4	55	Please add an allowance item for obstructions we run into when driving piling	<p>Differing site conditions will be handled according to the Standard Construction Contract.</p> <p>However, the Contractor's attention is drawn to the following items which are intended to reduce the number of differing site conditions encountered:</p> <ol style="list-style-type: none"> <li>1. Requirements for predrilling and removal of known obstructions such as timber cribbing where necessary (such as in Sections ESCR-5, ESCR-5.1, ESCR-551, and ESCR-552).</li> <li>2. Bid items for removal of known obstructions (such as in Section ESCR-6.27)</li> <li>3. Piling bid items that include predrilling. (such as in Sections ESCR-551 ESCR-552, and 551.03950017)</li> <li>4. Piling bid items for specific conditions, such as installation through timber cribbing (such as in Sections ESCR-551 and ESCR-552.)</li> </ol>
4	56	Please clarify the regions specified in bid items 940 and 941	<p>Sequence no. 940, Item No. PK-ESCR 929 is the Gouverneur Gardens property that is impacted by construction, mainly on the Montgomery Street and South Street building frontages. PDS120 and the 320 sheets in each of the landscape series (LM320, LG320, LP320, etc.) will most clearly define this area. However, items for salvage will be defined at the walk through with the Gouverneur Gardens representative.</p> <p>Sequence no. 941, Item No. PK-ESCR 930, is in East River Park at the existing Lower Side Water Park in Reach D. Sheet PDS103 shows this area.</p>
4	57	MPT drawing TC 180 note 5 mentions that all work conducted in this stage shall be conducted between the hours indicated in the schedule 1 for the FDR. Is this schedule valid also for the work related to the park, far from the interference of the FDR and not involved in the traffic maintenance?	<p>Note 5 refers to work that requires an FDR Drive Northbound Right Lane Closure, not for work in the park.</p>
4	58	MPT drawing TC 138 note 5 mentions that all work conducted in this stage shall be conducted between the hours indicated in the schedule 1 for the FDR (tc100). Is this schedule valid also for the work related to the park, far from the interference of the FDR and not involved in the traffic maintenance?	<p>Note 5 refers to work that requires an FDR Drive Northbound Right Lane Closure, not for work in the park.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
4	59	Is August 1st, 2022 a milestone for Phase 1 completion? And it's subject to contractual penalty or acceleration bonus?	The Phase 1 completion milestone is 8/1/2023. See Spec. Section HW-900P
4	60	Can you specify which retaining walls need to be completed by 02/01/2023?	There is no 2/1/2023 milestone related to retaining walls.
4	61	Will Stay in Place forms be permitted on Corlears Hook Bridge, Delancey St Bridge, E. 10th St. Bridge, Houston St Bridge and the Waterfront Esplanade Slab?	Yes.
4	62	5. The Reach K – Advanced Traffic Control Layout (TC 183, Sheet 2732) is supposed to be in place during all constructions stages or only during Reach K construction. Please clarify.	TC 183 applies for any temporary right lane closure of the FDR Drive. See TC 182 as an example of a work area that may require TC 183.
4	63	Should the temporary bridging mentioned in drawing TC 156/Sheet 2705 be paid under 6.70 Maintenance and Protection of Traffic or as separate item? Please clarify	It will be paid under item 6.70.
4	64	Please clarify where the REGRADING DRAWINGS can be found for the areas marked for removal under ITEM NO. 6.02 AAN.	Refer to drawings LG300 and FG130 through FG132.
4	65	How are the areas marked as DEMO-CLEAR AND GRUBB to be paid?	See Note 12 on drawing F100.
4	66	Please provide proposed contour lines, typical sections, and cross sections for the pavement reconstruction of FDR.	Refer to drawings FG130 through FG132.
4	67	Phasing dwg PH009 states "East 6th Street Bridge to be Closed and Modified During Phase 1". Please provide details of the modifications to the 6th street pedestrian bridge	The modifications referenced are to the access and stairs to the East 6th street bridge from the park. The existing bridge is to remain. Drawings detailing this work include PDS107, LD837, LD838, LD933, LG307, and PUD307.

Addendum	Addendum Question No.	Bidder's Question	Response
5	1	General notes; sheet 21; 7.08; Please provide specifications for 8.25PT, and 8.52FP	Refer to Addendum 4, Article 2.
5	2	General notes; sheet 21; 7.09; Pay items 8.52WSF-A through D is not on the bid schedule. Please provide direction	Refer to Addendum 5, Article 1
5	3	Contract drawings DS100 (SHT 1176) and DS101 (SHT 1177) refer to 'Item No. 6.36 DR' this pay item is not part of the bid breakdown please provide.	Refer to Addendum 5, Article 1.
5	4	Please refer to Contract Drawing DS703 (SHT 1283) the sheet description is "Manhole Schedule Sheet 1 of 2" sheet 2 of 2 appears to be missing please provide.	Drawing DS703 has been renamed to "MANHOLE SCHEDULE". Refer to Addendum 5, Article 3.
5	5	14th Street crossing gate section c states micro piles. Where can we find these micro piles and what pay item are they associated with?	There are no micropiles at this location. Drawing FG293 has been revised. Refer to Addendum 5, Article 3.
5	6	Due to the size of the scope, complexity, large number of drawings and specs, and specialized nature of the project, our subcontractors and suppliers require additional time to prepare comprehensive and competitive bid packages. We request a 6 week postponement in order to secure competitive pricing for this project.	Refer to Addendum 4, Article 1.
5	7	Shaft foundations for Sports Light Tower, fields 1-6. Which pay item is associated with the construction of the shafts?	Item 670.0145, Foundation for Light Standards 45 Feet Long. Refer to Addendum 5, Article 1.
5	8	Shaft foundations shown on sheet #2048. What size spiral is required? Differing details state #4 bar or a #5 bar. Please clarify.	Drawing LD927 has been revised. Refer to Addendum 5, Article 3.
5	9	Sheet 2219 M&O Canopy 1 Sections are showing piles in the pile caps, but structural drawings have the footing bearing on soil. Does Canopy 1 require piles?	Drawing A130 has been revised. Refer to Addendum 5, Article 3.
5	10	Sheet 2272, M&O Area 2 Building has HP12x53 piles within the spread footing. What tip elevations are required for these piles. Additionally, what pay item will the piles be paid under?	Item 551.012053. Refer to Addendum 5, Article 1. See revised drawing S-206.00 for tip elevation. Refer to Addendum 5, Article 3.
5	11	Sheet 2306 M&O Area 2 Prefabricated Building Sections are showing piles in the pile caps, but structural drawings have the footing bearing on soil. Does the Area 2 Building require piles?	Drawing A330 has been revised. Refer to Addendum 5, Article 3.

Addendum	Addendum Question No.	Bidder's Question	Response
5	12	Sheet 2329 M&O Area 3 BLDG Sections are showing piles in the pile caps, but structural drawings have the footing bearing on soil. Does the Area 3 Building require piles?	Drawing A430 has been revised. Refer to Addendum 5, Article 3.
5	13	Sheet 2382 Track Building Sections are showing piles in the pile caps, but structural drawings have the footing bearing on soil. Does the Track Building require piles?	Drawings A530 and A531 have been revised. Refer to Addendum 5, Article 3.
5	14	Sheet 2481 Tennis Building Sections are showing piles in the pile caps, but structural drawings have the footing bearing on soil. Does the Tennis Building require piles?	Drawing A630 has been revised. Refer to Addendum 5, Article 3.
5	15	Piles for Comfort Station East 10th Street are paid under 551.014073 or under the building item?	Piles and foundation are to be paid under the building item. Refer to Addendum 4, Article 2.
5	16	Please provide a boring plan and borings for the Comfort Station at East 10th Street	Soil borings used for the design of the E. 10th Street comfort station can be found on drawing BT108 (boring B-21) and drawing B-F-014 (boring P1I-3A).
5	17	Sheet 2575; Note 1 states "Foundation is on drilled piles as per geotechnical report." Please provide this report and is the note suggesting that H-Piles are to be drilled for this foundation.	Drawing S702 has been revised. Refer to Addendum 5, Article 3.
5	18	What pay items are to be used for the bearings shown on Drawing BT-141 Sheet 391 of 2791?	Drawing BT141 has been revised. Refer to Addendum 5, Article 3.
5	19	What pay items are to be used for the bearings shown on Drawing BD-152 Sheet 279 of 2791?	Drawing BD152 has been revised. Refer to Addendum 5, Article 3.
5	20	What pay items are to be used for the bearings shown on Drawing BC-125 Sheet 135 of 2791?	Drawing BC125 has been revised. Refer to Addendum 5, Article 3.
5	21	Drawing BT-144 Sheet 394 of 2791, Drawing BD-155 Sheet 282 of 2791 and Drawing BC -107 Sheet 117 of 2791 have conflicting pay items for the structural steel. We believe the bottom floor beams, the lower lateral braces, the bottom tie girders and the upper arch rib lateral braces are to be paid for under item 564.0501. We also believe the arc ribs and the arch rib knuckles are to be paid for under item 564.0502. Is this correct?	Drawings BD155, BT144, and BC107 have been revised. Refer to Addendum 5, Article 3.
5	22	If the steel in the question above is to be paid under the items stated above which pay item will be used for the splice plates between the arch rib knuckles and the bottom tie girders?	Drawings BD158, BT147, BC131 have been revised. Refer to Addendum 5, Article 3.

Addendum	Addendum Question No.	Bidder's Question	Response
5	23	Drawings F850 thru F856, F400 and F401 show conflicting information for the transition wall. Profile sheet shows top of sheet pile to El. +16.0, but sections show sheet pile extends only to the footing. Please clarify.	Drawings F400 and F401 have been revised with correct elevations. Refer to Addendum 5, Article 3.
5	24	Drawing F850 and F851 show conflicting sheet pile alignment. F851 show sheet piles on the FDR side of the Con Ed transmission lines, but F850 show all sheet pile on the park side. Please clarify	Drawing F851 currently shows sheet piles on the park side, which corresponds to drawing F850.
5	25	Utility crossing schedule drawing F710 refers to drawing FD103 for utilities B-6 to B-16 but no such drawing is provided. On F711, multiple crossings refer to drawing FXXX. Please clarify	Drawings F710 and F711 have been revised to include correct cross references. Refer to Addendum 5, Article 3.
5	26	Utility crossing schedule drawing F711 refers to drawing FG301 but no such drawing is provided. Please clarify.	Drawing F711 has been revised to include the correct cross references. Refer to Addendum 5, Article 3.
5	27	Multiple utility crossings are labeled Type G on drawing F710 and F711 but drawing F706 for Type G is intentionally left blank. Please clarify.	All "Type G" references should be "Type E". Drawings F710 and F711 have been revised. Refer to Addendum 5, Article 3.
5	28	F100-F110 drawings label shared use pathway pavement, curb, etc. to be removed under item 6.02 AAN, but F120 section drawing indicates different pay item numbers for the pavement and curb. Please clarify which pay item is correct.	Pay items have been revised on drawing F120. References to F120 have been added on drawings F101, F102, and F109. Refer to Addendum 5, Article 3.
5	29	Please provide the missing contract drawing SM328	Drawings SM311-SM316 have been revised to reference drawing SM318 instead of SM328, which does not exist. Refer to Addendum 5, Article 3.
5	30	Please provide as built plans for the existing bridge structures, ramps and other associated structural elements that will be demolished, including but not limited to Corlears Hook Bridge, Delancey Street Bridge, East 10th Street Bridge and Houston Street Bridge.	Refer to Addendum 3, Article 3.
5	31	Reference: Corlears Hook Bridge, Drawing BC119, Sheet 129. Notes at Section B-West Abutment Section and Section D-East Abutment Section reads: "Abutment (MP) Item No. 555.02000001". This item is not part of the bid breakdown. Please clarify.	Refer to Addendum 5, Article 1.

Addendum	Addendum Question No.	Bidder's Question	Response
5	32	Reference: Corlears Hook Park, Drawing BC119A, Sheet 129A. a) Please provide missing retaining wall foundation and wall reinforcing. b) Please confirm that retaining wall footing width is 12'-0". c) Note at Retaining Wall Section reads: "6" Crushed Stone Compacted Subgrade (Stone: Item No. 65.7156)". This item is not part of the bid breakdown. Please clarify.	Drawing BC119A has been revised. Refer to Addendum 5, Article 3.
5	33	Reference: Corlears Hook Bridge, Drawing BC149 & 113, Sheet 160 & 125. Please confirm that payment for construction of curb on top of wingwalls and retaining walls, will be made under Items No. 555.09 and 556.0202.	Yes, payment for curb will be under items 555.09 and 556.0202
5	34	Due to the size and scope of the project as well as the nature of unit price contracts, we propose the addition of a bid item for Project Management and Administration to be paid on monthly basis. We believe this is mutually beneficial to NYCDDC and the GC and will produce a more competitive bid, since it would reduce the uncertainties for recovering project indirect cost and fixed costs for items that could be omitted or for underruns. Otherwise, we would need to include a contingency that NYCDDC could save.	The costs for overhead, including Project Management and Administration must be included in the costs bid for all items.
5	35	<b>REDACTED</b>	

Addendum	Addendum Question No.	Bidder's Question	Response
5	36	We did not see where the owner had provided us with any drawings for the existing esplanade/floodwall. Can you please provide these so that we can accurately develop our demolition quantities and pricing.	Refer to Addendum 3, Article 3.
5	37	The Superstructure removal notes on sheets 105, 220 and 345 of 2791 indicate that lead protection is required during the removal of loose/peeling paint from the existing steel structures for demolition. In order to properly price the demolition of the existing bridges or any other structures on the project we need to be aware if there is any presence of lead paint, lead, asbestos or any other contaminated materials in any of these structures. Can you please provide us with any type of lead or asbestos reports that are available for the project.	Asbestos and Lead Paint Survey Report has been provided. Refer to Addendum 5, Article 2.
5	38	Note No 4 on Sheet No 1095 of 2791 indicates that there will be Dynamic Pile Load Test, Item ESCR-551.24.05 DT, Static Compression Test, Item ECSCR-551.24.05 ST and Lateral Load Test, Item ESCR-551.24.05 LT. There is no Bid Item listed within the Schedule of values for these items. Please provide the appropriate bid items and quantities for each for the Schedule of Values.	Items ESCR-551.24.05 DT, ESCR-551.24.05 LT, and ESCR-551.24.05 ST have been added to the bid schedule. Refer to Addendum 5, Article 1.

Addendum	Addendum Question No.	Bidder's Question	Response
5	39	<p>Sheet 135 of 2791 indicates that the bearings for the Corlears Hook Bridge are to be paid for in Item 565.1521 TYPE M.R. Expansion Bearings (0 to 225 KIPS and also in Item 565.1721 TYPE M.R. Fixed Bearings (0 to 225 Kips). The table below on the same drawings indicates that these bearings exceed the 225 Kips design capacity whereas other bearings for the other pedestrian bridges have less design capacity and are classified in the 225 to 450 Kips Bid Item. Also the table list 2 of the bearings for this bridge to be guided bearings and not fixed or expansion. Should there not be a separate bid item for guided bearings? This also leads to the question as to whether or not the bearings for the other two pedestrian bridges (Delaney Street and 10th Street) as to whether or not they should also be guided bearings. Please provide clarification as to where these bearings are paid for and if they are classified properly.</p>	<p>Drawing BC125 has been revised. Refer to, Addendum 5, Article 3.</p>
5	40	<p>There is no "Specification Type" reference on Sheet PD-5 in the SANDRESM1 Volume 3.pdf file for "Bid" Item Number 557.2001 Structural Approach Slab with Integral Wearing Surface Type 1 Friction. Please provide direction as to whether or not there will be a special specification provision for this item or if we are to follow the NYSDOT Specification.</p>	<p>Page PD-5 has been revised. Refer to Addendum 4, Article 2.</p>
5	41	<p>On sheet 1083 of 2791 in the lower right hand corner of the drawings the box indicates that these are for "30% Submission". Please provide the "For Bid" drawing.</p>	<p>Drawing FG133 (the error was on sheet 1085, not 1083) has been revised to say "For Bid" . Refer to Addendum 5, Article 3.</p>
5	42	<p>Reference sheets 873-902. Sections show haunch concrete paid using item ESCR 563.03. This item does not exist in the bid schedule. Please include or clarify pay item.</p>	<p>The concrete haunch shall be paid under items ESCR-4.06 HP ES &amp; ESCR 4-14. Drawings WS600 through WS629 have been revised. Refer to Addendum 3, Article 4 and Addendum 5, Article 3.</p>
5	43	<p>Reference Plan sh. 963 &amp; 964 – Proposed Concrete Pile Cap and Concrete Plug reference note 3 and 5. No notes are on these sheets. Please clarify.</p>	<p>Drawings WS758 and WS759 have been revised. Refer to Addendum 5, Article 3.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
5	44	Drawing number DS302 shows that for proposed 12" RCP Branch Interceptor Pipe use item no. 50.21C4012D". However, this item does not exist on provided bid schedule. Please clarify.	Drawing DS302 has been revised. Refer to Addendum 5, Article 3.
5	45	Bid Schedule item no. 51.21C000000C – Cleanout manholes, does not appear on the drawings. Please clarify.	Drawings PUD003 and PUD004 have been revised. Refer to Addendum 5, Article 3.
5	46	MH A02, A03, A04, K08, and K14 appear on the drawings but without an item number. Please clarify which item number do the manholes mentioned fall under.	Item 6.36DR.
5	47	Section A on sheet 603 of 2791 mentions Proposed AZ46-700N (Gr 60) Steel Sheet Pile Item NO ESCR-552.11 46-700N.CPI. There is item within the bid item schedule for this item. Please clarify if there is to be a new bid item or if this item was labeled wrong.	Drawing F704 has been revised to show item ESCR-552.11 46CP. Refer to Addendum 5, Article 3.
5	48	The bid item schedule in SANDRESM1 Volume 1 OF 3 of the specifications does not list Bid Item ESCR-551.36.05.C that is called out in the Floodwall Schedule on sheet 597 of 2791 where is calls out bid item ESCR-551.36.05.C and Sheet FW-66 in Volume 3 of the Specifications references this bid item as well. Please provide a bid item and quantity for this item or correct the references to it within their drawings and specifications.	Item ESCR-551.36.05.C has been added to the bid schedule. Refer to Addendum 5, Article 1.
5	49	The pile schedule on sheets 1006 and 1011 of 2791 refer to bid item ESCR-551.36.05.SD as this bid item is not listed within the Schedule of Items in SANDRESM1 Volume 1 of 3 of the Specifications. Please clarify	Drawings WS860 and WS870 have been revised to show item ESCR-551.36.05.CSD. Refer to Addendum 5, Article 3.
5	50	The pile schedule on sheets 1002, 1006, 1011 and 1016 refer to bid item ESCR-551.30.01.C and sheet FW-66 of the specifications refer to this bid item as well as this bid items is not listed in SANDRESM1 Volume 1 of 3 document. Please clarify.	Item ESCR-551.30.01.C has been added to the bid schedule. Refer to Addendum 5, Article 1.

Addendum	Addendum Question No.	Bidder's Question	Response
5	51	<p>On sheet 260 of 2791 for the Delancey Street Bridge and on sheet 375 of 2791 for the East 10th Street Bridge show the limits of soil stabilizing elements for these two bridges whereas on sheet 106 of 2791 mentions the Soil Stabilization Element Notes for the Corlears Hook Bridge but we did not see where the limits were shown for this bridge. Please clarify if the Soil Stabilizing Elements are required for the Corlears Hook Bridge and if so provide a drawing for this area..</p>	<p>Stabilization is not required for Corlears Hook Bridge. Drawing BC002 has been revised. Refer to Addendum 5, Article 3.</p>
5	52	<p>Excavation support and protection system plans and sections were provided for all bridge abutments and ramps for the Delancey Street Bridge on sheets 237 and 238 of 2791 and the East 10th Street Bridge on sheets 360 and 361 of 2791 and one was also provided for the west abutment for the Corlears Hook Bridge on sheet 120 and 121 of 2791 but we did not see one for the East Abutment for the Corlears Hook Bridge. Is there a reason why one wasn't provided and if one is available there please provide.</p>	<p>Drawings BC110 and BC111 have been revised. Refer to Addendum 5, Article 3.</p>
5	53	<p>The pile data table on sheet number 133 of 2791 indicates that there are HP12x53 H-piles required for the foundations for the east abutment and the east and west retaining or wingwalls for the Corlears Hook Bridge. There is no bid item for this pile type in the bid item schedule in the SANDRESM1 Volume 1 of 3 document. Please clarify</p>	<p>Item 551.012053 for 12x53 H-piles has been added to the bid schedule. Refer to Addendum 5, Article 1.</p>
5	54	<p>1. Referring to Table on drawing WS 704, AASHTO Girders for Waterfront esplanade extends only up to Span 162. However, as per Cross section on Drawing WS 627 &amp; WS 628, these girders are also required for Span 163, Span 164 &amp; Span 166. a. Please confirm, Girder Schedule provided on drawings WS 702, WS 703 &amp; WS 704 is correct and includes all necessary AASHTO Girders required for Esplanade.</p>	<p>Drawings WS702, WS703, and WS704 have been revised. Refer to Addendum 4, Article 3.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
5	55	<p>Bid Item ESCR-56-2926 Steel Laminated Bearings is called out on sheet 881 of 2791 (WS608) to be used underneath the 21" Prestressed Concrete Hollow Slab Units. The current bid item schedule within Volume 1 of 3 does not list this bid item. The steel laminated bearing tables on sheet numbers 740 thru 742 of 2791 call these bearings to be paid for under Bid Item 565.1925 . Please clarify</p>	<p>See revised WS600 series drawings and bearing tables on revised drawings WS740, WS741, and WS742. Refer to Addendum 5, Article 3.</p>
5	56	<p>Bid Item ESCR-56-2926 Steel Laminated Bearings is called out on sheet 881 of 2791 (WS608) to be used underneath the 21" Prestressed Concrete Hollow Slab Units. The current bid item schedule within Volume 1 of 3 does not list this bid item. The steel laminated bearing tables on sheet numbers 740 thru 742 of 2791 call these bearings to be paid for under Bid Item 565.1925 TYPE E&gt;.L. BEARINGS (OVER 225 KIPS) . Please clarify</p>	<p>See revised WS600 series drawings and bearing tables on revised drawings WS740, WS741, and WS742. Refer to Addendum 5, Article 3.</p>
5	57	<p>The Steel Laminated Bearing Tables on sheets 740 thru 742 of 2791 indicates that all of the bearings are to be paid under Bid Item 565.1925 Type E.L. Bearings (over 225 Kips) but none of the bearings on the table have a capacity greater than 194 Kips with most of them less than 100 kips and some less than 55 kips which should fall into the Bid Item 565.1921 Type E.L. Bearing (0 to 55K). There seems to be missing a bid item range of capacities within the bid item list and the current bearings listed on this table should be re-classified into new bid items. Please clarify</p>	<p>Drawings WS740, WS741, and WS742, with bearing tables, have been revised. Refer to Addendum 5, Article 3.</p>
5	58	<p>Please provide electronic drawing files to aid in takeoff. If electronic files of the proposed data is unavailable, please consider supplying the digital files of the existing conditions and topography of the project site.</p>	<p>CAD Files will not be provided.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
5	59	REDACTED	
5	60	<p>The profile for the 36" DIP Class 56 installed in 48" steel sleeve on piles sewer states that we are to replace 92'1" of 36x24 Combination sewer but only shows 39' to be replaced. Please clarify and provide pay item.</p>	<p>Drawing BD206 has been revised with a profile that shows 38'-8" of 36" DIP Class 56 to be replaced. Refer to Addendum 5, Article 3.</p>
5	61	<p>On sheets 879A, 880, 880A, 881, 902 thru 904 and 941 thru 944 of 2791 addresses the Bid Item 563.03 Prestressed Hollow Slab Units for the esplanade deck. This bid item is assigned to two different precast hollow slab thicknesses, 15" and 21" Slabs. Should there not be two (2) separate bid items for these two types of precast elements. Please clarify.</p>	<p>Bid as shown, Item 563.03 covers both slab thicknesses.</p>
5	62	<p>Please provide a pay item for the 24" Polyethelene Corregated Pipe shown in Reach H,I, and J Drawings and on teh park utilities drainage summary</p>	<p>Item number PK-78 as shown on drawings including PUD001 and PUD002 in the Pipe Schedule.</p>
5	63	<p>MTA General notes; Sheet 541; Note 1: Who will be responsible for the cost of any personnel the MTA deems necessary for work associated with this contract?</p>	<p>MTA will bill either DDC or the appropriate utility company directly for any and all MTA force account efforts.</p>
5	64	<p>Please provide as-built drawings for existing sign structures</p>	<p>NYSDOT as-builts are included in the Appendix A materials. Refer to Addendum 3, Article 3.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
5	65	<p>Within the SP pages noted there are two (2) OCMC Work Permits noted as "HCP- Draft", the older draft titled: "Pedestrian Bridge Replacement Project; FDR Drive between Exits 2 and 7; Six (6) 10-hour closures" and dated April 2, 2020 indicates in stipulation 2 that the FDR may be closed in either or both directions from 12:00A to 10:00A Sunday mornings 3-6 times over a 12-18mo period. The more recent draft titled more generally: "East Side Coastal Resiliency, SANDRESM1; From Montgomery Street to East 15th Street" and dated April 21, 2020 indicates in stipulation 2e that the FDR may be closed 3 times in each direction for either 4 or 5 hours as noted: 1:00AM to 5:00AM, Tuesday morning to Friday morning; 2:00AM to 7:00AM, Saturday morning; or 2:00AM to 7:00AM, Sunday morning. Please clarify if the intent was to supercede the April 2 FDR full closure stipulations with the more broad April 21 draft permit.</p>	<p>Both stipulations apply. The 6 10-hour closures are intended for the installation of the three (3) permanent pedestrian bridges as noted in the title. The 4 or 5 hour closures are intended for other work impacting the FDR Drive that may require full closures.</p>

