches for use in applications where supervision of the open position of the valve may be desired. The tamper switch is operated by a cam connected to the valve stem. The Contractor should make certain that the valve disc when fully open does not interfere with the operation of other system components immediately adjacent to the valve.
  - 3. Install the floor control valve assembly inside the specified recessed cabinet or an access panel
- E. Installation of Sprinkler Pressure Gauges: Install gauges in accordance with Articles 2.01.F, G & H.
- F. Installation of Electrical Devices: Provide wiring requirements for electrical wiring of control panel, bells, valves, tamper switch, alarm valves, and water flow detectors.
- G. Installation of Sprinkler Head
  - 1. Install sprinkler head at the proper position shown on the Drawings, or as required. Install concealed type sprinkler heads with factory painted white cover plate in areas with suspended ceilings. Install recessed type sprinkler head with manufacturer supply escutcheon.
  - 2. Install sprinkler piping, heads, and all other items and accessories to clear electric lighting fixtures.
- H. Installation of Pipe Escutcheons: Install pipe escutcheons on each pipe penetration through floors, walls, partitions, and ceilings. Secure escutcheon to pipe or insulation so escutcheon covers penetration hole, and is flush with adjoining surface.

### **3.02 ADJUSTING AND CLEANING**

- A. Cleaning and Inspecting: Clean and inspect fire protection systems in accordance with Article 3.05.

### **3.03 FIELD PAINTING**

- A. Paints and coatings used in the interior of building to mark piping for identification purposes shall not exceed the VOC content limits established in Section G01600.
- B. Paint exposed sprinkler piping with a priming coat and two finish coats as specified in Section 09900: Painting. Protect sprinkler heads during painting with small paper bags. Painting of sprinkler piping, hangers, and all other items and accessories shall conform to the code requirements.
- C. Painting of Dedicated Piping:
  - 1. Dedicated sprinkler piping such as risers, cross-over mains and cross-over connections shall be painted red and the handles of valves fitted into the dedicated piping shall be painted green prior to the hydrostatic pressure test of the system. Painting shall be applied whether the pipe is ultimately concealed or remained exposed.

2. Not Used.

### 3.04 CERTIFICATE OF COMPLETION OF SYSTEM PAINTING

- A. A licensed master plumber, licensed master fire suppression piping contractor, registered design professional, or an individual holding an appropriate certificate of fitness from the FDNY for the operation and/or maintenance of sprinkler shall certify on forms provided by the Building Code Compliance (BCC) unit that painting of system was complied with. The certificate of completion of painting is required for buildings where the special inspection provision of chapter 17 of the NYC Building Code did not apply.

The certificate of completion of painting shall be maintained on the premises and made available for inspection by the FDNY

### 3.05 FIELD QUALITY CONTROL/INTERDISCIPLINARY TESTS AND FUNCTIONAL PERFORMANCE TESTS

- A. Cooperate with the Engineer and provide all required access to facilitate all testing and inspections required by the Engineer for quality control and Regulatory Compliance.

- B. Sprinkler Piping Flushing

Prior to connecting sprinkler risers for flushing, flush water feed mains, lead-in connections and control portions of sprinkler piping. After fire sprinkler piping installation has been completed and before piping is placed in service, flush entire sprinkler system, as required to remove foreign substances, under pressure as specified in NFPA 13. Continue flushing until water is clear, and check to ensure that debris has not clogged sprinkler heads.

- C. Test

1. Hydrostatic Testing: After flushing system, test fire sprinkler piping hydrostatically, for one (1) hour period, at not less than 200 psi or 50 psi in excess of the system working pressure, whichever is greater. Check system for leakage of joints. Measure hydrostatic pressure at low point of each system or zone being tested.
2. Repair or replace piping system as required to eliminate leakage and to demonstrate compliance with NFPA standards.
3. Test the entire sprinkler installation, including sprinkler alarm system, in accordance with the requirements of the Building Code and give at least 2 days advance notice in writing of tests and inspections to the Commissioner of Buildings and the Engineer. Tests shall be conducted in the presence of the Commissioner or Commissioner's authorized representative and the Engineer, Fire Department and any other public authority having jurisdiction. All tests shall be performed as part of this contract.

- D. Interdisciplinary Pre-Start-Up and Start-Up Tests/Inspections:

The Contractor shall conduct interdisciplinary pre-start up and start up tests/inspections (ex. verifying correct seismic restraint installations, verifying correct installation of sprinkler flow detectors and alarm gong) as per the manufacturer's start up procedures. Contractor shall submit signed start up affidavit signed by the factory authorized service representative/Contractor's

seismic P.E. certification indicating that all of the manufacturer's pre-start up and start up procedures have been successfully completed.

E. Functional Performance Tests:

Contractor shall also submit signed functional performance testing affidavit signed by the factory authorized service representative indicating that all of the manufacturer's functional performance tests (flushing, hydrostatic tests and testing of the sprinkler alarm system activation) have been successfully completed.

**3.06 SPECIAL INSPECTION**

- A. Installation of sprinkler systems, including all supports and attachments is subject to the Special Inspection requirements of Section BC 1704.23 of the 2014 NYC Building Code. The Engineer will engage a Special Inspector to perform the required inspections.
- B. Cooperate with the Engineer and provide all required access to facilitate all testing and inspection related to the Special Inspection.
- C. The special inspector shall verify that the material and test certification forms have been transmitted to the Fire Department and the Department of Buildings.

**3.07 FLOW TEST**

- A. The sprinkler system shall be flow tested as follows:
  - 1. The main drain valve shall be opened and remain open until the system pressure stabilizes
  - 2. The static and residual pressures shall be recorded on the contractor's test certificate
  - 3. Water flow detecting devices including the associated alarm circuits shall be flow tested through the inspector's test connection and shall result in an audible alarm on the premises within 5 minutes after such flow begins and until such flow stops.
  - 4. All components of the sprinkler system and auxiliary must have been pressure tested as a composite system
  - 5. Discharge tests of the sprinkler system shall be conducted using the fire department connections (Fire Department connections)
  - 6. Pressure gauges shall be installed at critical points and readings shall be taken under various modes of auxiliary equipment operation.
  - 7. Water flow alarm signals shall be responsive to discharge of water through the system test pipes (Fire Department connections) while auxiliary equipment is in each of the possible modes of operation
  - 8. Where sprinkler booster pumps are part of the water supply, testing shall be conducted while the pumps are operating.

**END OF SECTION**

## **SECTION 28 46 00 – FIRE DETECTION AND ALARM SYSTEM WITH CENTRAL STATION CONNECTION**

### **PART 1 – GENERAL**

#### **1.01 DESCRIPTION OF WORK**

- A. The Work shall include all labor, equipment, materials and necessary services to provide a complete addressable Manual, Automatic Smoke/Heat Detection and Sprinkler Alarm System with Central Station Connection (hereinafter denoted by the phrase “the system”). The system shall be addressable, with all initiating devices individually annunciated on the Fire Alarm Control Panel. Evacuation alarm tones shall be programmed to be TEMPORAL 3 in accordance with Appendix Q (NFPA 72-2010 with NYC modifications as adopted in RCNY 3616-04) of the 2014 NYC Building Code. The system shall have supervised wiring with all operations as herein described. The system shall consist of, but not be limited to, the following:
1. Fire alarm control panel(s).
  2. Manual pull stations.
  3. Area smoke detectors.
  4. Carbon monoxide detectors.
  5. Heat Detectors.
  6. Sprinkler waterflow switches.
  7. Visual Notification Appliances (Strobes).
  8. Sprinkler valve tamper switches for sprinkler valve supervision.
  9. Fused disconnect switch in the electrical room.
  10. Battery Backup.
  11. Digital Alarm Communicator Transmitter (DACT) for Central Station notification.

#### **1.02 APPLICABLE LISTINGS, CODES AND STANDARDS**

- A. The 2014 New York City Building Code.
- B. The 2014 New York City Mechanical Code.
- C. The 2014 New York City Fire Code.
- D. New York City Electrical Code – NFPA 70 as amended by New York City.
- E. NFPA 72-2010 edition, as modified for use in NYC - See Appendix Q of the NYC Building Code.
- F. NFPA 72-2010 edition - Chapter 10, as adopted without modifications by the NYC Fire Code, shall be used for all acceptance and re-acceptance testing and maintenance of fire alarm systems.
- G. NFPA 13–2007 edition, as modified for use in NYC - See Appendix Q of the NYC Building Code.

- H. The New York City Amendment to the 2008 NEC Code.
- I. The New York City Department of Buildings - Office of Technical Certification and Research (OTCR) for other equipment not specifically described by the NYC Construction Codes.
- J. UL 1971 and ADA Guidelines related to Strobe Synchronization.
- K. UL 864 – 9<sup>th</sup> Edition requirements for fire alarm control equipment. Contractor shall submit proof in writing from the proposed Fire Alarm System manufacturer that submitted Fire Alarm Control Panel has been UL listed based on the UL 864 9<sup>th</sup> Editions. UL listing based on the 8<sup>th</sup> Edition or earlier Editions is not acceptable.
- L. UL 2075-07 “Gas and Vapor detectors and sensors” for CO detectors.
- M. UL listings or FM Approvals for all fire alarm equipment shall be for its intended use.
- N. NYC Fire Department Certificate of Approval for the Fire Alarm Control Panel (FACP) based on UL 864 – 9<sup>th</sup> Edition.

### 1.03 RELATED WORK

- A. The Contractor shall coordinate the work in this Section with all related trades. Work and/or equipment provided in other Sections and related to the fire alarm system shall include, but not be limited to:
  - Sprinkler water flow and tamper switches shall be provided by the Mechanical trade. The switches shall be wired and connected to the Fire Alarm System by this Contractor.
  - 2. Boiler and non-electric hot water heater control circuits shall be furnished by the equipment’s control equipment for shut-down upon activation of **carbon monoxide and heat** detectors.  
  
Interconnecting wiring to the boilers and gas fired hot water heaters from the Fire Alarm Control Panel shall be provided by this contractor.

### 1.04 SYSTEM DESCRIPTION

- A. The system shall perform as described below. All equipment, components, and labor required shall be provided by the Contractor.
- B. Fire Alarm Initiation
  - 1. Fire alarm initiation shall be accomplished by:
    - a. Operation of a manual pull station.
    - b. Operation of a water flow switch in the Sprinkler System.
    - c. Operation of an Area Smoke Detector.
    - d. Operation of a Heat Detector.
    - e. Operation of a kitchen Fire Extinguishing System (Ansul System).
- C. Alarm Indications
  - 1. Operation of a manual pull station:
    - a. New Fire Alarm System Operation of a pull station shall immediately alarm the building audibly via the sounding an evacuation signal of

continuous Temporal 3 tones over the horns and visibly with the flashing of strobe lights. The horns and strobes shall operate continuously until an acknowledge/silence button on the Fire Alarm Control Panel is pushed. In addition, manual pull station operation shall be communicated as a “manual alarm” to the central station through the DACT.

2. Activation of a waterflow switch in the sprinkler system:
    - a. New Fire Alarm System Activation of a waterflow switch in the sprinkler system shall immediately alarm the building audibly via the sounding an evacuation signal of continuous Temporal 3 tones over the horns and visibly with the flashing of strobe lights. The horns and strobes shall operate continuously until an acknowledge/silence button on the Fire Alarm Control Panel is pushed. In addition, waterflow switch operation shall be communicated as a “sprinkler alarm” to the central station through the DACT.
  3. Activation of the Kitchen Fire Suppression System (Ansul System), smoke detector, heat detector or flame detector:
    - a. New Fire Alarm System Activation of the Kitchen Fire Suppression System (Ansul System), smoke detector, heat detector or flame detector shall immediately alarm the building audibly via the sounding an evacuation signal of continuous Temporal 3 tones over the horns and visibly with the flashing of strobe lights. The horns and strobes shall operate continuously until an acknowledge/silence button on the Fire Alarm Control Panel is pushed. In addition, operation of the Kitchen Fire Suppression System (Ansul System), smoke detector, heat detector or flame detector shall be communicated as an “automatic alarm” to the central station through the DACT.
  4. Activation of a carbon monoxide detector:
 

New Fire Alarm System Activated Carbon Monoxide Detector shall sound the integral horn (integral to the CO detector) in a Temporal 4 tone. No evacuation signal shall be sounded upon activation of a carbon monoxide detector. Activation of the carbon monoxide detectors shall send an alarm to the panel and be communicated as a “CO Alarm” to the central station through the DACT.
  5. Other devices connected to the Fire Alarm system:
    - a. Sprinkler system tamper and flow switches and sprinkler tank water level and pressure switches shall be monitored by a central supervisory station as individual “Supervisory Signals” (per device type).
 

Trouble signals from the Fire Alarm Control Panel shall be monitored by a central supervisory station as a “General Trouble”.
- D. Other Fire Alarm System Operations
1. Boiler and hot water heater shut-down:

Activation of a carbon monoxide detector or heat detector shall shut down boilers and non-electric hot water heaters.

E. Display Module Operation/Indications

1. An alarm may be acknowledged by actuating the "ALARM/TROUBLE ACKNOWLEDGE" key/button. This shall silence the audible device in the Fire Alarm Control Panel and change the "SYSTEM ALARM" LED from flashing to steadily lit.
2. If multiple alarm conditions are present, the first alarm must be shown on the LCD display. The LCD display can then be scrolled to show all other alarm conditions.
3. Failure of normal power, open or short circuits, disarrangement in system wiring, failure of microprocessor, failure of any addressable module or any ground fault condition shall activate the system trouble circuitry. Amber "SYSTEM TROUBLE" LED shall illuminate when any of these conditions exist. Along with the trouble LED, a steady trouble audible signal shall be sounded and an alphanumeric trouble error message shall be displayed on the LCD display.
4. All trouble conditions and error messages shall be indicated on the system printer, including the time and date of each occurrence.
5. A trouble signal may be acknowledged by actuating the "ALARM/TROUBLE ACKNOWLEDGE" key/button. This shall silence the trouble audible signal and change the display from flashing to steady. If multiple trouble conditions are present, the LED shall stay lit and the audible signal will sound until all troubles are acknowledged.
6. During an "alarm" condition, all "trouble" signals shall be suppressed with the exception of illumination of the "SYSTEM TROUBLE" LED.

## 1.05 QUALITY ASSURANCE

A. Equipment/System

1. All equipment furnished under these Specifications shall be UL Listed or FM Approved for its intended purpose.
2. All Fire Alarm Control Panels shall be UL listed in accordance with UL 864 – 9<sup>th</sup> Edition and listed in the UL Fire Protection Equipment Directory under product category "Control Units System (UOJZ)". Use of equipment listed under UL 864 - 8<sup>th</sup> Edition or earlier is not permitted.
3. NYC Fire Department Certificate of Approval for the Fire Alarm Panel and Data Gathering Panels, based on UL 864 – 9<sup>th</sup> Edition.

B. Manufacturer

- The manufacturer providing material or equipment specified in this section must, for the past five (5) years, have been regularly engaged in the manufacture of material or equipment similar in type to that required for this Project. Such material or equipment provided by the manufacturer must have been in satisfactory service for not less than five (5) years.

C. Fire Alarm Company

1. The Fire Alarm Company providing the material and supervision shall be a manufacturer - authorized distributor for the equipment to be provided.
2. If brand names other than those listed are proposed for use, the Fire Alarm Company shall pay all costs, including travel expenses to the test facility for the Engineer to witness the tests demonstration.
3. The Fire Alarm Company shall be a manufacturer - trained and authorized repair and service organization capable of providing on-site supervision throughout the project and warranty/maintenance service after acceptance.
4. The Fire Alarm Company shall provide all technical support required for an operational system. All technicians shall provide all of the following qualifications in writing:
  - \* NICET Level 2 in Fire Alarm Systems,
  - \* Factory Certificate for the proposed equipment,
  - \* Fire Department Certificate of Fitness for smoke detector testing and maintenance, in accordance with Section FC 901.6.3.4 of the NYC Fire Code.

D. Company Field Advisor

The Fire Alarm Company shall provide a Company Field Advisor to provide all technical supervision and installation support. That individual shall provide all of the following qualifications in writing: NICET Level 3 in Fire Alarm Systems, Factory Certificate for the proposed equipment and a Fire Department Certificate of Fitness in accordance with Section FC 901.6.3.4. Company Field Advisor shall be available for a minimum of 16 working hours for the following:

1. Render advice regarding the installation and final adjustment of the system.
2. Render advice on the suitability of each signal-initiating device for its particular application.
3. Witness final system tests and then certify with an affidavit that the system is installed in accordance with the Contract Documents and applicable codes, and is operating properly.
4. Instruct facility personnel in operation, programming, and routine maintenance of the system (minimum of 4 hours).
5. Explain available service programs to facility supervisory personnel for their consideration.

**1.06 SUPPLEMENTAL SUBMITTALS**

- A. Fire Alarm Contractor shall submit the following material for review by the Engineer.
1. Provide a list (bill of materials) of all equipment and components to be used in the system.
  2. Provide description of operation of the system, to include any and all exceptions, variances or substitutions. Include a copy of printer headings, reports, prompts, etc.
  3. Provide system Ampere load (during both normal and alarm conditions) and time calculations to substantiate compliance (battery Ampere-Hour capacity) with battery back-up power requirements for a 24-hour standby followed by a 15-minute full alarm load, as required in NYC. Standard battery calculations based on NFPA 72 are not permitted, as NYC requirements exceed those of NFPA 72.
  4. Provide manufacturer's printed product data, catalog pages and descriptions of any special installation procedures.
  5. Provide Data from the Manufacturer proving that:
    - a. Fire alarm initiating devices that receive their power from the initiating circuit of a Fire Alarm Control Panel are multiple listed by the UL or FM for use with the control unit.
    - b. UL listings or FM approvals of all products and components.
    - c. NYC Fire Department Certificate of Approval for the Fire Alarm Control Panels and Data Gathering Panels (DGPs).
    - d. The batteries proposed for use are compatible with the battery charger.
  6. Provide Shop Drawings as follows:
    - a. Large scale drawing, including actual dimensions, of the fire alarm control panel(s) (FACP), and all ancillary equipment.
    - b. Riser diagram showing all equipment and types, all connections and number and size of all conductors.
    - c. Floor plans showing all equipment and types, all connections and number and size of all conductors.
  7. Provide a schedule, for review and approval, of the proposed label for each auxiliary control switch at the fire alarm control panel.
  8. Provide a schedule, for review and approval, of the proposed label and color for each LED/lamp indicator at the remote annunciator.
  9. Close-out submittals as listed in Part 3 of this specification.
  10. Warranty

**1.07 MAINTENANCE**

- A. Service Availability of the Fire Alarm Company
- It shall be a fully equipped service organization, capable of an 8 hour response

time to service calls and must be available 24 hours a day, 7 days a week to service the complete Fire Alarm System.

## **1.08 WARRANTY**

- A. Special Warranty: Written warranty, executed by manufacturer agreeing to repair or replace materials or workmanship for a period of one (1) year from the date of Substantial Completion (successful 100% acceptance testing by a Company Field Advisor).

## **PART 2 - PRODUCTS**

### **2.01 MANUFACTURERS**

- A. The following manufacturers are approved for the furnishing of the specified items of Fire Detection and Signaling Equipment: FCI, Honeywell/Notifier, EST (UTCFS), Siemens, Wheelock and System Sensor, Firecom and Mircom.
- B. Each item of equipment offered by these manufacturers must meet the full requirements of the Specification for that item, and shall be UL listed in accordance with UL 864 – 9<sup>th</sup> Edition and listed in the UL Fire Protection Equipment Directory under product category “Control Units System (UOJZ)”. Use of equipment listed under UL 864 - 8<sup>th</sup> Edition or earlier is not permitted.

### **2.02 APPROVALS**

- A. The fire alarm system, as installed, shall be approved by the Bureau of Fire Prevention of the New York City Fire Department. A Fire Department Letter of Approval shall be obtained by the contractor and delivered to the Engineer as a prerequisite for final acceptance. Refer to Article 3.02.

### **2.03 EQUIPMENT**

- A. General
  - 1. The following equipment where shown on the Drawings or called for in the Specifications shall be furnished and installed by the Contractor at locations where shown on the Drawings, called for in the Specifications or as otherwise directed in writing by the Engineer.
- B. Manual Pull Station
  - 1. Provide an addressable manual pull station at each location indicated on the Drawings or called for in the Specifications.
  - 2. Each pull station shall be addressable manual pull lever single-action type. When operated, the handle shall be locked in the operated position until the station is reset (by use of either a key or a reset tool, depending on model).
  - 3. Each pull station shall have hinged inner and outer doors with the inner door locked. A common key shall be required to gain access for resetting the station. Instructions for operating station shall appear on front of the outer door.
  - 4. The pull station shall be interfaced into the addressable system by means of an internal or external addressable interface module.
  - 5. For surface or semi-flush mounting, the mechanism shall be set into a separate stamped steel box with one 3/4” knockout. All parts shall have a

baked enamel red finish and exposed edges shall be rounded. Steel box shall be EST (UTCFS) model #27193-11 or RSG/Aames Security model #RMS-DBB-1K. Pull stations with internal module shall be UL listed for use with the FACP.

6. Pull stations shall be set so that the top of the operating lever of station shall be 3'-6" to 4'-0" above the finished floor. The Contractor shall report to the Engineer any interference with wainscot, or other construction or mechanical equipment.
7. False Fire Alarm Stopper Cover: provide false fire alarm stopper cover to fit every pull station shown on the drawings. False fire alarm stopper shall be Safety Technology International Stopper II P/N – STI 1100 with 9 volts dc battery.

C. Audible Notification Appliances (Horns)

1. The Contractor shall provide fire alarm horns wherever the Drawings require.
2. Each horn shall be installed on a standard 4" galvanized electrical box, either flush or surface mounted, as indicated on Drawings. Provide weatherproof box and gasket in damp, wet or exterior locations.
3. Horns shall be electrically polarized and include a blocking network to allow for connection to a supervised fire alarm signal circuit.
4. Each horn shall have a high volume setting between 82 and 91 dBA at 10'-0". Each horn shall have adjustable Hi-Lo dBA setting.
5. Horns shall be 24 VDC and shall have a selectable Temporal 3 setting to allow one pair of wires to power both horn and strobe.
6. All horns shall be by single supplier. Horns shall be EST (UTCFS) Genesis Series GIRF-HD, Siemens, Honeywell Gamewell/FCI or approved equal.