Revised Pre-Bid Question Responses

#	Original Addendum	Addendum Question No.	Bidder's Question	Discard Original Response	Incorporate Revised Response
1	4	8	Volume 3 of 3; Highway special provisions; B.15 Us Army Corps of Engineers Requirements; Paragraph D; Please provide a list of ESA-listed species that will affect pile driving operations, along with date restrictions.	<del>Winter Flounder: Avoid installing cofferdams between January 15 and May 31. Migrating anadromous fishes (shad and herring): Avoid pile driving, sheetpile installation, and other in-water construction activities occurring outside of the cofferdams from March 1 to June 30.</del>	Winter Flounder: Avoid installing cofferdams between January 15 and May 31.

Addendum	Addendum Question No.	Bidder's Question	Response
7	1	FDR Drive crossing gate section c states micro piles. Where can we find these micro piles and what pay item are they associated with?	There are no micropiles at this location. Drawing FG245 has been revised with an updated Section C. Refer to Addendum 7, Article 2.
7	2	Bid Schedule item no. 51.31D00200V, 51.31S00242R, 51.31S00254R, 51.31DS00254R and 51.71M0M000 appear on the drawings but not on the bid schedule list. Please clarify.	Drawing DS300 has been revised to remove reference to item 51.71M0M000, refer to Addendum 7, Article 2. Items 51.31D00200V, 51.31S00242R, 51.31S00254R, 51.31DS00254R have been added to the bid schedule. Refer to Addendum 6, Article 2 for the current bid schedule.
7	3	The proposed Sea Rail Item No PK-ESCR 031A shown on sheets 873 thru 902 does not exist in the Bid Schedule form. Please clarify	Drawings WS600 to WS631 have been revised to include item PK-ESCR 031. Refer to Addendum 7, Article 2.
7	4	Can you please provide the locations that might contain asbestos or PCB's where the gas facilities coated with coal tar wrap?	EP-7 item UTL-6.03.1A (CE), Removal of Abandoned Gas Facilities with Possible Coal Tar Wrap, is paid per linear foot. The bidder must review the gas plates in the contract drawings and use their engineering judgement. Coal tar wrap is found on certain steel pipes.
7	5	Sheet Number 727 (WS301) of 2791, indicates that the cut-off wall Tip Elevation is to be at EL -55.0 at Section D-1 shown on Sheet 875 (WS602) of 2791 shows the Cut-off wall Combi-Pile at EL-55.0 and the bottom of the intermediate pile to be at EL-32.0 yet on the cut-off Wall Profile on Sheet 796 shows both the Combi-Pile wall and the intermediate piles to be at EL-55.0. Please clarify	Drawing WS402 has been revised. Drawings WS301 and WS602 are correct. Refer to Addendum 7, Article 2.
7	6	On Sheet number 232 of 2791 the conc rete deck slab in Section A is called out to be paid for under Bid Item 557.0109 which is Superstructure Slab with Integral Wearing Surface - Bottom Formwork Required - Type 9 Friction. Underneath this slab it has a geosynthetic membrane and select fill material and will be placed on grade and no bottom formwork is required. Please clarify that this is the appropriate bid item for this section of concrete.	Item 557.0109 is correct; bottom formwork is required to avoid surcharging the geo foam and underlying soils.

Addendum	Addendum Question No.	Bidder's Question	Response
7	7	On Sheet numbers 232 of 2791 Note: 1 indicates that the deck reinforcement cost to be included under Item 557.0109 and Note 2 indicates that the reinforcement is to be paid separately under Items 556.0202. We would request that the reinforcement be paid under Item 556.0202. Please clarify	The item number is correct and the basis of payment will not be adjusted.
7	8	Section D-2A on sheet 904 of 2791 (Dwg WS631) refers to Bid Item No ESCR-551-30.01 RS Proposed 24" Diameter , 10-0" Deep Rock Socket and the rock socket detail is on Sheet 1004 of 2791 (WS852). Please clarify or add bid item with the appropriate quantity and specification.	The work for the 24" diameter rock socket for the 30" pipe piles shall be paid under ESCR-551.30.01 RS. All work included to install each rock socket shown on WS852 shall be paid under ESCR-551.30.01 RS.
7	9	Section D-7 on sheet 881 of 2791 (WS608) indicated that the Intermediate Sheet Pile Tip Elevation is to be at EL-32, however on Sheets 8901 and 802 of 2791 (WS407 & WS408) from Sta 21+29.19 to Sta 22+50.08 it shows that the Intermediate Sheet Pile Elevation is to be EL -20. Please clarify	Drawing WS608 has been revised. Drawings WS407 and WS408 are correct. Refer to Addendum 7, Article 2.
7	10	Please add a pay item for PK-78 POLYETHYLENE CORRUGATED PIPE (24")	Item PK-78 has been added. Refer to Addendum 6, Article 2 for the current bid schedule.
7	11	Please correct pay item PK-ESCR 188P to read POLYETHYLENE CORRUGATED PIPE (12") AS SHOWN ON THE PIPE SCHEDULES	Confirmed that drawing, specifications and bid schedule read the same.
7	12	Please provide a pay item for the 4" Ductile Iron Sewer Pipe shown in Reach D and J	Items PK-687A and PK-687B have been added to the bid schedule and specifications. Refer to Addendum 6, Article 2.
7	13	ON sheet 880A (WS607A) The cross section refers to it as Section D-7, should this not be labeled Section D-6A as referenced from the structural plan view drawing 727 of 2791 (WS301). Please clarify	Drawing WS607A has been revised. Refer to Addendum 7, Article 2.
7	14	Please provide a pay item for the 6" Ductile Iron Sewer Pipe shown in Reach D and F	Items PK-687A and PK-687B have been added to the bid schedule and specifications. Refer to Addendum 6, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
7	15	The plan view on sheet 729 Of 2791 (WS303) refers to Cross Section F-2 on Sheet 886 of 2791 (WS613) that shows the Intermediate Sheet Pile Tip to be at EI-32, however on Sheet 811 and 812 of 2791 (WS417 & WS418) the Elevation views from Sta 35+77.56 to Sta 37+83.90 shows that the cut-off wall elevation is to be the same as the Combi-Wall to be at EL -43. Please clarify	Drawings WS613, WS417, and WS418 have been revised. Refer to Addendum 7, Article 2.
7	16	The partial Framing Plans on sheet numbers 855 thru 862 of 2791. (Dwgs WS520-527) show different span lengths than the Elevation Views on Sheets 836 thru 847 of 2791. (WS450 thru WS461). Please clarify	Drawings WS450 through WS461 have been revised. Refer to Addendum 7, Article 2.
7	17	Please add a pay item for the 12" RCP item 50.21C4012D	Item has been added. Refer to Addendum 6, Article 2 for the current bid schedule.
7	18	Please add a pay item for the MH-D09 AND MH-D10 ITEM # 51.31S00242R	Item has been added. Refer to Addendum 6, Article 2 for the current bid schedule.
7	19	Please add a pay item for the MH-H02 AND H-10 ITEM # 51.31S00254R	Item has been added. Refer to Addendum 6, Article 2 for the current bid schedule.
7	20	Please add a pay item for the MH-H01 50.11V000 Connection Manhole	Drawing DS307 has been revised with the item number changed to 51.11V000. Refer to Addendum 7, Article 2.
7	21	Please add a pay item for the MH-H04 AND H-05 ITEM # 51.21D0B2030R	Drawing DS307 has been revised with the item number changed to 51.21S0A2024R and item 51.2150B2030R is no longer referenced. Refer to Addendum 7, Article 2.
7	22	Please add a pay item for MH I-04 ITEM # 51.2150B2030R	Drawing DS308 has been revised and item 51.2150B2030R is no longer referenced. Refer to Addendum 7, Article 2.
7	23	Using the latest Drawings from Addenda #2 Cross Section G-1 on Sheet 890 of 2791 (WS617) shows the Intermediate Sheet Pile Tip to be at EI-32, however on Sheet 817 of 2791 (WS423) the Elevation views from Sta 44+66.42 to Sta 45+03.34 shows that Intermediate Sheet Pile tip extends to the bottom of the Combi-Wall to EI -50. Please clarify	Drawings WS423 and WS617 have been revised. Refer to Addendum 7, Article 2.
7	24	Using the latest Drawings from Addenda #2 Cross Section G-2 on Sheet 891 of 2791 (WS618) shows the Intermediate Sheet Pile Tip to be at EI-30, however on Sheet 817 thru 819 of 2791 (WS423-WS425) the Elevation views from Sta 45+03.34 to Sta 47+14.59 shows that Intermediate Sheet Pile tip extends to the bottom of the Combi-Wall to EI -50. Please clarify	Drawings WS423 through WS425 have been revised. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
7	25	Using the latest Drawings from Addenda #2 Cross Section G-4 on Sheet 893 of 2791 (WS620) shows the Intermediate Sheet Pile Tip to be at EL-30, however on Sheet 819 thru 819 of 2791 (WS425) the Elevation views from Sta 47+14.59 to Sta 47+55.20 shows that Intermediate Sheet Pile tip extends to the bottom of the Combi-Wall to EL -62. Please clarify	Drawing WS425 has been revised. Drawing WS620 is correct. Refer to Addendum 7, Article 2.
7	26	Please clarify the region of bid item 6.01 AC	The bid schedule and drawings F100, F101, and F110 have been revised to more accurately reflect the regions and quantities of clearing & grubbing required for installation of the floodwall. Refer to Addendum 7, Article 2 for the revised drawings and Addendum 6, Article 2 for the current bid schedule.
7	27	Please add a pay item for 50.22CS080050 as shown in note 7	Drawing Notes have been revised on drawings DS800 through DS823. Refer to Addendum 5, Article 3.
7	28	Referring to Drawing FG – 163, Pier 42 Swing Gate Fabrication section and detail. a. Section C suggests Sill Plate detail and embedded steel work below Top of Sill level are too be coordinated with civil drawing. We went through Civil Drawings, there is no relevant details pertaining to this portion of work. Please provide exact drawing number you are referring too.	Drawing FG163 has been revised with an added reference. Refer to Addendum 7, Article 2.
7	29	Referring to Drawing FG – 163, Pier 42 Swing Gate Fabrication section and detail. b. Section C, shows top and bottom girders are W24X84 & middle girder is W24x146. However, Detail 1, 2 & 3 on same drawing shows different girder sizes of W27x161 & W27x102. Please clarify, which girder section are correct?	Drawing FG163 has been revised. Refer to Addendum 7, Article 2.
7	30	The original set of plans along with the Addenda #2 drawings the Plan View on Sheet 730 of 2791 (WS304) and the Elevation View on Sheet 819 of 2791 (WS425) shows the Cut-off wall Sheet Pile Tip to be at EL-44, however on Sheet 893 of 2791 (WS620) Cross Section G-4 shows the Tip Elevation for the Cut-off Wall to be at EL-62. Please clarify	WS620 Section G-4 refers only to the pile supported platform.
7	31	The Original set of plans and the Addenda #2 drawings show Cross Section G-4 on Sheet 893 of 2791 (WS620) shows the Intermediate Sheet Pile Tip to be at EL-30, however on Sheet 819 of 2791 (WS425) the Elevation views shows that Intermediate Sheet Pile tip extends to the bottom of the Combi-Wall to EL -44. Please clarify	Drawing WS425 has been revised. Drawing WS620 is correct. Refer to Addendum 7, Article 2.

QUESTIONS SUBMITTED BY BIDDERS AND DDC'S RESPONSES

PROJECT ID: SANDRESM1

Addendum	Addendum Question No.	Bidder's Question	Response
7	32	The Original set of plans and the Addenda #2 drawings show Cross Section G-5 on Sheet 894 of 2791 (WS621) shows the Intermediate Sheet Pile Tip to be at El-30, however on Sheet 821 of 2791 (WS427) , from Sta 49+43.88 to Sta 49+93.60 the Elevation views shows that Intermediate Sheet Pile tip is to be at El -18. Please clarify	Drawings WS427 and WS62 have been revised. Refer to Addendum 7, Article 2.
7	33	The Original set of plans and the Addenda #2 drawings show Cross Section G-6 on Sheet 893 of 2791 (WS622) shows the Cut-off Wall Tip elevation to be at El-52, however on Sheet 730 of 2791 (WS304) the Plan View and on Sheet 821 of 2791 (WS427) the Elevation View shows the Cut-off Wall Tip Elevation to be at El-46. Please clarify	Drawings WS304, WS427, and WS622 have been revised. Refer to Addendum 7, Article 2.
7	34	The Original set of plans and the Addenda #2 drawings show Cross Section G-6 on Sheet 895 of 2791 (WS622) shows the Intermediate Sheet Pile Wall Tip elevation to be at El-30, however on Sheets 821 & 822 of 2791 (WS427 & WS 428) from Sta 49+93.60 to Sta 52+75.90 show the Intermediate Sheet Piles is extended to the bottom of the Combi-Wall to EL -46. Please clarify	Drawings WS427, WS428, and WS622 have been revised. Refer to Addendum 7, Article 2.
7	35	The Original set of plans and the Addenda #2 drawings show Cross Section G-6 on Sheet 895 of 2791 (WS622) and the Plan View on Sheet 731 of 2791 (WS305) both show the Cut-off Wall Tip elevation to be at El-52 and, however on the extended Plan View on Sheet 730 of 2791 (WS304) shows the Cut-off Wall Tip Elevation to be at EL-46.0. Please clarify	Drawings WS304, WS305, and WS622 have been revised. Refer to Addendum 7, Article 2.
7	36	The Original set of plans and the Addenda #2 drawings show Cross Section H-1 on Sheet 896 of 2791 (WS623) shows the Intermediate Sheet Pile Wall Tip elevation to be at El-30, however on Sheets 824 thru 826 (WS430 thru WS 432) from Sta 53+44.91 to Sta 57+80.33 show the Intermediate Sheet Piles tip elevation to be at EL-25. Please clarify	Drawings WS430, WS431, WS432, and WS623 have been revised. Refer to Addendum 7, Article 2.
7	37	What bid item will the concrete parapets seen in Section A (Typical Deck) on sheet 117 (BC107) and also in Section A on Sheet 150 (BC140) that the Handrail/Guardrail and Light Standards rest upon for the Main Arch Spans of each Pedestrian Bridge get paid under as there is no mention as to where this concrete is to be paid under (Referring to Corlears Hook Bridge Drawings only as we would assume your response will also be for the Delancey Street and East 10th Street Pedestrian Bridges as well). Is there a separate railing item similar to the approaches or is this to be paid for under Bid item 557.0109 Concrete Deck. Please Clarify.	Drawings BC107 and BC140 have been revised. Refer to Addendum 7, Article 2.

Addendum 7

5 of 9

Addendum	Addendum Question No.	Bidder's Question	Response
7	38	The steel H-Pile anchorages detail on Sheet 133 of 2791 (BC123) for the Corlears Bridge does not state whether or not these anchorages are to be epoxy coated or black as the other two bridges call for these bars to be epoxy coated. Also these bar are embedded into a 2'-0" thick footings for the wingwalls and the west abutment but this detail only addresses what the bar lengths would be for a 3 ft Thick footing or a 4 ft Thick footing. Please clarify	There is no two-foot thick pile foundation at Corlears Hook Bridge. Drawing BC123 has been revised. Refer to Addendum 5, Article 3.
7	39	Section A on sheet no 117 of 2791 (BC107) it indicates that the Arch Rib (Typ) is to be paid for under Bid Item 564.0502 - Structural Steel - Type 2 (Curved Steel) but same arch rib members on the Delancey Street (Sheet no 282 of 2791 (BD155) and East 10th Street Bridges (Sheet 394 of 2791 (BT144) are shown to be paid under Bid Item 564.0501 - Structural Steel Type 1 (Straight Steel). Please clarify	Drawings BC107, BD155, and BT144, have been revised. Refer to Addendum 5, Article 3 and Addendum 7, Article 2.
7	40	On sheets 913 thru 940 (WS660 thru WS667) and sheets 936 thru 940 (WS709 thru WS713) shows that the #8 Anchor Rod and #10 Diaphragm Rods that are to be drilled and epoxy anchored into the cap along with the Expansion/Fixed And Material to be paid as part of Bid Item 565.1821 Elastomeric Bearings E.P and Bid Item 565.1925 Elastomeric Bearings E.L. (Over 225K). We would like to request that a separate bid item be setup to address these materials.	The work for the anchor rods to be drilled and epoxy anchored into the cap falls under item number 586.0201, as shown on WS660-WS667. This is a separate bid item from the bearings, which includes the anchor rods themselves but not the installation. For the diaphragm rods, the material and epoxy are included in pay item 565.1821 and a separate item number is provided for the drilling as 586.0201. These are in accordance to NYSDOT Standard Specifications Section 565.
7	41	The Original set of plans and the Addenda #2 drawings show Cross Section H-2 on Sheet 897 of 2791 (WS624) shows the Intermediate Sheet Pile Wall Tip elevation to be at EI+30, however on Sheets 826 thru 830 (WS432 thru WS 436) the elevation view shows the Intermediate Sheet Pile Wall extending to the bottom of the Combi Wall to EI-50. Please clarify	Drawings WS432 through WS436 are correct. Drawing WS624 has been revised. Refer to Addendum 7, Article 2.
7	42	Sheet 557; Predrilling of existing timber wall state 11'-3" . Stationing state its approx. 120 linear feet. Please clarify	Drawing F104 has been revised. Refer to Addendum 7, Article 2.
7	43	Sheet 558; Existing timber crib bulkhead to be removed, see drawing WS161 for details. Sheet WS161 is for predrilling through existing timber bulkhead. Please clarify. Additionally clarify what pay item is associated with partial removal of timber bulkhead for pile installation	Drawings WS161 and F104 have been revised with timber crib demolition item number. Refer to Addendum 7, Article 2.
7	44	Sheet 584; Sta 17+00 - 18+25 and Sta 20+00 - 21+25; Reference along with sheet 595. Is it the intent to install a double sheeting wall at these locations?	Details can be found on drawings WS850 through WS857A.