D. Visual Notification Appliances (Strobes)

1. The rating of the strobe unit shall be a minimum of 15 candelas and shall deliver all characteristics and requirements called for in NFPA 72-10 as accepted by Appendix Q of the NYC Building Code and the American with Disabilities Act (ADA), including the "Equivalent Facilitation" rule, and UL 1971.
2. In corridors, places of assembly and common areas, the strobes shall be synchronized when 3 or more strobes are in line of sight. Strobes to be synchronized shall be UL listed for use with the FACP/power source to ensure synchronization.
3. Strobes shall be listed for wall-mounted application.
4. Strobes shall be listed for 24 volt DC.
5. Fixture assembly shall be mounted on a painted steel plate. A translucent dome of hi-impact plastic, with the work "Fire" silk-screened red in 1/2" high letters, shall be provided to provide readability from both sides of the unit. The dome shall be screw-fastened or epoxied to plate so as to prevent dome from being removed.

6. Strobes and their wiring shall be 100% supervised by the Fire Alarm Control Panel.
  7. In new construction, the indicator shall be mounted to a flush 2-gang outlet box with suitably placed threaded holes to accept mounting of the indicator plate. In existing construction, surface mounted boxes shall be a finished cast type box with no knockouts, Type FS or FD.
  8. Strobes installed in damp, wet or exterior locations shall be provided with a weatherproof box and gasket listed for such application.
  9. Strobes shall be EST (UTCFS) Genesis Series GIRF-VM, Wheelock #RSS-241575W-FR, System Sensor SR or approved equal.
- E. Audible/Visual Notification Appliances (Horns/ Strobes)
1. Where indicated on Drawings horns shall come equipped with a strobe unit that mounts directly to basic horn mechanism.
  2. The strobe section and horn section shall be separate and can be connected to either separate signal circuit loops or to the same signal circuit loop.
  3. Horn and strobe components of a horn/strobe unit shall meet all criteria listed above.
  4. Horns/strobe units shall be EST (UTCFS) Genesis Series GIRF-HDVM, Wheelock HS4-241575W-FR, System Sensor Horn/Strobe P2R or P4R, or approved equal. Strobes to be synchronized shall be UL listed for use with the FACP/power source to ensure synchronization.
- F. Area Type Smoke Detectors
1. The Contractor shall provide intelligent analog addressable photoelectric smoke detectors with bases at locations shown on the Drawings or called for in the Specifications. Ionization type smoke detectors are not permitted.
  2. Smoke detectors shall operate on 24V D.C. received from the Fire Alarm Control Panel. Smoke detectors shall be analog type supervised by the panel for sensitivity rating within acceptable thresholds. Deviations shall be annunciated at the Fire Alarm Control Panel & Remote Annunciator(s).
  3. All smoke detectors shall be supplied with an LED indicator lamp, which shall give indication that the smoke detector is active (flash) and latch (on steady) when the detector has tripped into alarm.
  4. Area type photoelectric smoke detector shall be EST (UTCFS) SIGA2-PS, Honeywell/Notifier FSP-851, Siemens, or approved equal. Detectors shall be UL listed for use with the FACP.
- G. Heat Detectors
1. Contractor shall provide heat detectors in boiler room and in other locations as shown on plans.
  2. Heat detectors shall be EST (UTCFS) model 284BPL 194°F fixed temperature and shall be monitored with an EST (UTCFS) monitor module SIGA-CT1, Honeywell/Notifier FST-851, Siemens, Honeywell Gamewell/FCI or approved equal. Detectors shall be UL listed for use with

the FACP.

H. Guards

1. Guards shall be 9-gauge minimum wire that will provide protection without interfering with the operation and maintenance of the unit. The guard shall have a heavy duty corrosion-resistant polyester coating to protect against rust and corrosion. Guards for audible and visual notification devices shall be UL listed.
2. Horns, strobes, and combination horn/strobe units in gymnasiums, playrooms, corridors, locker rooms and toilets shall be equipped with guards.

I. Carbon Monoxide Detectors.

1. The Contractor shall provide carbon monoxide detectors where shown on the drawings.
2. Carbon monoxide detectors shall be designed to detect the presence of carbon monoxide.
3. Carbon Monoxide detectors shall installed and operational be in accordance with NYC Building Code Section BC 908.7.2.
4. Carbon monoxide detectors shall be listed in accordance with UL 2075-04 (revised 7/20/05) and have, at a minimum the response times as follows:  
At 70 +/- 5 ppm, unit must alarm within 60-240 minutes.  
At 150 +/- 5 ppm, unit must alarm within 10-50 minutes.  
At 400 +/- 10 ppm, unit must alarm within 4-15 minutes.
5. Carbon Monoxide detectors shall operate on 24 VDC received from the Fire Alarm Control Panel, and have an integral trouble relay that will send trouble / supervisory signals to the control panel for conditions including sensor failure, sensor missing, or end-of-life signal. They shall be capable of being system-monitored.
6. Carbon monoxide detector shall have an operating temperature of 32°F (or less) to 104°F (or more).
7. Carbon monoxide detector must be wired for supervised operation, and shall send a trouble condition to the panel when sensor supervision is in a trouble condition.
8. Carbon Monoxide detectors shall be EST (UTCFS) 260-CO or SIGA2-COS Addressable CO with AB4GT sounder base, System Sensor model CO1224T, Notifier model CO1224T or approved equal.
9. Use of Carbon Monoxide Alarms (Stand-alone) is not permitted.

J. Alarm Interface Modules

1. Alarm interface Modules shall interface normally open contacts of sprinkler water flow switches, tamper switches and other supervisory devices to the addressable Fire Alarm System.
2. Each Interface Module shall provide selector switches to set an individual address to identify the module to the fire alarm control panel. These

switches shall be field adjustable. Interface Modules that require an external programmer or PROM burner shall not be acceptable.

3. Alarm Interface module shall be EST (UTCFS) model SIGA-CT1 (single input) or SIGA-CT2 (double input), Honeywell/Notifier FMM-1 or FMM-101 (Mini Version) or approved equal. Modules shall be UL listed for use with the FACP.

K. Document Storage Box

Provide a storage box large enough to store the fire alarm documents for ready use by the Fire Department similar to FDB Box by Space Age Electronics, Notifier, Grainer or approved equal. Box to be red and use FDNY access keys.

## 2.04 CONTROL PANELS

A. Fire Alarm Control Panel

1. Fire Alarm Control Panel shall be EST (UTCFS) (model EST3X for less than 750 points or EST3 for more than 750 points), or Honeywell/Notifier (NFC-640 for less than 636 points, NFS-3030 for more than 636 points), FCI E3 series, , Firecom 2000 or Mircom FX-2000 and Siemens XLS.
2. The Fire Alarm Control Panel and associated Data Gathering Panels (DGPs) must be listed in accordance with UL 864 9<sup>th</sup> Edition. Contractor must provide proof of such listing.
3. The Fire Alarm Control Panel and associated Data Gathering Panels (DGPs) must have a NYC Fire Department Certificate of Approval based on UL 864 – 9<sup>th</sup> Edition. Contractor must provide proof of such listing. UL listing based on the 8<sup>th</sup> Edition or earlier Editions is not acceptable.

B. System Power Supply

1. The system power supply shall operate on 120 VAC main power. This power shall be transformer converted to low voltage providing rectified and filtered 24 VDC for system operation. This 24 VDC shall be rated @ 4 Amps and shall comply with U.L. Standard 864 9<sup>th</sup> Edition for power limited operation.
2. The power supply shall provide power for all system and auxiliary control functions, including the charging of the back-up batteries.
3. The charger output shall be supervised and fused.
4. The battery charger shall be capable of charging nickel-cadmium (Ni-Cad) or lead acid batteries.
5. The batteries shall be sized to provide 24 hours of standby operation in the supervision mode, with 15 minutes of full general evacuation operation of all notification appliances at the end of the 24 hour standby.
6. System power supply shall be Notifier PS12250, Siemens, Honeywell Gamewell/FCI or approved equal.

C. Microprocessor Module

1. The microprocessor module shall contain the microprocessor, memory, system operating software, configuration memory and the circuits necessary to support the fire control system.

2. The microprocessor module shall function as the system's information and control center, processing all messages from the field devices (supervisory, trouble, alarm).
  3. Microprocessor Functions:
    - a. The microprocessor shall execute all supervisory programming to detect and report the failure or disconnection of any module or peripheral device. An isolated circuit shall be incorporated, which will monitor the microprocessor, if a failure were to occur, this circuitry would provide audible and visual indication of this abnormal condition.
    - b. The microprocessor shall access the system program for all control-by-event (CBE) functions. No system memory shall be lost due to failure of the primary and secondary power. Volatile memory shall not be acceptable.
    - c. All job specific system programming, as to device monitoring and control functions, shall be field programmable.
  4. Real-Time Clock:
    - a. The microprocessor module shall have a real-time clock capable of monitoring all real-time programming and all time control functions.
- D. Display & Switch Module
1. These modules shall provide display, annunciation and control for the complete Fire Alarm Control System.
  2. An alphanumeric, true English, display shall be an integral part of the module. This display shall be back - lighted for ease of reading in the dark or bright ambient light conditions.
  3. The Module shall provide a keypad permitting selection of system functions. Also incorporated with the keypad shall be three (3) control keys: ALARM/TROUBLE ACKNOWLEDGE, RESET and ALARM SILENCE.
- E. Notification Appliance Circuits
1. Provide a Notification Appliance Circuit Module in the Fire Alarm Control Panel to supervise the audible and visual notification appliance circuit wiring for open conditions, grounds and shorts.
  2. Field - located modules shall be housed in Transponders or other approved enclosures.
  3. The use of Control Modules for signal circuits will not be accepted.
- F. Coder Module
1. The coder module, if provided, shall be solid state located at the Fire Alarm Control Panel. The coder shall be 100% field programmable for a "Temporal 3" code, as described elsewhere in the specifications.
- G. Addressable Loop Module
1. An addressable loop module shall be provided for communications with all addressable devices (initiation/control) connected to the system.

2. Each addressable loop module shall contain one loop, capable of communicating with a minimum of 160 addressable devices. Each system shall be capable of monitoring multiple loop modules. Provide a minimum of 25% spare capacity on each loop.
  3. Communication loops shall be capable of being wired either Class "A" (Style 6), a ground fault on either conductor or a break shall not prevent a device from operating on either side of the break or Class "B" (Style 4), a break or ground fault in any conductor shall be reported as a trouble condition.
  4. Each communication loop shall be electrically supervised for opens, shorts, and ground fault conditions.
  5. The system shall be capable of a minimum capacity of 160 addressable smoke detectors, 160 addressable control modules and additional capacities for full point annunciation without decreasing the aforementioned capacities.
- H. Digital Alarm Communicator System (DACT).
1. A Digital Alarm Communicator System shall be installed to send alarm, supervisory and trouble signals to a NYC Fire Department approved Central Station.
  2. The DACT shall be integral to the fire alarm control panel (FACP) and shall be labeled to indicate the central station monitoring.
- I. Presignal Event/Non-Event Mode Annunciator
- The Presignal Event/Non-Event Mode annunciator shall consist of a remote annunciator LCD displaying all points of the system as well as a remote microphone and switches as needed for paging operation. It shall be an EST 3-6ANN annunciator with LCD Display and 3-RMICA microphone, Siemens, Honeywell Gamewell/FCI or approved equal.

## **2.05 FIRE ALARM FUSED DISCONNECT SWITCH.**

- A. The Contractor shall provide an individual fused disconnect switch with 3 poles, and a removable solid neutral bar in fuse gap for each fire alarm system indicated on the Engineering Drawings, in accordance with Art. 4000 (new NEC/NFPA 70 - 2008 Art. 760 as modified for use in NYC).
- B. Rating of the fused disconnect switch shall be as required by the connected load. The fusible disconnect switch shall be heavy-duty type, UL listed for use as Service Entrance Equipment.
- C. Each fused disconnect switch shall be painted RED and bear a white-core bakelite identification nameplate to identify its use by the phrase "FIRE ALARM SYSTEM DISCONNECT" and control equipment served.
- D. Power connection to fused disconnect switch shall be provided per code.
- E. Provide a padlock for the disconnect switch that is to be locked with the switch in the on position.

## 2.06 MARKERS, RISER DIAGRAM, AND OPERATING INSTRUCTIONS

### A. Markers

Premarked self-adhesive; W.H. Brady Co.'s B940, Thomas and Betts Co.'s E-Z Code WSL self-laminating, Ideal Industries' Mylar/Cloth wire markers, or Markwick Corp.'s permanent wire markers.

### B. Riser Diagram

Provide a readable riser diagram in a frame with glass cover. Riser shall be mounted where indicated by the Engineer and properly secured to the wall. All Fire Alarm devices shall be clearly indicated on riser diagram.

### C. Operating Instructions

Provide a legible set of operating instructions in a frame with a glass cover. Mount in same vicinity as Riser diagram and properly secure to the wall.

## 2.07 WIRING

### A. Power Conductors (Above 75 volts) shall be:

1. Copper, THHN, minimum 600 volts, 90°C and shall be installed in Rigid Galvanized Steel Conduit (RGC).
2. Cable type MI, U.L. listed for 2-hour fire resistance rating.
3. Minimum wire size shall be No. 12 AWG.

### B. Low Voltage Conductors (75 volts and less) shall be:

1. Copper, THHN, minimum 600 volts, 90°C. Minimum wire size shall be No.14 AWG.
2. Multi-conductor cables shall meet the following requirements:
  - a. Type FPLP (plenum type), minimum insulation thickness of 15 mils, minimum temperature 150°C.
  - b. Type FPLP (plenum type) red colored jacket overall with minimum thickness of 25 mils.
  - c. Cable printing as per UL 1424 and additionally shall be marked "ALSO CLASSIFIED NYC CERT. FIRE ALARM CABLE" legible without removing jacket.
  - d. Minimum conductor size in a multi-conductor cable shall be No. 14 AWG.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

- A. The entire system shall be installed in a workmanlike manner, in accordance with approved manufacturers' wiring diagram. The Contractor shall provide all conduit, wiring, outlet boxes, junction boxes, cabinets and similar devices necessary for the complete installation.
- B. All penetrations of floor slabs and fire walls shall be fire stopped in accordance with the 2014 NYC Building Code and the NYC Electrical Code.

- C. End of Line Devices (Resistors/Diodes/Capacitors) shall be provided as directed by the manufacturer and installed to provide proper circuit supervision, as required by the NYC Building Code Appendix Q (NFPA 72-10 with NYC modifications) and Art. 4000 (new NEC/NFPA 70 - 2008 Art. 760 as modified for use in NYC).
- D. Installation of conductors and raceway shall be in accordance with the following.
  - 1. Power conductors shall not be installed in common raceways with low voltage conductors. Power conductors other than M.I. cable shall be run in Rigid Galvanized Conduit (RGC).
  - 2. For existing buildings, all low voltage conductors shall run in RGC, concealed or exposed. Low voltage THHN copper wires must be installed in RGC in accordance with Art. 4000 (NEC/NFPA 70 - 2008 Art. 760 as modified for use in NYC).
  - 3. Low voltage conductors shall be run in RGC raceway.
  - 4. Telephone lines shall be installed in RGC from the DACT to the Telephone Demarcation point.
  - 5. Conductors for other electrical systems shall not be installed in raceways containing fire alarm conductors. Power-limited wiring shall not be run in the same raceways with non-power limited wiring. Fire alarm conductors shall not be installed with other low voltage conductors.
  - 6. Installation of raceways, boxes and cabinets shall comply with the following general requirements.
    - a. Covers of boxes and cabinets shall be painted red and permanently identified as to their use.
    - b. Penetrations of fire-rated walls, floors or ceilings shall be fire stopped.
    - c. Raceways or cables shall not penetrate top of any equipment box or cabinet.
  - 7. Splices and terminations of wires and cables shall be as follows:
    - a. Permitted only in boxes or cabinets specifically approved for the purpose.
    - b. Utilize mechanical connections specifically approved by UL 486 A & C for the conductors, or if soldered, first joined so as to be mechanically and electrically secure prior to soldering and insulating. Temperature rating of completed splices shall equal or exceed the temperature rating of the highest rated conductor.
  - 8. All wiring shall be color coded throughout to New York City Electrical Code standards and shall be of the type recommended by the manufacturer.
- E. Circuits from the fire alarm control panel to the system peripheral equipment shall be a minimum of as follows:
  - 1. Each alarm initiating or supervisory circuit: Two (2) No. 14 AWG conductors.
  - 2. Each alarm signaling/notification appliance circuit: Two (2) No. 14 AWG conductors.

3. Each control circuit: Two (2) No. 14 AWG conductors.
- F. Identification, Labeling, Marking
1. Procedure Sign: Install adjacent to FACP and remote annunciator.
  2. Zone Locator: Install adjacent to FACP and remote annunciator.
  3. Power-Limited Circuits: Mark circuits at terminations, indicating that circuit is a power-limited fire protective signaling circuit.
  4. Labeling Circuit Disconnects: Label the device used as the circuit disconnecting means for the dedicated branch circuits serving the system "FIRE ALARM SYSTEM POWER".
  5. Identification of Circuits: Identify wires and cables in interconnection cabinets, and FACP with premarked, self-adhesive, wraparound type markers. Designations shall correspond with point to point wiring diagrams.
  6. Battery Data: Insert a copy of the battery warranty in each battery compartment and mark on batteries the date placed in service.
  7. Fire alarm system terminal and junction locations shall be identified in accordance with Art. 4000 (new NEC/NFPA 70 - 2008 Art. 760 as modified for use in NYC).
  8. Terminal and junction boxes shall be painted red.
  9. Coordinate with the Engineer and obtain a sticker indicating the account number and phone number of the monitoring company and place on the FACP.
- G. The system shall be arranged to receive power from 120 volt, 60-cycle alternating current supply through a fused disconnect switch. All low voltage operation shall be provided from the fire alarm control panel(s).
- H. All final connections shall be made under the supervision of a trained technical representative to be provided by the Fire Alarm Company.
- I. Do not install smoke detector until the Work (including cleaning) of all trades in the area has been completed. Protect installed smoke detectors from airborne dust and debris with covers provided by the manufacturer for this purpose.
- J. Guards
1. Attach guards directly to the surface with vandal resistant fasteners.
  2. Where detectors are installed on suspended ceiling provide additional supports in the ceiling, such as channel support system, angel iron or additional runner bars. Fasten the additional supports rigidly to the ceiling runner bar system. Attach frame of resistant fasteners. Install metal spacers between the vandal guard frame and the supports so that the ceiling tiles will not be a part of the support system.
  3. Use finishing collar between ceiling and vandal guard where vandal guard cannot be mounted tight against ceiling due to job conditions.
- K. Grounding
1. All conduits supplying power to the fire alarm control panel and control

cabinets shall contain a green insulated grounding conductor sized in accordance with Art. 4000 (new NEC/NFPA 70 - 2008 Art. 760 as modified for use in NYC). Ground wiring shall be No. 10 AWG minimum from the fused disconnect switch to the service panel.

2. The Contractor shall connect the grounding conductor to the ground bus or other suitable grounding terminal in each panel and cabinet in which it enters. At the fused disconnect switch supplying the fire alarm system, the contractor shall provide a grounding electrode conductor sized and installed in accordance with the New York City Electrical Code, Table 250.66 (No. 8 AWG minimum). The grounding electrode conductor shall be connected to the service ground bus of the building. Ground connection at water pipe shall be by means of Thomas and Betts 3670 line, Appleton, Crouse-Hinds or other approved ground fitting.

L. Document Storage Box

Install box adjacent to the FACP at a location approved by the Engineer.

### 3.02 TESTS

- A. Prior to the final acceptance test, the Contractor and a trained representative of the Fire Alarm Company shall test the completed system for proper operation in the presence of the Engineer. The entire system shall be demonstrated to perform all of the functions as below listed in these Specifications. Any system, equipment device or wiring failure discovered during said test shall be repaired or replaced before requesting scheduling of the final acceptance test. All repairs shall be retested in the presence of the Engineer prior to the final acceptance test.
- B. The Contractor shall obtain and file Form A-433R, "Application for Electrical Inspection and Summary of Contract Equipment to be Installed" signed and sealed by a Master Electrician, "as-built" drawings in 11" x 17" format, prepared, signed and sealed by the Engineer-of-Record and Form B-45 "Request for Inspection" with the NYC Fire Department - Bureau of Fire Prevention. On the "as-built" drawing, the Contractor shall provide the operational statement certifying the installation and testing of the system in the wording required in FDNY Technology Management Bulletin #3-1/2010, which shall be signed and sealed by a master electrician or licensed fire alarm installer. The Contractor shall then submit the above-mentioned documents to the Fire Department and schedule their inspection. This shall be done in preparation for the final tests of the system.
  1. To facilitate the inspection process, the Contractor shall notify the Engineer in sufficient time as to when the system is completed and ready for final inspection and the Contractor must make the "as-built" drawings so they may be filed and approved to allow the Fire Department inspection.
- C. Upon completion of above, the Contractor shall perform final acceptance in the presence of the Engineer, the Inspector from the New York City Fire Department - Bureau of Fire Prevention, Contractor's representative and the Fire Alarm Company's representative. Notify the Engineer at least 5 working days prior to the test so arrangements can be made to have a facility representative witness the test. The Contractor shall then accompany the Fire Department inspector during his/her inspection of the system, make all adjustments required by the inspector and re-file for additional inspections until a non-conditional approval is received from the Fire Department.