Addendum	Addendum Question No.	Bidder's Question	Response
7	45	The jet grout zones as identified in the plans and profiles do not match in Drawings F400 through F410. Please revise to show a consistent set of plans in order to determine how much jet grouting should be incorporated into the flood wall.	Please refer to the utility crossing drawings F700 series (F710 & F711 for schedule) for dimensions of the jet grout zones around utilities. For the flood gates, see revised drawings F400 to F410 that include reference to FG drawing which contains details of the gate monoliths and jet grout zones. Drawings F400-F410 have been revised. F4100-F410 show the jet grout zone overlap and the profiles show only the jet grout in between the sheet pile openings. Refer to Addendum 7, Article 2.
7	46	Drawings F400 through F410 do not identify the bid items for the jet grouting at each section. Please revise drawings to show which jet grout sections correspond to which bid items.	Drawings F400 through F410 have been revised. Refer to Addendum 7, Article 2.
7	47	For the jet grout bid items (0401 through 0406), how is the cubic yardage calculated? Is it based on a 3'-0", 4'-0", or 7'-0" wall thickness? Is it based on the centerline-centerline of the outside columns, or the edge-edge of the outside columns? Is it based on the total height of jet grout (i.e. bottom of treatment zone to top of treatment zone)? Is it based on the length of jet grout between the sheet piles (as identified in drawings F400 through F410), or the total length of jet grout including overlap with the sheet piles for each utility (as identified in drawings F700 through F705)? The contract drawings are not clear, and it is not possible to determine how the jet grout bid item quantities were calculated.	The jet grout bid item quantities are calculated by CY based on the individual jet grout column volume (diameter and height), excluding volume of overlap between adjacent columns, and number of jet grout columns needed per location.
7	48	The jet grout bid items ESCR-2.AO, ESCR-2.FDO, and ESCR-2.GCO (0402, 0404, and 0406) are not identified anywhere in the contract drawings. How were the bid item quantities calculated? How is it determined where these bid items are to be applied versus their counterparts, ESCR-2.A, ESCR-2.FD, and ESCR-2.GC (0401, 0403, and 0405)?	Refer to drawings F700-F707, which include jet grout bid items as callouts and in the notes, where applicable.  ESCR-2.FDO shall include all work involved in the installation of jet grout columns with obstructions.  ESCR-2.AO shall include all work involved in the installation of angled jet grout columns with obstructions.  ESCR-2.GCO can be seen on FG100, FG150, & FG200.  Drawings F700, F701, F702, F703, F705, FG100, FG150, and FG200 have been revised with allowance noted. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
7	49	Specification Section ESCR-2 – Jet Grouting, Part 2.13 (D) identifies that the hydraulic conductivity of the jet grout shall be 1x10 <sup>-6</sup> cm/sec; however, Contract drawing F002 Jet Grouting note 4 identifies a minimum hydraulic conductivity of 1x10 <sup>-7</sup> cm/s. As a design permeability of 1x10 <sup>-7</sup> cm/sec is beyond the capabilities of jet grouting, please revise the drawings to identify a design hydraulic conductivity of 1x10 <sup>-6</sup> cm/sec.	1x10 <sup>-6</sup> cm/sec is the correct value for the minimum hydraulic conductivity. Drawing F002 was revised in Addendum 2, Article 2 with reference to the specification.
7	50	Specification Section ESCR-2 – Jet Grouting, Part 2.11 (G) identified “borehole deviation measurements on 5% of the columns.” Part 2.13 (H) later identifies “vertical alignment profiles over the length of one soil-cement element per day.” Are these contradictory specifications referring to the same measurement (i.e. down the hole), or are these two separate measurements? Please clarify which specification takes precedent or what the different measurements entail.	The requirement is that the vertical alignment profile for a soil-cement element is done on a daily basis. It was estimated to be about 5% of the columns, but this is approximate based on the daily check specified above. Therefore, the daily requirement takes precedence.
7	51	Drawing F-410 is indecipherable in regard to identifying the utility crossing identifications, as there are duplicates across the page. Please revise.	Drawing F410 has been revised to only show the correct utility crossing ID numbers. Refer to Addendum 7, Article 2.
7	52	Drawings F710 and F711 reference drawing “FXXX” for identifying the crossing types for certain utilities. This drawing does not exist. Please revise with accurate crossing types for all utilities.	Drawings F710 and F711 have been revised. Refer to Addendum 7, Article 2.
7	53	Drawing F710 refers to drawing FD103 for crossing K-11. This drawing does not exist. Please either include drawing FD103, or identify what drawing should be referenced if drawing FD103 does not exist.	Drawings F710 and F711 have been revised with corrected references. Refer to Addendum 7, Article 2.
7	54	Drawing F711 refers to drawing FG301 for crossing K-11. This drawing does not exist. Please either include drawing FG301, or identify what drawing should be referenced if drawing FG301 does not exist.	Drawing F711 has been revised to include the correct cross reference. Refer to Addendum 7, Article 2.
7	55	Drawings F710 and F711 refer to crossing type G. Drawing F706 is supposed to detail crossing type G, but the page is blank. Please either include the detail for crossing type G, or identify what crossing type should be referenced if crossing type G does not exist.	All "Type G" references should be "Type E". Drawings F710 and F711 have been revised. Refer to Addendum 7, Article 2.
7	56	Drawings F400 through F410 do not show all of the proposed jet grout zones in the profiles that will be required as per the utility crossing schedules in F710 and F711. Please revise drawings to identify all proposed jet grout zones.	Please refer to the utility crossing drawings in the F700s (F710 & F711 for schedule) for dimensions of the jet grout zones around utilities. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
7	57	The jet grout zones on drawings F410, F022, and FG271 do not match (e.g. lengths, depths). Please clarify which drawing takes precedent and revise drawings as necessary.	The jet grout depths on all 3 drawings match at -34.0'. The jet grout zone can be found on the partial plan on F885. A cross-reference note has been added to revised drawing F410, Refer to Addendum 7, Article 2.
7	58	The utility crossings as identified on drawings F710 and F711 reference crossing types that require jet grouting, but many are not identified in drawings F400 through F410 as requiring jet grout. Please revise drawings F400 through F410 to identify all locations where jet grouting is required.	The locations where jet grouting is required are shown on the profiles on revised drawings F400 to F402, F409 and F410. Refer to Addendum 7, Article 2.
7	59	Drawing FG271 identifies jet grouting beneath the East 14th Street crossing, but the details are lacking. Is there to be a continuous six (6) feet thick wall on either side of the foundation, or a six (6) feet diameter treatment zone around each pipe pile? What are the depths of the jet grouting in the center of the foundation? Is there no jet grouting beneath the existing double barrel sewer, or is there continuous treatment beneath the foundation as depicted in drawing F885?	The 6 foot thick wall on either side of the foundation is correct. See revised drawing FG272 with limits of the jet grout. Depth of jet grout in the center of the foundation has been added to revised drawing FG271. Refer to Addendum 7, Article 2. There is no jet grouting beneath this existing sewer; F885 is not related to the East 14th Street gate crossing.
7	60	Drawing FG271, Note 2 identifies "jet grouting shall be performed with the triple fluid system." This contradicts Specification ESCR-2 – Jet Grouting, which allows the contractor to select the jet grouting system. Please revise drawing to eliminate Note 2.	Drawing FG271 has been revised. Refer to Addendum 7, Article 2.
7	61	For the jet grouting identified in drawings F850 and F855, what bid item does the jet grouting fall under?	Drawings F850 and F855 have been revised. Refer to Addendum 7, Article 2.
7	62	For the jet grouting identified in drawings F880, what bid item does the jet grouting fall under?	Drawing F880 has been revised. Refer to Addendum 7, Article 2.
7	63	Sheet 597; Cutoff Floodwall ESCR-551.36.05.C at Sta 47+54. Please provide this pay item in the Bid Schedule	Item has been added. Refer to Addendum 6, Article 2 for the current bid schedule.
7	64	Sheet 583; Reference Sheet 594; How much of the AZ46 steel sheeting has low overhead issues?	Drawing F400 has been revised to show the limits of AZ46 sheeting with low overhead issues. Refer to Addendum 7, Article 2.
7	65	Sheet 592; Starting at station 90+00, is it the intent to for the layout to increase by 500 additional feet. Station limits 91, 92, 93, and 94 are not shown.	Drawing F409 has been revised with stationing conversion. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
8	1	Sheet 598; Cross Section J1 shows ESCR-552.11 46CT, but there is no Station 91+22 located on the drawings. What section does this detail apply?	Drawing F610 has been revised with corrected stationing. Refer to Addendum 7, Article 2.
8	2	Sheet 614; Section 5 Typical Shear Stud Detail. Does this detail apply to all AZ46 Steel Sheeting?	No, the shear stud detail on AZ46 sheeting is also typical as shown on drawings F704, F851, and F856.
8	3	Historic Bulkhead removal; Is removal of the historic bulkhead, pre-drilling, and partial removals paid under item ESCR 6.27 TC? There is a conflict with the sheeting, combo wall and pipe pile specifications, in which the contractor is required to remove any interferences under the pile items. Please confirm.	ESCR-6.27 TC only includes removal of the timber cribbing for tie rod and deadman installation. Refer to drawing WS162 for details. The pre-drilling is paid under the pre-drilling pile item numbers.
8	4	What pay item is associated with removing existing H-Piles along Esplanade structure, as shown on sheets 678-698	The removal of the H-piles along the esplanade are included in the demolition pay items by type shown on revised drawings WS140 to WS149, Addendum 7, Article 2.
8	5	What pay item is associated with cutting existing timber piles along Esplanade structure, as shown on sheets 678-698.	Pulling the timber piles for the cutoff wall is paid under ESCR-6.27 TP. Cutting the timber piles for the cutoff wall is paid under the esplanade type demo numbers shown in drawings WS140 through WS149.
8	6	What pay item is associated with pre-drilling after removal of timber pile locations along Esplanade structure, as shown on sheets 678-698	The pre-drilling is included in the pay item for the installation of each associated pile.
8	7	Please clarify the pay limit for each bid item (type ESCR-552.11 20, ESCR-552.11 20 C, ESCR-552.11 20 CT and ESCR-552.11 20CT) as shown on sheets 572 - 598 and sheets 726-1000. A schedule table for each type shown on sheet 597 is preferred	New drawing WS441A, with a cut-off wall schedule and pay items, has been added. Refer to Addendum 7, Article 2.
8	8	Please clarify the pay limit for each bid item (type ESCR-552.11 4219C, ESCR-552.11 4219 CD, ESCR-552.11 4219 CI and ESCR-552.11 4219 D) as shown on sheets 726-1000. A schedule table for each type shown on sheet 597 is preferred	New drawing WS441A, with a cut-off wall schedule and pay items, has been added. Refer to Addendum 7, Article 2.
8	9	Contract drawings FM700 (SHT 1049) to FM713 (SHT 1061) refer to 'Item No. ESCR-522.11 46-700N. CPI' this pay item is not part of the bid breakdown please provide.	The correct item is ESCR-552.11 46CP. Callouts have been revised as necessary on drawings FM700 through FM713. Refer to Addendum 7, Article 2.
8	10	Please clarify where item ESCR-552.11 38 CW is to be used.	Item has been removed. Refer to Addendum 6, Article 2 for the current bid schedule.
8	11	Please clarify where item ESCR-552.11 4238C and ESCR-552.11 4238RS is to be used.	Item has been removed. Refer to Addendum 6, Article 2 for the current bid schedule.

Addendum	Addendum Question No.	Bidder's Question	Response
8	12	Please provide bar list table associated with floodwall cap, cut-off wall(cap and plug), esplanade structures (pile cap, pier, deck, etc.), pile supported platform, and I-Wall from sheet 533 to 1066	All rebar is called out on the drawings and provides sufficient information for bidding and fabrication.
8	13	Waterfront Esplanade Demolition Plans are blank. Please provide the sheet 704 to sheet 707.	WS136 to WS139 are intentionally left blank.
8	14	Drawing F300 to F310 and Drawing F850 to F887 compare to Drawing FM300 to FM717, which one governs the details for I-Wall, please advise.	Drawings F850 to F887 are special structures and their details are shown within this range of drawings. Drawings F300 to F310 are structural general plans that includes I-Walls and other structures as well. The I-Wall details are on drawings FM300 to FM717.
8	15	What pay item is associated with bent plate used for I-Wall Monolith sheeting connection , as shown on sheets FM709 to FM713	Drawing FM709 has been revised. Refer to Addendum 7, Article 2. Bent plate has been deleted. The I-Wall to FDR Gate structure has a bent plate that is paid under structural steel ESCR-564.CT. All miscellaneous structural steel is to be paid under this item as per specification.
8	16	Sheet BT123, pile data table indicated 2 type of steel pile, notes stated all pile installation and material requirements shall conform to NYSDOT Std Spec 551.012084, please clarify how many pile types to be used in this structure	Drawing BT123 is the west ramp wall reinforcement plan. Drawing BT133 has the Pile Data Table and it shows that all piles are HP 12 X 84.
8	17	Reference: Delancey Street Bridge, Drawing BD105, Sheet 232, Cross Section A/BD104. Please provide the width of EPS (Geofoam Block), Item No. 203.03950017 Extruded Polystyrene Fill and Select Granular Fill, Item No. 203.07 to fill space between EPS and new West Ramp concrete walls, since it is not clearly shown on above referenced cross section?	Drawing BD105 has been revised to clarify that there shall be a 3 inch gap (to be filled with granular fill as noted already). Refer to Addendum 7, Article 2.
8	18	Reference: Delancey Street Bridge, Drawing BD117, Sheet 244, Footing Pile Plan and Drawing BD168, Sheet 295, Staircase Plan and Elevation. Please confirm that payment for 4" Foam Material NYSDOT Stand. Spec. 705-08 shown on above referenced drawing, will be made under Item No. 555.08 Footing Concrete, Class HP?	Drawing BD117 has been revised. Refer to Addendum 7, Article 2.
8	19	Reference: Delancey Street Bridge, Drawing BD102 & 122, Sheet 232 & 249, Cross Section B/BD104 & Typical Section Spans 1 and 2. Please clarify under what bid item(s) costs for construction of 6" curb on top of 1'-6" thick reinforced concrete slab and curb reinforcement should be included?	As noted on BD105, the concrete curb / parapet shall be paid for under item 569.03. As per the specification, the cost for reinforcement is included under item 569.03.

Addendum	Addendum Question No.	Bidder's Question	Response
8	20	Reference: Delancey Street Bridge, Drawing BD137 & 134, Sheet 264 & 261. Please confirm that payment for construction of curb/parapet on top of wingwalls, will be made under Items No. 555.09 and 556.0202.	The concrete curb / parapet shall be paid for under Item 569.03. As per the specification, the cost for reinforcement is included under Item 569.03. Drawing BD134 has been revised. Refer to Addendum 7, Article 2.
8	21	Reference: Corlears Hook Park, Drawing BC120 & 140, Sheet 130 & 150, Cross Section B/BC140. Shear studs are not shown on End Floor Beams but note on Shear Stud Connector Detail reads: "Top flange for box shape end floor beam shear stud similar". Please confirm that two (2) rows of shear studs are required on each End Floor Beam	Yes, the shear studs configuration for end floor beams and interior floor beams are similar.
8	22	Reference: Delancey Street Bridge, Drawing BD137 & 134, Sheet 264 & 261. Please clarify if payment for construction of East Ramp Deck, will be made under Items No. 557.0109 and please clarify if deck reinforcement cost to be included under the same item?	Correct. Deck and reinforcement shall be paid for under item 557.0109. Drawing BD 134 has been revised. Refer to Addendum 7, Article 2.
8	23	Drawings WS755 thru WS757 all reference sections on WS766, but WS766 is labeled as intentionally blank. Please clarify.	Drawing WS766 has been revised. Refer to Addendum 7, Article 2.
8	24	Please refer to SHT 1522, "Drainage Mini-Pile Table" there appears to be two structures missing from the table STR-302 and STR-303 which are shown to receive Mini-piles on SHT 1517.	Drawing PUD705 has been revised. Refer to Addendum 7, Article 2.
8	25	Please refer to SHTS 1517-1520 there is not details information provided for structures STR-601 and STR-602 which are listed in the "Drainage Mini-pile Table". Please provide these details.	Refer to "Drainage/Sanitary Structure Pile Cap Detail" on drawing PUD705.
8	26	Under notes table on sheet 1486 and 1487, Structure Type C-5B is not listed for specified structure: STR-7002. Please provide Structure Type with details.	Drawing PUD003 has been revised. Refer to Addendum 7, Article 2.
8	27	Under pipe schedule notes on sheet 1484 and 1485, Item numbers for Ductile Iron Sewer Pipe – 4" D.I.A, Ductile Iron Sewer Pipe – 6" D.I.A, Polyethylene Corrugated Pipe (4"), and Polyethylene Corrugated Pipe (6") are not provided. Please provide Item numbers for these pipes.	Items PK-687A, PK-687B and PK-ESCR 188A have been added to the specifications and bid schedule. Refer to Addendum 6, Article 2. Drawings PUD001 and PUD002 have been revised. Refer to Addendum 7, Article 2.
8	28	Please refer to SHTS 1176, 1177, 1185, 1186, 1187, 1188, 1196, 1197 mention is made for Pay item 6.36 DR but this item does not exist on the bid breakdown. Please remove these notes and/or provide the associated Pay item, Thank you.	Item 6.36 DR has been added. Refer to Addendum 6, Article 2.
8	29	Sheet 1004; Does the HP12x84 Pile Stinger as shown on the Rock Socket for all L-Wall foundations included in the pipe pile pay item?	The stinger is included in the rock socket pay item shown on drawing WS850 and the typical cross section for all other L Wall Platform Drawings.

Addendum	Addendum Question No.	Bidder's Question	Response
8	30	Sheet 1004; The HP12x84 stinger is shown to be 3' below from the proposed concrete plug. The concrete plugs are shown to be no more than 10' from cutoff. Is the pile stinger to be installed from the proposed plug or the dimensions as shown in details for typical pile rock sockets?	Drawings WS852, WS862, WS872, WS882, WS885C have been revised. Refer to Addendum 7, Article 2. The dimensions are now consistent showing the 10'.
8	31	The Original set of plans and the Addenda #2 drawings show Cross Section I-2 on Sheet 898 of 2791 (WS625) and the Plan View on Sheet 732 of 2791 (WS306) both show the Cut-off Wall Tip Elevation to be at EL+85 and, however on the Elevation View on Sheet 832 of 2791 (WS438) shows the Cut-off Wall Tip Elevation to be at EL-61.0. Please clarify	There are (2) L-Walls at this location and the tip elevation should be -85.0'. Drawing WS438 shows the correct extents where the tip elevation goes from -61' to -85' for the L-walls then back to -61'.
8	32	Typically manufactures requirements call for bedding for polyethylene corrugated pipe to extend to 1' above the top of pipe but the detail 5 is only calling out for bedding to be installed 6" below the bottom of pipe. Please confirm.	Please use the bedding depth as shown on Detail 5 on Sheet 3 of NYC Parks Standard Details.
8	33	Reference plan sh. 129. Pay item for abutment wall is 555.0200001. Please clarify. Will footing be paid with item 555.08?	Footing concrete will be paid under item 555.08
8	34	Please add missing pay item for T-3.18 so this work can be properly accounted for	T-3.18 is incorrect. Drawing F100 has been revised with correct items. Refer to Addendum 7, Article 2.
8	35	This sheet shows FENCE TO BE REMOVED AND REPLACED ITEM NO. 6.34 X and FENCE TO BE REMOVED ITEM NO. 6.34 X but the pay item for 6.34 X is REMOVE AND DISPOSE OF EXISTING CHAIN LINK FENCE. Please clarify.	Drawings F100 has been revised. Refer to Addendum 7, Article 2. The removal of the existing chainlink fence at Gouverneur Gardens (north side Montgomery Street) is to be accounted for under item 6.01 AC Clearing and Grubbing. Costs for removal and disposal of the existing fence beneath the FDR Drive (Montgomery St Parking lot) to be accounted for under item 6.34 X.
8	36	Please add missing pay item for NYCT-LP.SW so this work can be properly accounted for	Drawing F100 has been revised with reference to the item removed. Refer to Addendum 7, Article 2.
8	37	Please add missing pay item for ESCR-4.1.1 R so this work can be properly accounted for	The correct pay item is ESCR-4.11 RR. Drawing WS148 has been revised. Refer to Addendum 7, Article 2.
8	38	Sheets LL501 to LL560 reference the LAYOUT POINT SYMBOLS KEY but none are shown on the drawings. Please add and resend the drawings.	Drawings LL501 through LL560 were revised in Addendum 5, Article 3.