- D. During the tests indicated above and during the final acceptance test, the following shall be conducted in accordance with NFPA 72-2010 – Chapter 10, as adopted by the 2014 NYC Fire Code.
1. Every manual fire alarm station shall be tested.
  2. Every smoke detector, heat detector and carbon monoxide detector shall be tested using a UL approved method.
  3. Every sprinkler system waterflow alarm switch shall be tested by flowing water.
  4. Every sprinkler system valve tamper switch shall be tested by closing the sprinkler valve. On dry type sprinkler systems, the air pressure shall be measured.
  5. Every audible notification appliance shall be sounded. Audibility of the notification appliances shall be verified throughout the entire premises for compliance with NFPA 72-10 as adopted by the NYC Building Code, Appendix Q per RCNY 3616-04, using the sound pressure meters set for A-scale.
  6. Every visual notification appliance shall be activated. Visibility of the notification appliances shall be verified throughout the entire premises for compliance with NFPA 72-10 as adopted by the NYC Building Code, Appendix Q.
  7. Every system control function shall be tested for its proper operation by activating each type of the initiating device that shall cause such function, including boiler and gas-fired hot water heater shutdown, and Central Station Transmitter operation.
  8. All circuits shall be opened at two (2) locations to test for proper supervision.
  9. Any and all other tests which the inspector from the NYC Fire Department - Bureau of Fire Prevention shall request.
- E. If any of the tests shall fail to indicate proper operation or if the Fire Department inspector issues a list of defects for the system, the Contractor shall immediately correct all defects and improper functioning as part of his Contract obligation. The Contractor shall furnish and install all labor and materials that is necessary to accomplish this. The Contractor shall then reschedule the final acceptance test, file a new A-433R and B-45 form, and redo all tests until the system is accepted by the Fire Department without qualification.
- F. Upon successful completion of all pre-testing, the Contractor and the Fire Alarm Company shall co-sign certificate attesting to the completion of testing and the updated and completed operational matrix, forward one (1) copy of said certificate to the Engineer and one (1) copy to the Fire Department as part of the inspection scheduling process. The Contractor is responsible for creating the as-built input-output matrix meeting the requirements of NFPA 72 to permit the filing.
- G. All final acceptance testing shall be done at a time convenient to the Bureau of Fire Prevention official and the Engineer. All FDNY testing, re-testing and audit costs shall be paid by the Contractor as part of this Contract.

**3.03 CLOSEOUT DOCUMENTATION AND INSTRUCTION**

- A. The following shall be submitted immediately after receiving the Letter of Approval by the Bureau of Fire Prevention of the New York City Fire Department.
  - 1. Copies of the Fire Department Letter of Approval.
  - 2. Copies of the updated form A-433R, "Application for Electrical Inspection and Summary of Contract Equipment to be Installed" filed with the Bureau of Fire Prevention, as well as all other forms required to be filed by the Contractor with the FDNY and Building Department.
  - 3. As required by NFPA 72-10 as adopted by the NYC Building Code Appendix Q and NYC Fire Code, the Contractor shall provide three (3) Compact Disks (CDs) and four (4) hard copies of the System Data Base, including all system data files as programmed (as built) and all information to allow alternate authorized Fire Alarm Company to access, modify, alter, add to, or maintain the installed system. Manufacturers that do not comply with this provision of the specification shall not be considered "as equal".
- B. Contractor shall compile and provide to the Engineer manuals on the finished system to include: operating and maintenance instructions, manufacturer's catalog pages of all equipment and components, detailed as-built floor plans and riser diagrams showing all installed devices and point-to-point wiring diagrams (this is separate from the Engineer-of-Record "as-built" drawings), and a manufacturer's suggested spare parts list.
- C. Contractor shall arrange with the manufacturer to provide Two (2) four-hour instruction sessions. Both four-hour instruction sessions shall be conducted during normal business hours to instruct personnel on the operation and maintenance of the entire system, including how to program the fan shut down, by-pass and start up operation. The first shall be conducted after final acceptance; the second shall take place after six (6) months as a reinstruction course. The Contractor may schedule this session in conjunction with the first semi-annual maintenance as required under this Contract.
- D. Contractor shall provide Sensitivity Reports for all smoke detectors (Ionization and photoelectric types).

**END OF SECTION**

**SECTION 22 05 00 – COMMON WORK RESULTS FOR PLUMBING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
1. General Plumbing Requirements specifically applicable to all Division 22 Sections.
  2. Some piping material and installation instructions common to most piping systems.
  3. Grout.
  4. Plumbing Demolition (when indicated on the drawings).
  5. Equipment installation requirements common to equipment sections.
  6. Concrete bases.
  7. Supports and anchorages.

**1.2 DEFINITIONS**

- A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.
- B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.
- C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.
- D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and chases.
- E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.
- F. The following are industry abbreviations for rubber materials:
1. EPDM: Ethylene-propylene-diene monomer rubber.
  2. NBR: Acrylonitrile-butadiene rubber.

**1.3 REFERENCES AND STANDARDS:**

- A. The editions recognized by the latest of the following are hereby included in and made a part of Division 22:
1. NFPA National Fire Protection Association
  2. UL Underwriters' Laboratories, Inc.
  3. NEMA National Electrical Manufacturer's Association
  4. NEC National Electric Code
  5. ASME American Society of Mechanical Engineers

- |     |       |                                       |
|-----|-------|---------------------------------------|
| 6.  | AWS   | American Welding Society              |

| 8.  | AGA   | American Gas Association              |
| 9.  | HI    | Hydronics Institute                   |
| 10. | OSHA  | Occupational Safety and Health Act    |
| 11. | AWWA  | American Water Works Association      |
| 12. | CISPI | Cast Iron Soil Pipe Institute         |

#### **1.4 QUALITY ASSURANCE AND COORDINATION**

- A. Electrical Characteristics for Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.
- B. All work to meet in-force local plumbing code. In the case of discrepancies between the project contract documents and the in-force local code, the most stringent shall govern.
- C. Comply with most current edition of New York City Building Code.
- D. All materials and installations shall meet applicable FM Global requirements.

#### **1.5 DELIVERY, STORAGE, AND HANDLING**

- A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.
- B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

#### **1.6 COORDINATION**

- A. Contractor shall coordinate the work of the different trades so that interference between piping, equipment, structural, and electrical work will be avoided. All necessary offsets in piping and ductwork, and all fittings, and other components, required to install the work properly shall be furnished complete in place at no additional cost.
- B. Unless otherwise stipulated under a particular heading, the following rules relative to responsibilities of the entity performing the work will apply:
  - 1. Make-up water piping connections shall be provided by the Plumbing Contractor to within five (5) feet of the required point of connection to the equipment and there terminated with a shut-off valve. Each trade shall make the final connection to the equipment it installs.
  - 2. Ceiling access panels will be installed by the General Contractor at locations determined by the Plumbing Contractor.
  - 3. The Plumbing Contractor shall install all roughing-in pertaining to his trade for each item of equipment furnished under another Section of the Specifications or by the City.
  - 4. The Plumbing Contractor shall make final connections of equipment to rough-ins.

**1.7 EQUIPMENT START-UP**

- A. Start-up of all plumbing equipment shall be video-recorded by the plumbing contractor. Two DVD copies shall be turned over to the City maintenance staff.

**1.8 TESTING AND REPAIR**

- A. All piping and ductwork systems shall be thoroughly cleaned and flushed prior to final testing.
- B. Pressure testing shall be completed for the following piping systems:
  - 1. Domestic water, sanitary and vent, storm and gas piping systems, and other systems as noted on the plans.
- C. All testing must be witnessed and accurately recorded noting methods of testing, times, dates, and results.
- D. Any damage as a result of tests shall be repaired or damaged materials replaced at no cost to the City.

**1.9 FINAL COMPLETION**

- A. All work shall be cleaned prior to issuance of Substantial Completion.
- B. Retouch or repaint factory painted prime and finish coats where scratched or damaged.
- C. Deliver any equipment as required by this Specification to City and obtained signed receipts of delivery.
- D. Clean equipment, restore damaged materials, and leave the Work in acceptable condition.
- E. Remove all site tools, equipment, surplus materials and rubbish continuously at no additional cost to the City.
- F. Contractor shall submit written certificates warranting each item of equipment.

**PART 2 - PRODUCTS****2.1 EQUIPMENT AND MATERIALS:**

- A. All equipment and materials shall be furnished in strict accordance with the equipment named and according to Specification requirements.
- B. Equipment and materials specified shall be considered to have prior approval, but submittal for approval is required. Furnish construction drawings to other Contractors when required to coordinate construction.
- C. Where multiple manufacturers are named the drawings and specifications are based on the requirements and layouts for the equipment of the first named manufacturer. Any change required by the use of other named manufacturers such as revisions to foundations, bases, piping, controls, wiring, openings, and appurtenances shall be made by the Contractor at no additional cost to the City.

**2.2 PIPE, TUBE, AND FITTINGS - GENERAL**

- A. Refer to individual Division 22 Piping Sections for pipe, tube, and fitting materials and joining methods.

- B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

## **2.3 GROUT**

- A. Description: ASTM C 1107, Grade B, non-shrink and nonmetallic, dry hydraulic-cement grout.
  - 1. Characteristics: Post-hardening, volume-adjusting, non-staining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
  - 2. Design Mix: 5000-psi, 28-day compressive strength.
  - 3. Packaging: Premixed and factory packaged.

## **PART 3 - EXECUTION**

### **3.1 PIPING SYSTEMS - COMMON REQUIREMENTS**

- A. All materials and/or equipment shall be installed per manufacturer's recommendations and instructions.
- B. When temporary water is required, an approved backflow device shall be used and testing reports from device shall be sent to the Engineer for verification.
- C. Install piping according to the following requirements and Division 22 Sections specifying piping systems.
- D. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- E. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
- F. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- G. Piping shall not project beyond walls or steel lines nor shall it hang below slabs more than is absolutely necessary. Particular attention shall be paid to the required clearances.
- H. Offset piping where required to avoid interference with other work, to provide greater headroom or clearance, or to conceal pipe more readily. Offsets shall be properly drained or trapped where necessary.
- I. Provide swing joints and expansion bends wherever required to allow the piping to expand without undue stress to connections or equipment.
- J. Exposed piping around fixtures or in other conspicuous places shall not show tool marks at fittings.
- K. Isolate pipe from the building construction to prevent transmission of vibration to the structure and to eliminate noise.
- L. Install piping such that any equipment connected to piping may be removed by

disconnecting two (2) flanges or unions and removing only one or two pipe sections. All equipment shall have bolted or screwed flanges or unions at pipe connections.

- M. Install fittings for changes in direction and branch connections. T-drill system for mechanically formed tee connections and couplings, and Victaulic hole cut piping system are not allowed.
- N. Do not route piping through transformer vaults or above transformers, panelboards, or switchboards, including the required service space for this equipment, unless the piping is serving this equipment.
- O. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.
- P. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- Q. Install piping to permit valve servicing.
- R. Install piping at indicated slopes.
- S. Install piping free of sags and bends.
- T. Install piping to allow application of insulation.
- U. Eccentric reducing couplings shall be provided in all cases where air or water pockets would otherwise occur due to a reduction in pipe size.
- V. Cap and plug all openings in pipes during construction with suitable metal plugs or cap to keep out dirt and rubbish until equipment is connected.
- W. Install drains, consisting of a tee fitting, NPS 3/4 full port-ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.
- X. Select system components with pressure rating equal to or greater than system operating pressure.
- Y. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 07 Section " FIRESTOPPING" for materials.
- Z. Verify final equipment locations for roughing-in.
- AA. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.
- BB. Provide proper access to materials and equipment that require inspection, repair, service, or maintenance.
- CC. Minimum service access size for materials equipment/components above ceilings shall be 24" square.

### **3.2 PIPING JOINT CONSTRUCTION**

- A. Join pipe and fittings according to the following requirements and Division 22 Sections specifying piping systems.
- B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

- D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
  2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

### **3.3 PIPING CONNECTIONS**

- A. Pipe sizes indicated shall be carried full size to equipment served. Any change of size to match equipment connection shall be made within one foot of the equipment. At temperature control valves with sizes smaller than connected lines, reduction shall be made immediately adjacent to valves.

### **3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS**

- A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.
- B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.
- C. Install Plumbing equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.
- D. Install equipment to allow right of way for piping installed at required slope.

### **3.5 ERECTION OF METAL SUPPORTS AND ANCHORAGES**

- A. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor Plumbing materials and equipment.

### **3.6 GROUTING**

- A. Mix and install grout for Plumbing equipment base bearing surfaces, pump and other equipment base plates, and anchors.
- B. Clean surfaces that will come into contact with grout.
- C. Provide forms as required for placement of grout.
- D. Avoid air entrapment during placement of grout.
- E. Place grout, completely filling equipment bases.
- F. Place grout on concrete bases and provide smooth bearing surface for equipment.
- G. Place grout around anchors.
- H. Cure placed grout.

**END OF SECTION**

**SECTION 22 05 16 – EXPANSION JOINTS AND LOOPS FOR PLUMBING PIPING****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Expansion joints.
  - 2. Pipe loop installation.

**1.2 PERFORMANCE REQUIREMENTS**

- A. Compatibility: Products shall be suitable for piping service fluids, materials, working pressures, and temperatures.
- B. Capability: Products to absorb 200 percent of maximum axial movement between anchors.

**1.3 SUBMITTALS**

- A. Product Data: For each type of product indicated the Contractor shall submit Shop Drawings indicating the product Manufacturer, size, performance and material.
- B. Product Certificates: For each type of expansion joint, from manufacturer.
- C. Maintenance Data: For expansion joints to include in maintenance manuals.

**PART 2 - PRODUCTS****2.1 EXPANSION JOINTS**

- A. Flexible expansion joints shall be installed in the locations indicated on the drawings and shall be manufactured of ductile iron for domestic water, sanitary and storm drains conforming to the material requirements of ASTM A536 and ANSI/AWWA C153/A21.53. Foundry certification of material shall be readily available upon request. Flexible expansion joints for irrigation system must be manufactured of PVC.
- B. Each flexible expansion joint shall be pressure tested prior to shipment against its own restraint to a minimum of 350 psi (250 psi for flexible expansion joints 2 inch and 30 inches diameter and larger.) A minimum 2:1 safety factor, determined from the published pressure rating, shall apply. Factory Mutual Approval for each size is required.
- C. Each flexible expansion joint shall consist of an expansion joint designed and cast as an integral part of a ball and socket type flexible joint, having a minimum per ball deflection of 20° and 4-inches minimum expansion. Additional expansion sleeves shall be available and easily added or removed at the factory or in the field. The total required expansion for each expansion joint is shown on the contract drawings. Both standardized mechanical joint and flange end connections shall be available.
- D. All internal surfaces (wetted parts) shall be lined with a minimum of 15 mils of fusion bonded epoxy conforming to the applicable requirements of ANSI/AWWA C213. Sealing gaskets shall be constructed of EPDM. The coating shall meet ANSI/NSF-61.

- E. Exterior surfaces shall be coated with a minimum of 6 mils of fusion bonded epoxy conforming to the applicable requirements of ANSI/AWWA C116/A21.16.
- F. Appropriately sized polyethylene sleeves, meeting ANSI/AWWA C105/A21.5, shall be included for direct buried applications.
- G. Manufacturer's certification of compliance to the above standards and requirements shall be readily available upon request. The purchaser shall reserve the right to inspect the manufacturer's facility for compliance.
- H. Expectable manufacturers:
  - 1. FLEX-TEND as manufactured by EBAA Iron, INC. Eastland, TX., U.S.A.
  - 2. Approved equal.

### **PART 3 - EXECUTION**

#### **3.1 EXPANSION-JOINT INSTALLATION**

- A. Install expansion joints of sizes matching sizes of piping in which they are installed.

#### **3.2 PIPE LOOP INSTALLATION**

- A. Connect risers and branch connections to mains with at least five pipe fittings including tee in main.
- B. Connect risers and branch connections to terminal units with at least four pipe fittings including tee in riser.
- C. Connect mains and branch connections to terminal units with at least four pipe fittings.

**END OF SECTION**

**SECTION 22 05 17 – SLEEVES AND SLEEVE SEALS FOR PLUMBING PIPING****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Sleeves.
  - 2. Stack-sleeve fittings.
  - 3. Sleeve-seal systems.
  - 4. Sleeve-seal fittings.
  - 5. Grout.

**1.2 SUBMITTALS**

- A. Product Data: For each type of product indicated.

**PART 2 – PRODUCTS****2.1 SLEEVES**

- A. Cast-Iron Wall Pipes: Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

**2.2 STACK-SLEEVE FITTINGS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Smith, Jay R. Mfg.Co.
  - 2. Zurn Specification Drainage Operation; Zurn Plumbing Products Group.
  - 3. Metraflex.
  - 4. Or Approved equal.
- B. Description: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring, bolts, and nuts for membrane flashing.
  - 1. Underdeck Clamp: Clamping ring with setscrews.

**2.3 SLEEVE-SEAL SYSTEMS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Advance Products & Systems, Inc.
  - 2. CALIPICO, Inc.
  - 3. Metraflex Company (The)
  - 4. Pipeline Seal and Insulator, Inc.
  - 5. Proco Products, Inc.

6. Or approval equal.
- B. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve.
1. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
  2. Pressure Plates: Carbon steel.
  3. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, of length required to secure pressure plates to sealing elements.

## 2.4 SLEEVE-SEAL FITTINGS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Prescaled Systems
  2. Flexicraft.
  3. Link-Seal
  4. Or approved equal.
- B. Description: Manufactured plastic, sleeve-type, waterstop assembly made for imbedding in concrete slab or wall. Unit has plastic or rubber waterstop collar with center opening to match piping OD.

## 2.5 GROUT

- A. Standard: ASTM C 1107, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- B. Characteristics: Nonshrink; recommended for interior and exterior applications.
- C. Design Mix: 5000-psi, 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

## PART 3 – EXECUTION

### 3.1 SLEEVE INSTALLATION

- A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.
- B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls.
1. Sleeves are not required for core-drilled holes.
- C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
1. Permanent sleeves are not required for holes in slabs formed by molded-PE or – PP sleeves.
  2. Cut sleeves to length for mounting flush with both surfaces.

- a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.
- 3. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.
- D. Install sleeves for pipes passing through interior partitions.
  - 1. Cut sleeves to length for mounting flush with both surfaces.
  - 2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
  - 3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in Section 079200 "Joint Sealants."
- E. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping specified in Section 078400 "Firestops."

### **3.2 STACK-SLEEVE-FITTING INSTALLATION**

- A. Install stack-sleeve fittings in new slabs as slabs are constructed.
  - 1. Install fittings that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
  - 2. Secure flashing between clamping flanges for pipes penetrating floors with membrane waterproofing.
  - 3. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level.
  - 4. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
  - 5. Using grout, seal the space around outside of stack-sleeve fittings.
- B. Fire-Barrier Penetrations: Maintain indicated fire rating of floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping specified in Section 078400 "Firestops."

### **3.3 SLEEVE-SEAL-SYSTEM INSTALLATION**

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at service piping entries into building.
- B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or whole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

### **3.4 SLEEVE-SEAL-FITTING INSTALLATION**

- A. Install sleeve-seal fittings in new walls and slabs as they are constructed.
- B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.
- C. Secure nailing flanges to concrete forms.

- D. Using grout, seal the space around outside of sleeve-seal fittings.

### **3.5 SLEEVE AND SLEEVE-SEAL SCHEDULE**

- A. Use sleeves and sleeve seals for the following piping-penetration applications:
  - 1. Concrete Slabs-on-Grade:
    - a. Piping Smaller than NPS 6: Galvanized-steel wall sleeves with sleeve-seal system.
      - 1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
    - b. Piping NPS 6 and larger: Galvanized-steel wall sleeves with sleeve-seal system.
      - 1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
  - 2. Concrete Slabs above Grade:
    - a. Piping Smaller than NPS 6: Galvanized-steel-pipe sleeves and Sleeve-seal fittings.
    - b. Piping NPS 6 and larger: Galvanized-steel-pipe sleeves.
  - 3. Interior Partitions:
    - a. Piping Smaller than NPS 6: Galvanized-steel-pipe sleeves.
    - b. Piping NPS 6 and larger: Galvanized-steel-sheet sleeves.

**END OF SECTION**

**SECTION 22 05 18 – ESCUTCHEONS FOR PLUMBING PIPING****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Escutcheons.
  - 2. Floor plates.

**1.2 SUBMITTALS**

- A. Product Data: For each type of product indicated.

**PART 2 - PRODUCTS****2.1 ESCUTCHEONS**

- A. One-Piece, Cast-Brass Type: With polished, chrome-plated finish and setscrew fastener.

**2.2 FLOOR PLATES**

- A. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.

**PART 3 - EXECUTION****3.1 INSTALLATION**

- A. Install escutcheons for piping penetrations of walls, ceilings, and finished floors.
- B. Install escutcheons with ID to closely fit around pipe, tube, and insulation of insulated piping and with OD that completely covers opening.
  - 1. Escutcheons for New Piping:
    - a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
    - b. Chrome-Plated Piping: One-piece, cast-brass type with polished, chrome-plated finish.
    - c. Insulated Piping: One-piece, stamped-steel type.
    - d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished, chrome-plated finish.
    - e. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass type with polished, chrome-plated finish.
    - f. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, stamped-steel type.
    - g. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass.
    - h. Bare Piping in Unfinished Service Spaces: One-piece, stamped-steel type.

- i. Bare Piping in Equipment Rooms: One-piece, cast-brass type with rough-brass finish.
  - j. Bare Piping in Equipment Rooms: One-piece, stamped-steel type.
- C. Install floor plates for piping penetrations of equipment-room floors.
- D. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
  - 1. New Piping: One-piece, floor-plate type.

### **3.2 FIELD QUALITY CONTROL**

- A. Replace broken and damaged escutcheons and floor plates using new materials.

**END OF SECTION**

**SECTION 22 05 19 – METERS AND GAGES FOR PLUMBING PIPING****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Water Meters.
  - 2. Dial-type pressure gages.
  - 3. Test plugs and test plug kits.
  - 4. Gage attachments.

**1.2 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Product certificates.
- C. Operation and maintenance data.

**PART 2 - PRODUCTS****2.1 WATER METERS**

- A. Water meter shall be “evoQ4 Electronic Meter” with Scancode emulation manufactured by Elster AMCO Water, LLC, Ocala, FL or “Omni C2” with full electronic register manufactured by Sensus, Raleigh, NC, or approved equal.
- B. Meter shall be of the size shown on the NYC DEP approved plans. Only meters on the current “List of Approved Water Meters and Related Equipment”, published by NYC DEP will be accepted as an approved equal.
- C. The installation of water meters shall comply with RCNY Title 15, Chapter 20, “Rules and Regulations Governing and Restricting the Use and Supply of Water”.

**2.2 PRESSURE GAGES**

- A. Direct-Mounted, Metal-Case, Dial-Type Pressure Gages:
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Ashcroft Inc.
    - b. Trerice, H. O. Co.
    - c. Watts Regulator Co.; a div. of Watts Water Technologies, Inc.
    - d. Weiss Instruments, Inc.
  - 2. Standard: ASME B40.100.
  - 3. Case: Liquid-filled type(s); cast aluminum or drawn steel; 4-1/2-inch nominal diameter.
  - 4. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.