Addendum	Addendum Question No.	Bidder's Question	Response
8	39	Per NYCDOT Specifications, Bid Item 6.02 AAN UNCLASSIFIED EXCAVATION is paid for as the area "between the existing surface of the roadway, or area to be widened, and the finished subgrade of the pavement base." However, sheet F100 of the plans shows PAVEMENT TO BE REMOVED AND REPLACED AFTER REGRADING as ITEM NO. 6.02 AAN and sheet F120 shows ASPHALT PAVING AND CONCRETE SUB-BASE TO BE REMOVED as ITEM NO 6.03 AA. Please clarify where items 6.02 AAN, 6.03 AA, and 6.03 AA (S) are paid. Please provide sheet HW300.	Drawing F120 has been revised with correct item numbers. References to drawing F120 have been added where appropriate in drawings F100, F101, F102, and F109. Refer to Addendum 7, Article 2.
8	40	Please provide sheet HW101.	There is no Highway Reconstruction work in Segment 1 Reach A. Sheet has been intentionally left blank.
8	41	In Volume 1 of 3, Special Experience Requirements, Page A-8, Other No. 9 states "PK-ESCR 928: Entity performing masonry work....". We find no Specification Section PK-ESCR 928 nor any bid items with that number. Please clarify.	There is no Highway Demolition work in Segment 1 Reach B. Sheet has been intentionally left blank.
8	42	Drawing number DS309 shows 36" combined sewer (item 5121VC3E036D) however, this item is not exist on bid schedule.	The special experience requirements have been revised. Refer to Addendum 3, Article 1.
8	43	Please clarify what is included in outfall structure. It looks like all the outfall structure is included in proposed combined sewer structure and it is not clear that where the portion of outfall structure starts and which part is included in outfalls.	Drawing DS309 has been revised with correct item number. Refer to Addendum 7, Article 2.
8	44	Please provide Con Edison Dwg EO-9230-C as stated in section E "Price to Cover" for the JB-117?	Drawings DS600 through DS609 and DS302 through DS308 have been revised. Refer to Addendum 7, Article 2.
8	45	Please provide drawing BWS Standard Drawing No. 46464-Z as stated on JB-404?	Refer to Sketch 1 (Con Edison Drawing EO-9230-C), attached.
8	46	The table on Drawing number DS303 show that MH-D07 is STD PC 6' DIA manhole. However, the profile on drawing number DS405 shows that the same pipe is type R manhole. Same for MH-E04 on drawing DS304. Please clarify.	Please refer to the NYCDEP Water Main Standard Drawings, as referenced in the Specifications and Standards of New York City sheet in Volume 3.
8	47	Please confirm that MH-E03 on drawing DS304 does not have H pile.	Manhole types have been updated. Drawings DS405, DS413, DS414, DS418, DS419, DS421, DS422, and DS423 have been revised. Refer to Addendum 7, Article 2.
8	48		Drawing DS815 has been revised to add information about MH-E03. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
8	49	Section F states that the details will be provided during construction can the owner provide details for bidding purposes?	For bidding purposes, refer to Sketch 1 (Con Edison Drawing EO-9230-C), attached.
8	50	Sheet No 711 of 2791 (WS143) refers to Bid Item ESCR-6.27D Demolition Type D1: 3-Pile Esplanade with Conc Deadman (Typ) but this item is not mentioned in the specifications or in the Schedule of Bid Item Values in Volume 1 of 3. Please provide bid item in the schedule of values for this work.	Item ESCR-6.27 D has been added. Refer to Addendum 6, Article 2.
8	51	Sheet No 713 of 2791 (WS145) refers to Bid Item ESCR-6.27F Demolition Type F: Partial Demolition of Existing South Embayment North Abutment but this item is not mentioned in the specification or in the Schedule of Values in Volume 3 of 3. Please provide a bid item in the schedule of values for this work.	Item ESCR-6.27 F has been added. Refer to Addendum 6, Article 2.
8	52	The Original set of plans and the Addenda #2 drawings show Cross Section J-1 on Sheet 900 of 2791 (WS627) shows the Intermediate Sheet Pile Wall Tip elevation to be at El -50, however on Sheets 834 & 835 (WS440 & WS 441) the elevation view from Sta 69+24.00 to Sta 70+33.15 shows the Intermediate Sheet Pile Wall extending to the bottom of the Combi Wall to El -82. Please clarify	Drawings WS440 and WS441 have been revised and show an intermediate sheet pile tip elevation at -50.0' to match. Refer to Addendum 7, Article 2. Drawing WS627 is correct.
8	53	The new Waterfront Wall Cross Sections within the Addendum 2 drawings doesn't show the 12" Dia. PVC Sleeve covering the Tie Rods, for example this appear in plan set "SANDRESM1 Addendum 2 (292 drawings)" On sheet 873 of 2791 (Dwg WS600) Cross Section C-1. However all the Cross Sections in the original drawings this PVC Sleeve within the Tie Rods were shown, for example this appears in plan set on sheet 873 of 2791 (WS600) Cross Section C-1. This area was not "clouded" as a change so is this 12" Dia PVC Sleeve required for the Tie Rods, or is it just missing in the New Cross Sections provided in Addenda 2. Please clarify	The tie rods do not require PVC Sleeves. See Addendum 2, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
8	54	<p>Bid Item No ESCR-551.24.05 - 24" Steel Pipe Pile is referred to in Cross Section D-1 on Sheet Nos. 875 (WS 602) and also within similar cross sections on sheet nos. 878, 890 &amp; 893 of Sheet 2791 (WS605, WS617 &amp; WS620) and is shown in plan view on sheet nos. 993 thru 1000 (WS810 thru WS817) - Proposed South &amp; North Embayment areas. This bid item is missing in the schedule of Values in Volume 1 of 3. Should this be a new bid item or should these piles be paid for under the existing Bid Item No ESCR-551.24.05C - Coated 24" Diameter x 0.5" wall thickness steel pipe pile as shown in Cross section F-2 of sheet no 886 of 2791 (WS613). Please clarify</p>	<p>Drawings WS602 and WS810 through WS817 have been revised with corrected bid item number for the proposed pipe piles, ESCR-551.24.75.C. Refer to Addendum 7, Article 2.</p>
8	55	<p>The plan view on Sheet no 584 of 2791 (Dwg F401) shows a shaded at approx. Sta 18+40 +/- a section No 5 cut thru it which the shaded area is to depict the need for Jet Grouting in this area whereas the elevation View below is missing the detail yet when you go to the overall Plan Transition 1 - Reach B on sheet no 610 Of 2791 (Dwg F850) it shows the detailed view at approx. Sta 18+39.50 that Jet Grouting is required as well as the details in Sections 3 &amp; 5 on the same sheet. Please clarify</p>	<p>The profile elevation in drawing F401 has been revised to reflect the correct location of the jet grouting, at STA 18+40. Refer to Addendum 7, Article 2.</p>
8	56	<p>Re:Drawing WS146, note pay item ESCR-6.27 F. Kindly provide pay item on bid sheet</p>	<p>Item ESCR-6.27 F has been added. Refer to Addendum 6, Article 2.</p>
8	57	<p>Please add missing pay item for 55.11AB abandoning basins and inlets</p>	<p>Item 55.1AB has been added. Refer to Addendum 6, Article 2.</p>
8	58	<p>Drawing WS143, note pay item ESCR 6.27D. Kindly provide missing pay item on bid sheet</p>	<p>Item ESCR-6.27 D has been added. Refer to Addendum 6, Article 2.</p>
8	59	<p>On Sheet No 584 of 2791 (Dwg F401) within the latest Addendum no 3 drawings that were received on June 30th, they elevation view shows Proposed Steel Pipe Piles Bid Item No. ESCR-552.24.05.CJG but there is not a bid item that exist on most recent Bid Item Schedule of Values updated thru Addendum No 3 dated June 30, 2020 for this item. Also, Section B-4 at Sta 22.+43 on Sheet No. 595 of 2791 (Dwg F601) still shows that this proposed 24" Pipe Pile is to be paid under Bid Item ESCR-551.24.05C. Should this pile be paid under the existing Bid Item ESCR-551.24.05 CJG or is there a new bid item ESCR-552.24.05CJG that was overlooked. Please clarify</p>	<p>Drawings F401 and F601 have been revised to show ESCR-551.24.05.CJG for the proposed steel pipe piles in jet grout. Refer to Addendum 7, Article 2.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	60	The elevation view on sheet 583 of 2791 (Dwg F400) (Addendum #3 dwgs) for approx Sta 11+30 to Sta 13+00 refers to a Proposed AZ46-700N Sheet Pile Bid Item ESCR-552.11.46CP however there is no new cross section for this area in Addendum #3 drawings as the current Section A-3 for Sta 11+63 on sheet 594 of 2791 (Dwg F600) still shows that this portion of the wall is to be paid for under Bid Item ESCR-552.11.46CPL. Please clarify	Drawing F400 has been revised. Refer to Addendum 7, Article 2. The corresponding cross section is A-4 on drawing F600.
8	61	The elevation view on sheet 585 of 2791 (Dwg F402) (Addendum #3 dwgs) for approx Sta 28+00 to Sta 31+25 refers to a Proposed AZ46-700N Sheet Pile Bid Item ESCR-552.11.46CP however there is no new cross section for this area in Addendum #3 drawings as the current Floodwall Table for Sta 28+00 to Sta 31+25 on sheet 597 of 2791 (Dwg F603) indicates that the proposed sheets will be AZ20-700 sheets and will be aid under Bid Item ESCR-552.11.20C. Please clarify	Drawing F402 has been revised to include AZ20-700. Refer to Addendum 7, Article 2.
8	62	The elevation view on sheet 593 of 2791 (Dwg F410) (Addendum #3 dwgs) for approx Sta 97+50 to Sta 98+80 refers to a Proposed AZ46-700N Sheet Pile Bid Item ESCR-552.11.46CIP however there is no new cross section for this area in Addendum #3 drawings as the current Section K-1 for Sta 93+17 on sheet 598 of 2791 (Dwg F610) still shows that this portion of the wall is to be paid for under Bid Item ESCR-552.11.46CP. Please clarify	Drawing F610 has been revised to include ESCR-552.11.46CIP. Refer to Addendum 7, Article 2.
8	63	The Pedestrian Swing Gate Schedule Table on Sheet 1131 of 2791 (Dwg FG260) refers to a Pedestrian Swing Gate for 15th Street but the ESCR Gates Summary on Sheet 1068 of 2791 (Dwg FG001) only list 6 gates and only one pedestrian gate No 6 for East 14th Street Crossing Pedestrian Gate. Also the Bid Value Schedule in Volume 1 of 3 only list these 6 gates as separate bid items. Please clarify if there is to be a pedestrian gate at 15th Street.	Drawing FG260 has been revised to include only the 14th Street pedestrian gate. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
8	64	REDACTED	
8	65	<p>Section C on Sheet no 966 of 2791 (Dwg WS761) shows a typical sliding joint detail that refers to Bid Item No 565.14200008 but the Proposed Waterfront Cross Sections on Sheets No 873 thru 902 of 2791 (WS607A thru WS629) within the most recent Addenda #3 drawings refer to this typical sliding joint to be paid for under Bid item No ESCR-567.LG. Please clarify</p>	<p>Drawings WS600 through WS629 have been revised. Refer to Addendum 7, Article 2.</p>
8	66	<p>There is no item number for the 8" Ductile Iron Pipe with cradle items. Please Clarify.</p>	<p>Watermain piping doesn't require cradle supports. PK-ESCR 607 "8" Dia. Ductile Iron Cement Water Pipe Line" shall be used for the water main work within East River Park.</p>
8	67	<p>On drawing PUD417 it shows pipe (P-1202B) with no pile or cradle, but on drawing PUD705 on the "Drainage Mini Pile Table" it shows that the pipe requires mini pile/cradle. Please Clarify.</p>	<p>The reason P-1202B is depicted in the Drainage Mini-Pile table is because the pipe is associated with structures STR-1202 and STR-1203 as shown in the table and is only included in the table for reference. The pipe does not require piles and the profile shown on PUD705 is correct.</p>
8	68	<p>The following pipes that require mini pile are not showing on the "Drainage Mini Pile Table" on drawing PUD705. The estimated total length of the piles is needed. The missing pipes are P-302B, P-4025, P-60, P-917, P-916, P-4025, P-11005, P-1220, and P-121. Please Clarify.</p>	<p>Pipes shown in the Drainage Mini Pile Table are shown for reference. Refer to the plans shown on PUD300 series &amp; profiles shown in the PUD400 series drawings for pipes that requires piles. All piles should follow the NYCDEP Detail-SE2 and NYCDEP Detail-SE6.</p>
8	69	<p>Please clarify if Regulator M-24 Flood proofing mentioned in Sheet 1178/ DS 102 is paid under "51.71C00M24 MODIFICATION OF EXISTING CHAMBER M-24". There is no reference to pay item in page DS 102.</p>	<p>Bid item 51.71C00M24 has been removed from the bid schedule. Refer to Addendum 6, Article 2 for the current bid schedule.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	70	Please clarify item "51.11V000 DIVERSION CHAMBER". Chamber M-25 on page DS 302/Sheet 1189 is assigned to be paid under this item. Yet details page for M-25 Chamber on DS 500-502/Sheet 1227-1229 states all work for Chamber M-25 to be paid under Pay Item 51.11CS25 REGULATOR CHAMBER NO. M-25.	Drawing DS302 has been revised with the item number for Chamber M-25 changed to 51.11CM25. Refer to Addendum 7, Article 2.
8	71	Please clarify which chambers are paid under item "51.11V000 DIVERSION CHAMBER 14 each".	All connections (12) and junction chambers (2) are to be paid under Item No. 51.11V000.
8	72	Please clarify location and scope of work for items "51.71C00M22 MODIFICATION OF EXISTING CHAMBER M-22", "51.71C00M23 MODIFICATION OF EXISTING CHAMBER M-23", "51.71C00M24 MODIFICATION OF EXISTING CHAMBER M-24", "51.71C00M36 MODIFICATION OF EXISTING CHAMBER M-36". Could not locate them in the drawings.	These items have been removed from the bid schedule. Refer to Addendum 6, Article 2.
8	73	Please clarify if work performed for Regulator Chamber M-29 is to be paid under Item 51.11HCM29 as per page DS 305/Sheet 1192. Bid item does not exist. Should it be paid under existing item 51.11CM29?	Drawing DS305 has been revised to include 51.11CM29. Refer to Addendum 7, Article 2.
8	74	Please clarify pay item for Junction Chamber JC-D01. Page DS 535/Sheet 1264 says work for this chamber will be paid under item 51.11CSD01 but item does not exist. Additionally, Note 3 of page DS 535 says all work for the structure should be paid under item 51.11CS26 - REGULATOR CHAMBER NO. M-26. What is the correct pay item for work associated to this Junction Chamber?	Drawing DS535 has been revised and Note 3 now references item 51.11V000. Refer to Addendum 7, Article 2.
8	75	Please clarify pay item for Junction Chamber JC-G01. Page DS 537 says work for this chamber will be paid under item 51.11CSG01 but item does not exist. Additionally, Note 3 of page DS 537 says all work for the structure should be paid under item 51.11CS26 - REGULATOR CHAMBER NO. M-26. What is the correct pay item for work associated to this Junction Chamber.	Drawing DS537 has been revised and Note 3 now references item 51.11V000. Refer to Addendum 7, Article 2.
8	76	Please provide the cast in place beam on S-508/Sheet # 2442. It says see the plan – there is nothing showed on the plan and there is no beam schedule.	The plan where the edge is shown is located on drawing S507. The detail of the edge beam is shown on drawing S512. There is no beam schedule as one beam detail is applicable for the entire perimeter of the building.
8	77	Beam Plate and Cap Plate Schedule shows P4 in drwg S-513 / Sheet # 2447. However there is no P4 on drawing S-503 /Sheet #2437 – Only P1, P2, P3 are showing. Can you please clarify.	Refer to drawing S506 for location of post P4.

Addendum	Addendum Question No.	Bidder's Question	Response
8	78	What size underdrain pipes are used for the proposed amphitheater area?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	79	What size underdrain pipes are used for the Franklin D Roosevelt Drive roadside area?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	80	What size underdrain pipes are used near the proposed Soccer Field?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	81	What size underdrain pipes are used near the Lawn area?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	82	What size underdrain pipes are used for the Lawn area near proposed Multi-Use Field?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	83	What size underdrain pipes are used near the proposed South Tennis Courts?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	84	What size underdrain pipes are used near the proposed North Tennis Courts?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	85	What size underdrain pipes are used for the Lawn area near Water Play?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	86	What size underdrain pipes are used near the proposed Maintenance Area?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	87	What size underdrain pipes are used near the proposed Field 7?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	88	What size underdrain pipes are used in the field near the proposed Play area?	Underdrain details and sizing can be found in the LD760 series and LD820 series.
8	89	On sheet No 976 of 2791 (WS774) "Cut-off Sewer Crossing Details" it shows the details for the Sewer Outfall NCM-057 which is located approximately between Bents 78 and 79. Cross Section B on this same sheet depicts this portion of the wall to be a Combi-Wall as other sections depict this section as a Continuous Pipe Pile Wall. The elevation view seems to be correct with the cross sections and elevation views on other sheets/drawings. We believe that this Section B should be shown on the other side of the sewer outfall and a new cross section should be provided for the current location of section B depicting the proper type of wall at this location. Please clarify.	Drawing WS774 has been revised. Refer to Addendum 5, Article 3.

Addendum	Addendum Question No.	Bidder's Question	Response
8	90	<p>Cross Section 4a "Pile Cap Type IVa" on Sheet 959 &amp; 960 of 2791 (WS754 &amp; S755) shows a dashed line that represents the cap bottom elevations, one for the interior side of the wall and one for the exterior side of the wall. These sheets also show Cross Section 4b "Pile Cap Type IVb", Cross Section 6a "Pile Cap Type VIa" and Cross Section 6b "Pile Cap VIb" are similar caps where both the interior and exterior side cap bottom elevations are different, however the cross sections are not showing the same dashed lines for the bottom of the cap. Shouldn't these cross sections also have a dashed line showing the different elevations for the bottom of these caps? Please clarify.</p>	<p>Dashed lines have been added to show different elevations on revised drawings WS754 and WS755. Refer to Addendum 7, Article 2.</p>
8	91	<p>The metal architectural mesh for the East 10th St and Delancey Street Bridges are shown on drawings BT105 and BD105 respectively and the mesh is called out to be paid for under NYC180002 which is in the schedule of values in Volume 1 of 3. However on general cross section on drawing BC105 the architectural mesh for the Corlears Hook Bridge this same architectural mesh is called out to be paid for under bid item NYC-607.064AD, which this bid item does not exist within the schedule of values in Volume 1 of 3. Please clarify if the Corlears Hook architectural mesh is to be paid for under the same item as the other two pedestrian bridges or if a new bid item and mesh type should be setup for the Corlears Hook Bridge. Please clarify.</p>	<p>Drawing BC107 has been revised. Refer to Addendum 7, Article 2.</p>
8	92	<p>The standard flood gate details on sheets 1156 and 1168 of 2791 (Dwgs FG708 and FG720) indicate that there are various field welds required within the various cross sections the floodgates. We are not sure why field welds are required for the installation of these gates as we would assume that these welds can be performed in the fabrication shop. If these are labeled correctly we would want to know if a bolted connection could be substituted for these field welds if they were intended to be called out this way. Please clarify.</p>	<p>The field welds for the 16Ga lock box shown on drawing FG720 can be shop welds. Drawing FG720 will be revised accordingly in a future addendum. On drawing FG708, the welds shown on Detail 2 and Detail 4 are shop welds. However, for Detail 2 Section A &amp; Detail 3, field welds shown are required for braces to the gusset plates and other gate steel members. Bolted connection in this application is not accepted.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	93	<p>The general cross sections on drawings BT105 and BD105 for the East 10th Street and Delancey Street Bridges respectively, calls for the main span railing to be paid for under bid item 568.12010010 and the ramp/abutment railing to be paid for under bid item 607.91120001. Meanwhile, for the Corlears Hook Bridge the similar general cross sections on drawings BC105 indicates that the same main span railing is to be paid for under item NYC-607.064 AA as this item does not appear on the current schedule of values in Volume 1 of 3. In addition the Corlears Hook Bridge drawings do not show what bid item the railings for the abutments are to be paid under. Please clarify</p>	<p>Drawing BC107 has been revised with item 568.12010010 for the main span railing. Drawing BC145 has been revised with item 607.91120001 for the ramp/abutment railing. Refer to Addendum 7, Article 2.</p>
8	94	<p>REDACTED</p>	
8	95	<p>We did not see anywhere within the contract drawings that shows where Current Bid Item 449 ESCR-551.24.05.CD COATED 24" DIAMETER X 0.5 IN WALL THICKNESS STEEL PIPE PILE INSTALLED IN PREDRILLED LOCATION is used. Please clarify</p>	<p>Item ESCR-551.24.05.CD has been deleted and replaced by item ESCR-551.24.75.C. Refer to Addendum 6, Article 2 for the current bid schedule. Refer to WS600 series for existing embayment cross sections and WS810-WS818 for proposed platform drawings for this item.</p>
8	96	<p>We did not see anywhere within the contract drawings that shows where Current Bid Item 451 ESCR-551.24.05.CJG COATED 24" DIAMETER X 0.5 IN WALL THICKNESS STEEL PIPE PILE INSTALLED IN TIMBER CRIBBING is used. Please clarify</p>	<p>ESCR-551.24.05.CJG is included in the contract drawings on drawing FG272 in the pile schedule, identifying the pipe piles for the 14th Street Gate crossing are all installed in jet grout. The item number for 24" x0.5" diameter pipe pile being installed in timber cribbing is also identified in the contract drawings on sheet FG207, identifying which piles for the FDR Drive Crossing Gate foundation will be installed in existing timber cribbing.</p>
8	97	<p>We did not see anywhere within the contract drawings that shows where Current Bid Item 455 ESCR-551.36.05.CSD COATED 36" DIAMETER X 0.5 IN WALL THICKNESS STEEL PIPE with interlock sealant installed in predrilled locations is used. Please clarify</p>	<p>Drawings with item ESCR-551.36.05.CSD include the revised WS860 and WS870. Refer to Addendum 7, Article 2.</p>
8	98	<p>We did not see anywhere within the contract drawings that shows where Current Bid Item 464 ESCR-552.11 20 C COATED AZ-20-700N OR EQUAL STEEL SHEET PILE INSTALLED IN TIMBER CRIBBING USING PRESSED-IN METHOD is used. Please clarify</p>	<p>Drawings with ESCR-552.11 20C include F603, the F400 profiles, and the WS600 series—where applicable for the floodwall. For the AZ-20-700N floodwall installed in timber cribbing, F603 has been revised to include ESCR-552.11 20CT. Refer to Addendum 7, Article 2.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	99	We did not see anywhere within the contract drawings that shows where Current Bid Item 466 ESCR-552.11 38 CW COATED PAZ42/AZ38-700N OR EQUAL COMBI-WALL INSTALLED is used. Please clarify	Item has been removed from the bid schedule. Refer to Addendum 6, Article 2 for the current bid schedule.
8	100	We did not see anywhere within the contract drawings that shows where Current Bid Item 470 ESCR-552.11 4219DI COATED PAZ42/NZ19 OR EQUAL COMBI-WALL WITH INTERLOCK SEALANT INSTALLED IN PREDRILL LOACTIONS is used. Please clarify	Item has been removed from the bid schedule. Refer to Addendum 6, Article 2 for the current bid schedule.
8	101	We did not see anywhere within the contract drawings that shows where Current Bid Item 471 ESCR-552.11 46CIP COATED AZ46-700N OR EQUAL STEEL SHEET PILE WITH INTERLOCK SEALANT INSTALLED USING PRESS-IN METHOD is used. Please clarify	Drawing F610 has been revised to include ESCR-552.11.46 CIP. Refer to Addendum 7, Article 2.
8	102	Sheets 993, 995,997,999; Please provide which pay item these 24" piles are paid under. Does the pipe piles in the North and South Embayment area receive a concrete plug and rebar cage?	A concrete plug and rebar cage is required. Drawing WS818 has been revised. Refer to Addendum 7, Article 2.
8	103	There are four different PAZ42/NZ19 combo wall pay items. Please define limits for each system.	New drawing WS441A, with a cut-off wall schedule and pay items, has been added. Refer to Addendum 7, Article 2.
8	104	There are four different AZ20 sheeting pay items. Please define limits for each system.	New drawing WS441A, with a cut-off wall schedule and pay items, has been added. Refer to Addendum 7, Article 2.
8	105	There are four different AZ46-700 sheeting pay items. Please define limits for each system.	New drawing WS441A, with a cut-off wall schedule and pay items, has been added. Refer to Addendum 7, Article 2.
8	106	Please reissue Sheet 850. The information is unreadable.	Drawing WS510 has been revised to be readable. Refer to Addendum 7, Article 2.
8	107	Sheet WS513: Please clarify pedestal elevation for Pier 164 to 166	Drawing WS513 has been revised. Refer to Addendum 7, Article 2. The pedestal elevations for P164(N) to P166(S) are listed on the pedestal elevation summary table. The P166(N) and P167 Pedestals heights from top of existing pier caps are denoted on Section S-1. These two pedestals are solid across the entire pier cap width and so their elevation changes as shown in the "pedestal to pier 166 pile cap connection" detail. Elevations have been added to this detail for further clarity.
8	108	Sheet 965; Please confirm the length of the required MC13x50 splice plate for the threaded rod wales	The length of the splice plate has been added to revised drawing WS760. Refer to Addendum 7, Article 2.
8	109	Sheet 1323; Pile tip elevation table states sta 1+07 - sta 2+91; 30" RCP Branch Interceptor foundation plan show stationing starting at 11+06.02. Please provide correct elevation chart.	Elevation chart updated to reflect new stationing. See revised drawing DS822. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
8	110	Sheet 1517; Please provide pay item 70.13 MV	Drawings PUD700 and PUD701 have been revised to include item 70.13 MN. Refer to Addendum 7, Article 2.
8	111	Sheet 1522; Please provide mini pile details on the following structures: STR-302,STR-45,STR-60,STR-917,STR-916,STR-11005,STR-1220 and STR-121	Please refer to the Drainage/Sanitary Structure Pile Cap Detail on drawing PUD705.
8	112	Sheet 1522; Will the following structures require mini-piles if shown on table, but not on sanitary profiles : STR-403,STR-516,STR-903,STR-1003,STR-1103,STR-1202 and STR-1203	Follow table on PUD705.
8	113	Please provide recommended pile bent spacing for all Park Drainage pipe runs that requires mini pile foundations	See revised drawings PUD705 and PUD400-PUD 417 that reference NYCDEP Standard Detail-SE2 and NYCDEP Standard Detail-SE6 for pile spacing. Refer to Addendum 7, Article 2.
8	114	Sheet 1522; Does the representation of the "Pile Plan" the typical detail for "Park Drainage" structures that require mini-pile foundations?	Correct, that detail is intended for any standard NYC Parks standard pile-supported structure
8	115	Contract drawing WS142 (Sheet 710), detail drawing states "Demolition Type C is on Item No. ESCR-6.27C", but Note 4 states "Item No. ESCR-6.27B". Please clarify which pay item is correct.	Correct item is ESCR-6.27C. Drawing WS142 has been revised with a corrected Note 4. Refer to Addendum 7, Article 2.
8	116	Please provide as-built drawings for the existing Esplanade Structures and Waterfront Structures.	All available as-builts have been provided.
8	117	For Item No. "ESCR-6.27 PRSE" on Sheet 709 and "ESCR-6.27 PRNE" on sheet 715, please provide details for the existing steel pipe pile under the Esplanade. Is there any concrete in the steel pipe piles?	The existing steel pipe piles have concrete. Drawings WS144, WS148, WS145, & WS147 have been revised to include "CONCRETE-FILLED" in pipe pile demo callout. Refer to Addendum 7, Article 2.
8	118	For Reach E, F and G in Phase 1 on drawings PH006 to PH009 (Sheet 6 to 8), please provide the limit of work (width or the length from riverside) for the first early closure area and second early closure area.	The contractor shall occupy the minimum width necessary to install the flood walls at these locations that will allow adjacent park amenities to remain in operation. Refer to drawings WS003 through WS005.
8	119	Please provide a Profile view through the proposed 66' Micro-Tunnel this information is critical in determining the production of the machine based on the elevation change.	Drawings PCC350, PCC305A, and PCC351 have been revised. Refer to Addendum 7, Article 2.
8	120	Please refer to Spec Section ESCR 4-11.8, (J) there is mention of the settlement criteria which needs to be met before the pre-loaded stockpiles may be re-graded for other work to commence. For bidding purposing provide the settlement criteria so that we can analyze the existing ground conditions and determine a more accurate duration for the pre-loading.	The settlement criteria for fill with no ground modification and for prefabricated vertical drains is to achieve 95 percent consolidation within 6 months of embankment completion. The settlement criteria for the deep soil mix columns is to limit the total settlement to less than 1.5 inches.