5. Pressure Connection: Brass, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
  6. Movement: Mechanical, with link to pressure element and connection to pointer.
  7. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi.
  8. Pointer: Dark-colored metal.
  9. Window: Glass.
  10. Ring: Metal.
  11. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.
- B. Direct-Mounted, Plastic-Case, Dial-Type Pressure Gages:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    - a. Ashcroft Inc.
    - b. Marsh Bellofram.
    - c. Terice, H. O. Co.
    - d. Weiss Instruments, Inc.
  2. Standard: ASME B40.100.
  3. Case: Sealed type; plastic; 4-1/2-inch nominal diameter.
  4. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
  5. Pressure Connection: Brass, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
  6. Movement: Mechanical, with link to pressure element and connection to pointer.
  7. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi.
  8. Pointer: Dark-colored metal.
  9. Window: Glass.
  10. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.
- C. Remote-Mounted, Metal-Case, Dial-Type Pressure Gages:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Ashcroft Inc.
    - b. Marsh Bellofram.
    - c. Terice, H. O. Co.
    - d. Weiss Instruments, Inc.
  2. Standard: ASME B40.100.

3. Case: Liquid-filled type; cast aluminum or drawn steel; 4-1/2-inch nominal diameter with back flange and holes for panel mounting.
  4. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
  5. Pressure Connection: Brass, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
  6. Movement: Mechanical, with link to pressure element and connection to pointer.
  7. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi.
  8. Pointer: Dark-colored metal.
  9. Window: Glass or plastic.
  10. Ring: Metal.
  11. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.
- D. Remote-Mounted, Plastic-Case, Dial-Type Pressure Gages:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Ashcroft Inc.
    - b. Terice, H. O. Co.
    - c. Weiss Instruments, Inc.
  2. Standard: ASME B40.100.
  3. Case: Sealed type; plastic; 4-1/2-inch nominal diameter with back flange and holes for panel mounting.
  4. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
  5. Pressure Connection: Brass, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
  6. Movement: Mechanical, with link to pressure element and connection to pointer.
  7. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi.
  8. Pointer: Dark-colored metal.
  9. Window: Glass or plastic.
  10. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.

### 2.3 TEST PLUGS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Flow Design, Inc.
  2. Miljoco Corporation.
  3. National Meter, Inc.
  4. Peterson Equipment Co., Inc.

5. Sisco Manufacturing Company, Inc.
  6. Trerice, H. O. Co.
  7. Watts Regulator Co.; a div. of Watts Water Technologies, Inc.
  8. Weiss Instruments, Inc.
- B. Description: Test-station fitting made for insertion into piping tee fitting.
- C. Body: Stainless steel with core inserts and gasketed and threaded cap. Include extended stem on units to be installed in insulated piping.
- D. Thread Size: NPS 1/4 (DN 8) or NPS 1/2 (DN 15), ASME B1.20.1 pipethread.
- E. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F (3450 kPa at 93 deg C).
- F. Core Inserts: Chlorosulfonated polyethylene synthetic and EPDM or neoprene or Nordel, but all potable water rated.

## **2.4 TEST-PLUG KITS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Flow Design, Inc.
  2. Miljoco Corporation.
  3. National Meter, Inc.
  4. Peterson Equipment Co., Inc.
  5. Sisco Manufacturing Company, Inc.
  6. Trerice, H. O. Co.
  7. Watts Regulator Co.; a div. of Watts Water Technologies, Inc.
  8. Weiss Instruments, Inc.
- B. Furnish two test-plug kit(s) containing two thermometer(s), one pressure gage and adapter, and carrying case. Thermometer sensing elements, pressure gage, and adapter probes shall be of diameter to fit test plugs and of length to project into piping.
- C. Low-Range Thermometer: Small, bimetallic insertion type with 1- to 2-inch- (25- to 51-mm-) diameter dial and tapered-end sensing element. Dial range shall be at least 25 to 125 deg F (minus 4 to plus 52 deg C).
- D. High-Range Thermometer: Small, bimetallic insertion type with 1- to 2-inch- (25- to 51-mm-) diameter dial and tapered-end sensing element. Dial range shall be at least 0 to 220 deg F (minus 18 to plus 104 deg C).
- E. Pressure Gage: Small, Bourdon-tube insertion type with 2- to 3-inch- (51- to 76-mm-) diameter dial and probe. Dial range shall be at least 0 to 200 psig (0 to 1380 kPa).
- F. Carrying Case: Metal or plastic, with formed instrument padding.

## **2.5 GAGE ATTACHMENTS**

- A. Snubbers: ASME B40.100, brass; with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and piston-type surge-dampening device. Include extension for use on insulated piping.

- B. Valves: Brass or stainless-steel needle, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. Install thermowells with socket extending a minimum of 2 inches into fluid and in vertical position in piping tees.
- B. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.
- C. Install thermowells with extension on insulated piping.
- D. Fill thermowells with heat-transfer medium.
- E. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.
- F. Install remote-mounted thermometer bulbs in thermowells and install cases on panels; connect cases with tubing and support tubing to prevent kinks. Use minimum tubing length.
- G. Install direct-mounted pressure gages in piping tees with pressure gage located on pipe at the most readable position.
- H. Install remote-mounted pressure gages on panel.
- I. Install valve and snubber in piping for each pressure gage for fluids.
- J. Install thermometers in the following locations:
  - 1. Inlet and outlet of each water heater.
- K. Install pressure gages in the following locations:
  - 1. Building water service entrance into building.
  - 2. Inlet and outlet of each pressure-reducing valve.
  - 3. Suction and discharge of each domestic water pump.
- L. Install meters and gages adjacent to machines and equipment to allow service and maintenance of meters, gages, machines, and equipment.
- M. Adjust faces of meters and gages to proper angle for best visibility.

#### **3.2 THERMOMETER SCHEDULE**

- A. Thermometers at inlet and outlet of each domestic water heater shall be one of the following:
  - 1. Liquid-filled, bimetallic-actuated type.
  - 2. Industrial-style, liquid-in-glass type.
- B. Thermometer stems shall be of length to match thermowell insertion length.

**3.3 THERMOMETER SCALE-RANGE SCHEDULE**

- A. Scale Range for Domestic Cold-Water Piping: 0 to 100 deg F.
- B. Scale Range for Domestic Hot-Water Piping: 0 to 250 deg F.

**3.4 PRESSURE-GAGE SCHEDULE**

- A. Pressure gages at discharge of each water service into building shall be one of the following:
  - 1. Liquid-filled Sealed, direct-mounted, metal case.
  - 2. Sealed, direct-mounted, plastic case.
- B. Pressure gages at inlet and outlet of each water pressure-reducing valve shall be one of the following:
  - 1. Liquid-filled Sealed Open-front, pressure-relief Solid-front, pressure-relief Insert type, direct-mounted, metal case.
  - 2. Sealed, direct-mounted, plastic case.
- C. Pressure gages at suction and discharge of each domestic water pump shall be one of the following:
  - 1. Liquid-filled, -mounted, metal case.
  - 2. Sealed, direct-mounted, plastic case.

**3.5 PRESSURE-GAGE SCALE-RANGE SCHEDULE**

- A. Scale Range for Water Service Piping: 0 to 100 psi.
- B. Scale Range for Domestic Water Piping: 0 to 160 psi.

**END OF SECTION**

**SECTION 22 05 23 – GENERAL DUTY VALVES FOR PLUMBING PIPING****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Brass ball valves.
  - 2. Bronze ball valves.
  - 3. Bronze swing check valves.
  - 4. Bronze gate valves.
  - 5. Iron gate Valve.
  - 6. Lubricated Plug Valves.
- B. Related Sections:
  - 1. Section 22 05 53 "Identification for Plumbing Piping and Equipment" for valve tags and schedules.
  - 2. Section 22 11 16 "Domestic Water Piping" for valves applicable only to this piping.

**1.2 DEFINITIONS**

- A. CWP: Cold working pressure.
- B. EPDM: Ethylene propylene copolymer rubber.
- C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.
- D. NRS: Nonrising stem.
- E. OS&Y: Outside screw and yoke.
- F. RS: Rising stem.
- G. SWP: Steam working pressure.

**1.3 ACTION SUBMITTALS**

- A. Product Data: For each type of valve indicated.

**1.4 QUALITY ASSURANCE**

- A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.
- B. ASME Compliance:
  - 1. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
  - 2. ASME B31.9 for building services piping valves.
- C. NSF Compliance: NSF 61 for valve materials for potable-water service.

EFFECTIVE JAN. 4TH, 2014, ALL PROPOSED INSTALLATIONS OF VALVES TO BE UTILIZED ON ALL DOMESTIC DRINKING WATER SERVICES FOR HUMAN CONSUMPTION, MUST BE LEAD-FREE IN COMPLIANCE WITH THE AMENDED FEDERAL LAW, SAFE DRINKING WATER ACT (SDWA).

## 1.5 DELIVERY, STORAGE, AND HANDLING

- A. Prepare valves for shipping as follows:
  - 1. Protect internal parts against rust and corrosion.
  - 2. Protect threads and flange faces ends.
  - 3. Set ball and plug valves open to minimize exposure of functional surfaces.
  - 4. Block check valves in either closed or open position.
- B. Use the following precautions during storage:
  - 1. Maintain valve end protection.
  - 2. Store valves indoors and maintain at higher than ambient dew point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.
- C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use hand-wheels or stems as lifting or rigging points.

## PART 2 - PRODUCTS

### 2.1 GENERAL REQUIREMENTS FOR VALVES

- A. Refer to valve schedule articles for applications of valves.
- B. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- C. Valve Sizes: Same as upstream piping unless otherwise indicated.
- D. Valve Actuator Types:
  - 1. Handwheel: For valves other than quarter-turn types.
- E. Valves in Insulated Piping: With 2-inch stem extensions and the following features:
  - 1. Gate Valves: With rising stem.
  - 2. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation.
- F. Valve-End Connections:
  - 1. Flanged: With flanges according to ASME B16.1 for iron valves.  
Valve solder-joint connections are common in smaller sizes of plumbing piping. Soldering and brazing methods used to achieve required pressure-temperature ratings may damage internal valve parts. Special installation requirements for soldered valves may make threaded valves more cost-effective.
  - 2. Solder Joint: With sockets according to ASME B16.18.
  - 3. Threaded: With threads according to ASME B1.20.1.
- G. Valve Bypass and Drain Connections: MSS SP-45.

## 2.2 BRASS BALL VALVES

- A. Two-Piece, Regular-Port, Brass Ball Valves with Brass Trim:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Hammond Valve.
    - b. Jamesbury; a subsidiary of Metso Automation.
    - c. Legend Valve.
    - d. Marwin Valve; a division of Richards Industries.
    - e. Milwaukee Valve Company.
    - f. Or approved equal
  2. Description:
    - a. Standard: MSS SP-110.
    - b. SWP Rating: 150 psig.
    - c. CWP Rating: 600 psig.
    - d. Body Design: Two piece.
    - e. Body Material: Forged brass.
    - f. Ends: Threaded.
    - g. Seats: PTFE or TFE.
    - h. Stem: Brass.
    - i. Ball: Chrome-plated brass.
    - j. Port: Regular.
- B. Three-Piece, Full-Port, Brass Ball Valves with Brass Trim:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Jomar International, LTD.
    - b. Kitz Corporation.
    - c. Red-White Valve Corporation.
    - d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
    - e. Or approved equal.
  2. Description:
    - a. Standard: MSS SP-110.
    - b. SWP Rating: 150 psig.
    - c. CWP Rating: 600 psig.
    - d. Body Design: Three piece.
    - e. Body Material: Forged brass.

- f. Ends: Threaded.
- g. Seats: PTFE or TFE.
- h. Stem: Brass.
- i. Ball: Chrome-plated brass.
- j. Port: Full.
- k. Vented.
- l. Port: Full.

### **2.3 BRONZE BALL VALVES**

#### **A. Three-Piece, Full-Port, Bronze Ball Valves with Bronze Trim:**

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Conbraco Industries, Inc.; Apollo Valves.
  - b. DynaQuip Controls.
  - c. Hammond Valve.
  - d. Milwaukee Valve Company.
  - e. NIBCO INC.
  - f. Red-White Valve Corporation.
  - g. Or approved equal.
2. Description:
  - a. Standard: MSS SP-110.
  - b. SWP Rating: 150 psig.
  - c. CWP Rating: 600 psig.
  - d. Body Design: Three piece.
  - e. Body Material: Bronze.
  - f. Ends: Threaded.
  - g. Seats: PTFE or TFE.
  - h. Stem: Bronze.
  - i. Ball: Chrome-plated brass.
  - j. Port: Full.

### **2.4 BRONZE SWING CHECK VALVES**

#### **A. Class 125, Bronze Swing Check Valves with Bronze Disc:**

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. American Valve, Inc.
  - b. Crane Co.; Crane Valve Group; Crane Valves.

- c. Crane Co.; Crane Valve Group; Jenkins Valves.
  - d. Crane Co.; Crane Valve Group; Stockham Division.
  - e. Hammond Valve.
  - f. Kitz Corporation.
  - g. Milwaukee Valve Company.
  - h. NIBCO INC.
  - i. Powell Valves.
  - j. Red-White Valve Corporation.
  - k. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - l. Zy-Tech Global Industries, Inc.
  - m. Or approved equal.
2. Description:
- a. Standard: MSS SP-80, Type 3.
  - b. CWP Rating: 200 psig.
  - c. Body Design: Horizontal flow.
  - d. Body Material: ASTM B 62, bronze.
  - e. Ends: Threaded.
  - f. Disc: Bronze.
- B. Class 150, Bronze Swing Check Valves with Bronze Disc:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- a. American Valve, Inc.
  - b. Crane Co.; Crane Valve Group; Crane Valves.
  - c. Crane Co.; Crane Valve Group; Jenkins Valves.
  - d. Crane Co.; Crane Valve Group; Stockham Division.
  - e. Kitz Corporation.
  - f. Milwaukee Valve Company.
  - g. NIBCO INC.
  - h. Red-White Valve Corporation.
  - i. Zy-Tech Global Industries, Inc.
  - j. Or approved equal.
2. Description:
- a. Standard: MSS SP-80, Type 3.
  - b. CWP Rating: 300 psig.
  - c. Body Design: Horizontal flow.

- d. Body Material: ASTM B 62, bronze.
- e. Ends: Threaded.
- f. Disc: Bronze.

## 2.5 BRONZE GATE VALVES

### A. Class 125, NRS Bronze Gate Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. American Valve, Inc.
  - b. Crane Co.; Crane Valve Group; Crane Valves.
  - c. Crane Co.; Crane Valve Group; Jenkins Valves.
  - d. Crane Co.; Crane Valve Group; Stockham Division.
  - e. Hammond Valve.
  - f. Kitz Corporation.
  - g. Milwaukee Valve Company.
  - h. NIBCO INC.
  - i. Powell Valves.
  - j. Red-White Valve Corporation.
  - k. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - l. Zy-Tech Global Industries, Inc.
  - m. Or approved equal.
2. Description:
  - a. Standard: MSS SP-80, Type 1.
  - b. CWP Rating: 200 psig.
  - c. Body Material: ASTM B 62, bronze with integral seat and screw-in bonnet.
  - d. Ends: Threaded or solder joint.
  - e. Stem: Bronze.
  - f. Disc: Solid wedge; bronze.
  - g. Packing: Asbestos free.
  - h. Handwheel: Malleable iron, bronze.

### B. Class 125, RS Bronze Gate Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. American Valve, Inc.
  - b. Crane Co.; Crane Valve Group; Crane Valves.
  - c. Crane Co.; Crane Valve Group; Jenkins Valves.

- d. Crane Co.; Crane Valve Group; Stockham Division.
  - e. Hammond Valve.
  - f. Kitz Corporation.
  - g. Milwaukee Valve Company.
  - h. NIBCO INC.
  - i. Powell Valves.
  - j. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - k. Zy-Tech Global Industries, Inc.
  - l. Or approved equal.
2. Description:
- a. Standard: MSS SP-80, Type 2.
  - b. CWP Rating: 200 psig.
  - c. Body Material: ASTM B 62, bronze with integral seat and screw-in bonnet.
  - d. Ends: Threaded.
  - e. Stem: Bronze.
  - f. Disc: Solid wedge; bronze.
  - g. Packing: Asbestos free.
  - h. Handwheel: Malleable iron.
- C. Class 150, RS Bronze Gate Valves:
1. Manufacturers: Subject to compliance with requirements, [provide products by one of the following:
- a. Crane Co.; Crane Valve Group; Crane Valves.
  - b. Crane Co.; Crane Valve Group; Stockham Division.
  - c. Hammond Valve.
  - d. Kitz Corporation.
  - e. Milwaukee Valve Company.
  - f. NIBCO INC.
  - g. Powell Valves.
  - h. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - i. Zy-Tech Global Industries, Inc.
  - j. Or approved equal.
2. Description:
- a. Standard: MSS SP-80, Type 2.
  - b. CWP Rating: 300 psig (2070 kPa).
  - c. Body Material: ASTM B 62, bronze with integral seat and union-ring bonnet.

- d. Ends: Threaded.
- e. Stem: Bronze.
- f. Disc: Solid wedge; bronze.
- g. Packing: Asbestos free.
- h. Handwheel: Malleable iron

## 2.6 IRON GATE VALVES

### A. Class 125, NRS, Iron Gate Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Crane Co.; Crane Valve Group; Crane Valves.
  - b. Crane Co.; Crane Valve Group; Jenkins Valves.
  - c. Crane Co.; Crane Valve Group; Stockham Division.
  - d. Flo Fab Inc.
  - e. Hammond Valve.
  - f. Kitz Corporation.
  - g. Legend Valve.
  - h. Milwaukee Valve Company.
  - i. NIBCO INC.
  - j. Powell Valves.
  - k. Red-White Valve Corporation.
  - l. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - m. Zy-Tech Global Industries, Inc.
  - n. Or approved equal.
2. Description:
  - a. Standard: MSS SP-70, Type I.
  - b. CWP Rating: 200 psig .
  - c. Body Material: ASTM A 126, gray iron with bolted bonnet.
  - d. Ends: Flanged.
  - e. Trim: Bronze.
  - f. Disc: Solid wedge.
  - g. Packing and Gasket: Asbestos free.

### B. Class 125, OS&Y, Iron Gate Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Crane Co.; Crane Valve Group; Crane Valves.

- b. Crane Co.; Crane Valve Group; Jenkins Valves.
  - c. Crane Co.; Crane Valve Group; Stockham Division.
  - d. Flo Fab Inc.
  - e. Hammond Valve.
  - f. Kitz Corporation.
  - g. Legend Valve.
  - h. Milwaukee Valve Company.
  - i. NIBCO INC.
  - j. Powell Valves.
  - k. Red-White Valve Corporation.
  - l. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - m. Zy-Tech Global Industries, Inc.
  - n. Or approved equal.
2. Description:
- a. Standard: MSS SP-70, Type I.
  - b. CWP Rating: 200 psig .
  - c. Body Material: ASTM A 126, gray iron with bolted bonnet.
  - d. Ends: Flanged.
  - e. Trim: Bronze.
  - f. Disc: Solid wedge.
  - g. Packing and Gasket: Asbestos free.
- C. Class 250, NRS, Iron Gate Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- a. Crane Co.; Crane Valve Group; Crane Valves.
  - b. Crane Co.; Crane Valve Group; Stockham Division.
  - c. NIBCO INC.
  - d. Or approved equal.
2. Description:
- a. Standard: MSS SP-70, Type I.
  - b. CWP Rating: 500 psig .
  - c. Body Material: ASTM A 126, gray iron with bolted bonnet.
  - d. Ends: Flanged.
  - e. Trim: Bronze.
  - f. Disc: Solid wedge.

- g. Packing and Gasket: Asbestos free.
- D. Class 250, OS&Y, Iron Gate Valves:
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Crane Co.; Crane Valve Group; Crane Valves.
    - b. Crane Co.; Crane Valve Group; Stockham Division.
    - c. Hammond Valve.
    - d. Milwaukee Valve Company.
    - e. NIBCO INC.
    - f. Powell Valves.
    - g. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
    - h. Or approved equal.
  - 2. Description:
    - a. Standard: MSS SP-70, Type I.
    - b. CWP Rating: 500 psig .
    - c. Body Material: ASTM A 126, gray iron with bolted bonnet.
    - d. Ends: Flanged.
    - e. Trim: Bronze.
    - f. Disc: Solid wedge.
    - g. Packing and Gasket: Asbestos free.

## **2.7 LUBRICATED PLUG VALVES**

- A. Class 125, Regular-Gland, Lubricated Plug Valves with Threaded Ends:
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Nordstrom Valves, Inc.
    - b. Val-Matic Valve & Mfg. Corp.
    - c. Scv Valve, LLC
    - d. Or approved equal.
  - 2. Description:
    - a. Standard: MSS SP-78, Type II.
    - b. CWP Rating: 200 psig (1380 kPa).
    - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
    - d. Pattern: Regular or short.
    - e. Plug: Cast iron or bronze with sealant groove.

- B. Class 125, Regular-Gland, Lubricated Plug Valves with Flanged Ends:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Nordstrom Valves, Inc.
    - b. Val-Matic Valve & Mfg. Corp.
    - c. Scv Valve, LLC
    - d. Or approved equal.
  2. Description:
    - a. Standard: MSS SP-78, Type II.
    - b. CWP Rating: 200 psig.
    - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
    - d. Pattern: Regular or short.
    - e. Plug: Cast iron or bronze with sealant groove.
- C. Class 125, Cylindrical, Lubricated Plug Valves with Threaded Ends:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Homestead Valve; a division of Olson Technologies, Inc.
    - b. Milliken Valve Company.
    - c. R & M Energy Systems; a unit of Robbins & Myers, Inc.
    - d. Or approved equal.
  2. Description:
    - a. Standard: MSS SP-78, Type IV.
    - b. CWP Rating: 200 psig.
    - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
    - d. Pattern: Regular or short.
    - e. Plug: Cast iron or bronze with sealant groove.
- D. Class 125, Cylindrical, Lubricated Plug Valves with Flanged Ends:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Homestead Valve; a division of Olson Technologies, Inc.
    - b. Milliken Valve Company.
    - c. R & M Energy Systems; a unit of Robbins & Myers, Inc.
    - d. Or approved equal.

2. Description:
  - a. Standard: MSS SP-78, Type IV.
  - b. CWP Rating: 200 psig .
  - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
  - d. Pattern: Regular or short.
  - e. Plug: Cast iron or bronze with sealant groove.
- E. Class 250, Regular-Gland, Lubricated Plug Valves with Threaded Ends:
  1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Nordstrom Valves, Inc.
    - b. Val-Matic Valve & Mfg. Corp.
    - c. Scv Valve, LLC
    - d. Or approved equal.
  2. Description:
    - a. Standard: MSS SP-78, Type II.
    - b. CWP Rating: 400 psig.
    - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
    - d. Pattern: Regular or short.
    - e. Plug: Cast iron or bronze with sealant groove.
- F. Class 250, Regular-Gland, Lubricated Plug Valves with Flanged Ends:
  1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Nordstrom Valves, Inc.
    - b. Val-Matic Valve & Mfg. Corp.
    - c. Scv Valve, LLC
    - d. Or approved equal
  2. Description:
    - a. Standard: MSS SP-78, Type II.
    - b. CWP Rating: 400 psig.
    - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
    - d. Pattern: Regular or short
    - e. Plug: Cast iron or bronze with sealant groove.

- G. Class 250, Cylindrical, Lubricated Plug Valves with Threaded Ends:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Homestead Valve; a division of Olson Technologies, Inc.
    - b. Milliken Valve Company.
    - c. R & M Energy Systems; a unit of Robbins & Myers, Inc.
    - d. Or approved equal.
  2. Description:
    - a. Standard: MSS SP-78, Type IV.
    - b. CWP Rating: 400 psig.
    - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
    - d. Pattern: Regular or short.
    - e. Plug: Cast iron or bronze with sealant groove.
- H. Class 250, Cylindrical, Lubricated Plug Valves with Flanged Ends:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Homestead Valve; a division of Olson Technologies, Inc.
    - b. Milliken Valve Company.
    - c. R & M Energy Systems; a unit of Robbins & Myers, Inc.
    - d. Or approved equal.
  2. Description:
    - a. Standard: MSS SP-78, Type IV.
    - b. CWP Rating: 400 psig.
    - c. Body Material: ASTM A 48/A 48M or ASTM A 126, Grade 40 cast iron with lubrication-sealing system.
    - d. Pattern: Regular or short.
    - e. Plug: Cast iron or bronze with sealant groove.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION**

- A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.
- B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.
- C. Examine threads on valve and mating pipe for form and cleanliness.

- D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
- E. Do not attempt to repair defective valves; replace with new valves.

### **3.2 VALVE INSTALLATION**

- A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- B. Locate valves for easy access and provide separate support where necessary.
- C. Install valves in horizontal piping with stem at or above center of pipe.
- D. Install valves in position to allow full stem movement.
- E. Install check valves for proper direction of flow and as follows:
  - 1. Swing Check Valves: In horizontal position with hinge pin level.

### **3.3 ADJUSTING**

- A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

### **3.4 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS**

- A. If valve applications are not indicated, use the following:
  - 1. Shutoff Service: Ball, gate, or plug valves.
  - 2. Pump-Discharge Check Valves:
    - a. NPS 2 and Smaller: Bronze swing check valves with bronze disc.
- B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP classes or CWP ratings may be substituted.
- C. Select valves, with the following end connections:
  - 1. For Copper Tubing, NPS 2 and Smaller: Threaded ends except where solder-joint valve-end option is indicated in valve schedules below.
  - 2. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules below.

### **3.5 DOMESTIC, HOT- AND COLD-WATER VALVE SCHEDULE**

- A. Pipe NPS 2 and Smaller:
  - 1. Bronze Valves: May be provided with solder-joint ends instead of threaded ends.
  - 2. Ball Valves: Two piece, regular port, brass with brass trim.
  - 3. Bronze Swing Check Valves: Class 150 disc.
  - 4. Bronze Gate Valves: Class 150 RS.

B. Pipe NPS 2-1/2 and Larger:

1. Iron Valves, NPS 2-1/2 to NPS 4: May be provided with threaded ends instead of flanged ends.
2. Iron Gate Valves: Class 250, OS&Y.

**END OF SECTION**

## SECTION 22 05 29 – HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. The work under this section shall include all labor, material, plant equipment, services and administrative tasks required to complete and make operable the plumbing work shown on the Drawings and specified herein.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Metal pipe hangers and supports.
  - 2. Trapeze pipe hangers.
  - 3. Metal framing systems.
  - 4. Thermal-hanger shield inserts.
  - 5. Fastener systems.
  - 6. Pipe stands.
  - 7. Pipe positioning systems.
  - 8. Equipment supports.
- B. Related Sections:
  - 1. Section 22 05 00 "Common Work Results for Plumbing".

#### 1.3 DEFINITIONS

- A. MSS: Manufacturers Standardization Society of the Valve and Fittings Industry Inc.

#### 1.4 PERFORMANCE REQUIREMENTS

- A. Design Criteria: Design trapeze pipe hangers and equipment supports, including comprehensive engineering analysis by a professional engineer licensed in the State of New York, using performance requirements and design criteria indicated.
- B. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.

#### 1.5 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Show fabrication and installation details and include calculations for the following; include Product Data for components:
  - 1. Trapeze pipe hangers.
  - 2. Pipe hangers, rods, washers and nuts.
  - 3. Pipe stands.
  - 4. Equipment supports.

## **PART 2 – PRODUCTS**

### **2.1 METAL PIPE HANGERS AND SUPPORTS**

- A. Carbon-Steel Pipe Hangers and Supports:
  - 1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
  - 2. Galvanized Metallic Coatings: Pre-galvanized or hot dipped.
  - 3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
  - 4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
  - 5. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.
- B. Copper Pipe Hangers:
  - 1. Description: MSS SP-58, Types 1 through 58, copper-coated-steel, factory-fabricated components.
  - 2. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

### **2.2 TRAPEZE PIPE HANGERS**

- A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural carbon-steel shapes with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U- bolts.

### **2.3 METAL FRAMING SYSTEMS**

- A. MFMA Manufacturer Metal Framing Systems:
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Allied Tube & Conduit.
    - b. Cooper B-Line, Inc.
    - c. Flex-Strut Inc.
    - d. GS Metals Corp.
    - e. Thomas & Betts Corporation.
    - f. Unistrut Corporation; Tyco International, Ltd.
    - g. Wesanco, Inc.
    - h. Or approved equal.
  - 2. Description: Shop- or field-fabricated pipe-support assembly for supporting multiple parallel pipes.
  - 3. Standard: MFMA-4.
  - 4. Channels: Continuous slotted steel channel with inturred lips.
  - 5. Channel Nuts: Formed or stamped steel nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.
  - 6. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.

7. Metallic Coating: Electroplated zinc, Hot-dipped galvanized.
8. Paint Coating: Epoxy.
9. Plastic Coating: PVC, Polyurethane.
10. Combination Coating:

## **2.4 THERMAL-HANGER SHIELD INSERTS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Carpenter & Paterson, Inc.
  2. Clement Support Services.
  3. ERICO International Corporation.
  4. National Pipe Hanger Corporation.
  5. PHS Industries, Inc.
  6. Pipe Shields, Inc.; a subsidiary of Piping Technology & Products, Inc.
  7. Piping Technology & Products, Inc.
  8. Rilco Manufacturing Co., Inc.
  9. Value Engineered Products, Inc.
  10. Or approved equal.
- B. Insulation-Insert Material for Cold Piping: ASTM C 552, Type II cellular glass with 100-psig (688-kPa) minimum compressive strength and vapor barrier.
- C. Insulation-Insert Material for Hot Piping: ASTM C 552, Type II cellular glass with 100-psig (688-kPa)] minimum compressive strength.
- D. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.
- E. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.
- F. Insert Length: Extend 2 inches (50 mm) beyond sheet metal shield for piping operating below ambient air temperature.

## **2.5 FASTENER SYSTEMS**

- A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
- B. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated stainless- steel anchors, for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

## **2.6 PIPE STANDS**

- A. General Requirements for Pipe Stands: Shop- or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.

- B. Compact Pipe Stand: One-piece plastic unit with integral-rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.
- C. Low-Type, Single-Pipe Stand: One-piece stainless-steel base unit with plastic roller, for roof installation without membrane penetration.
- D. High-Type, Single-Pipe Stand:
  - 1. Description: Assembly of base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.
  - 2. Base: Stainless steel.
  - 3. Vertical Members: Two or more cadmium-plated-steel or stainless-steel, continuous- thread rods.
  - 4. Horizontal Member: Cadmium-plated-steel or stainless-steel rod with plastic or stainless- steel, roller-type pipe support.
- E. High-Type, Multiple-Pipe Stand:
  - 1. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
  - 2. Bases: One or more; plastic.
  - 3. Vertical Members: Two or more protective-coated-steel channels.
  - 4. Horizontal Member: Protective-coated-steel channel.
  - 5. Pipe Supports: Galvanized-steel, clevis-type pipe hangers.
- F. Curb-Mounting-Type Pipe Stands: Shop- or field-fabricated pipe supports made from structural-steel shapes, continuous-thread rods, and rollers, for mounting on permanent stationary roof curb.

## **2.7 PIPE POSITIONING SYSTEMS**

- A. Description: IAPMO PS 42, positioning system of metal brackets, clips, and straps for positioning piping in pipe spaces; for plumbing fixtures in commercial applications.

## **2.8 EQUIPMENT SUPPORTS**

- A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon- steel shapes.

## **2.9 MISCELLANEOUS MATERIALS**

- A. Structural Steel: ASTM A 36/A 36M, carbon-steel plates, shapes, and bars; black and galvanized.
- B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
  - 1. Properties: Nonstaining, noncorrosive, and nongaseous.
  - 2. Design Mix: 5000-psi, 28-day compressive strength.

## **PART 3 - EXECUTION**

### **3.1 HANGER AND SUPPORT INSTALLATION**

- A. Metal Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.
- B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.
  - 1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
  - 2. Field fabricate from ASTM A 36/A 36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.
- C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled metal framing systems.
- D. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.
- E. Fastener System Installation:
  - 1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches (100 mm) thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
  - 2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.
- F. Pipe Positioning-System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture.
- G. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.
- H. Equipment Support Installation: Fabricate from welded-structural-steel shapes.
- I. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- J. Install lateral bracing with pipe hangers and supports to prevent swaying.
- K. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 (DN 65) and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.
- L. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

- M. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.
- N. Insulated Piping:
  - 1. Attach clamps and spacers to piping.
    - a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
    - b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
    - c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
  - 2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
    - a. Option: Thermal-hanger shield inserts may be used. Include steel weight- distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
  - 3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
    - a. Option: Thermal-hanger shield inserts may be used. Include steel weight- distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
  - 4. Shield Dimensions for Pipe: Not less than the following:
    - a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick.
    - b. NPS 4: 12 inches long and 0.06 inch thick.
    - c. NPS 5 to NPS 6 : 18 inches long and 0.06 inch thick.
    - d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick.
    - e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick.
  - 5. Pipes NPS 8 and Larger: Include wood or reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.
  - 6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

### **3.2 EQUIPMENT SUPPORTS**

- A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.
- B. Grouting: Place grout under supports for equipment and make bearing surface smooth.
- C. Provide lateral bracing, to prevent swaying, for equipment supports.

### **3.3 ADJUSTING**

- A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

- B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

### 3.4 PAINTING

- A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
  1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils (0.05 mm).
- B. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Section 099123 "Interior Painting." Section 099600 "High-Performance Coatings."
- C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

### 3.5 HANGER AND SUPPORT SCHEDULE

- A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.
- B. Comply with MSS SP-69 for pipe-hanger selections and applications that are not specified in Piping system Sections.
- C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.
- D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.
- E. Use carbon-steel pipe hangers and supports metal trapeze pipe hangers, metal framing systems and attachments for general service applications.
- F. Use stainless-steel pipe hangers and stainless-steel or corrosion-resistan attachments for hostile environment applications.
- G. Use copper-plated pipe hangers and stainless-steel attachments for copper piping and tubing.
- H. Use padded hangers for piping that is subject to scratching.
- I. Use thermal-hanger shield inserts for insulated piping and tubing.
- J. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
  1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated, stationary pipes NPS 1/2 to NPS 30.
  2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of up to 1050 deg F, pipes NPS 4 to NPS 24, requiring up to 4 inches of insulation.
  3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes NPS 3/4 to NPS 36, requiring clamp flexibility and up to 4 inches of insulation.
  4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes NPS 1/2 to NPS 24 if little or no insulation is required.

5. Pipe Hangers (MSS Type 5): For suspension of pipes NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.
  6. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of noninsulated, stationary pipes NPS 3/4 to NPS 8.
  7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8 .
  8. Adjustable Band Hangers (MSS Type 9): For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8.
  9. Adjustable, Swivel-Ring Band Hangers (MSS Type 10): For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8 .
  10. Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11): For suspension of noninsulated, stationary pipes NPS 3/8 to NPS 8.
  11. Extension Hinged or Two-Bolt Split Pipe Clamps (MSS Type 12): For suspension of noninsulated, stationary pipes NPS 3/8 to NPS 3
  12. U-Bolts (MSS Type 24): For support of heavy pipes NPS 1/2 to NPS 30.
  13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
  14. Pipe Saddle Supports (MSS Type 36): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.
  15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon- steel plate, and with U-bolt to retain pipe.
  16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel- pipe base stanchion support and cast-iron floor flange.
  17. Single-Pipe Rolls (MSS Type 41): For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction might occur.
  18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes NPS 2-1/2 to NPS 24, from single rod if horizontal movement caused by expansion and contraction might occur.
  19. Complete Pipe Rolls (MSS Type 44): For support of pipes NPS 2 to NPS 42 if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
  20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes NPS 2 to NPS 24 if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary.
  21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes NPS 2 to NPS 30 if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.
- K. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers NPS 3/4 to NPS 24.
  2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.
- L. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches (150 mm) for heavy loads.
  2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.
  3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
  4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
  5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F piping installations.
- M. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
  2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.
  3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
  4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
  5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
  6. C-Clamps (MSS Type 23): For structural shapes.
  7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
  8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
  9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
  10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
  11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
  12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
    - a. Light (MSS Type 31): 750 lb .

- b. Medium (MSS Type 32): 1500 lb .
  - c. Heavy (MSS Type 33): 3000 lb .
13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
  14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
  15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.
- N. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
  2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
  3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.
- O. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
  2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches (32 mm).
  3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.
  4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
  5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
  6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
  7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.
  8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:
    - a. Horizontal (MSS Type 54): Mounted horizontally.
    - b. Vertical (MSS Type 55): Mounted vertically.
    - c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

- P. Comply with MSS SP-69 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.
- Q. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.
- R. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.
- S. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

**END OF SECTION**

**SECTION 22 05 53 – IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Equipment labels.
  - 2. Warning signs and labels.
  - 3. Pipe labels.
  - 4. Stencils.
  - 5. Valve tags.
  - 6. Warning tags.

**1.2 ACTION SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Samples: For color, letter style, and graphic representation required for each identification material and device.
- C. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.
- D. Valve numbering scheme.
- E. Valve Schedules: For each piping system to include in maintenance manuals.

**1.3 COORDINATION**

- A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- B. Coordinate installation of identifying devices with locations of access panels and doors.
- C. Install identifying devices before installing acoustical ceilings and similar concealment.

**PART 2 - PRODUCTS****2.1 EQUIPMENT LABELS**

- A. Metal Labels for Equipment:
  - 1. Material and Thickness: Aluminum, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
  - 2. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
  - 3. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
  - 4. Fasteners: Stainless-steel self-tapping screws.

5. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- B. Plastic Labels for Equipment:
1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch (3.2 mm) thick, and having predrilled holes for attachment hardware.
  2. Letter Color: Black.
  3. Background Color: Yellow.
  4. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
  5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
  6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
  7. Fasteners: Stainless-steel rivets or self-tapping screws.
  8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- C. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified.
- D. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch bond paper. Tabulate equipment identification number and identify Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

## 2.2 WARNING SIGNS AND LABELS

- A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.
- B. Letter Color: Black.
- C. Background Color: White
- D. Maximum Temperature: Able to withstand temperatures up to 160 deg F (71 deg C).
- E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch (64 by 19 mm).
- F. Minimum Letter Size: 1/4 inch (6.4 mm) for name of units if viewing distance is less than 24 inches (600 mm), 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm), and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
- G. Fasteners: Stainless-steel rivets or self-tapping screws.
- H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

- I. Label Content: Include caution and warning information, plus emergency notification instructions.

## 2.3 PIPE LABELS

- A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.
- B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.
- C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.
- D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.
  1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions, or as separate unit on each pipe label to indicate flow direction.
  2. Lettering Size: At least 1-1/2 inches (38 mm) high.

## 2.4 STENCILS

- A. Stencils: Prepared with letter sizes according to ASME A13.1 for piping; and minimum letter height of 3/4 inch (19 mm) for access panel and door labels, equipment labels, and similar operational instructions.
  1. Stencil Material: Aluminum.
  2. Stencil Paint: Exterior, gloss, alkyd enamel black unless otherwise indicated. Paint may be in pressurized spray-can form.
  3. Identification Paint: Exterior, acrylic enamel in colors according to ASME A13.1 unless otherwise indicated.

## 2.5 VALVE TAGS

- A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.
  1. Tag Material: Brass, 0.032-inch (0.8-mm) minimum thickness, and having predrilled or stamped holes for attachment hardware.
  2. Fasteners: Brass wire-link or beaded chain; or S-hook.
- B. Valve Schedules: For each piping system, on 8-1/2-by-11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
  1. Valve-tag schedule shall be included in operation and maintenance data.

## 2.6 WARNING TAGS

- A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags, of plasticized card stock with matte finish suitable for writing.
  1. Size: Approximately 4 by 7 inches.
  2. Fasteners: Brass grommet and wire.

3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE."
4. Color: Yellow background with black lettering.

## **PART 3 - EXECUTION**

### **3.1 PREPARATION**

- A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

### **3.2 EQUIPMENT LABEL INSTALLATION**

- A. Install or permanently fasten labels on each major item of mechanical equipment.
- B. Locate equipment labels where accessible and visible.

### **3.3 PIPE LABEL INSTALLATION**

- A. Piping Color-Coding: Painting of piping is specified in Architectural Section "Interior Painting."
- B. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels with painted, color-coded bands or rectangles, complying with ASME A13.1, on each piping system.
  1. Identification Paint: Use for contrasting background.
  2. Stencil Paint: Use for pipe marking.
- C. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
  1. Near each valve and control device.
  2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
  3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
  4. At access doors, manholes, and similar access points that permit view of concealed piping.
  5. Near major equipment items and other points of origination and termination.
  6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
  7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.
- D. Pipe Label Color Schedule:
  1. Domestic Water Piping:
    - a. Background Color: Blue
    - b. Letter Color: White.

2. Sanitary Waste and Storm Drainage Piping:
  - a. Background Color: Black.
  - b. Letter Color: Yellow.

### **3.4 VALVE-TAG INSTALLATION**

- A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves; faucets; convenience and lawn-watering hose connections; and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.
- B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:
  1. Valve-Tag Size and Shape:
    - a. Cold Water: 2 inches, round.
    - b. Hot Water: 2 inches, round.
  2. Valve-Tag Color:
    - a. Cold Water: Green.
    - b. Hot Water: Green.
  3. Letter Color:
    - a. Cold Water: Black.
    - b. Hot Water: Black.

### **3.5 WARNING-TAG INSTALLATION**

- A. Write required message on, and attach warning tags to, equipment and other items where required.

**END OF SECTION**

**SECTION 22 07 19 – PLUMBING PIPING INSULATION****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
1. Insulation Materials:
    - a. Flexible elastomeric.
    - b. Mineral fiber.
    - c. Polyolefin.
  2. Insulating cements.
  3. Adhesives.
  4. Mastics.
  5. Sealants.
  6. Factory-applied jackets.
  7. Field-applied fabric-reinforcing mesh.
  8. Field-applied jackets.
  9. Tapes.
  10. Securements.
  11. Corner angles.

**1.3 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. LEED Submittal:
1. Product Data for Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.
- C. Shop Drawings:
1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
  2. Detail attachment and covering of heat tracing inside insulation
  3. Detail insulation application at pipe expansion joints for each type of insulation.
  4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
  5. Detail removable insulation at piping specialties, equipment connections, and access panels.
  6. Detail application of field-applied jackets.
  7. Detail application at linkages of control devices.
  8. Detail field application for each equipment type.
- D. Field quality-control reports.

## 1.4 QUALITY ASSURANCE

- A. Fire-Test-Response Characteristics: Insulation and related materials shall have fire-test response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.
  - 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
  - 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

## PART 2 - PRODUCTS

### 2.1 INSULATION MATERIALS

- A. Comply with requirements in Part 3 schedule articles for where insulating materials shall be applied.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Product that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- F. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type I for tubular materials and Type II for sheet materials.
  - 1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Aeroflex USA Inc.; Aerocel.
    - b. Armacell LLC; AP Armaflex.
    - c. RBX Corporation; Insul-Sheet 1800 and Insul-Tube 180.
- G. Mineral-Fiber, Preformed Pipe Insulation:
  - 1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Johns Manville; Micro-Lok.
    - b. Knauf Insulation; 1000 Pipe Insulation.
    - c. Owens Corning; Fiberglas Pipe Insulation.
  - 2. Type I, 850 deg F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A, with factory-applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

- H. Polyolefin: Unicellular, polyethylene thermal plastic insulation. Comply with ASTM C 534 or ASTM C 1427, Type I, Grade 1 for tubular materials and Type II, Grade 1 for sheet materials.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Armacell LLC; Tubolit.
    - b. Nomaco Inc.; IMCOLOCK, IMCOSHEET, NOMALOCK, and NOMAPLY.
    - c. RBX Corporation; Therma-cell.

## 2.2 INSULATING CEMENTS

- A. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C 449/C 449M.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Insulco, Division of MFS, Inc.; SmoothKote.
    - b. P. K. Insulation Mfg. Co., Inc.; PK No. 127, and Quik-Cote.
    - c. Rock Wool Manufacturing Company; Delta One Shot.