Addendum	Addendum Question No.	Bidder's Question	Response
8	121	Please confirm that the Contractor is responsible for all costs associated with the hiring a third-party testing company to perform Soil Compaction Tests and Modified Protector Tests every 1,000 CY as outlined in Spec Section ESCR 4.11.7, (A) and (L)	Yes, the Contractor is responsible for these costs.
8	122	Reference: Delancey Street Bridge, Drawings BD189 & 185, Sheets 316 & 312. All three bridge elevations on Drawing BD189, at continuation line have reference to drawing BD185. However, text on drawing BD185, (1) Delancey St. Ramp - Ramp North Elevation at continuation line reads: "O1/BD422)". Please clarify if listed drawings at continuation lines on above referenced drawings are correct and please provide missing drawing BD422?	Drawings BD184, BD185, BD186, and BD189 have been revised. There is no drawing BD422; the reference on BD185 has been revised. Refer to Addendum 7, Article 2.
8	123	Reference: Delancey Street, Drawing BD146, Sheet 273. Note at Removable Bollard Section reads: "Crushed Stone in place (typ.) Item No. 623.12". This item is not part of the bid breakdown. Please clarify.	Item has been added. Refer to Addendum 6, Article 2 for the current bid schedule.
8	124	Reference: East 10th Street Bridge, Drawings BT115 & 117, Sheets 365 & 367. On Drawing BT115, West Abutment Section, at top of bridge seat is shown 10-#10@6" (T&B). However, on same Elevation on same drawing, and on Drawing BT117, Sections E and E1 is shown #6 @ 6". Please clarify what is correct?	See revised west abutment section on drawing BT115. Drawing BT117 is correct. Refer to Addendum 7, Article 2.
8	125	Reference: East 10th Street Bridge, Drawings BT119 & 122, Sheets 365 & 372. On Drawing BT119, Wall C Elevation, footing thickness is 3'0". However, on Drawing BT122, Typical Section (Looking East) footing thickness is 4'-0". Please clarify what is correct?	Drawing BT119 has been revised to clarify that the footing thickness for Wall C shall be 4'-0" as shown in Section A of BT122. Refer to Addendum 7, Article 2.
8	126	Reference: East 10th Street Bridge, Drawing BT120, Sheet 370, Wall E Reinforcement (Looking East), and Wall E footing on Drawing BT121, Sheet 371 Pedestrian Ramp Footing Reinforcement Plan.  Please confirm that payment for 4" Foam Material shown on above referenced drawing, will be made under Item No. 555.08 Footing Concrete, Class HP and Item No. 555.09 Concrete for Structures, Class HP?	Drawings BT120 and BT121 have been revised. Refer to Addendum 7, Article 2. On BT120, Wall E Reinforcement (Looking East), the payment for 4" Foam material shall be paid under item 555.09. On BT121, for Wall E footing 4" Foam material shall be paid under item 555.08.
8	127	Reference: East 10th Street Bridge, Drawing BT105, Sheet 355, Cross Section B/104. Please provide the width of EPS (Geofoam Block), Item No. 203.03950017 Extruded Polystyrene Fill and Select Granular Fill, Item No. 203.07 to fill space between EPS and new West Approach Ramp concrete walls, since it is not clearly shown on above referenced cross section?	Drawings BT105 and BD105 have been revised to clarify a 3-inch max gap (to be filled with granular fill, as noted already) between the edge of the Geofoam and the ramp wall. Refer to Addendum 7, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
8	128	<p>Reference: East 10th Street Bridge, Drawing BT105, Sheet 355, Cross Section B/104. Thickness of Select Granular Fill above EPS varies and is shown at two locations on above referenced Cross Section, but it is not shown in area between West Approach Ramp Walls C and D.</p> <p>a) Please provide missing information.</p> <p>b) Please clarify if including but not limited to EPS, sand backfill, select granular fill, geomembrane, etc. need to be installed between Approach Ramp Wall D and South Stair Wall?</p>	<p>See revised drawings BT105 and BD105 that note the following:                      a) When height under ramp is 3'-0" or less, item 203.02 Select Granular Fill shall be used to fill area under ramp. When height under ramp is greater than 3'-0", see typical section for EPS related details.                      b) See response to "a" above. Refer to Addendum 7, Article 2.</p>
8	129	<p>Reference: East 10th Street Bridge, Drawing BT105, Sheet 355, Cross Sections B &amp; C/104 and Drawing BT161, Sheet 411, Typical Parapet Details. Thickness of Concrete Slab (Item 557.0109) is 1'-0" per Cross Sections B &amp; C/104. However, per Typical Parapet Details deck thickness appears to be less than 1'-0", because bottom portion of #5@6" is 1'-0". Please clarify deck thickness.</p>	<p>Deck thickness of concrete slab shall be minimum 1'-0" per sections B &amp; C shown on drawing BT105. Drawings BT161 and BD172 have been revised. Refer to Addendum 7, Article 2.</p>
8	130	<p>Reference: East 10th Street Bridge, Drawing BT105, Sheet 355, Cross Sections B &amp; C/104 and Drawing BT161, Sheet 411, Typical Parapet Details. As per Cross Sections B &amp; C/104 on Drawing BT105, and Typical Parapet Details Drawing BT161 typical parapet height is 6". However, per Section A/BT122 and X/BT123 parapet height varies from 6" to 18". Contract drawings do not show parapet transition from 6" to 18". Please clarify?</p>	<p>Refer to drawing BT131 for north and south parapet transition details from west ramp span to arch span.</p>
8	131	<p>Reference: East 10th Street Bridge, Drawings BT127 &amp; 130, Sheets 377 &amp; 380. Please clarify if payment for construction of East Ramp Deck, will be made under Item No. 557.0109 or under Item No. 557.2001 and please clarify if deck reinforcement cost to be included under the Item No. 557.0109 or under Item No. 556.0202?</p>	<p>Drawing BT127 has been revised to clarify the following: East ramp deck to be paid for under item No. 557.0109. Deck reinforcement shall be included under item 557.0109 per specification. Refer to Addendum 7, Article 2.</p>
8	132	<p>Reference: East 10th Street Bridge, Drawings BT157, 158 &amp; 159, Sheets 407, 480 &amp; 409. Please clarify if payment for construction of 8" thick walls and 8" thick slabs shown on above referenced drawings and sections, will be made under Item No. 555.09 and reinforcement cost to be included under the Item No. 556.0202?</p>	<p>As noted, the slab shall be paid for under item 555.09. Drawing BT157 has been revised to clarify that the 8-inch walls will also be paid for under 555.09. For both items, the reinforcement will be paid for under item 556.0202 per specification. Refer to Addendum 7, Article 2 for revised drawings.</p>
8	133	<p>Reference: East 10th Street, Drawing BT136, Sheet 386. Note at Removable Bollard Section reads: "Crushed Stone in place (typ.) Item No. 623.12". This item is not part of the bid breakdown. Please clarify.</p>	<p>Item has been added. Refer to Addendum 6, Article 2 for the current bid schedule.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	134	Reference: Houston Street, Drawing BH119, Sheet 516. Please confirm that Wall W7, Bottom of Footing Elev. as shown on referenced drawing is correct.	Drawing BH119 has been revised to clarify that the bottom of footing elevation shall be EL. 6.07 for Wall W7. Refer to Addendum 7, Article 2.
8	135	Reference: Houston Street Bridge, Drawing BH102, Sheet 499, Section A/BH101. Please clarify that Proposed Section A/BH101, shows typical section from STA. H100+44 to H104+04	Proposed Section A/BH101 shows typical section from 100+44.11 to 104+04.11. Drawings BH102, BH103, and BH117 have been revised. Refer to Addendum 7, Article 2.
8	136	Reference: Houston Street Bridge, Drawings BH118, 117 & 103, Sheets 515, 514 & 500. Please confirm that top of grade and top of parapet at Wall W1 are the same, and please confirm that top of wall and existing grade are the same, and please confirm that Wall 1 height is 2'-0".	Per BH103 and BH117 Sections D1 and D2, the top of parapet is not the same as top of proposed grade but the top of wall and top of proposed grade are the same at Wall W1. The top of existing grade and top of wall are not the same. The height of Wall W1 is not 2'-0. The height of the wall varies as shown in sections D1 and D2 on BH117. Callouts on drawings BH118 and BH119 have been revised to be consistent with information provided on section A/BH117. Refer to Addendum 7, Article 2.
8	137	Reference: Houston Street Bridge, Drawings BH117, 118 & 121, Sheets 514, 515 & 518, Section A/BH117.  a) As per, Section A/BH117, Drawing BH117, distance from top of wall to top of grade is 0" for W2, W3 & W18. However, per Drawing BH118, Retaining Wall Elevation average distance from top of wall to top of grade for W2 is +/-2.95', for W3 is +/-3.61', and for W18 top of wall is not even shown on Drawing BH121, Sheet 518. Please clarify and provide missing information.  b) As per, Section A/BH117, Drawing BH117, wall W2 and W3 thickness is 2'-0" with change to +/-2'-10" (corbel) and corbel height is 3'-0" and varies. However, per Drawing BH118, Retaining Wall Elevation average distance from top of wall to top of footing for W2 and W3 is +/-1.5'. Please clarify above because it will help in determination of retaining wall thickness/transition.	a) As the 0" dimension is called out in section A/BH117 for W2, W3, and W18, the top of grade shall be level with top of wall. Callouts on revised drawings BH118 and BH121 have been added to be consistent with information provided on section A/BH117. Refer to Addendum 7, Article 2.  b) Drawing BH117 has been revised with a 3'-0" maximum corbel height noted. Refer to Addendum 7, Article 2.
8	138	Reference: Houston Street Bridge Retaining Walls, Drawing BH117 (Wall Sections), BH118 through BH121 (Wall Elevations), and BH102 & 103. Please confirm that vertical payment limits for Item 569.03 Vertical Faced Concrete Parapets, as shown on above referenced drawings, should include concrete from Top of Grade up, and payment for Item No. 555.09 Structural Concrete should include concrete from Top of Grade down to top of footing?	That is correct, as shown on BH102 and BH103.

Addendum	Addendum Question No.	Bidder's Question	Response
8	139	<p>Reference: Flood Protection Drawings, Waterfront Demolition Section Sheet 4 of 10, Drawing WS143, Sheet 711. On above referenced drawing are shown two (2) demolition types, Type D1 – Item No. ESCR-6.27D and Type D2 – Item No. ESCR-6.27C. However, Item No. ESCR-6.27D is not part of the bid breakdown and Item No. ESCR-6.27C is DEMOLITION EXISTING ESPLANADE TYPE C-1 AND C-2.</p> <p>a) Please clarify above conflicting demolition types information.</p> <p>b) Please provide bid items for Type D1 and D2 demolition types shown on Waterfront Demolition Plans.</p>	<p>Item ESCR-6.27 D covers both type D1 and D2 demolition and has been added to the bid schedule. Drawing WS143 has been revised. Refer to Addendum 6, Article 2 for current bid schedule and Addendum 7, Article 2 for revised drawings.</p>
8	140	<p>Reference: Flood Protection Drawings, Waterfront Demolition Plan WS101, Sheet 671 and Waterfront Demolition Section Sheet 2 of 10, Drawing WS141, Sheet 709. On Drawing WS101 are shown limits of Demolition Type B. However, Section B/WS141 reads: "Demolition Type B: Proposed South Embayment – Item No.-ESCR-6.27 PRSE". Item No. ESCR-6.27 B is DEMOLITION EXISTING ESPLANADE TYPE B and Item No. ESCR-6.27 PRSE is DEMOLITION OF THE EXISTING ESPLANADE STRUCTURE FOR THE PROPOSED SOUTH EMBAYMENT (REMOVAL LIMITS AS SHOWN ON THE CONTRACT DRAWINGS).</p> <p>a) Please clarify above conflicting information.</p> <p>b) Does the cross section shown on sheet WS141 in the Flood Protection plans only correlate to the Item No. ESCR-6.27 PRSE and not ESCR-6.27 B? And if so, is there a cross section for ESCR-6.27 B?</p> <p>c) Removals limits for Item No. ESCR-6.27 PRSE are not shown on plans. Please provide missing information.</p> <p>d) Please confirm that Engineer Quantity for Item No. Item No. ESCR-6.27 B is correct, since this type of Waterfront Demolition is shown only on Drawing WS101?</p>	<p>The cross section on sheet WS141 correlates to ESCR-6.27 PRSE. Item ESCR-6.27 B has been removed from the bid schedule. Refer to Addendum 6, Article 2. Refer to WS101 for removal limits for the proposed south embayment.</p>
8	141	<p>Reference: Flood Protection Drawings, Waterfront Demolition Plan WS103, Sheet 673 and Waterfront Demolition Section Sheet 5 of 10, Drawing WS144, Sheet 712. On Drawing WS103 are shown limits of Demolition Type E1. However, Section E1/WS144 reads: "Demolition Type E1: Existing South Embayment Center – Item No.-ESCR-6.27 EXSE" and Section E2/WS144 reads: "Demolition Type E2: Existing South Embayment Edge – Item No.-ESCR-6.27 EXSE". Item No. ESCR-6.27 EXSE is DEMOLITION OF THE EXISTING SOUTH EMBAYMENT (REMOVAL LIMITS AS SHOWN ON THE CONTRACT DRAWINGS). Please clarify above reference to Type E1 and E2 Demolition?</p>	<p>Demolition Type E1 &amp; E2 are both covered under the bid item ESCR-6.27 EXSE.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	142	Reference: Flood Protection Drawings, Waterfront Demolition Plan WS103, Sheet 673 and Waterfront Demolition Section Sheet 7 of 10, Drawing WS146, Sheet 714. On Drawing WS103 are shown limits of Demolition Type F and Section G/WS146. However, Section G/WS146 reads: "Demolition Type G: Partial Demolition of Esplanade Pile Cap— Item No.-ESCR-6.27 S". Item No. ESCR-6.27 S is DEMOLITION OF STRUCTURES and not Type G Demolition. Please clarify above reference to Type G Demolition.	Drawing WS146 and bid schedule have been revised to include item ESCR-6.27 G. Refer to Addendum 6, Article 2 for current bid schedule and Addendum 7, Article 2 for revised drawing.
8	143	Reference: Item No. Item No. ESCR-6.27 C DEMOLITION EXISTING ESPLANADE TYPE C-1 AND C-2. Please confirm that Engineer Quantity for Item No. Item No. ESCR-6.27 C DEMOLITION EXISTING ESPLANADE TYPE C-1 AND C-2 is correct?	There is no Type C1 or C2. Specification has been revised. Refer to Addendum 6, Article 3.
8	144	Many of the sections shown on drawings LD826, LD827, LD829 differ from what is shown on LD911 as well as what is in the table on LD911A. Please clarify which details are correct.	Sizing of walls is included in the LD900 series.
8	145	Please clarify that the use of turbidity curtains as the only means of sediment control has been approved by the USACE under the Owner's project application permit for demolition of the existing esplanade. Please verify that the Owner's permit with the USACE does not require cofferdam(s) to be installed for any demolition of the existing esplanade.	Per the USACE provisional permit (dated March 12, 2020), turbidity curtains will be installed in the East River prior to demolition of the existing East River bulkhead and esplanade. Cofferdams required only for construction of the proposed outfalls.
8	146	Please clarify if the USACE permit applied for under Article B15 of the Special Provisions was exclusively filed for the permanent works denoted on the Contract Drawings and if that permit can be utilized for the Contractor's temporary marine works or not.	The temporary and permanent work covered by the USACE permit is referenced in the provisional permit (dated March 12, 2020).
8	147	Please clarify if the potential barge access locations depicted on the Contract Drawings are to be covered under the Owner's application for USACE permit denoted in B15 and if those barges can be spudded since the Owner has denoted the existing esplanade pier cannot be utilized as mooring for the Contractor's marine equipment.	Barging activities are covered under the permit, with the stipulations noted in the provisional permit as well as any other conditions determined by NYSDEC.
8	148	Please confirm that the cofferdams referenced in the utility drawing notes fall under the USACE permit the Owner applied for in Article B15 of the Special Provisions.	The USACE provisional permit (dated March 12, 2020) includes the cofferdams.

Addendum	Addendum Question No.	Bidder's Question	Response
8	149	<p>Addendum 4; Question 8; sheet 2 of 9; The NYCDCC stated that from January 15th – May 31st, no installation of cofferdams. Additionally, avoid pile work, sheet pile work, and any other in-water work outside of cofferdams from March 1st – June 30th. Please address the following:</p> <ol style="list-style-type: none"> <li>Special Provisions; Article B15 Us Army Corps of Engineers Requirements; paragraph D states pile driving activities that occur during the presence of ESA-listed species, the permittee shall ensure the use of a vibratory hammer. If the use of an impact hammer is practical, 20-minute soft starts will commence. Will the approved Army Corp permit now state no water work unless inside a cofferdam from March 1st – June 30th?</li> </ol>	<p>Contractor shall base the bid on the USACE provisional permit (dated March 12, 2020). Per the USACE provisional permit, the only activities entirely restricted between January 15th and May 31st are the installation of the cofferdams. Other in-water activities are permitted, and must comply with the permit conditions. In addition, any conditions or stipulations required by NYSDEC must be adhered to.</p>
8	150	<p>Addendum 4; Question 8; sheet 2 of 9; The NYCDCC stated that from January 15th – May 31st, no installation of cofferdams. Additionally, avoid pile work, sheet pile work, and any other in-water work outside of cofferdams from March 1st – June 30th. Please address the following:</p> <ol style="list-style-type: none"> <li>The contract documents and specifications do not stipulate any cofferdam installation (other than outfalls) for the demolition or construction of the Esplanade, Cutoff wall, or any other elements of the Waterfront Structure. Will new drawings show the anticipated cofferdams for these activities?</li> </ol>	<p>Per the USACE provisional permit (dated March 12, 2020), cofferdams are authorized for the installation of the outfalls only. Turbidity control requirements are noted in the provisional permit for demolition and construction of the esplanade and cutoff wall. Additional conditions or stipulations required by NYSDEC must be adhered to.</p>
8	151	<p>Addendum 4; Question 8; sheet 2 of 9; The NYCDCC stated that from January 15th – May 31st, no installation of cofferdams. Additionally, avoid pile work, sheet pile work, and any other in-water work outside of cofferdams from March 1st – June 30th. Please address the following:</p> <ol style="list-style-type: none"> <li>Will the new Army Corps permit allow the contractor to perform any in-water activities outside potential cofferdams from January to June? E.g., spudding of barges, movement of barges, material delivery, any work disturbing the mudline such as the cutting of timber or steel piles, or any other requirements for the project?</li> </ol>	<p>Per the USACE provisional permit (dated March 12, 2020), the only activities entirely restricted between January 15th and May 31st are the installation of the cofferdams. Other in-water activities are permitted, and must comply with the permit conditions. In addition, any conditions or stipulations required by NYSDEC must be adhered to.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	152	<p>Addendum 4; Question 8; sheet 2 of 9; The NYDCC stated that from January 15th – May 31st, no installation of cofferdams. Additionally, avoid pile work, sheet pile work, and any other in-water work outside of cofferdams from March 1st – June 30th. Please address the following:                      4. Special Provisions; Article B15 Us Army Corps of Engineers Requirements; paragraph E, O, P, and R explicitly states the requirements of turbidity management for all in-water work. In Addendum 2 issued by the NYC DDC, sheet 666, the agency deleted all in water-sediment control measures. As the contractor is required to abide by the US Army Corps permit stipulations, the agency has removed all specific notes associated with maintaining these requirements. What was the intent of eliminating these notes?</p>	<p>Notes have been removed to avoid contradictory information. Contractor shall follow notes provided on drawings ESC001 to ESC155 and specification section ESCR 9.30.</p>
8	153	<p>Addendum 4; Question 8; sheet 2 of 9; The NYDCC stated that from January 15th – May 31st, no installation of cofferdams. Additionally, avoid pile work, sheet pile work, and any other in-water work outside of cofferdams from March 1st – June 30th. Please address the following:                      5. Please verify that the installation of the proposed cut-off wall is not considered a cofferdam; therefore all work associated with the sheeting wall is excluded from the restrictions outlined in Special Provisions; Article B15 Us Army Corps of Engineers Requirements; paragraph C and D. It is the bidder's understanding that a turbidity curtain is all that is required, but this assumption requires the clarification requested in the previous question.</p>	<p>Per the USACE permit, the installation of the cut-off wall is not considered a cofferdam. The cut-off wall is to be installed largely within the alignment and landward of the existing bulkhead. The sheet piles would be pile driven, initially vibrated down and driven to final tip elevations. All pile driving activities shall be completed in accordance with the requirements of the provisional permit. All other applicable requirements for in-water activities must be adhered to. In addition, any conditions or stipulations required by NYSDEC must be adhered to.</p>
8	154	<p>According Section 564.02010211 – Bridge Hanger Assemblies the strands shall be open spiral strand. Will the contractor be allowed to take into account different type of strands, that meets or exceeds the requirements, such as Full Locked Coil?</p>	<p>Proposals for alternate strand types will be entertained as part of a VECP per the requirements of the S-Pages.</p>
8	155	<p>According ASTM A586 the outer wires shall be provided with Class C weight zinc-coated. Will the contractor be allowed to use Galfan (Zinc-Aluminum coating) instead of Class C zinc? As this product offers a higher corrosion protection and it complies with ASCE 19-16 design code.</p>	<p>Proposals for alternate coatings will be entertained as part of a VECP per the requirements of the S-Pages.</p>
8	156	<p>Ref: Bid Item 202.12003 Removing Superstructure and obstructions. Kindly clarify what work is covered by this item.</p>	<p>Item 202.19 has been added for the substructure removal. Refer to Addendum 6, Article 2 for the current bid schedule.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	157	Drawings LM-300 and LM 500 series show details of various pavements. Kindly clarify the exact pay items for the described pavement base items.	Pay items for pavement types shown in LM300 and LM500 series are included on Paving Detail sheets (LD727, LD728, and LD729).
8	158	With reference to the temporary pedestrian bridge over FDR Drive. Specification section ESCR-HW-901- Temporary Phasing Measures. A. What is the Pedestrian loading required?	The pedestrian Live Load shall be a minimum of 90 psf.
8	159	With reference to the temporary pedestrian bridge over FDR Drive. Specification section ESCR-HW-901- Temporary Phasing Measures. B. Will there be any vehicle loading required. If so, what load rating is required?	No vehicles, other than those utilized by the contractor as part of their normal bridge maintenance (i.e. snow removal, light pole luminaire replacements, etc.) are anticipated to utilize the temporary pedestrian bridge.
8	160	With reference to the temporary pedestrian bridge over FDR Drive. Specification section ESCR-HW-901- Temporary Phasing Measures. C. Will the temporary bridge need to carry any utilities?	The temporary bridge will only require utilities for temporary lighting as applicable.
8	161	Track House : There is no beam schedule and beam CIP's dimensions are not indicated on the drawings. Can you please clarify?	All CIP beams are one size and shown on drawing S513
8	162	Comfort Building : There is no info on " House Trap Pit ". Can you please clarify?	Plumbing House Trap detail is shown on drawing P702 & P705.
8	163	The "Proposed Flow Diversion Structure" that appear on DWG PUD302,303,304,306,307,308 does not have an item number & does not go under any other item. Please provide a pay item for this work	Refer to the Structure Type Schedule, drawings PUD003 and PUD004. Flow Diversion Structure or "FDS" is paid for under item no. PK-ESCR 691 and other related items noted on the table.
8	164	It is unclear to which structures in the parks require a drywell (Item PK-ESCR 405). Please clarify.	Drainage structure nos. STR-4027, STR-6002 and STR-11018 are all Drywells. Additional quantities may be required for site connection permit requirements.
8	165	Detail DS424 for RCP pipes shows that 6" Stone Ballast is required under concrete cradle. Please clarify, under which item this material is covered. Since it is not under items 50.21XXXXXX based on specification section 50.2.1.	Crushed stone bedding (NYCDEP Spec 40.12) shall be deemed included in the prices bid for all contract items of work. No direct pay will be issued for crushed stone under NYCDEP sewers.
8	166	Please clarify location of bid item "6.91 REFLECTIVE CRACKING MEMBRANE (18" WIDE)". Could not locate this item in the drawings.	The cracking membrane can be found on drawings BD209, BT199, BT200 and HW 700. It is also shown on NYCDOT Standard Details of Construction drawings H1034 and H1042A.
8	167	Please clarify if signs for MPT are to be paid under item "6.25 RS Temporary Signs", as seen on bid item list, or under "6.70 MPT" as stated in MPT drawing notes.	Temporary construction signs for MPT are paid under item 6.70 - Maintenance and Protection of Traffic.
8	168	Drawings SM311/SM312 (sheet 81-82) show preloading fill areas where drawings SM303/SM304 (sheet 73-74) do not show any earthwork settlement mitigation plan. Please clarify.	All certain areas, as shown on the drawings, require preloading to reduce future settlement when the site is "formed" for use.