## 2.3 ADHESIVES

- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.
- B. Flexible Elastomeric and Polyolefin Adhesive: Comply with MIL-A-24179A, Type II, Class I.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Aeroflex USA Inc.; Aeroseal.
    - b. Armacell LCC; 520 Adhesive.
    - c. Foster Products Corporation, H. B. Fuller Company; 85-75.
    - d. RBX Corporation; Rubatex Contact Adhesive.
  2. For indoor applications, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- C. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Childers Products, Division of ITW; CP-82.
    - b. Foster Products Corporation, H. B. Fuller Company; 85-20.
    - c. ITW TACC, Division of Illinois Tool Works; S-90/80.
    - d. Marathon Industries, Inc.; 225.
    - e. Mon-Eco Industries, Inc.; 22-25.
  2. For indoor applications, use adhesive that has a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

- D. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Childers Products, Division of ITW; CP-82.
    - b. Foster Products Corporation, H. B. Fuller Company; 85-20.
    - c. ITW TACC, Division of Illinois Tool Works; S-90/80.
    - d. Marathon Industries, Inc.; 225.
    - e. Mon-Eco Industries, Inc.; 22-25.
  2. For indoor applications, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- E. PVC Jacket Adhesive: Compatible with PVC jacket.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Dow Chemical Company (The); 739, Dow Silicone.
    - b. Johns-Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
    - c. P.I.C. Plastics, Inc.; Welding Adhesive.
    - d. Speedline Corporation; Speedline Vinyl Adhesive.
  2. For indoor applications, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

## 2.4 MASTICS

- A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.
1. For indoor applications, use mastics that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- B. Vapor-Barrier Mastic: Water based; suitable for indoor and outdoor use on below ambient services.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Childers Products, Division of ITW; CP-35.
    - b. Foster Products Corporation, H. B. Fuller Company; 30-90.
    - c. ITW TACC, Division of Illinois Tool Works; CB-50.
    - d. Marathon Industries, Inc.; 590.
    - e. Mon-Eco Industries, Inc.; 55-40.
  2. Water-Vapor Permeance: ASTM E 96, Procedure B, 0.013 perm at 43-mil dry film thickness.
  3. Service Temperature Range: Minus 20 to plus 180 deg F.
  4. Solids Content: ASTM D 1644, 59 percent by volume and 71 percent by weight.
  5. Color: White.

- C. Breather Mastic: Water based; suitable for indoor and outdoor use on above ambient services
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Childers Products, Division of ITW; CP-10.
    - b. Foster Products Corporation, H. B. Fuller Company; 35-00.
    - c. ITW TACC, Division of Illinois Tool Works; CB-05/15.
    - d. Marathon Industries, Inc.; 550.
    - e. Mon-Eco Industries, Inc.; 55-50.
  2. Water-Vapor Permeance: ASTM F 1249, 3 perms at 0.0625-inch dry film thickness.
  3. Service Temperature Range: Minus 20 to plus 200 deg F.
  4. Solids Content: 63 percent by volume and 73 percent by weight.
  5. Color: White.

## 2.5 SEALANTS

- A. Joint Sealants:
1. Joint Sealants for Cellular-Glass Products: Subject to compliance with requirements, provide one of the following:
    - a. Childers Products, Division of ITW; CP-76.
    - b. Foster Products Corporation, H. B. Fuller Company; 30-45.
    - c. Marathon Industries, Inc.; 405.
    - d. Mon-Eco Industries, Inc.; 44-05.
- B. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Childers Products, Division of ITW; CP-76.
  2. Materials shall be compatible with insulation materials, jackets, and substrates.
  3. Fire- and water-resistant, flexible, elastomeric sealant.
  4. Service Temperature Range: Minus 40 to plus 250 deg F.
  5. Color: White.
  6. For indoor applications, use sealants that have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

## 2.6 FACTORY-APPLIED JACKETS

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.

2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
4. PVDC Jacket for Indoor Applications: 4-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.02 perms when tested according to ASTM E 96 and with a flame-spread index of 5 and a smoke-developed index of 20 when tested according to ASTM E 84.
  - a. Products: Subject to compliance with requirements, provide one of the following:
    - 1) Dow Chemical Company (The); Saran 540 Vapor Retarder Film and Saran 560 Vapor Retarder Film;
    - 2) 3M Pipe Insulation;
    - 3) Armacell LLC;
    - 4) Or approved equal.
5. PVDC-SSL Jacket: PVDC jacket with a self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip.
  - a. Products: Subject to compliance with requirements, provide one of the following:
    - 1) Dow Chemical Company (The); Saran 540 Vapor Retarder Film and Saran 560 Vapor Retarder Film;
    - 2) 3M Pipe Insulation;
    - 3) Armacell LLC;
    - 4) Or approved equal.

## 2.7 FIELD-APPLIED FABRIC-REINFORCING MESH

- A. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. inch, in a Leno weave, for equipment and pipe.
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Foster Products Corporation, H. B. Fuller Company; Mast-A-Fab.
    - b. Vimasco Corporation; Elastafab 894.

## 2.8 FIELD-APPLIED JACKETS

- A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.
- B. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming Thickness is indicated in field-applied jacket schedules.
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Johns Manville; Zeston.

- b. P.I.C. Plastics, Inc.; FG Series.
  - c. Proto PVC Corporation; LoSmoke.
  - d. Speedline Corporation; SmokeSafe.
2. Adhesive: As recommended by jacket material manufacturer.
  3. Color: White.
  4. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.
    - a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.

## 2.9 TAPES

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835.
    - b. Compac Corp.; 104 and 105.
    - c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
    - d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
  2. Width: 3 inches.
  3. Thickness: 11.5 mils.
  4. Adhesion: 90 ounces force/inch in width.
  5. Elongation: 2 percent.
  6. Tensile Strength: 40 lbf/inch in width.
  7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
  1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
    - b. Compac Corp.; 110 and 111.
    - c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
    - d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
  2. Width: 3 inches.
  3. Thickness: 6.5 mils.
  4. Adhesion: 90 ounces force/inch in width.
  5. Elongation: 2 percent.
  6. Tensile Strength: 40 lbf/inch in width.

7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.
- C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive.
- Suitable for indoor and outdoor applications.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555.
    - b. Compac Corp.; 130.
    - c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape.
    - d. Venture Tape; 1506 CW NS.
  2. Width: 2 inches.
  3. Thickness: 6 mils.
  4. Adhesion: 64 ounces force/inch in width.
  5. Elongation: 500 percent.
  6. Tensile Strength: 18 lbf/inch in width.
- D. PVDC Tape: White vapor-retarder PVDC tape with acrylic adhesive.
1. Products: Subject to compliance with requirements, provide one of the following:
    - a. Dow Chemical Company (The); Saran 540 Vapor Retarder Tape.
    - b. 3M Pipe Insulation;
    - c. Armacell LLC;
    - d. Or approved equal.
  2. Width: 3 inches.
  3. Film Thickness: 4 mils.
  4. Adhesive Thickness: 1.5 mils.
  5. Elongation at Break: 145 percent.
  6. Tensile Strength: 55 lbf/inch in width.

## **PART 3 - EXECUTION**

### **3.1 PREPARATION**

- A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.
- B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.
- C. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

### **3.2 GENERAL INSTALLATION REQUIREMENTS**

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment and piping including fittings, valves, and specialties.
- B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment and pipe system as specified in insulation system schedules.
- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.
- G. Keep insulation materials dry during application and finishing.
- H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- I. Install insulation with least number of joints practical.
- J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
  - 1. Install insulation continuously through hangers and around anchor attachments.
  - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
  - 3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
  - 4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- L. Install insulation with factory-applied jackets as follows:
  - 1. Draw jacket tight and smooth.
  - 2. Cover circumferential joints with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
  - 3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
    - a. For below ambient services, apply vapor-barrier mastic over staples.
  - 4. Cover joints and seams with tape as recommended by insulation material

manufacturer to maintain vapor seal.

5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.
- M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.
- N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.
- P. For above ambient services, do not install insulation to the following:
1. Vibration-control devices.
  2. Testing agency labels and stamps.
  3. Nameplates and data plates.
  4. Manholes.
  5. Handholes.
  6. Cleanouts

### 3.3 PENETRATIONS

- A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
1. Seal penetrations with flashing sealant.
  2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
  3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
  4. Seal jacket to roof flashing with flashing sealant.
- B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.
- C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
1. Seal penetrations with flashing sealant.
  2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
  3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
  4. Seal jacket to wall flashing with flashing sealant.

- D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.
- E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
  - 1. Comply with requirements in Division 07 Section "Penetration Firestopping" and fire-resistive joint sealers.
- F. Insulation Installation at Floor Penetrations:
  - 1. Pipe: Install insulation continuously through floor penetrations.
  - 2. Seal penetrations through fire-rated assemblies. Comply with requirements in Division 07 Section "Penetration Firestopping."

### 3.4 GENERAL PIPE INSULATION INSTALLATION

- A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.
- B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
  - 1. Install Insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity, unless otherwise indicated.
  - 2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
  - 3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
  - 4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
  - 5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below ambient services, provide a design that maintains vapor barrier.
  - 6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe

insulation, or one pipe diameter, whichever is thicker.

7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below ambient services and a breather mastic for above ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
  8. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
  9. Stencil or label the outside insulation jacket of each union with the word "UNION." Match size and color of pipe labels.
- C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.
- D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
  2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless steel or aluminum bands. Select band material compatible with insulation and jacket.
  3. Construct removable valve insulation covers in same manner as for flanges except divide the two-part section on the vertical center line of valve body
  4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
  5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

### **3.5 FLEXIBLE ELASTOMERIC INSULATION INSTALLATION**

- A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- B. Insulation Installation on Pipe Flanges:
  1. Install pipe insulation to outer diameter of pipe flange.
  2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.

3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as pipe insulation.
  4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- C. Insulation Installation on Pipe Fittings and Elbows:
1. Install mitered sections of pipe insulation.
  2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- D. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed valve covers manufactured of same material as pipe insulation when available.
  2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
  3. Install insulation to flanges as specified for flange insulation application.
  4. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

### **3.6 MINERAL-FIBER INSULATION INSTALLATION**

- A. Insulation Installation on Straight Pipes and Tubes:
1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
  2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
  3. For insulation with factory-applied jackets on above ambient surfaces, secure laps with outward clinched staples at 6 inches o.c.
  4. For insulation with factory-applied jackets on below ambient surfaces, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.
- B. Insulation Installation on Pipe Flanges:
1. Install preformed pipe insulation to outer diameter of pipe flange.
  2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
  3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
  4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

- C. Insulation Installation on Pipe Fittings and Elbows:
  - 1. Install preformed sections of same material as straight segments of pipe insulation when available.
  - 2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.
- D. Insulation Installation on Valves and Pipe Specialties:
  - 1. Install preformed sections of same material as straight segments of pipe insulation when available.
  - 2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
  - 3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
  - 4. Install insulation to flanges as specified for flange insulation application.

### **3.7 POLYOLEFIN INSULATION INSTALLATION**

- A. Insulation Installation on Straight Pipes and Tubes:
  - 1. Seal split-tube longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- B. Insulation Installation on Pipe Flanges:
  - 1. Install pipe insulation to outer diameter of pipe flange.
  - 2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
  - 3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of polyolefin sheet insulation of same thickness as pipe insulation.
  - 4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- C. Insulation Installation on Pipe Fittings and Elbows:
  - 1. Install mitered sections of polyolefin pipe insulation.
  - 2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- D. Insulation Installation on Valves and Pipe Specialties:
  - 1. Install cut sections of polyolefin pipe and sheet insulation to valve body.
  - 2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
  - 3. Install insulation to flanges as specified for flange insulation application.
  - 4. Secure insulation to valves and specialties, and seal seams with manufacturer's

recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

### 3.8 FIELD-APPLIED JACKET INSTALLATION

- A. Where FSK jackets are indicated, install as follows:
1. Draw jacket material smooth and tight.
  2. Install lap or joint strips with same material as jacket.
  3. Secure jacket to insulation with manufacturer's recommended adhesive.
  4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
  5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.
- B. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive.
1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.
- C. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.
- D. Where PVDC jackets are indicated, install as follows:
1. Apply three separate wraps of filament tape per insulation section to secure pipe insulation to pipe prior to installation of PVDC jacket.
  2. Wrap factory-presized jackets around individual pipe insulation sections with one end overlapping the previously installed sheet. Install presized jacket with an approximate overlap at butt joint of 2 inches over the previous section. Adhere lap seal using adhesive or SSL, and then apply 1-1/4 circumferences of appropriate PVDC tape around overlapped butt joint.
  3. Continuous jacket can be spiral wrapped around a length of pipe insulation. Apply adhesive or PVDC tape at overlapped spiral edge. When electing to use adhesives, refer to manufacturer's written instructions for application of adhesives along this spiral edge to maintain a permanent bond.
  4. Jacket can be wrapped in cigarette fashion along length of roll for insulation systems with an outer circumference of 33-1/2 inches or less. The 33-1/2-inch-circumference limit allows for 2-inch- overlap seal. Using the length of roll allows for longer sections of jacket to be installed at one time. Use adhesive on the lap seal. Visually inspect lap seal for "fishmouthing," and use PVDC tape along lap seal to secure joint.
  5. Repair holes or tears in PVDC jacket by placing PVDC tape over the hole or tear and wrapping a minimum of 1-1/4 circumferences to avoid damage to tape edges.

### 3.9 FINISHES

- A. Equipment and Pipe Insulation with ASJ or Other Paintable Jacket Material: Paint jacket

with paint system identified below and as specified in Division 09 painting Sections.

1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
  - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.
- C. Color: Final color as selected by Engineer. Vary first and second coats to allow visual inspection of the completed Work.
- D. Do not field paint aluminum or stainless-steel jackets.

### **3.10 FIELD QUALITY CONTROL**

- A. Perform tests and inspections.
- B. Tests and Inspections:
  1. Inspect pipe, fittings, strainers, and valves, randomly selected by Engineer, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of threaded fittings, three locations of welded fittings, two locations of threaded strainers, locations of welded strainers, locations of threaded valves, and locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.
- C. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

### **3.11 PIPING INSULATION SCHEDULE, GENERAL**

- A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.
- B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
  1. Drainage piping located in crawl spaces.
  2. Underground piping.
  3. Chrome-plated pipes and fittings unless there is a potential for personnel injury.

### **3.12 INDOOR PIPING INSULATION SCHEDULE**

- A. Domestic Cold and Non-potable Cold Water: Insulation shall be one of the following:
  1. Flexible Elastomeric: 1/2 inch thick for pipe sizes less than 1-1/2 inches, 1 inch thick for pipe sizes 2 inches and greater
  2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1/2 inch thick for pipe sizes less than 1- 1/2 inches, 1 inch thick for pipe sizes 2 inches and greater
  3. Polyolefin: 1/2 inch thick for pipe sizes less than 1-1/2 inches, 1 inch thick for pipe sizes 2 inches and greater
- B. Domestic Hot, and Re-circulated Hot Water and Tempered Water: Insulation shall be one of the following:

1. Flexible Elastomeric: 1 inch thick.
  2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
  3. Polyolefin: 1 inch thick.
- C. Horizontal Stormwater and Emergency Drain: Insulation shall be one of the following:
1. Flexible Elastomeric: 1 inch thick.
  2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
  3. Polyolefin: 1 inch thick.
- D. Roof Drain and Emergency Drain Bodies: Insulation shall be one of the following:
1. Flexible Elastomeric: 1 inch thick.
  2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch Insert thickness thick.
  3. Polyolefin: 1 inch thick.
- E. Exposed Sanitary Drains, Domestic Water, Domestic Hot Water, and Stops at lavatories shall be insulated and finished with Truebro Model No. 102 "Lav-Guard" or Brocar "Trap-Wrap" white insulation kit.
- F. Sanitary Waste Piping Where Heat Tracing Is Installed, insulation shall be:
1. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1-1/2 inches thick.

### **3.13 OUTDOOR, ABOVEGROUND PIPING INSULATION SCHEDULE**

- A. Domestic Cold, Hot, and Recirculated Hot Water: Insulation shall be one of the following:
1. Flexible Elastomeric: 2 inches thick.
  2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.
- B. Sanitary Waste Piping Where Heat Tracing Is Installed: Insulation shall be:
1. Mineral-Fiber, Preformed Pipe Insulation, Type I: 2 inches thick.

### **3.14 OUTDOOR, FIELD-APPLIED JACKET SCHEDULE**

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the fieldapplied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Piping, Exposed:
1. PVC: 20 mils thick.
- D. Aluminum, Smooth or Corrugated or Stucco Embossed: 0.016 inch thick.

**END OF SECTION**

**SECTION 22 11 16 – DOMESTIC WATER PIPING****PART 1 – GENERAL****RELATED DOCUMENTS**

- A. Section 22 05 17 - SLEEVES AND SLEEVE SEALS FOR PLUMBING PIPING
- B. Section 22 05 18 - ESCUTCHEONS FOR PLUMBING PIPING.
- C. Section 22 05 19 – MERTERS AND GAGES FOR PLUMBING PIPING.
- D. Section 22 05 23 - GENERAL DUTY VALVES FOR PLUMBING PIPING
- E. Section 22 05 53 – IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMNET.
- F. Section 22 07 19 – PLUMBING PIPING INSULATION.
- G. Section 22 11 19 – DOMESTIC WATER PIPING SPECIALTIES.

**1.1 SUMMARY**

- A. Section Includes:
  - 1. Aboveground domestic water pipes, tubes, and fittings inside buildings.
- B. Related Requirements:
  - 1. Water Tap – 2” DIA.
  - 2. Type K Copper Tubing – 2”
  - 3. Wet Connection – 4”
  - 4. Ductile Iron Cement Lined Water Pipe – 4”

**1.2 SUBMITTALS**

- A. Product Data: Piping material, type of connections, transition fittings and dielectric fittings.
- B. System purging and disinfecting activities report.
- C. Field quality-control reports.

**PART 2 – PRODUCTS****2.1 PIPING MATERIALS**

- A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.
- B. Potable-water piping and components shall comply with NSF 14 and NSF 61. Plastic piping components shall be marked with "NSF-pw."

**2.01 STEEL PIPE AND FITTINGS**

- A. Steel Pipe for Threading: Standard weight, Schedule 40, black or galvanized; ASTM A 53 or ASTM A 135.
- B. Malleable Iron, Steam Pattern Threaded Fittings:

1. 150 lb Class: ASME B16.3.
  2. 300 lb Class: ASME B16.3.
- C. Cast Iron Fittings:
1. Drainage Pattern, Threaded: ASME B16.12.
  2. Steam Pattern, Threaded: ASME B16.4.
    - a. Standard Weight: Class 125.
    - b. Extra Heavy Weight: Class 250.
  3. Flanged Fittings and Threaded Flanges: ASME B16.1.
    - a. Standard Weight: Class 125.
    - b. Extra Heavy: Class 250.
- D. Unions: Malleable iron, 250 lb class, brass to iron or brass to brass seats.
- E. Couplings: Same material and pressure rating as adjoining pipe, conforming to standards for fittings in such pipe. Use taper tapped threaded type in screwed pipe systems operating in excess of 15 psig.
- F. Nipples: Same material and strength as adjoining pipe, except nipples having a length of less than one inch between threads shall be extra heavy.

## **2.2 COPPER TUBE AND FITTINGS**

- A. Hard Copper Tube: ASTM B 88, Type K, L and M water tube, drawn temper.
- B. Cast-Copper, Solder-Joint Fittings: ASME B16.18, pressure fittings.
- C. Wrought-Copper, Solder-Joint Fittings: ASME B16.22, wrought-copper pressure fittings.
- D. Flared-Joint Fittings: ASME B16.26, Cast Copper Alloy Fittings for Flared Copper Tubes
- E. Copper Unions:
  1. MSS SP-123.
  2. Cast-copper-alloy, hexagonal-stock body.
  3. Ball-and-socket, metal-to-metal seating surfaces.
  4. Solder-joint or threaded ends.

## **2.3 DUCTILE IRON PIPE AND FITTINGS**

- A. Water Pipe: Bitumin coated and cement-mortar lined; AWWA C151.
  1. 3 and 4 Inch Sizes: Class 51.
- B. Fittings: Bitumin coated and cement-mortar lined; AWWA C110.

## **2.4 PIPING JOINING MATERIALS**

- A. Solder Filler Metals: ASTM B 32, lead-free alloys.
- B. Flux: ASTM B 813, water flushable.
- C. Braze Filler Metal: AWS A5.8

## 2.5 TRANSITION FITTINGS

- A. General Requirements:
  - 1. Same size as pipes to be joined.
  - 2. Pressure rating at least equal to pipes to be joined.
  - 3. End connections compatible with pipes to be joined.
- B. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
- C. Sleeve-Type Transition Coupling: AWWA C219.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by the following:
    - a. Cascade Waterworks Manufacturing.
    - b. Dresser, Inc.; Piping Specialties Products.
    - c. Ford Meter Box Company, Inc. (The).
    - d. JCM Industries.
    - e. Romac Industries, Inc.
    - f. Smith-Blair, Inc.; a Sensus company.
    - g. Viking Johnson.
    - h. Or approved equal.