Addendum	Addendum Question No.	Bidder's Question	Response
8	169	Drawing SM311 (sheet 81) shows preloading fill area at S of Delancey Ped Bridge. This fill covers the areas for Ph 1 and Ph2 per phasing plans drawings PH6 and PH16. Please clarify.	The phasing plans are suggested only. The contractor shall submit the specific phasing plan for review and approval. This plan can include adjusted limits as necessary to accomplish the work in accordance with the contractor's planned operations and sequences. Please reference the requirements of Drawing PH001 and the contract specifications.
8	170	Phasing drawings PH010 & PH011 (Reaches I & J) show that 10th St Playground and Basketball Court is open in Phase 1. However the Milestone drawings require us to build the Floodwall in Phase 1. Can you please clarify when the flood wall section 83+50 to 90+00 can be built while this section is open to public?	The floodwall in reaches I and J must be constructed while those reaches are closed. The contractor shall schedule his work accordingly to meet the floodwall milestone date.
8	171	Can you please provide Specification ESCR-7.13 per Note 6 in drawing PH01?	Drawing PH001 has been revised and Note 6 now references specification ESCR-7.13 PK. Refer to Addendum 7, Article 2.
8	172	Can you please identify project area 1.A, 1.B, 1.C which was referred in drawing PH01 for open park amenities? These project areas are not shown in phase drawings.	Drawing PH001 has been revised. Refer to Addendum 7, Article 2.
8	173	SANDRESM2 bid on May 28, 2020. It is now 2 months later and that contract has not been awarded. Documents for SANDRESM1 state Phase 1 Floodwall must be completed by August 1, 2023. Past experience has been that it can take quite some time for award of NYC contracts. This uncertainty places undue risk on the contractor. We propose setting number of calendar days from award for the completion of Phase 1.	Phase 1 completion date has been deleted. Refer to Addendum 6, Article 3.
8	174	Please clarify that the shared access road referenced on Contract Drawing PH001 is not part of the shared path depicted on The LP300 and 400 series drawings and that the shared path is not open to the public until the work in a particular phase is completed.	The shared use path will be closed to the public and available for the contractor's use. However, the contractor must always maintain safe access to open portions of the park across the shared use path as necessary.

Addendum	Addendum Question No.	Bidder's Question	Response
8	175	<p>Please clarify what the intent of notes 3 and 4 on Contract Drawing PH001 under "Pier 42 Construction Access". Specifically Note 4 where the end date of June 2022 is given. This can be interpreted as a Constraint to this contract. Notes 3 and 4 require more detail then coordination with adjacent contractors. For example, is it the Owner's intent to make Pier 42 the priority if they have to close the access road for their sewer work? If that is the intent, we would have to make a new access road somewhere else which would not be accomplished quickly due to the vicinity of this project and the trucking restrictions required on the FDR drive. Clarification is required to the bidders if alternate access will be required at any time the Pier 42 contractor deems necessary or not.</p>	<p>Note 4 was intended to provide current information regarding the time and duration of construction work at Pier 42 only. No alternate access is anticipated during the Pier 42 sewer work. The Pier 42 sewer work is forecast to occur Spring/Summer 2021 and to take a total 5-6 days.</p>
8	176	<p>Please clarify where the Pier 42 contract plans to exit the shared access road. This is required to determine additional gates and/or guards. Clarify that Pier 42 Contract would provide the guards for their gates. Also, clarify that the Pier 42 contract is responsible for all SWPPP requirements with respect to their use of the shared access road. How will this delineation of maintenance be managed? Clarify that is not the intent of the Owner for ESCR to be responsible for any SWPPP or MPT required for the Pier 42 contract.</p>	<p>The Pier 42 contractor will be responsible for its security into and out of its site. The exact locations of the Pier 42 contractor entry point will be determined upon award of that project. The bidders under SANDRESM1 are responsible for all maintenance, etc., of the shared use path in its entirety. It is confirmed that the SANDRESM1 bidder is not responsible for any Pier 42 SWPP or MPT.</p>
8	177	<p>Please reference the OCMC stipulations for this job. Note 2 of the 4/2 draft states that there will only be between 3 and 6 total closures allowed for the FDR Drive. The 3 pedestrian bridges will each require 1 total closure for both the demolition of the existing bridges and the installation of the proposed bridges, which is assumedly the basis for the 6 total allowable nights. Please consider adding 2 additional nights for the installation and removal of the temporary walkway located at the Corlears Hook Bridge, which will also require full closures in order to erect and remove.</p>	<p>The contractor shall request 10 hour and 5 hour FDR Drive roadway closures from OCMC as part of their normal permitting process and as their planned construction operations and sequence requires. The draft OCMC stipulations included as part of the bid package serve to document some of the initial conversations and ground work that has been established as part of the design process.</p>
8	178	<p>Please indicate if a Final OCMC permit will be issued prior to the bid date.</p>	<p>No. The draft stipulations included will not be updated prior to bid. Note that the contractor must obtain all roadway closure permits from OCMC .</p>

Addendum	Addendum Question No.	Bidder's Question	Response
8	179	Please clarify if the Construction Fence (typ.) seen in the MPT Drawings (Pages 2649-2747) are to be paid under bid item 6.70 - MPT (Lump Sum) or bid item 6.34 ACTP. The spec (Page 905 –Volume 3 of Specs) states “No separate payment will be made for Items 6.34 ACT, 6.34 ACTP, 6.34 BCT, 6.34 ADT, and 6.34 BDT; the costs must be included in the price bid for Item 6.70, Maintenance and Protection of Traffic.” What is the purpose of having a separate bid item in bid item list if no payment is supposed to be made?	Item 6.34 ACTP has been removed. Refer to Addendum 6, Article 2.
8	180	Reference Bid Schedule Form page B-71 (Revision #1). Bid Items ESCR-901-SSVS, ESCR-902-SSVS, ESCR-903-SSVS, ESCR-904-SSVS and ESCR-905-SSVS are all ALLOWANCE items for Sub-Slab Venting Systems but no price has been posted to columns 5 and 6. Please clarify.	Item descriptions for items ESCR-901-SSVS, ESCR-902-SSVS, ESCR-903-SSVS, ESCR-904-SSVS, and ESCR-905-SSVS have been updated in the bid schedule. Refer to Addendum 6, Article 2.
8	181	Tug Boat requirements are for the Tug to be provided 24/7 365 on site , and is allowed to be "assigned to Construction", Please confirm that if the tug is making barge moves to and from the waterfront loading facility WF1 to WF2 and is engaged it is considered assigned to construction.	No. The Tug Boat needs to be on site and available at all times. Trips to and from WF1 to WF2 would be considered off site.
8	182	Drawings PH006/7/8 shows the PH2 areas available in Phase 1. However the given area is not enough to have the combi wall done as the stone columns/rigid inclusions, the deadmen sheeting and outfalls need to be completed to achieve MS1 Flood Wall completion. Can you please clarify?	MS1 has been deleted. Refer to Addendum 6, Article 3
8	183	Drawings PH009/10 shows the PH2 areas with the comboi flood wall but the area is not available in PH1. How can MS1 Flood Wall can be completed? Can you please clarify?	MS1 has been deleted. Refer to Addendum 6, Article 3.
8	184	Drawings PH006/7/8 shows the PH2 area second closure available in Phase 1 as 2/1/2023. The milestone 1 early completion date for incentive is June 2. This leaves us 4 months to complete demo, sewer, stone columns/rigid inclusions (with curing/testing), deadmen sheeting and combi wall with anchor ties, and 2 outfalls. Can you please review and revise MS 1 date for incentive and/or closure time frame?	MS1 has been deleted. Refer to Addendum 6, Article 3.

Addendum	Addendum Question No.	Bidder's Question	Response
8	185	REDACTED	
8	186	Specification Section ESCR-7.13 WF-1 States that the Facility is to be capable of accepting all Materials, Equipment and Items related to the project for Inspection, Transfer, and Transportation to and from the Project Site. Is the contractor required to transport all materials to and from the Project Site through this Facility?	No.

Addendum	Addendum Question No.	Bidder's Question	Response
9	1	Please provide the contractor with as-builts for: existing pedestrian bridges, waterfront structures, tennis building, track building, etc. Will the removal of the Historic "Concrete" bulkhead be paid under ESCR-6.27 TC?	Refer to revised drawing G018 in Addendum 9, Article 4. Material added to Appendix A is attached to Addendum 9.
9	2		Drawing WS160 has been revised. Refer to Addendum 9, Article 4. The partial removal of the historic concrete bulkhead for deadman installation is paid under ESCR-6.27 S. For predrilling through historic concrete bulkhead for floodwall installation, use pay item ESCR-552.11 20CB. Refer to Addendum 9, Article 2 for the current bid schedule.
9	3	Cross Section J-1 on sheet no 900 of 2791 (WS6727) refers to the 24" Diameter rock socket to be paid for under Bid Item ESCR-551.24.05RS but when you go to the Platform Detail sheet nos 1002, 1006, 1011 and 1016 of 2791 (WS850, WS860, WS870 & WS800) the various cross sections indicate that this rock socket is to be paid for under Bid Item ESCR-551.30.05RS. Please clarify as to which bid item this 24" Diameter rock socket is to be paid under.	The rock sockets shown on drawings WS850, WS860, WS870, and WS880 are to be paid under item ESCR-551.30.01 RS. Drawing WSG27 has been revised. Refer to Addendum 9, Article 4.
9	4	Please add missing pay item PK-ESCR 1190	Drawing BD207A has been revised to remove reference to item PK-ESCR 1190. Item is not in bid schedule. Refer to Addendum 9, Article 4.
9	5	We did not see anywhere within the contract drawings that shows where Current Bid Item 456 ESCR-551.993.1200 12 IN O.D. X 0.54 IN WALL THICKNESS MICROPILE is used. Please clarify	Item has been removed from the bid schedule. Refer to Addendum 9, Article 2.
9	6	We did not see anywhere within the contract drawings that shows where Current Bid Item 457 ESCR-551.993.1200C PILE LOAD TESTING FOR 12.00 IN O.D. X 0.54 IN WALL THICKNESS MICROPILE - STATIC COMPRESSION TEST is used. Please clarify	Item has been removed from the bid schedule. Refer to Addendum 9, Article 2.
9	7	We did not see anywhere within the contract drawings that shows where Current Bid Item 458 ESCR-551.993.1800 18 IN O.D. X 0.54 IN WALL THICKNESS MICROPILE is used. Please clarify	Item has been removed from the bid schedule. Refer to Addendum 9, Article 2.
9	8	We did not see anywhere within the contract drawings that shows where Current Bid Item 459 ESCR-551.993.1800C 18 IN O.D. X 0.54 IN WALL THICKNESS MICROPILE - STATIC COMPRESSION TEST is used. Please clarify	Item has been removed from the bid schedule. Refer to Addendum 9, Article 2.
9	9	Please refer to the 'Gas Cost Saving Specification' Section (EP-7) located in Volume 3 in this section there is reference made to "UTL-GCS-2W S - GAS INTERFERENCES AND ACCOMMODATIONS" (F.S. Fixed Sum) which is not currently part of the bid 'Bid Schedule' please confirm if this will be added or if was added in error.	Item has been added. Refer to Addendum 9, Article 2 for the current bid schedule.

Addendum	Addendum Question No.	Bidder's Question	Response
9	10	Please clarify that the turbidity curtain requirements denoted in ESCR 6.20.5, E are to be applied to Specification Section ESCR 6.27.4, H as well.	Contractor must install turbidity curtains to meet requirements as specified in contract specifications and permits. The USACE permit (refer to the S-Pages) requires that turbidity curtains will be installed in the East River prior to demolition of the East River bulkhead and esplanade in order to contain debris and turbidity. As noted in response to PBQ 11 below, contractors should be advised that there may be additional conditions attached to the forthcoming NYSDEC Section 401 Water Quality Certification or waiver.
9	11	Please make available to the bidders the USACE permit referenced in Article B15, US Army Corps of Engineers Requirements. As the Owner is aware, the requirements outlined by the USACE can change from those applied for and would in turn create impacts to the bidder's pricing/scope.	DDC submitted a Joint Permit Application to USACE and DEC. In response to the application, USACE issued a provisional permit (3/12/2020), refer to the S-Pages. The USACE provisional permit is conditional on receipt of the NYSDEC Section 401 Water Quality Certification or waiver, which has not yet been received. The contractors are advised that there may be additional conditions attached to the forthcoming NYSDEC water Quality Certificate which must be adhered to. DDC and NYC Parks followed up with NYSDEC in late August regarding the status of the permit determination and are still awaiting a response.
9	12	Will the contractor be allowed to substitute resin instead of zinc in the sockets if they can prove it meets or exceeds the requirements?	Proposals for alternate socket types will be entertained as part of a VECP per the requirements of the S-Pages.
9	13	All the details for the park catch basins and manholes (DWG PUD706 & City of NY Parks & Recreations Sheet No.2), show brick masonry around the structures. However, for item PK-ESCR 691 (Brick/Precast for drain Structure) the specifications clearly say, "Brick Masonry drainage structures shall not be permitted for this contract". Please clarify, will the bricks be used according to the details or will it not be used according to the specifications.	Specification has been revised, refer to Addendum 6, Article 3.
9	14	Drawings PCS-304 show Launching and Receiving Pits. Please provide pay items for the components of this work.	Cost included under item ESCR 50.61C42D66. See revised drawing PCS304. Refer to Addendum 9, Article 4.
9	15	There are 3 Clear and Grub Items. Kindly clarify what work ESCR 6.01AC and PK ESCR 190 refer to.	Item PK-ESCR 190 has been removed. Refer to Addendum 9, Article 2 for the current bid schedule. Item 6.01 AC is used to clear along the flood wall alignment as shown on the plans and along the East River Housing parking lot. Item ESCR 6.01 AB is used to clear large areas of existing park as shown on the park demolition drawings and respective specifications.
9	16	Comfort Building : There is no info on arch drawings with regards to Finish on the roof. Structural drawings is referring to arch drawings for Finish on the roof but there is no info available on the arch drawings. Can you please clarify?	Roof type shall be RS-01 Fluid Applied Membrane Roofing (Specification section 07 55 56). See revised drawings A-750.00 to A-752.00. Refer to Addendum 9, Article 4.
9	17	Please provide the dwg for pay item 6.34 AB Chain Link Fence 4' High	Item 6.34 AB has been deleted. Refer to Addendum 9, Article 2.
9	18	Please provide the dwg for pay item 6.34 ACP Temporary chain link fence 6' high ( with top and bottom rail and posts mounted to the steel plates )	Item 6.34 ACP has been deleted. Refer to Addendum 9, Article 2 for the current bid schedule.
9	19	Please provide the dwg for pay item 6.34 AD Chain Link Fence 8' high	Drawings with item 6.34 AD include FG138. Refer to Addendum 9, Article 4.

Addendum	Addendum Question No.	Bidder's Question	Response
9	20	Please provide the drwg for pay item 6.34 BD Chain Link Fence Gate for 8' High Fence	Drawings with item 6.34 BD include FG138. Refer to Addendum 9, Article 4.
9	21	Please provide the dwg for pay item PK-ESCR 712 Chain Link Fence 8' HT ?	Item PK-ESCR 712 has been removed. Refer to Addendum 9, Article 2. Use item PK-305. See details 1-19, page 29 of the standard NYC Parks details.
9	22	Please provide the dwg for pay item PK_ESCR 802 A Steel Fence W Climbing Protection 6' HT ?	See Detail 1 on revised drawing LD830 and revised drawing LM525. Refer to Addendum 9, Article 4.
9	23	Please provide the dwg for pay item PK-ESCR 941 Galvanized Steel Chain Link Fence 4'HT?	Drawings with item PK-ESCR 941 include LD830, on Detail 10. The current version of LD830 is included in Addendum 9, Article 4.
9	24	RE: Drawing PDP 107, note9. We cannot locate payment Item 6.01AB. Kindly identify.	Payment for "Clearing and Grubbing" is under Item ESCR 6.01 AB.
9	25	We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - MPT".	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	26	a. 6.82 A REMOVING EXISTING TRAFFIC AND STREET NAME SIGNS We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - MPT".	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	27	b. 6.82 B REMOVING EXISTING TRAFFIC AND STREET NAME SIGN POSTS We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - MPT".	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	28	c. 6.83 AA FURNISHING NEW NON-REFLECTORIZED TRAFFIC SIGNS We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - MPT".	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	29	d. 6.83 AB FURNISHING NEW TRAFFIC SIGN POSTS We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - MPT". e. 6.83 AR FURNISHING NEW REFLECTORIZED TRAFFIC SIGNS	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.

QUESTIONS SUBMITTED BY BIDDERS AND DDC'S RESPONSES

PROJECT ID: SANDRESM1

Addendum	Addendum Question No.	Bidder's Question	Response
9	30	We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - IPT". f. 6.83 BA INSTALLING TRAFFIC SIGNS	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	31	We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - IPT". g. 6.83 BB INSTALLING TRAFFIC SIGN POSTS	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	32	We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - IPT". h. 6.86 AA FURNISHING NEW STREET NAME SIGNS	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	33	We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - IPT". i. 6.86 AB FURNISHING NEW STREET NAME SIGN POSTS	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	34	We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - IPT". j. 6.86 BA INSTALLING STREET NAME SIGNS	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	35	We could not locate plan or schedule for furnish and install of permanent signs. Please clarify bid items below and their location. These items seem redundant if all sign work is supposed to be paid under "6.25 RS Temporary Signs" or "6.70 - IPT". k. 6.86 BB INSTALLING STREET NAME SIGN POSTS	See revised notes on drawings LLP500, LLP503, LLP508, BC174, BD207, BD207A, and BT197. Refer to Addendum 9, Article 4.
9	36	Please clarify payment for the temporary signs used for the "Greenway Rerouting Plan" (Dwg TC 102/Sheet 2652. Notes state signs should be paid under item "ESCR 6.25 GS Install Temp. Signs Greenway Reroute Plan" and "ESCR 6.25 GSX Remove Temp. Signs Greenway Reroute Plan" but bid items do not exist.	Follow Note 4 on drawing TC102. Greenway rerouting signs are paid under item 6.70. The current version of TC102 is included in Addendum 2, Article 2.
9	37	Please provide pile detail under chambers 51.11C0110A and 51.11C0110B on drawing BT195.	Drawings BT195, BT203 and BT204 have been revised. Refer to Addendum 9, Article 4.
9	38	Pay Item PK-ESCR 937 D (9,463 CY) is indicated as NIC in drawing LSL-700 (sheet 1734). Please clarify.	Details identified as NIC are not in SANDRESM1 contract. Pay item PK-ESCR 937 D is included in other details, locations, and conditions and is included in SANDRESM1 contract.