## 2.6 DIELECTRIC FITTINGS

- A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
- B. Dielectric Unions:
  - 1. Manufacturers: Subject to compliance with requirements, provide products by the following:
    - a. Capitol Manufacturing Company; member of the Phoenix Forge Group.
    - b. Central Plastics Company.
    - c. Hart Industries International, Inc.
    - d. Jomar International.
    - e. Matco-Norca.
    - f. McDonald, A. Y. Mfg. Co.
    - g. Watts; a division of Watts Water Technologies, Inc.
    - h. Wilkins; a Zurn company.
    - i. Or approved equal.
  - 2. Standard: ASSE 1079.
  - 3. Pressure Rating: 250 psig (1725 kPa)

4. End Connections: Solder-joint copper alloy and threaded ferrous.
- C. Dielectric Flanges:
1. Manufacturers: Subject to compliance with requirements, provide products by the following:
  2. Approved Manufacturers: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
    - a. Capitol Manufacturing Company; member of the Phoenix Forge Group.
    - b. Central Plastics Company.
    - c. Matco-Norca.
    - d. Watts; a division of Watts Water Technologies, Inc.
    - e. Wilkins; a Zurn company.
    - f. Or approved equal.
  3. Standard: ASSE 1079.
  4. Factory-fabricated, bolted, companion-flange assembly.
  5. Pressure Rating: 175 psig (1200 kPa).
  6. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.
- D. Dielectric-Flange Insulating Kits:
1. Manufacturers: Subject to compliance with requirements, provide products by the following:
    - a. Advance Products & Systems, Inc.
    - b. Calpico, Inc.
    - c. Central Plastics Company.
    - d. Pipeline Seal and Insulator, Inc.
    - e. Or approved equal.
  3. Nonconducting materials for field assembly of companion flanges.
  4. Pressure Rating: 150 psig (1035 kPa).
  5. Gasket: Neoprene or phenolic.
  6. Bolt Sleeves: Phenolic or polyethylene.
  7. Washers: Phenolic with steel backing washers.
- E. Dielectric Nipples:
1. Manufacturers: Subject to compliance with requirements, provide products by the following:
    - a. Elster Perfection Corporation.
    - b. Grinnell Mechanical Products; Tyco Fire Products LP.
    - c. Matco-Norca.

- d. Precision Plumbing Products, Inc.
  - e. Victaulic Company.
  - f. Or approved equal.
3. Standard: IAPMO PS 66.
  4. Electroplated steel nipple complying with ASTM F 1545.
  5. Pressure Rating and Temperature: 300 psig at 225 deg F.
  6. End Connections: Male threaded or grooved.
  7. Lining: Inert and noncorrosive, propylene.

### **PART 3 - EXECUTION**

#### **3.1 PIPING INSTALLATION**

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of domestic water piping. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.
- B. Install copper tubing under building slab according to CDA's "Copper Tube Handbook."
- C. Install shutoff valve, hose-end drain valve, strainer, pressure gage, and test tee with valve inside the building at each domestic water-service entrance. Comply with requirements for pressure gages in Section 220519 "Meters and Gages for Plumbing Piping" and with requirements for drain valves and strainers in Section 221119 "Domestic Water Piping Specialties."
- D. Install shutoff valve immediately upstream of each dielectric fitting.
- E. Install water-pressure-reducing valves downstream from shutoff valves. Comply with requirements for pressure-reducing valves in Section 22 11 19 "Domestic Water Piping Specialties."
- F. Install domestic water piping level without pitch and plumb.
- G. Rough-in domestic water piping for water-meter installation according to utility company's requirements.
- H. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.
- I. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- J. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal, and coordinate with other services occupying that space.
- K. Install piping to permit valve servicing.
- L. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than the system pressure rating used in applications below unless otherwise indicated.

- M. Install piping free of sags and bends.
- N. Install fittings for changes in direction and branch connections.
- O. Install unions in copper tubing at final connection to each piece of equipment, machine, and specialty.
- P. Install pressure gages on suction and discharge piping for each plumbing pump and packaged booster pump. Comply with requirements for pressure gages in Section 220519 "Meters and Gages for Plumbing Piping."
- Q. Install thermometers on inlet and outlet piping from each water heater. Comply with requirements for thermometers in Section 220519 "Meters and Gages for Plumbing Piping."
- R. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 220517 "Sleeves and Sleeve Seals for Plumbing Piping."
- S. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 220517 "Sleeves and Sleeve Seals for Plumbing Piping."
- T. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 220518 "Escutcheons for Plumbing Piping."

### **3.3 JOINT CONSTRUCTION**

- A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.
- C. Brazed Joints: All joint surface shall be cleaned. An approved flux shall be applied where required. The joint shall be brazed with a filter metal conforming to AWS A5.8.
- D. Soldered Joints: Solder joints shall be made in accordance with the methods of ASTM B 828. All cut tube ends shall be reamed to the full inside diameter of the tube end. All joints surface shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. The joining of water supply piping shall made with lead-free solders and flux. "Lead-free" shall mean a chemical composition equal to or less than 0.2 percent lead.
- E. Mechanical joints: Mechanical joints for copper shall be installed in accordance with the manufacturer's instructions and shall be tested, designed and evaluated in accordance with IAPMO PS ICCES, ICC-ES PMG LC and ASSE 1061
- F. Flared Joints: Flared joints for water pipe shall be made by a tool designed for that operation. Join copper tube and pressure-seal fittings with tools recommended by fitting manufacturer.
- G. Joints for Dissimilar-Material Piping: Make joints using adapters compatible with materials of both piping systems.
- H. Join copper tube and fittings according to ASTM B 828 or CDA's "Copper Tube Handbook."

**3.4 TRANSITION FITTING INSTALLATION**

- A. Install transition couplings at joints of dissimilar piping.
- B. Transition Fittings in Underground Domestic Water Piping:
  - 1. Fittings for NPS 1-1/2 and Smaller: Fitting-type coupling.
  - 2. Fittings for NPS 2 and Larger: Sleeve-type coupling.
- C. Transition Fittings in Aboveground Domestic Water Piping NPS 2 and Smaller.

**3.5 DIELECTRIC FITTING INSTALLATION**

- A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.
- B. Dielectric Fittings for NPS 2 and Smaller: Use dielectric couplings.
- C. Dielectric Fittings for NPS 2-1/2 to NPS 4: Use dielectric nipples.
- D. Dielectric Fittings for NPS 5 and Larger: Use dielectric flange kits.

**3.6 HANGER AND SUPPORT INSTALLATION**

- A. Comply with requirements for pipe hanger, support products, and installation in Section 220529 "Hangers and Supports for Plumbing Piping and Equipment."
  - 1. Vertical Piping: MSS Type 8 or 42, clamps.
  - 2. Individual, Straight, Horizontal Piping Runs:
    - a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
    - b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
    - c. Longer than 100 Feet if indicated: MSS Type 49, spring cushion rolls.
  - 3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
  - 4. Base of Vertical Piping: MSS Type 52, spring hangers.
- B. Support vertical piping and tubing at base and at each floor.
- C. Rod diameter may be reduced one size for double-rod hangers, to a minimum of 3/8 inch.
- D. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 3/4 and smaller: 60 inches with 3/8-inch rod.
  - 2. NPS 1 and NPS 1-1/4 : 72 inches with 3/8-inch rod.
  - 3. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
  - 4. NPS 2-1/2: 108 inches with 1/2-inch rod.
  - 5. NPS 3 to NPS 5: 10 feet with 1/2-inch rod.
  - 6. NPS 6: 10 feet with 5/8-inch rod.
  - 7. NPS 8: 10 feet with 3/4-inch rod.
- E. Install supports for vertical copper tubing every 10 feet.
- F. Install supports for vertical steel piping every 15 feet.

### **3.7 CONNECTIONS**

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. When installing piping adjacent to equipment and machines, allow space for service and maintenance.
- C. Connect domestic water piping to exterior water-service piping. Use transition fitting to join dissimilar piping materials.
- D. Connect domestic water piping to water-service piping with shutoff valve; extend and connect to the following:
  - 1. Domestic Water Booster Pumps: Cold-water suction and discharge piping.
  - 2. Water Heaters: Cold-water inlet and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
  - 3. Plumbing Fixtures: Cold- and hot-water-supply piping in sizes indicated, but not smaller than that required by plumbing code.
  - 4. Equipment: Cold- and hot-water-supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 and larger.

### **3.8 IDENTIFICATION**

- A. Identify system components. Comply with requirements for identification materials and installation in Section 220553 "Identification for Plumbing Piping and Equipment."
- B. Label pressure piping with system operating pressure.

### **3.9 FIELD QUALITY CONTROL**

- A. Perform the following tests and inspections:
  - 1. Piping Inspections:
    - a. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
    - b. During installation, notify the Engineer at least one day before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
      - 1) Roughing-in Inspection: Arrange for inspection of piping before concealing or closing in after roughing in and before setting fixtures.
      - 2) Final Inspection: Arrange for the Engineer to observe tests specified in "Piping Tests" Subparagraph below and to ensure compliance with requirements.
    - c. Reinspection: If the Engineer finds that piping will not pass tests or inspections, make required corrections and arrange for reinspection.
    - d. Reports: Prepare inspection reports and have them signed by the Engineer.

2. Piping Tests:
  - a. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
  - b. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit a separate report for each test, complete with diagram of portion of piping tested.
  - c. Leave new, altered, extended, or replaced domestic water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.
  - d. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow it to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
  - e. Repair leaks and defects with new materials, and retest piping or portion thereof until satisfactory results are obtained.
  - f. Prepare reports for tests and for corrective action required.
- B. Domestic water piping will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

### 3.10 ADJUSTING

- A. Perform the following adjustments before operation:
  1. Close drain valves, hydrants, and hose bibbs.
  2. Open shutoff valves to fully open position.
  3. Open throttling valves to proper setting.
  4. Adjust balancing valves in hot-water-circulation return piping to provide adequate flow.
    - a. Manually adjust ball-type balancing valves in hot-water-circulation return piping to provide hot-water flow in each branch.
    - b. Adjust calibrated balancing valves to flows indicated.
  5. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
  6. Remove and clean strainer screens. Close drain valves and replace drain plugs.
  7. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
  8. Check plumbing specialties and verify proper settings, adjustments, and operation.

### 3.11 CLEANING

- A. Clean and disinfect potable domestic water piping as follows:
  - 1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
  - 2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction; if methods are not prescribed, use procedures described in either AWWA C651 or AWWA C652 or follow procedures described below:
    - a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    - b. Fill and isolate system according to either of the following:
      - 1) Fill system or part thereof with water/chlorine solution with at least 50 ppm of chlorine. Isolate with valves and allow to stand for 24 hours.
      - 2) Fill system or part thereof with water/chlorine solution with at least 200 ppm of chlorine. Isolate and allow to stand for three hours.
    - c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
    - d. Repeat procedures if biological examination shows contamination.
    - e. Submit water samples in sterile bottles to authorities having jurisdiction.
- B. Clean non-potable domestic water piping as follows:
  - 1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
  - 2. Use purging procedures prescribed by authorities having jurisdiction or; if methods are not prescribed, follow procedures described below:
    - a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
    - b. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.
- C. Prepare and submit reports of purging and disinfecting activities. Include copies of water- sample approvals from authorities having jurisdiction.
- D. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

### 3.12 PIPING SCHEDULE

- A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.
- B. Flanges and unions may be used for aboveground piping joints unless otherwise indicated.
- C. Fitting Option: Extruded-tee connections, 95/5 Lead Free Soldered Joints and brazed joints may be used on aboveground copper tubing.
- D. Under-building-slab, domestic water, building-service piping, NPS 3 and smaller, shall be one of the following:

1. Soft copper tube, ASTM B 88, Type K wrought-copper, solder-joint fittings and brazed joints or 95/5 Lead Free Soldered Joints.
- E. Under-building-slab, domestic water, building-service piping, NPS 4 and larger, shall be one of the following:
1. Ductile Iron cement lined water pipe
- E. Aboveground domestic water piping, NPS 2 and smaller, shall be one of the following:
1. Hard copper tube, ASTM B 88, Type K cast- or wrought-copper, solder-joint fittings; and brazed joints or 95/5 Lead Free Soldered Joints.
- F. Aboveground domestic water piping, NPS 2-1/2 to NPS 4, shall be one of the following:
1. Hard copper tube, ASTM B 88, Type K; cast or wrought copper, solder-joint fittings; and brazed joints or 95/5 Lead Free Soldered Joints.
- G. Aboveground not potable water piping, NPS 4 shall be one of the following:
1. Steel Pipe for Threading: Standard weight, Schedule 40, black or galvanized; ASTM A 53 or ASTM A 135.

**END OF SECTION**

**SECTION 22 11 19 – DOMESTIC WATER PIPING SPECIALTIES****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Backflow preventers.
  - 2. Strainers.
  - 3. Hose bibbs.
  - 4. Wall hydrants.
  - 5. Drain valves.
  - 6. Water-hammer arresters.
  - 7. Flexible connectors.
  - 8. Water meters
  - 9. Domestic Booster Pump.
- B. Related Requirements:
  - 1. Section 22 05 19 "Meters and Gages for Plumbing Piping" for thermometers, pressure gages, and flow meters in domestic water piping.
  - 2. Section 22 11 16 "Domestic Water Piping" for water meters.
  - 3. Comply with requirements for ground equipment in Section 260526 "Grounding and Bonding for Electrical Systems."

**1.2 SUBMITTALS**

- A. Product Data: For each type of product.
- B. Shop Drawings: For domestic water piping specialties.
  - 1. Include diagrams for power, signal, and control wiring.
- C. Field quality-control reports.
- D. Operation and Maintenance Data: For domestic water piping specialties to include in emergency, operation, and maintenance manuals.

**PART 2 - PRODUCTS****2.1 GENERAL REQUIREMENTS FOR PIPING SPECIALTIES**

- A. Potable-water piping and components shall comply with NSF 61 and NSF 14

**2.2 PERFORMANCE REQUIREMENTS**

- A. Minimum Working Pressure for Domestic Water Piping Specialties: 200 psig unless otherwise indicated.

**2.3 BACKFLOW PREVENTERS**

- A. Double Check Valves:

1. Double Check Valves 2" DIA and Smaller: The double check valve shall consist of two (2) independently operated, center guided, lead free, spring loaded check valves. The double check valves shall be Model No. 950XLT2, manufactured by Wilkins, Paso Robles, CA, or Model No. LF850 manufactured by FEBCO, Fresno, CA, or approved equal.
  2. Double Check Valve 4" DIA.:
    - a. Double check valve 4" DIA should be lead free ductile iron double check valve assembly, epoxy coated using ArmorTrek Technology, OS&Y shutoffs.
    - b. Acceptable Manufacturers:
      1. FEBCO; a division of Watts Water Technologies, Inc.
      2. Conbraco Industries, Inc.
      3. Watts; a division of Watts Water Technologies, Inc.
      4. Zurn Industries, LLC, Plumbing Products Group;
      5. Wilkens Water Control
      6. Honeywell International, Inc.,.
      7. or approved equal.
- B. Reduced-Pressure-Principle Backflow Preventers:
1. The Reduced Pressure Zone Backflow Prevention Device shall consist of two independently operating check valves and one hydraulically dependent differential relief valve. Check valve and relief valve components shall be constructed so they may be serviced without removing the valve body from the line.
  2. All RPZ's shall be furnished and installed complete with resilient seated shut off valves and test cocks. The assembly shall meet the requirements of ASSE Standard 1013 and AWWA Standard Code 506-78 and shall be lead free in compliance with the amended Federal Law (SDWA).
  3. The 2" RPZs and smaller shall be manufactured by Febco model LF825YA, Wilkins, Watts or approved equal.
  4. The 3" RPZs and larger shall be manufactured by Febco model LF860 Wilkins, Watts or approved equal. The RPZ shall be installed as shown on the Approved Drawings.

EFFECTIVE JAN. 4TH, 2014, ALL PROPOSED INSTALLATIONS/ REPAIR OF BACK FLOW PREVENTER (BFP) DEVICES AND ALL ASSOCIATED VALVES TO BE UTILIZED ON ALL DOMESTIC DRINKING WATER SERVICES FOR HUMAN CONSUMPTION, MUST BE LEAD-FREE IN COMPLIANCE WITH THE AMENDED FEDERAL LAW, SAFE DRINKING WATER ACT (SDWA).

Note: If the Contractor installs equipment Other than that approved by the Cross Connection Control Unit of DEP, it will be the Contractors responsibility to refile and obtain the required approvals at his/her own expense and at no additional cost to the City.

## 2.4 STRAINERS FOR DOMESTIC WATER PIPING

- A. Y-Pattern Strainers:

1. Pressure Rating: 125 psig minimum unless otherwise indicated.
2. Body: Bronze for NPS 2 and smaller; cast iron with interior lining that complies with AWWA C550 or that is FDA approved, epoxy coated and for NPS 2-1/2 and larger.
3. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
4. Screen: Stainless steel with round perforations unless otherwise indicated.
5. Perforation Size:
  - a. Strainers NPS 2 and Smaller: 0.062 inch .
  - b. Strainers NPS 2-1/2 to NPS 4 : 0.125 inch .
  - c. Strainers NPS 5 and Larger: 0.25 inch .
6. Drain: Factory-installed, hose-end drain valve.

## **2.5 HOSE BIBBS**

- A. Hose Bibbs:
  1. Standard: ASME A112.18.1 for sediment faucets.
  2. Body Material: Bronze.
  3. Seat: Bronze, replaceable.
  4. Supply Connections: NPS 1/2 or NPS 3/4 threaded or solder-joint inlet.
  5. Outlet Connection: Garden-hose thread complying with ASME B1.20.7.
  6. Pressure Rating: 125 psig.
  7. Vacuum Breaker: Integral nonremovable, drainable, hose-connection vacuum breaker complying with ASSE 1011.
  8. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
  9. Finish for Service Areas: Rough bronze.
  10. Finish for Finished Rooms: Chrome or nickel plated.
  11. Operation for Equipment Rooms: Wheel handle or operating key.
  12. Operation for Service Areas: Operating key.
  13. Operation for Finished Rooms: Operating key.
  14. Include operating key with each operating-key hose bibbs.
  15. Include integral wall flange with each chrome- or nickel-plated hose bibb.

## **2.6 WALL HYDRANTS**

- A. Nonfreeze Wall Hydrants:
  1. Manufacturers: Subject to compliance with requirements, provide products by the following:
    - a. Josam Company.
    - b. MIFAB, Inc.

- c. Prier Products, Inc.
  - d. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
  - e. Tyler Pipe; Wade Div.
  - f. Watts Drainage Products.
  - g. Woodford Manufacturing Company; a division of WCM Industries, Inc.
  - h. Zurn Industries, LLC; Plumbing Products Group; Light Commercial Products.
  - i. Zurn Industries, LLC; Plumbing Products Group; Specification Drainage Products.
  - j. Or approved equal.
2. Standard: ASME A112.21.3M for concealed-outlet, self-draining wall hydrants.
  3. Pressure Rating: 125 psig (860 kPa).
  4. Operation: Loose key.
  5. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
  6. Inlet: NPS 3/4 or NPS 1 (DN 20 or DN 25).
  7. Outlet: Concealed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.
  8. Box: Deep, flush mounted with cover.
  9. Box and Cover Finish: Polished nickel bronze.
  10. Outlet: Exposed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.
  11. Nozzle and Wall-Plate Finish: Polished nickel bronze.
  12. Operating Keys(s): One with each wall hydrant.

## **2.7 DRAIN VALVES**

- A. Ball-Valve-Type, Hose-End Drain Valves:
  1. Standard: MSS SP-110 for standard-port, two-piece ball valves.
  2. Pressure Rating: 400-psig minimum CWP.
  3. Size: NPS 3/4 .
  4. Body: Copper alloy.
  5. Ball: Chrome-plated brass.
  6. Seats and Seals: Replaceable.
  7. Handle: Vinyl-covered steel.
  8. Inlet: Threaded or solder joint.
  9. Outlet: Threaded, short nipple with garden-hose thread complying with ASME B1.20.7 and cap with brass chain.

## 2.8 WATER-HAMMER ARRESTERS

### A. Water-Hammer Arresters:

1. Manufacturers: Subject to compliance with requirements, provide products by the following:
  - a. AMTROL, Inc.
  - b. Josam Company.
  - c. MIFAB, Inc.
  - f. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
  - g. Tyler Pipe; Wade Div.
  - h. Watts Drainage Products.
  - i. Zurn Industries, LLC; Plumbing Products Group; Specification Drainage Products.
  - j. Or approved equal
2. Standard: ASSE 1010 or PDI-WH 201.
3. Type: Metal bellows.
4. Size: ASSE 1010, Sizes AA and A through F, or PDI-WH 201, Sizes A through F.

## 2.9 FLEXIBLE CONNECTORS

- A. Standard: ASME A112.18.1 , CSA B12, IAPMO PS 74 and PS 48
- B. Bronze-Hose Flexible Connectors: Corrugated-bronze tubing with bronze wire-braid covering and ends brazed to inner tubing.
  1. Working-Pressure Rating: Minimum 200 psig.
  2. End Connections NPS 2 and Smaller: Threaded copper pipe or plain-end copper tube.
  3. End Connections NPS 2-1/2 and Larger: Flanged copper alloy.
- C. Stainless-Steel-Hose Flexible Connectors: Corrugated-stainless-steel tubing with stainless-steel wire-braid covering and ends welded to inner tubing.
  1. Working-Pressure Rating: Minimum 200 psig.
  2. End Connections NPS 2 and Smaller: Threaded steel-pipe nipple.
  3. End Connections NPS 2-1/2 and Larger: Flanged steel nipple.

## 2.10 WATER METERS

### A. Displacement-Type Water Meters:

1. Manufacturers: Subject to compliance with requirements of NYC DEP, water meter shall be Omni C2 manufactured by Sensus or EvoQ4 electronic manufactured by Elster AMCO water , LLC, or approved equal.
2. Description:
  - a. Standard: AWWA C700.

- b. Pressure Rating: 150-psig (1035-kPa) working pressure.
  - c. Body Design: Nutating disc; totalization meter.
  - d. Registration: In gallons (liters) or cubic feet (cubic meters) as required by utility company.
  - e. Case: Bronze.
  - f. End Connections: Threaded.
- B. Remote Registration System: Direct-reading type complying with AWWA C706; modified with signal-transmitting assembly, low-voltage connecting wiring, and remote register assembly as required by utility company.
  - C. Remote Registration System: Encoder type complying with AWWA C707; modified with signal-transmitting assembly, low-voltage connecting wiring, and remote register assembly as required by utility company.