Addendum	Addendum Question No.	Bidder's Question	Response
9	39	Referencing Corlears Hook Bridge, Sheet 117 of 2791, Section (Typical Deck) shows 1"x1" Chain Link Fencing (Item No. NYC-607.064 AD). We do not see this item on the Bid Schedule Form. Please clarify.	Item number is NYC180002. Drawing BC107 has been revised. Refer to Addendum 9, Article 4.
9	40	Sht 2069/drawing PUE 308 calls for 4 Water Play Activator Bollards that will be paid under item PK-ESCR 618. Details of the system can be found on sheet PUP 321/ PG 2162. The pay item is not in the bid item list, please clarify.	Item PK-ESCR 618 has been added. Refer to Addendum 9, Article 2 for the current bid schedule.
9	41	Please clarify the location of Bid Items 4.04AC, 4.05A and 4.05BX for concrete pavement.	Drawings with item 4.05 BX include BT199. Item 4.04 AC is now only included in the Con Edison scope (refer to the JB-Pages) and 4.05 A has been deleted from the bid schedule.
9	42	Please clarify the location of Bid Items 4.01RAE, 4.02AB-R&4.02CB for Asphalt Pavement.	Item 4.02 CB is for temporary trench restoration per NYCDOT Standard Drawings H-1053 and H-1054 and drawing FG245. Drawings with item 4.02 AB-R include FG245. Item 4.01 RAE has been deleted from the bid schedule. Refer to Addendum 9, Article 2.
9	43	Please issue all historic borings as shown on the contract documents and final subsurface investigation reports.	Refer to revised drawing G018 in Addendum 9, Article 4. Material added to Appendix A is attached to Addendum 9.
9	44	Volume 1 of 3 Bid Booklet: ESCR-552.11 38 CW, PK-667, PK-ESCR 646. These items are located in the contract bid schedule but not in Contract Drawings. Please provide direction.	ESCR-552.11 38 CW has been removed. Refer to Addendum 9, Article 2 for the current bid schedule. Drawings with item PK-667 include PUD001-PUD003. Drawings with item PK-ESCR 646 include PUP302, PUP305, and PUP307.
9	45	Will the Department of Buildings have jurisdiction for this project and what NYCDOB requirements are attached to this contract?	NYCDOB/SBS will monitor or be responsible for all work types filed with them including, but not limited to, the site work, bulkhead work, landscaping, grading, etc.
9	46	Vol. 3 of 3; page S-70 states Special Inspections by the NYCDOB. What inspections are required by the NYCDOB?	Inspections will be performed based on work type. All applicable NYCDOB and SBS requirements will apply.
9	47	Vol. 3 of 3; page S-73 states NYC Department of Buildings will continue to enforce the NYC Building Codes and approve building permit applications. Will the responsibility of the NYCDOB only adhere to the construction of the proposed buildings?	NYCDOB/SBS will monitor or be responsible for all work types filed with them including but not limited to the site work, bulkhead work, landscaping, grading, etc.
9	48	The owner has provided pay items ESCR-2.AO, ESCR-2.FDO, and ESCR-2.GCO for jet grouting obstructions. Will other ground improvements and foundation items receive obstruction pay items?	New specification Section ESCR 203 and new items ESCR-203.12 PVD and ESCR-203.99 DSM have been added. Drawings SM305 to SM309 have been revised. Refer to Addendum 9, Article 2; Addendum 9, Article 4; and Addendum 9, Article 3.

Addendum	Addendum Question No.	Bidder's Question	Response
9	49	<p>Vol.3 of 3; Specification 5.1-Rigid inclusions has conflicting information. Initially all the cost for obstruction drilling is on the contractor (FW-94). (FW-100) states the contractor will be paid for abandoned rigid inclusions for obstructions. (FW-101) Removal of obstruction shall be paid under the obstruction rate. (FW-105 and FW-106) provide obstruction payments and bid item for Obstruction Removal for Rigid Inclusions. Please clarify</p>	<p>See revised specification section ESCR 5.1 for details to address obstructions. Refer to Addendum 9, Article 3.</p>
9	50	<p>Vol. 3 of 3; ESCR 552-Steel Sheet piling requires predrilling for the waterfront structure and the floodwall piling. The contractor is also expected to remove any bulkhead that interferes with the floodwall. Will the contractor be paid under ESCR-6.27 TC for removal of timber cribbing rock-filled bulkhead, when piles encounter obstructions? Contract drawings state the contractor should anticipate predrilling for 30% of the cutoff, before installation. Does that factor apply to the entire cutoff wall?</p>	<p>The assumed 30% predrilling is for piles along the waterfront, not in locations of timber cribbing. Refer to WS110 series for where the predrilling factors apply. Any elements of the existing bulkhead that need to be removed are part of the corresponding esplanade type demolition numbers shown on WS140-WS149. Contractor shall assume 100% predrilling when timber cribbing is shown (VIF) within the park to install floodwall. Work to install piles in timber cribbing is entirely covered by the pile installation numbers. ESCR-6.27 TC is only used for partial demolition of the timber cribbing for tie rod or deadman installation and is shown on WS162.</p>
9	51	<p>Waterfront structure demolition and construction plans/details do not show existing rip rap in between existing timber piles. Addendum #03 as-builts clearly note rip-rip was placed. Will the rip -rap need to be removed prior to installation of the proposed cutoff wall. Was any rip rap removed during the 2004 - Reconstruction of Bulkheads and Relieving Platforms project? What pay item is associated with rip rap removal.</p>	<p>The 1940 drawing shows rip rap. However it is not certain if this was a design or an as-built document. Also the 2012 era as-builts, along with our inspections, observations and geotechnical investigations do not indicate the existence of any riprap beneath the platform. This, however, does not mean it does not exist. It may simply be covered by river sediments. Due to this uncertainty, a pay item will not be provided specifically for rip rap removal. The contractor shall cover the costs to remove what ever material may be found within the current items provided in the contract.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
9	52	<p>Reference: Houston Street Bridge, Drawings BH117, 119 &amp; 120, Sheets 514, 516 &amp; 517, Walls W10, W11, and W12 Sections B1/BH117, B2/BH117 and C/BH117. As per Drawing BH117, Section B shows work from STA. H104+04 to H107+37.11 and STA. H108+27.11 to H113+19 (Walls W7, W8, W9, W12, W13, W14, W15W16, W17) and Section C shows work from STA. H107+11 to H108+27.11 (Wall W11).</p> <p>a) On Drawing BH119, Wall W10, are shown sections B1/BH117 and B2/BH117 and on these sections, parapet is shown above top of grade, as continuation of 1'-0" structural wall. However, parapet is not shown on Drawing BH119 (Wall W10) and in continuation on Drawing BH120, (Wall W1) is shown Section C/BH117 (STA. H107+37.11 to H108+27.11) without parapet and top of wall and top of grade are the same. Please clarify.</p> <p>b) On Drawing BH120, Wall W12, in first +/-46'-0" of wall length from STA. 108+27.11 is shown section B/BH117, including Top of Grade and Top of Wall and Top of Parapet is not shown. Top of parapet is shown after Match Line G-G. Per Section B/BH117, parapet is shown above top of grade, as continuation of 1'-0" structural wall. Please clarify.</p>	<p>a) For sections B1 and B2 on BH117, parapet details were removed in accordance with "Detail 1" on BH102 and wall W10 on BH119. For wall W11 on BH120, top of proposed grade and top of wall are the same as they meet the elevation of the existing Houston Street Bridge. Stationing limits for B1 and B2 have been provided. Note 5 has been added to BH 101 to clarify the non-parapet limits. Refer to Addendum 9, Article 4.</p> <p>b) For this portion of the wall W12, see "Detail 1" on BH102, which applies to STA. H106+68.11 to H107+37.11 and H108+27.11 to H108+79.18. Refer to Addendum 7, Article 2.</p>
9	53	<p>Reference: Houston Street Bridge, Drawings BH102, BH119, Sheets 499, 516, Walls W10 and W12, Detail 1/BH102, Sections B/BH117 and B2/BH117. Detail 1/BH102 B shows work from STA. H106+68.11 to H107+37.11 (Wall W10) and STA. H108+27.11 to H108+79.18 (Wall W12). However, on Drawing BH119, at Wall W10 are shown Sections B1/BH117 and B2/BH117, and at Wall W12 is shown Section B/BH117.</p> <p>a) Start and End Stations of wall W10 and work shown on Detail 1/BH102 does not show same work and stations shown on Sections B1 or B2. Please clarify if referenced Start and End wall stations are correct, why different Sections are shown, why parapet is shown on Section B/BH117 and not on Detail 1/BH102?</p> <p>b) Start and End Stations for Wall W12 are the same as on Section B/BH117 but work shown on Section B/BH117 and Detail 1/BH102 are not the same. Please clarify why parapet is shown on Section B/BH117 and not on Detail 1/BH102?</p>	<p>a) See response to PBQ 52 above.</p> <p>b) The parapet detail on section B on BH117 is marked as "varies". Therefore, this detail is consistent with stationing provided for "Detail 1" on BH102.</p>
9	54	<p>Reference: Houston Street Bridge, Drawing BH102, Section B/BH101, Detail 1. Texts on drawing BH102 and Proposed Section B/BH101 reads: "See Detail 1" and "2" premoulded joint filler at 68F (cost to be included under Item 569.03". Please clarify if Detail 1 2" Joint with elastomeric concrete header, provided on drawing BH117, is Detail 1 referenced on Section B/BH101 and A/BH101?</p>	<p>Detail 1 on BH117 is referenced to by Section C on BH103, as noted.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
9	55	<p>Reference: Houston Street Bridge, Retaining Wall Elevation and Footing Plans, Drawings BH112 through BH116, Sheets 509 through 513, and Retaining Wall Reinforcement Details, Drawings BH118 through BH121, Sheets 515 through 518. A) Texts with arrow on Retaining Wall Reinforcement Details drawings, walls W12, W13, W14, W15, W16, W17, W18 and W19 reads: "Approx. Existing Grade". However, above referenced texts does not match Approx. Existing Grade shown on Retaining Wall Elevation and Footing Plans. Please clarify. (a) Approx. Existing Grade is not shown for Wall W6. Please provide missing information.</p>	<p>a) Refer to drawings BH112 through BH116 for location of approximate existing grade. Drawings BH118 through BH121 have been revised to show the correct location of approximate existing grade. Refer to Addendum 7, Article 2 and Addendum 9, Article 4.</p> <p>b) Approximate existing grade are provided for walls W5 and W6 on drawings BH112, BH113, BH118, and BH119.</p>
9	56	<p>Reference: Houston Street Bridge, Drawing BH110 &amp; 102, Sheets 507 &amp; 499. Note No. 2 on drawing BH110 reads: "For limits of Select Structural Fill, Item 203.21, refer to typical sections on drawings BH102 and BH103". Referenced sections does not show limits of Select Structural Fill. Please clarify.</p>	<p>Please see response to PBQ 84 below.</p> <p>Note 2 on drawing BH110 has been revised. Refer to Addendum 9, Article 4.</p>
9	57	<p>Reference: East 10th Street Staircase Reinforcement, Drawing BT158, Sheet 408. Note 2 on drawing BT158 reads: "See Drawing BT118-BT123 for adjoining West Ramp drawings and details". Deck reinforcing is not shown on Stair Reinforcement Section and not on above referenced West Ramp drawings. Please clarify.</p>	<p>Reinforcement is shown on revised drawing BT129. Refer to Addendum 9, Article 4.</p>
9	58	<p>Reference: Waterfront Esplanade, Drawings WS680 through WS683, Sheets 921 through 924. Note No. 2 on drawings WS680-WS682 and Note No. 1 on drawing WS683 reads: "Refer to sheet WS790-WS794 for top and bottom elevations of esplanade retaining wall". However, top elevations of retaining walls are shown on drawings WS790-WS794 but bottom elevations are not. Please clarify.</p>	<p>Drawings WS790 to WS794 have been revised to include Note 1 for bottom elevations. Refer to Addendum 9, Article 4.</p>
9	59	<p>Reference: Waterfront Esplanade Deck Typical Reinforcement Plans, Drawings WS530 through WS538, Sheets 863 through 872. Note No. 1 on drawings WS530-WS538 reads: "A partial deck plan is shown and is typical to all one (and/or two, and/or three) span units supported on three (and/or five, and/or six) girders ... and/or five (nine) hollow slab units. Refer to sheets WS539A to sheets WS539H for partial plan locations". However, nothing has been shown on drawings WS539A-WS539H. Please clarify.</p>	<p>Drainage plans are shown no revised drawings WS539A through WS539H. Refer to Addendum 9, Article 4.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
9	60	<p>Reference: Waterfront Esplanade, Waterproofing membrane. Per Addendum No. 3 drawings WS730 and WS731 Waterfront Esplanade Expansion Joint Details Sheet 1 and 2, are replaced with new drawings. Per new details waterproofing membrane has been deleted from Transverse Expansion Joint at Pile Caps between the Esplanade Spans details but is still shown on drawing WS761 Cut-off Wall Details Sheet 12 of 17 and on Waterfront Cross Sections (drawings WS600 to WS629). Please clarify and please confirm that bid item quantity of waterproofing membrane is correct?</p>	<p>Waterproofing is not specifically called out on the joint drawings. However, it is applied to the entire deck and the bid item is correct. Refer to drawing WS691B for waterproofing details. Drawings WS730, WS731, and WS761 have been revised to include reference to WS691B for waterproofing membrane details. Refer to Addendum 9, Article 4.</p>
9	61	<p>Reference: One Span Unit – AASHTO Beams – Girders, Drawings WS533 &amp; WS682, Sheets 866 &amp; 923. Per drawing WS533 Typical Partial Deck Reinforcing Plan for One Span Unit – AASHTO Beams – 5 Girders out to out deck width is 39'-1" including 10'-5" deck extension. Per drawing WS682 typical spacing for Type V beams and Type I beams is 6'-8". Deck extension of deck with five (5) AASHTO Type I Beam Girders is 10'-5" and out to out deck width is 39'-1". However, per drawing WS682, deck extension of deck with five (5) AASHTO Type V Beam Girders is 9'-2" and out to out deck width is +/-37'-9". Please clarify if deck extensions shown on drawing WS682 are correct and if out to out deck widths for deck with Type V and I Beam Girders should be the same?</p>	<p>9'-2" was corrected to 10'-5" on drawing WS682 in Addendum 5, Article 3. Out-to-out deck width shall be the same for Type 5 and Type 1 girders.</p>
9	62	<p>Reference: Two Span Unit and Three Span Unit– AASHTO Beams – Girders, Drawings WS534, WS535 &amp; WS682, Sheets 867, 868 &amp; 923. Per drawing WS534 and WS535 Typical Partial Deck Reinforcing Plan for Two and Three Span Unit – AASHTO Beams – 5 Girders out to out deck width is 39'-1" including 10'-5" deck extension. However, per drawing WS682, deck extension of deck with five (5) AASHTO Type V Beam Girders is 9'-2" and out to out deck width is +/-37'-9". Please clarify if deck extension shown on drawing WS682 is correct and what is correct out to out deck widths for two and three span unit deck with five (5) Type V Beam Girders?</p>	<p>9'-2" was corrected to 10'-5" on drawing WS682 in Addendum 5, Article 3. 39'-1" is correct width out-to-out for the (5) Type V Beam Girders.</p>
9	63	<p>Reference: Drawing WS761 Cut-off Wall Details Sheet 12 of 17 Detail No. 2, on Drawing WS761 shows waterproofing membrane installed on face of proposed pile cap. Please clarify if this is correct and provide vertical installation limits of waterproofing membrane?</p>	<p>Drawing WS761 is correct in showing the waterproofing membrane installed on the face of the proposed pile cap. The latest version of the drawing references further detail on drawing WS691B. Drawing WS691B has been revised to show vertical installation limits. Refer to Addendum 9, Article 4.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
9	64	Reference: Drawing W5761 Cut-off Wall Details Sheet 12 of 17. Per Drawing W5761, Details No. 2 and No. 3, payment for 6"x14"x1" stainless steel bent plate, 6"x1" PTFE plate attached to deck, stainless steel epoxy anchors, 12"x1" stainless steel plate with 7/8" anchor studs is to be included under Item No. 565.14200008 NON-GUIDED POLYTETRAFLUORETHYLENE (PTFE) SLIDING BEARING. However, on Waterfront Cross Sections, drawings W5611, W5612, W5613, W5614, W5615, W5616, W5621, W5624, W5625, W5626, W5627 payment is to be made under Item No. ESCR-567. LG. Please clarify?	Drawings W5611 to W5616, W5621, and W5624 to W5627 have been revised to show item no. 565.14200008 for this type of sliding joint. Refer to Addendum 9, Article 4.
9	65	Please provide pay item 551.30 RS for 24" rock sockets at L-Wall locations	The rock sockets shown on drawings W5850, W5860, W5870, and W5880 are to be paid under item ESCR-551.30.01 RS.
9	66	Please define limits of interlock sealant for Flood Wall. Is it the intent to provide a interlock sealant for the entire floodwall?	The interlock sealant extents are shown on drawings W5305 through W5307. The interlock sealant is only required in parts of Reach H and Reach I & J.
9	67	Sheet 1025; Please define locations for Piers 13A, 13B, 13C, 14D, 14C, 14B, and 14A.	Drawing W5903 has been revised to show stationing and include correct pile designations matching drawing W5810 to W5818. Refer to Addendum 9, Article 4.
9	68	As described in Note 7; Sheet 1024. What sequence does the contractor follow for installation of anodes in the proposed embayment area	Note 5 on drawing W5900 has been revised to address order of preference for installation of anodes at the proposed platforms. Refer to Addendum 9, Article 4.
9	69	Sheet 1024; Bonding rod weld detail pipe cutoff wall. Does this state to weld a 3/8 bonding rod at every interlock for 36" combo wall.	Yes, the 3/8" bonding rod is applied at every interlock for the 36" continuous pipe pile wall. The adjacent detail for "SEAM WELD BONDING" is for the combo wall. Note 7 has been added to drawing W5902 to allow for alternative methods as approved by Engineer. Refer to Addendum 9, Article 4.
9	70	Sheet 1024; 3/8 x 2" bonding strap. Is this strap flat braided? Are there any specifications for the 3/8 x 2" banded strap?	No, the 3/8"x 2" bonding strap is a solid steel flat bar.
9	71	Sheet 1025; Please define locations for Piers 98A, 98B, 98C, 98D, 99D, 99C, 99B, and 99A	Drawing W5903 has been revised to show stationing and include correct pile designations matching drawing W5810 to W5818. Refer to Addendum 9, Article 4.
9	72	What is the design load (psf) for the pedestrian traffic on the Temporary Corlears Hook Bridge? Also, specify if the temporary bridge is to be outfitted with handrails or not.	Section ESCR-HW-901 has been revised. Refer to Addendum 9, Article 3.
9	73	As described in Note 7; Sheet 1024. What sequence does the contractor follow for installation of anodes on existing 3 pile piers	Note 5 on drawing W5900 has been revised to address order of preference for installation of anodes at all piers, including 3 pile piers. Refer to Addendum 9, Article 4.
9	74	As described in Note 7; Sheet 1024. What sequence does the contractor follow for installation of anodes on proposed 6 pile piers	Note 5 on drawing W5900 has been revised to address order of preference for installation of anodes at all piers, including 6 pile piers. Refer to Addendum 9, Article 4.

Addendum	Addendum Question No.	Bidder's Question	Response
9	75	Please indicate if the abutments are to be considered "Mass Concrete," for the Corlears Hook Bridge.	Abutment stem walls are mass concrete.
9	76	There are two callouts on Sheet BC119, in Details "B" and "D" for Bid Item 555.02000001. Please confirm if this should be 555.09.	Foundation concrete is paid under item no. 555.08. The abutment stem is paid under item 555.02000001.
9	77	Please indicate which Bid Item the approach slabs are paid under for the Corlears Hook Bridge, as displayed on Sheet BC149.	Item 557.2001 is for approach slabs
9	78	Please indicate which Bid Item the concrete wall will be paid for according to Sheet BC119A, Detail A.	Item 555.09
9	79	Please indicate what types of reinforcing bars are required according to Sheet BC119A, Detail A.	Epoxy coated reinforcing bars, item 556.0202
9	80	Please indicate what pay item the parapets across the bridge will be paid under in accordance with Sheet BC140, Detail C.	Item 569.03
9	81	Please Reference excavation limits given on Sheet BC110 in regard to Bid Item 206.01. The excavation limits only account for the removal of the existing West Abutment and West Wing Walls. Please provide excavation limits for the proposed Southwest Wing Wall, as well as the proposed retaining wall.	Drawings BC110 and BC111 have been revised. Refer to Addendum 9, Article 4.
9	82	Please Reference excavation limits given on Sheet BC110 in regard to Bid Item 206.01. In order to remove the existing East Abutment, it will be necessary to excavate the surrounding area. Please confirm that this excavation will be paid for under Bid Item 206.01. If this work is to be paid under Bid Item 206.01, please provide excavation limits for the abutment and wing walls.	Pay item 206.01 shall be used for this excavation. Drawings BC110 and BC111 have been revised to show excavation limits. See drawing BC119A for retaining wall excavation limits. Refer to Addendum 9, Article 4.
9	83	This contract calls for Bid Item 619.70040011, as shown on Sheets BD100 and BT100. This bid item does not appear in the NYS DOT Standard Specifications. Please provide the correct bid item number for temporary protective shielding.	Refer to Addendum 6, Article 3.
9	84	Reference is made to Bid Item 203.12 for the Houston Street Bridge, as indicated on Sheet BH109. This structural fill is called out as fill to be placed within the excavated area as defined by the horizontal limits displayed on this sheet. Due to the vertical raising of this ramp, please indicate if this bid item is to be utilized as backfill for the ramp itself. Please provide vertical limits of the proposed backfill for this ramp.	The select structural fill has been replaced with backfill item ESCR-4.11 CA. Drawings BH109 and BH110 have been revised. The SM series drawings show fill limits above existing grade. Select fill callouts on drawing BH102 and BH103 have been removed. Refer to Addendum 9, Article 4.
9	85	Please reference Bid Item 557.0101. This bid item does not appear in any of the drawings. Please indicate what this bid item pertains to.	Deck slab is accounted for in item 557.0109. Item 557.0101 has been removed. Refer to Addendum 9, Article 2
9	86	Please reference Bid Item 559.90010011. This bid item does not appear in any of the drawings. Please indicate what this bid item pertains to.	Please see revised Construction Note 1 on drawings BD001 and BT001. Refer to Addendum 9, Article, DR.
9	87	Please reference Bid Item 564.0503. This bid item does not appear in any of the drawings. Please indicate what this bid item pertains to.	Item 564.0503 has been removed from the bid schedule. Refer to Addendum 9, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
9	88	Please reference Bid Item 203-20. Please confirm if this bid item is utilized only at the East Abutment at the Delancey Street Pedestrian Bridge and the East 10th Street Pedestrian Bridge, shown on Sheets BD130 and BT124 respectively.	Correct.
9	89	Please reference Bid Item 564.0502. The structural steel framing for the arch girder on the Corlears Hook Bridge was paid under this item, but the Delancey Street Bridge and East 10th Street bridge have the arch framing paid under 564.0501. Please indicate if this is correct, and please consider revising the bid quantities accordingly.	Please see responses to pre-bid questions 21 and 22 in Addendum 5, Article 4.
9	90	Please reference Bid Item ESCR-13.BRDG. The bid item quantity appears to be significantly too high for the areas given on sheets BT176, BT177, BD189, BD190, and BC155. Please indicate if this bid item is utilized anywhere else.	Item ESCR-13.BRDG is also used to identify the Architectural Concrete Textured Finishes along the Houston Street Retaining Wall as shown on drawings FW305 to FW306. Drawing FW001 has been revised to clarify the scope of the bid items associated with the Houston Street Retaining Wall. Refer to Addendum 9, Article 4.
9	91	Significant obstruction drilling will be required to install all the wick drains. Please provide a pay item for the obstruction drilling similar to the jet grouting items.	New specification Section ESCR 203 and new items ESCR-203.12 PVD and ESCR-203.99 DSM have been added. Drawings SM305 to SM309 have been revised. Refer to Addendum 9, Article 2; Addendum 9, Article 4; and Addendum 9, Article 3.
9	92	Drawing PCS304A, Secant Pile Construction, Note 4.1 requires "temporary casing to be installed using internal liquid fluid flush duplex drilling method." Please confirm conventional sectional steel casing and single rotary/kelly drilling methods will be considered acceptable for casing installation and soil excavation.	Alternative drilling methods will be considered during shop drawing review based on the contractor's SOE plan.
9	93	Drawing PCS304A, general note 4, references a geotechnical engineering report prepared by AKRF. Please provide the referenced geotechnical report.	Refer to revised drawing G018 in Addendum 9, Article 4. Material added to Appendix A is attached to Addendum 9.
9	94	Please provide the tieback anchor design loads for anchors at both the Microtunnel Launch and Receiving Pits at East 10th Street.	Design load is 80 kips. See general note 3.2 on drawing PCS304A under tie back anchor testing for more details.
9	95	Sheet 484 references #11 grade 75 bar for the tieback anchors. It is normal construction practice to utilize grade 150 bar for tieback anchors. Please confirm the size and grade of the tieback anchor denoted is correct.	It is designed for a grade 75 bar. Drawing PCS304A (sheet 484) reference is correct.
9	96	There are existing utilities nearby to the excavations for the Launch and Receiving Pits at East 10th Street. Please reconsider and/or confirm the angle of installation for the tieback anchors to avoid impacts.	Contractor's tiebacks are intended to be installed below any existing utilities.