## 2.11 DOMESTIC BOOSTER PUMP

- A. Booster pump system must be as follows:
  - a. Booster pump 100 GPM @ 50 PSI pressure boost shall be Model PB-100 Simplex as manufactured by Thrush Company, Inc., DuraMac, Grundfos, or approved equal, having a pressure range of 20 to 80 psig, flow of 100 GPM, pressure boost of 50 psig at 7.5 HP motor, minimum suction pressure of 5 psig and a 40-gallon storage tank precharged to 38 psig.
  - b. Booster pump 150 GPM @ 50 PSI pressure boost should be model DVM-5.OPC-C-83-VM-PFD-NSF-DOL, Duplex as manufactured by Tigerflow, Duramac, Grundfos or approved equal. Each pump should provide 75 GPM @ 50 PSI of boost and 7.5 HP each.
  - c. Booster pump 200 GPM @50 PSI booster should be model DVM-7.5PC-C-83-VM-P-VFD-NSF-DOL, Duplex as manufactured by Tigerflow, Duramac, Grundfos or approved equal. Each pump should provide 100 GPM @ 50 SPI booster and 7.5 HP each.
- B. Contractor (Electrician) shall verify the power available to the building and order the unit with the correct voltage and phase required. Unit shall be furnished and installed complete with motors indicated above, 1 1/2" Boostrol valve, Nema #1 enclosure, motor starter, start/stop switch, low suction alarm light, power on light, fused disconnect switch, pressure switch set at 40/60 psig and low pressure cut-off switch.
- C. The Contractor shall furnish (where required by the contract) and install all the necessary and/or required conduit, wires, boxes, wiring devices, etc. for a complete branch circuit supplying power to the Booster System.
- D. The size of the wires shall be the minimum or larger than that specified by the manufacturer. All Work shall be done in accordance with the New York City Electrical Code and in accordance with Section D. All power and control wiring shall be done by this Contractor.

**PART 3 - EXECUTION****3.1 INSTALLATION**

- A. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.
  - 1. Locate backflow preventers in same room as connected equipment or system.
  - 2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe-to-floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are unacceptable for this application.
  - 3. Do not install bypass piping around backflow preventers.
- B. Install water regulators with inlet and outlet shutoff valves and bypass with memory-stop balancing valve. Install pressure gages on inlet and outlet.
- C. Install water-control valves with inlet and outlet shutoff valves and bypass with globe valve. Install pressure gages on inlet and outlet.
- D. Install balancing valves in locations where they can easily be adjusted.
- E. Install temperature-actuated, water mixing valves with check stops or shutoff valves on inlets and with shutoff valve on outlet. Install cabinet-type units recessed in or surface mounted on wall as specified.
- F. Install outlet boxes recessed in wall or surface mounted on wall. Install 2-by-4-inch fire-retardant-treated-wood blocking, wall reinforcement between studs. Comply with requirements for fire-retardant-treated-wood blocking in Section 061000 "Rough Carpentry."
- G. Install hose stations with check stops or shutoff valves on inlets and with thermometer on outlet.
  - 1. Install cabinet-type units recessed in or surface mounted on wall as specified. Install 2- by-4-inch fire-retardant-treated-wood blocking, wall reinforcement between studs. Comply with requirements for fire-retardant-treated-wood blocking in Section 061000 "Rough Carpentry."
- H. Set nonfreeze, nondraining-type post hydrants in concrete or pavement.
- I. Set freeze-resistant yard hydrants with riser pipe in concrete or pavement. Do not encase canister in concrete.
- J. Water-hammer arresters shall be installed in accordance with manufacturers' specifications. Install water-hammer arresters in water piping according to PDI-WH 201.
- K. Install air vents at high points of water piping.
- L. Install supply-type, trap-seal primer valves with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting. Adjust valve for proper flow.
- M. Install drainage-type, trap-seal primer valves as lavatory trap with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting.

- N. Install trap-seal primer systems with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting. Adjust system for proper flow.
- O. Flexible water connectors shall not exceed 24 inch, shall be used in exposed locations only and shall be used singularly: that is, two connectors cannot be joined.

### **3.2 CONNECTIONS**

- A. Comply with requirements for ground equipment in Section 260526 "Grounding and Bonding for Electrical Systems."
- B. Fire-retardant-treated-wood blocking is specified in Section 260519 "Low-Voltage Electrical Power Conductors and Cables" for electrical connections.

### **3.3 LABELING AND IDENTIFYING**

- A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:
  - 1. Pressure vacuum breakers.
  - 2. Intermediate atmospheric-vent backflow preventers.
  - 3. Reduced-pressure-principle backflow preventers.
  - 4. Double-check, backflow-prevention assemblies.
  - 5. Double-check, detector-assembly backflow preventers.
  - 6. Hose stations.
  - 7. Trap-seal primer systems.
- B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Nameplates and signs are specified in Section 22 05 53 "Identification for Plumbing Piping and Equipment."

### **3.4 FIELD QUALITY CONTROL**

- A. Perform the following tests and inspections:
  - 1. Test each pressure vacuum breaker reduced-pressure-principle backflow preventer, double-check, backflow-prevention assembly and double-check, detector-assembly backflow preventer according to authorities having jurisdiction and the device's reference standard.
- B. Domestic water piping specialties will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

### **3.5 ADJUSTING**

- A. Set field-adjustable pressure set points of water pressure-reducing valves.
- B. Set field-adjustable flow set points of balancing valves.
- C. Set field-adjustable temperature set points of temperature-actuated, water mixing valves.

**END OF SECTION**

**SECTION 22 13 16 – SANITARY WASTE AND VENT PIPING****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
  - 1. Pipe, tube, and fittings.
  - 2. Specialty pipe fittings.

**1.2 PERFORMANCE REQUIREMENTS**

- A. Components and installation shall be capable of withstanding the following minimum working pressure unless otherwise indicated:
  - 1. Soil, Waste, and Vent Piping: 10-foot head of water.
  - 2. Waste, Force-Main Piping: 150 psig.

**1.3 ACTION SUBMITTALS**

- A. Product Data: For each type of product indicated.

**1.4 INFORMATIONAL SUBMITTALS**

- A. Field quality-control reports.

**1.5 QUALITY ASSURANCE**

- A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

**1.6 PROJECT CONDITIONS**

- A. Interruption of Existing Sanitary Waste Service: Do not interrupt service to facilities occupied by City of New York or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
  - 1. Notify Resident Engineer no fewer than two days in advance of proposed interruption of sanitary waste service.
  - 2. Do not proceed with interruption of sanitary waste service without Agency's written permission.

**PART 2 - PRODUCTS****2.1 PIPING MATERIALS**

- A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

**2.2 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS**

- A. Pipe and Fittings: ASTM A 74, Service class.
- B. Gaskets: ASTM C 564, rubber.
- C. Calking Materials: Oakum or hemp.

- D. Hub-and-Spigot Pipe and Pipe Fittings:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. ANACO-Husky.
    - b. Dallas Specialty & Mfg. Co.
    - c. Fernco Inc.
    - d. Matco-Norca, Inc.
    - e. MIFAB, Inc.
    - f. Mission Rubber Company; a division of MCP Industries, Inc.
    - g. Stant.
    - h. Tyler Pipe.
    - i. Or approved equal.
  2. Standards: ASTM C 564, ASTM C 1563.
  3. Description: Compression gaskets for hub and spigot pipe and fittings shall conform to ASTM C 564 and shall be tested to ASTM C 1563

### **2.3 HUBLESS, CAST-IRON SOIL PIPE AND FITTINGS**

- A. Pipe and Fittings: ASTM A 888 or CISPI 301.
- B. ASTM B16.4 Gray Iron Threaded Fittings Classes 125 and 250
- C. ASTM B16.12 Cast Iron Threaded Drainage Fittings
- D. CISPI, Hubless-Piping Couplings:
  1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. ANACO-Husky.
    - b. Dallas Specialty & Mfg. Co.
    - c. Fernco Inc.
    - d. Matco-Norca, Inc.
    - e. MIFAB, Inc.
    - f. Mission Rubber Company; a division of MCP Industries, Inc.
    - g. Stant.
    - h. Tyler Pipe.
    - i. Or approved equal.
  2. Standards: ASTM C 1277, ASTM C 1540 or CISPI 310.
  3. Description: The elastomeric sealing sleeve shall conform to ASTM C 564 or CAN/CSA B602 and shall provide with a center stop.

## 2.5 SPECIALTY PIPE FITTINGS

### A. Transition Couplings:

1. General Requirements: Fitting or device for joining piping with small differences in OD's or of different materials. Include end connections same size as and compatible with pipes to be joined.
2. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
3. Unshielded, Nonpressure Transition Couplings:
  - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - 1) Dallas Specialty & Mfg. Co.
    - 2) Fernco Inc.
    - 3) Mission Rubber Company; a division of MCP Industries, Inc.
    - 4) Plastic Oddities; a division of Diverse Corporate Technologies, Inc.
    - 5) or approved equal
  - b. Standard: ASTM C 1173.
  - c. Description: Elastomeric, sleeve-type, reducing or transition pattern. Include shear ring and corrosion-resistant-metal tension band and tightening mechanism on each end.
  - d. Sleeve Materials:
    - 1) For Cast-Iron Soil Pipes: ASTM C 564, rubber.
    - 2) For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
    - 3) For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
4. Shielded, Nonpressure Transition Couplings:
  - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - 1) Cascade Waterworks Mfg. Co.
    - 2) Mission Rubber Company; a division of MCP Industries, Inc.
    - 3) Fernco Inc.
    - 4) Or approved equal
  - b. Standard: ASTM C 1460.
  - c. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.

5. Mechanical Transition Couplings:
  - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - 1) Cascade Waterworks Mfg. Co.
    - 2) Dresser, Inc.
    - 3) EBAA Iron, Inc.
    - 4) JCM Industries, Inc.
    - 5) Romac Industries, Inc.
    - 6) Smith-Blair, Inc.; a Sensus company.
    - 7) The Ford Meter Box Company, Inc.
    - 8) Viking Johnson.
    - 9) Or approved equal.
  - b. Standard: ASTM C 1461
  - c. Description: Thermoplastic Electrometric gasket
- B. Dielectric Fittings:
  1. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
  2. Dielectric Unions:
    - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      - 1) Capitol Manufacturing Company.
      - 2) Central Plastics Company.
      - 3) Hart Industries International, Inc.
      - 4) Jomar International Ltd.
      - 5) Matco-Norca, Inc.
      - 6) McDonald, A. Y. Mfg. Co.
      - 7) Watts Regulator Co.; a division of Watts Water Technologies, Inc.
      - 8) Wilkins; a Zurn company.
      - 9) Or approved equal.
    - b. Description:
      - 1) Standard: ASSE 1079.
      - 2) Pressure Rating: 125 psig (860 kPa) minimum at 180 deg F (82 deg C).
      - 3) End Connections: Solder-joint copper alloy and threaded ferrous.

3. Dielectric Flanges:
  - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - 1) Capitol Manufacturing Company.
    - 2) Central Plastics Company.
    - 3) Matco-Norca, Inc.
    - 4) Watts Regulator Co.; a division of Watts Water Technologies, Inc.
    - 5) Wilkins; a Zurn company.
    - 6) Or approved equal.
  - b. Description:
    - 1) Standard: ASSE 1079.
    - 2) Factory-fabricated, bolted, companion-flange assembly.
    - 3) Pressure Rating: 125 psig (860 kPa) minimum at 180 deg F (82 deg C).
    - 4) End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.
4. Dielectric-Flange Insulating Kits:
  - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - 1) Advance Products & Systems, Inc.
    - 2) Calpico, Inc.
    - 3) Central Plastics Company.
    - 4) Pipeline Seal and Insulator, Inc.
    - 5) Or approved equal.
  - b. Description:
    - 1) Nonconducting materials for field assembly of companion flanges.
    - 2) Pressure Rating: 150 psig (1035 kPa).
    - 3) Gasket: Neoprene or phenolic.
    - 4) Bolt Sleeves: Phenolic or polyethylene.
    - 5) Washers: Phenolic with steel backing washers.
5. Dielectric Nipples:
  - a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - 1) Elster Perfection.
    - 2) Grinnell Mechanical Products.
    - 3) Matco-Norca, Inc.

- 4) Precision Plumbing Products, Inc.
  - 5) Victaulic Company.
  - 6) Or approved equal.
- b. Description:
- 1) Standard: IAPMO PS 66
  - 2) Electroplated steel nipple.
  - 3) Pressure Rating: 300 psig (2070 kPa) at 225 deg F (107 deg C).
  - 4) End Connections: Male threaded or grooved.
  - 5) Lining: Inert and noncorrosive, propylene.

### **PART 3 - EXECUTION**

#### **3.1 PIPING INSTALLATION**

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.
- B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
- C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- E. Install piping to permit valve servicing.
- F. Install piping at indicated slopes.
- G. Install piping free of sags and bends.
- H. Install fittings for changes in direction and branch connections.
- I. Install piping to allow application of insulation.
- K. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if two fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.
- L. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements.

Maintain swab in piping and pull past each joint as completed.

- M. Install soil and waste drainage and vent piping at the following minimum slopes unless otherwise indicated:
  - 1. Building Sanitary Drain: 2 NPS 3 and smaller; 2 percent downward in direction of flow for piping NPS 4 and larger.
  - 2. Horizontal Sanitary Drainage Piping: 2 percent downward in direction of flow.
  - 3. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.
- N. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
  - 1. Install encasement on underground piping according to ASTM A 674 or AWWA C105/A 21.5.
- O. Install steel piping according to applicable plumbing code.
- P. Install engineered soil and waste drainage and vent piping systems as follows:
  - 1. Combination Waste and Vent: Comply with standards of authorities having jurisdiction.
  - 3. Reduced-Size Venting: Comply with standards of authorities having jurisdiction.
- Q. Install underground, ductile-iron, force-main piping according to AWWA C600. Install buried piping inside building between wall and floor penetrations and connection to sanitary sewer piping outside building with restrained joints. Anchor pipe to wall or floor. Install thrust-block supports at vertical and horizontal offsets.
  - 1. Install encasement on piping according to ASTM A 674 or AWWA C105/A 21.5.
- R. Install underground, copper, force-main tubing according to CDA's "Copper Tube Handbook."
  - 1. Install encasement on piping according to ASTM A 674 or AWWA 105/A 21.5.
- S. Install force mains at elevations indicated.
- T. Plumbing Specialties:
  - 1. Install backwater valves in sanitary waster gravity-flow piping. Comply with requirements for backwater valves specified in Section 221319 "Sanitary Waste Piping Specialties."
  - 2. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers in sanitary drainage gravity-flow piping. Install cleanout fitting with closure plug inside the building in sanitary drainage force-main piping. Comply with requirements for cleanouts specified in Section 221319 "Sanitary Waste Piping Specialties."
  - 3. Install drains in sanitary drainage gravity-flow piping. Comply with requirements for drains specified in Section 221319 "Sanitary Waste Piping Specialties."
- U. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.
- V. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 220517 "Sleeves and Sleeve Seals for Plumbing Piping."

- W. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 220517 "Sleeves and Sleeve Seals for Plumbing Piping."
- X. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 220518 "Escutcheons for Plumbing Piping."

### 3.2 JOINT CONSTRUCTION

- B. **Caulked Joints:** Joints for hub and spigot pipe shall be firmly packed with oakum or hemp. Molten lead shall be poured in one operation to a depth of not less than 1 inch. The lead shall not recede more than 0.125 inch below the rim of the hub and shall be caulked tight. Paint, varnish or other coatings shall not be permitted on the jointing material until after the joint has been tested and approved. Lead shall be run in one pouring and shall be caulked tight. Acid-resistant rope and acid proof cement shall be permitted.
- D. **Compression Gasket Joints:** Compression gaskets for hub and spigot pipe and fittings shall conform to ASTM C 564 and shall be tested to ASTM C 1563. Gaskets shall be compressed when the pipe is fully insert.
- E. **Mechanical Joint Coupling:** Mechanical Joint coupling for hub-less pipe and fittings shall comply with CISPI 310 or ASTM C 1277 or ASTM C 1540. The elastomeric sealing sleeve shall conform to ASTM C 564 or CAN/CSA B602 and shall be provided with a center stop. Mechanical joint couplings shall be installed in accordance with the manufacturer's installation instructions.
- F. **Join hub-and-spigot, cast-iron soil piping with calked joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for lead-and-oakum calked joints**
- G. **Join hubless, cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints. Threaded Joints:**
- H. **Joints between different materials:** Joints between different piping materials shall be made with a mechanical joint of the compression or mechanical-sealing type conforming to ASTM C1173, ASTM C 1460, or ASTM C 1461. Connectors and adaptors shall have an elastomeric seal conforming to ASTM C 425, ASTM C 443, ASTM C 564, ASTM C 1440, ASTM D 1869, ASTM F 477, CAN/CSA A257.3 M or CAN/CSA B 602 or as required from following:
  - 1. **Copper or copper-alloy tubing to cast-iron hub pipe:** Joints between copper or copper-alloy tubing and cast-iron hub pipe shall be made with a brass ferrule or compression joint. The copper or copper-alloy tubing shall be soldered to the ferrule in an approved manner, and the ferrule shall be joined to the cast-iron hub by a caulked joint or a mechanical compression joint.
  - 2. **Cast-iron pipe to galvanized steel or brass pipe:** Joints between cast-iron and galvanized steel or brass pipe shall be made by either caulked or threaded joints or with an approved adapter fitting.
  - 3. **Plastic pipe or tubing to other material:** Joints between different grades of plastic pipe or between plastic pipe and other piping material shall be made with an approved adapter fitting. Joints between plastic pipe and cast iron hub pipe shall be made by a caulked joint or a mechanical compression joint.

4. Lead pipe to other piping materials: Joint between lead pipe and other piping material shall be made by a wiped joint to a caulking ferrule, soldering nipple, or bushing or shall be made with an approved adapter fitting.
5. Borosilicate glass to other materials: Joints between glass pipe and other type of materials shall be made with adapters having a TFE seal and shall be installed in accordance with the manufacturer's instruction.
6. Stainless steel drainage systems to other materials: Joints between stainless steel drainage systems and other piping materials shall be made with approved mechanical couplings.

Joint between glass pipe and other types of materials shall be made with adapters having a TEF seal. Joint shall be installed in accordance with the manufacturer's instructions.

- I. Slip Joints connections: Slip joints shall be made with an approved elastomeric gasket and shall only be installed on the trap outlet, trap inlet and within the trap seal. Fixtures with concealed slip-joint connections shall be provided with an access panel or utility space at least 12 inches in its smallest dimension or other approved arrangement so as to provide access to the slip joint connection for inspection.
- J. Caulking ferrules: Ferrules shall be of red brass and shall be in accordance with 2014 New York City Plumbing Code Table 705.21 Caulking Ferrule Specifications
- K. Soldering Bushing: Soldering bushing shall be of red brass and shall be in accordance with 2014 New York City Plumbing Code Table 705.22 – Soldering Busing Specifications.
- L. Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
  1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
  2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open

### **3.3 SPECIALTY PIPE FITTING INSTALLATION**

- A. Transition Couplings:
  1. Install transition couplings at joints of piping with small differences in OD's.
  2. In Drainage Piping: Shielded, nonpressure transition couplings.
  3. In Aboveground Force Main Piping: Fitting-type transition couplings.
  4. In Underground Force Main Piping:
    - a. NPS 1-1/2 and Smaller: Fitting-type transition couplings.
    - b. NPS 2 and Larger: Pressure transition couplings.
- B. Dielectric Fittings:
  1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.
  2. Dielectric Fittings for NPS 2 and Smaller: Use dielectric nipples.
  3. Dielectric Fittings for NPS 2-1/2 to NPS 4: Use dielectric nipples.

4. Dielectric Fittings for NPS 5 and Larger: Use dielectric flange kits.

### 3.4 HANGER AND SUPPORT INSTALLATION

- A. Comply with requirements for pipe hanger and support devices and installation specified in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."
- B. Comply with requirements for pipe hanger and support devices and installation specified in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."
  1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
  2. Install stainless-steel pipe hangers for horizontal piping in corrosive environments.
  3. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
  4. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
  5. Vertical Piping: MSS Type 8 or Type 42, clamps.
  6. Install individual, straight, horizontal piping runs:
    - a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
    - b. Longer Than 100 Feet : MSS Type 43, adjustable roller hangers.
    - c. Longer than 100 Feet if indicated: MSS Type 49, spring cushion rolls.
  7. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
  8. Base of Vertical Piping: MSS Type 52, spring hangers.
- C. Support horizontal piping and tubing within 12 inches (300 mm) of each fitting, valve, and coupling.
- D. Support vertical piping and tubing at base and at each floor.
- E. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch (10-mm) minimum rods.
- F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
  1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
  2. NPS 3: 60 inches with 1/2-inch rod.
  3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
  4. NPS 6 and NPS 8: 60 inches with 3/4-inch rod.
  5. NPS 10 and NPS 12: 60 inches with 7/8-inch rod.
  6. Spacing for 10-foot lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches.

- G. Install supports for vertical cast-iron soil piping at base and at each story height no greater than 20 feet.
- H. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
  - 1. NPS 1-1/4: 84 inches with 3/8-inch rod.
  - 2. NPS 1-1/2: 108 inches with 3/8-inch rod.
  - 3. NPS 2: 10 feet with 3/8-inch rod.
  - 4. NPS 2-1/2: 11 feet with 1/2-inch rod.
  - 5. NPS 3: 12 feet with 1/2-inch rod.
  - 6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod.
  - 7. NPS 6 and NPS 8: 12 feet with 3/4-inch rod.
  - 8. NPS 10 and NPS 12: 12 feet with 7/8-inch rod.
- I. Install supports for vertical steel piping every 15 feet.

### **3.5 CONNECTIONS**

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.
- C. Connect drainage and vent piping to the following:
  - 1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code.
  - 2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
  - 3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code.
  - 4. Install test tees (wall cleanouts) in conductors near floor and floor cleanouts with cover flush with floor.
  - 5. Comply with requirements for cleanouts and drains specified in Section 221319 "Sanitary Waste Piping Specialties."
  - 6. Equipment: Connect drainage piping as indicated. Provide shutoff valve if indicated and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.
- D. Connect force-main piping to the following:
  - 1. Sanitary Sewer: To exterior force main.
- E. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.
- F. Make connections according to the following unless otherwise indicated:
  - 1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.

2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

### **3.6 IDENTIFICATION**

- A. Identify exposed sanitary waste and vent piping. Comply with requirements for identification specified in Section 220553 "Identification for Plumbing Piping and Equipment."

### **3.7 FIELD QUALITY CONTROL**

- A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
  1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
  2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
- B. Re-inspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for re-inspection.
- C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.
- D. Test sanitary drainage and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
  1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
  2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
  3. Roughing-in Plumbing Test Procedure: Test drainage and vent piping except outside leaders on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
  4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent- stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg (250 Pa). Use U-tube or manometer inserted in trap of water closet to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
  5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
  6. Prepare reports for tests and required corrective action.

- E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