Addendum	Addendum Question No.	Bidder's Question	Response
9	97	Sheet 623; Record Borings; Boring P1A-1 shows hard to very hard schist at elevation -8 to -8.5. This area requires A46 steel sheeting to be installed only using the press in method. Please provide guidance on how the contractor will install sheeting through rock, only using the press application.	The press-in method for installing the sheet piling was specified to minimize the vibrations and noise generated from the installation process, such that the work does not affect nearby structures and utilities. Special measures (such as driving shoes, auguring, water jetting, etc.) are available when encountering obstructions or difficult driving conditions. Contractor shall refer to specification Section ESCR-552 and evaluate options as appropriate.
9	98	"Discrepancy noted for pay item number ESCR 4.25 RW – recovery well installation – between specifications descriptions and Bid Schedule Form: <ul style="list-style-type: none"> <li>• Bid schedule form gives description of "recovery well installed to 35 feet below grade" for this pay item (see seq. no. 0428 on page B-58)</li> <li>• Specifications, volume 3, gives of "recovery well installed to 60 feet below grade" for this pay item (see page HAZ-10 of volume 3 of specifications)</li> </ul> We are therefore requesting confirmations of the appropriate description for pay item ESCR 4.25 RW – should it be "35 feet below grade" or "60 feet below grade"?"	Item ESCR-4.25 RW has been replaced with ESCR-4.25 RW60 with the description "RECOVERY WELL INSTALLED TO 60 FEET BELOW GRADE". Refer to Addendum 9, Article 2.
9	99	Please provide locations of item 70.11TT- Timber Piles (Treated).	Item 70.11TT has been removed. Refer to Addendum 9, Article 2 for the current bid schedule.
9	100	Reference: Waterfront Esplanade, Miscellaneous Pile Cap Details, Sheet 2 of 2, Drawing WS514, Sheet 854. Note at Backwall Section for Pier Type A reads: "#6 @ 6" embedded 2'-0" into pile cap with HILTI HIT-RE 500 V3 epoxy (Typ.) Item No. 565.0201." This item is not part of the bid breakdown. Please clarify.	Drawing WS514 has been revised to include the correct item 586.0201 for this work. Refer to Addendum 9, Article 4.
9	101	Reference: Waterfront Esplanade, Miscellaneous Pile Cap Details, Sheet 2 of 2, Drawing WS514, Sheet 854, Typical Sections, Sheet 1 of 8, Drawing WS660, Sheet 913, and Structural Elevation, Sheet 1 of 12, Drawing WS450, Sheet 836. As per Drawing WS514 and WS660, thickness of proposed conc. deck slab at Pier Type A is 9" min. or 10". However, per Drawing WS450 thickness of proposed conc. deck slab at Pier Type A is 6". Please clarify.	Deck callout has been revised on drawings WS450, WS451, and WS452. Refer to Addendum 9, Article 4
9	102	Please provide as built plans for the existing Amphitheater Building.	The list of Appendix A materials referenced on drawing G018 has been updated. Refer to Addendum 9, Article 4. New materials are provided with Addendum 9.
9	103	On sheet 1429 there is a portion of the existing Williamsburg Bridge West security bollards indicated to remain "Protect existing bollards and foundation to remain along west side of bridge piers" this contradicts what is shown on sheet 2200 which shows all of the existing bollards be demolished. Please advise which plans are to be followed.	Drawing PDD109 (sheet 1429) covers Reach J and shows the demolition of existing park drainage and sanitary structures. The Williamsburg Bridge is in Reach E. This drawing does not show any Williamsburg Bridge bollards.

QUESTIONS SUBMITTED BY BIDDERS AND DDC'S RESPONSES

PROJECT ID: SANDRESM1

Addendum	Addendum Question No.	Bidder's Question	Response
9	104	Please refer to sheet 2201 on this sheet it indicates that the removal of the existing Bar Picket Fence is to be paid under Pay item ESCR-6.27 S but this Payitem is not part of the bid there is however a Payitem 6.18 X "Picket Fence Removed". Please confirm if the removal of any Picket Fence on the project is to be included in this item.	Drawing SB101 has been revised to replace the reference to item ESCR-6.27 S with item 6.18 X. Refer to Addendum, 9, Article 4.
9	105	Please provide the flow rates during a storm event for each of the existing DEP NFM Outfalls within River Side Park so that proper By-Pass pumping systems can be designed.	Flow rates are not available.
9	106	Where are Pay Items 564.0503, 585.01 and ESCR-564 located in the contract drawings?	Items 564.0503 and 585.01 have been deleted. Refer to Addendum 9, Article 2. ESCR-564 is used for the deadman wale system, as shown on drawings WS600 to WS626.
9	107	"According to the specifications, ""the quantity of STONE VENEER TYPE 5B, STONE VENEER TYPE 5C, and STONE VENEER TYPE 5D to be paid for shall be the LINEAR FOOT furnished and installed complete, in accordance with the plans, specifications, and directions of the Engineer"". However, the bid schedule shows units in SQUARE FOOT. Please clarify which units these items will be paid for."	Correct unit of measure for bit items PK-ESCR 035 F, PK-ESCR 035 G, and PK-ESCR 035 H is SQUARE FOOT. Specification has been updated. Refer to Addendum 9, Article 3.
9	108	According to the specifications and Drawing No. LD800 (or Sheet No. 1956), there is a call out for bid item number PK-ESCR 906 E. This bid item number is not mentioned in the bid item schedule. Please clarify the correct item number or add this new bid item to the schedule.	Refer to Addendum 9, Article 2 for the current bid schedule, which includes PK-ESCR 906 E.
9	109	According to the specifications and Drawing No. LD774 (or Sheet No. 1945), there is a call out for bid item number PK-ESCR 035 D. This bid item number is not mentioned in the bid item schedule. Please clarify the correct item number or add this new bid item to the schedule.	Refer to Addendum 9, Article 2 for the current bid schedule, which includes PK-ESCR 035 D.
9	110	Please reference Bid Item 557.0109. Please indicate if the bridge deck concrete pours can be performed utilizing an air screed or a roller screed.	Either method is acceptable pending final Engineer's approval of contractor's submittal per specifications.
9	111	Please provide details for Pile Plugs at cutoff wall, we require tip elevations	Drawings WS758 to WS759 has been revised to include pile plug lengths. Refer to Addendum 9, Article 4.
9	112	Please provide the design loads for the existing Esplanade (Existing concrete pile cap, prestressed concrete slab units).	Refer to as-builts for design loads of existing esplanade structure which will be partially demolished. Drawing WS002 has been revised to include design criteria including loads and loading combinations for proposed esplanade work. Refer to Addendum 9, Article 4.
9	113	Please provide the lengths for the existing timber piles under the Esplanade which are to be removed.	All available records have been provided.

Addendum	Addendum Question No.	Bidder's Question	Response
9	114	<p>The Aggregate Pier required minimum Area Replacement Ratio (ARR) of 16.7% is very high for large-area treatment. It will probably be difficult or impossible to install that much stone for a mass area treatment. Due to densification from the installation efforts and the high ARR, it may be difficult or impossible to reach the design depth and/or to achieve the design diameter on all columns installed. If there is no site heave resulting from the work, in order to install an ARR of 16.7% there would need to be an equal (16.7%) reduction in volume of the soil at the site. That is a lot of densification. Volume reduction from densification of more than 10% is extremely difficult. If the soil profile contains layers of saturated fine grained soils, their densification during construction will be limited (theoretically zero). For shallower soils (top 10 to 20 ft) a portion of the volume associated with the ARR will likely result in heaving of the ground surface of the site. As depth increases beyond about 20 ft, the increasing stress due to the weight of the overburden soils will make it progressively more difficult to penetrate granular soils with the vibrator and to build the desired column diameters. It is our position that a 16.7% ARR will be extremely difficult to construct as designed.</p> <ul style="list-style-type: none"> <li>i. Will smaller ARRs be accepted?</li> <li>ii. If depth refusal of vibrator achieved prematurely to reaching design depth due to densification of adjacent columns, will the work be accepted?</li> <li>iii. It is our position that as the installer, it is our discretion when refusal is met to make the call. We do not intend to damage tooling and equipment when refusing on a dense layer. Please confirm that refusal criteria will be at the installer's discretion.</li> </ul>	<ul style="list-style-type: none"> <li>i. Contractor's bid shall be predicated on the assumption that the specified ARR is to be achieved with no reduction. As stated in Section ESCR-5, Contractor will be required to install demonstration or test stone columns and results will be reviewed by the Engineer.</li> <li>ii. The work will be accepted if the confirmation SPT boring or CPTs after installation of the stone columns show that sufficient improvement or densification has occurred, as stated in Section ESCR-5.</li> <li>iii. Current site conditions show that very loose soil is present on site; this generates concerns regarding excessive settlement and liquefaction potential. The site is required to be improved to address these issues to the satisfaction of the Engineer. After testing, contractor shall provide to the Engineer results and written description of proposed refusal criteria to be approved by Engineer.</li> </ul>
9	115	<p>Who is responsible for the verification calculations for aggregate pier post-treatment liquefaction and settlement?</p>	<p>Section ESCR 5.13 covers the performance requirements, where both settlement and liquefaction are addressed. The Contractor must perform these evaluations based on his post improvement SPT borings or CPTs, showing that conditions have been mitigated. The Engineer will evaluate the improved conditions, to verify that the results provided by the Contractor are adequate.</p>
9	116	<p>Is there any additional as built information on the existing timber cribbing? What material has the timber cribbing been filled with?</p>	<p>No additional as-builts are available.</p>
9	117	<p>Will TIP testing be accepted in lieu of PIT testing for rigid inclusions?</p>	<p>The Contractor may submit a VECP to use Thermal Integrity Profiler (TIP) testing rather than Pile Integrity Testing (PIT) for approval. However, should the VECP be approved and an anomaly be found in the Rigid Inclusions based on TIP, it might be necessary to confirm the condition with some other approach such as PIT.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
9	118	If a Rigid Inclusion meets refusal at tip elevation shallower than indicated in the Contract Drawings, clear of a surficial obstruction but in dense virgin/in-situ material, will the rigid inclusion be accepted?	As stated in Section ESCR-5.1, the Engineer will evaluate results from the required rigid inclusion column load tests and issue the final tip elevations. Contractor shall provide proposed refusal criteria to be approved by Engineer. Should refusal occur at a higher elevation during construction, with mutual agreement with the Engineer, the tip elevation may be adjusted.
9	119	Using displacement methods for Rigid Inclusions does not guarantee that prescribed tip elevations will be achieved at every location. Non-displacement methods will increase the likelihood of reaching prescribed tip elevations. Will non-displacement installation methods for Rigid Inclusions be accepted?	No, the displacement method must be used for installation of the rigid inclusions.
9	120	Typically, unreinforced drilled displacement rigid inclusions are spaced a minimum of 4 diameters apart to void damaging previously installed adjacent elements. The 5' spacing indicated on the drawings only provides 3.33 diameter spacing for the proposed elements. Will a smaller ARR be accepted to provide a minimum spacing of 4 diameters to protect adjacent elements?	No, the Contractor must follow the Rigid Inclusion spacing or ARR provided on the drawings. The Contractor must sequence construction operation such that when installing the Rigid Inclusions, the surrounding Rigid Inclusions will have sufficient time to set and gain strength. Sequencing the installation operations should minimize the possibility of damaging the Rigid Inclusions. The current design is based on the spacing or ARR provided, and the contractor should attempt to construct the Rigid Inclusions as shown on the drawings.
9	121	Soil Mixing Area Replacement Ratio (ARR) is ~23% based on 2' diameter columns on 4' center to center triangular grid. Are larger diameter soil mix columns acceptable, provided ARR is maintained?	Yes, larger soil mix columns maintaining the ARR may be used.
9	122	Construction of the 2' thick soil mix mat should be included in what bid item?	The soil mix mats are the spoils from the DSM installation and the cost is part of the DSM installation under Item 203.99010039.
9	123	Specification Item 203.99010039 - Deep Soil Mixing references a "deep mixing demonstration program" prior to production column installation. How many columns constitutes a "program"? Where would this program for columns be located since there are 3 different soil mix column depths/zones on the contract drawings (7, 8, and 9)?	Drawing SM308 has been revised to include the deep mixing demonstration program location and deep soil mix column depths. Refer to Addendum 9, Article 4.
9	124	If a soil mix design strength of 200psi is achieved prior to 28 days elapsed time from wet-grab samples taken during the demonstration program, can production DSM work commence prior to getting the 28-day result?	Yes, production of DSM work can commence prior to getting the 28-day result if a soil mix design strength of 200 psi is achieved prior to 28 days elapsed time from wet-grab samples taken during the demonstration program.

QUESTIONS SUBMITTED BY BIDDERS AND DDC'S RESPONSES

PROJECT ID: SANDRESM1

Addendum	Addendum Question No.	Bidder's Question	Response
9	125	Are continuous cores required for the soil mix demonstration program, and if so, how many?	The number of the continuous cores for the soil mix demonstration program will be selected by the Engineer as specified in Section G. Quality Control / DSM Testing Frequency of ITEM 203.99010039 - DEEP SOIL MIXING.
9	126	Soil mixing is a mixing technique, not a drilling technique. Obstructions, whether man-made or natural, can cause significant damage to tooling. Is there a separate pay line item for obstruction drilling (and/or pre-drilling) for soil mixing? If not, please provide one under addendum.	New specification Section ESCR 203 and new items ESCR-203.12 PVD and ESCR-203.99 DSM have been added. Drawings SM305 to SM309 have been revised. Refer to Addendum 9, Article 2; Addendum 9, Article 4; and Addendum 9, Article 3.
9	127	The Pay Item Descriptions for Items 202.120001, 202.120002 and 202.120003 per Addendum #3 Bid Schedule do not match the descriptions on pages PD-2R and PD-3R of the Specifications per Addendum #4. Please clarify this apparent discrepancy.	The item descriptions in the bid schedule have been revised. Refer to Addendum 9, Article 2.
9	128	Re: Drawings WS-140-WS-149 & WS 101-WS109. Quantity for the Types of Esplanade Demolition are completely different than what we are directed to on the Project Bid Pricing sheets.. Kindly clarify.	Drawings WS140 to WS148 have been revised and items ESCR.6.27 C, D, F, and G have been added to the bid schedule. Refer to Addendum 9, Article 4 and Addendum 9, Article 2.
9	129	Please provide detail for Manhole MH-B14 which is on drawing number DS301.	Drawing DS704 has been revised with new details for Manhole MH-B14. Drawing DS301 has been revised to include item 51.21LB14000V. Refer to Addendum 9, Article 4.
9	130	Referencing Sheets 2010 thru 2012, water play at Delancy, Houston and 10th Street. Please clarify how the work at the three locations are paid when there are only two Bid Items, PK-ESCR 617 Decorative Steel Spray Fixtures Houston Street (1 LS) and PK-ESCR 619 Sport Steel Spray Fixture (1.1 Each). By our count there are 12, 7 and 12 fixtures at Delancy, Houston and 10th Street respectively.	Water Play Features items PK-ESCR 616, PK-ESCR 617, and PK-ESCR 618 are listed on contract drawings PUP320, PUP321, and PUP322 for all the three (3) locations (Delancy, Houston and 10th Street). PK-ESCR 619 count from contract drawings are as follows: PUP303 - 2 EA, PUP304 - 1 EA, PUP305 - 2 EA, PUP306 - 3 EA, PUP307 - 1 EA, PUP308 - 1 EA, PUP309 - 1 EA, Total quantity = 11 Each.
9	131	Please provide profile detail for item 60.12D12- Laying 12-Inch Ductile Iron Pipe and Fittings.	Drawing DS309 has been revised to include text on tie-ins for the water main to match existing elevations. Refer to Addendum 9, Article 4. Profile of existing water mains is not available. Contractor shall verify existing elevations.
9	132	RE: Rigid Inclusion. Specification says: Removal of the obstruction or drilling through the obstruction shall be paid at the obstruction rate, while offsetting the column location will be paid at the standard rate for rigid inclusion in subsurface soils. However ESCR- 5.01 OB is not a bid item. Kindly clarify how obstructions are to be paid.	Item ESCR-5.1-OB has been added. Drawing WS320 has been revised to include assumed 10% of volume of rigid inclusions to be paid under this pay item. Refer to Addendum 9, Article 2 and Addendum 9, Article 4.

Addendum	Addendum Question No.	Bidder's Question	Response
9	133	Please clarify detail 8/LSL700	Detail and corresponding items have been reviewed and checked and no issue was found.
9	134	Reference item ESCR-4 MOVABLE TL4 STAINLESS STEEL JERSEY BARRIERS. After several conversations with barrier manufacturers and suppliers of movable barriers, they said no Test – Level 4 Stainless Steel moveable barriers exist that meet the spec. Can the agency spec out several suppliers?	Specification Section ESCR-4 has been revised to include all known manufacturers though approved equals will also be acceptable. Refer to Addendum 9, Article 3.
9	135	Reference Sheet 1956 of 2791, LD800-00 Precast Amphitheater Seatwalls. The module schedule lists Modules E1 and E2 as item Numbers PK-ESCR 906 E. We do not see that bid item in the Bid Schedule Form (Revision #1). Please clarify.	Item PK-ESCR 906 E has been added. Refer to Addendum 9, Article 2 for the current bid schedule.
9	136	Refer to PUD400 series of drawings - Specify spacing for mini-piles.	Drawings PUD400 to PUD417 have been revised to include a Note 6 referring to Standard Detail NYCDEP-SE2 and Standard Detail NYCDEP-SE6. Refer to Addendum 7, Article 2.
9	137	Provide detailed drawing (including dimensions) for Drop Manhole.	Refer to detail on drawing PUD705.
9	138	Supply detail for cleanout manhole - Item 51.21C00000C.	Drawing PUD707 has been revised. Refer to Addendum 9, Article 4.
9	139	Refer to drawings LM527 & LM528 - Specify beginning and end limits for curb type 1/17 located at the western edge of the site.	If the question is referring to the formed wall, see FW100 and FW300 series. If the question is referring to the curb type 1/17 the is running along the western edge of the Shared Use Path, the beginning of this curb is noted on sheet LM520 and the end of this curb is noted on sheet LM528.
9	140	Refer to sheets LD826, LD827 & LD 911A - The table on sheet LD 911A does not match the details on sheet LD826 and LD827. Which is correct?	Drawings LD826, LD827, and LD911 show typical details. The schedule on drawing LD911A shall be followed.
9	141	Refer to sheets LD911 & LD911A - The detail on sheet LD911 specifies a type 4 wall for backstops. The table on sheet LD911A specifies a type 2 wall. Which is correct?	Drawing LD911 shows typical details. The schedule on drawing LD911A shall be followed.
9	142	Refer to sheet LD911 - This sheet shows a type 3 wall. It does not appear in the table on sheet LD911A. Where is this used?	Drawing LD911 shows typical details. The schedule on drawing LD911A shall be followed. Wall Types 3 & 4 are not shown in the tables on drawing LD911A.
9	143	Refer to sheet LSL700, detail 8/LSL700 - The detail specifies item PK-ESCR967, Nonwoven geotextile separation. This does not match the description of item PK-ESCR976 in the bid sheets.	Per specification Section PK-ESCR 937 (which covers item PK-ESCR 967) and prices to cover description for item PK-ESCR 967 DRAINAGE FOR NATURAL TURF FIELDS, nonwoven geotextile separation is included in item PK-ESCR 967 in prices to cover.
9	144	Refer to sheet LSL700, detail 8/LSL700 - The detail specifies a Horticultural Drainage Layer, item PK-ESCR967. Is this the correct item? Should it be PK-ESCR937A?	Per specification Section PK-ESCR 937 (which covers item PK-ESCR 967) and prices to cover description for item PK-ESCR 967 DRAINAGE FOR NATURAL TURF FIELDS, horticultural drainage layer is included in item PK-ESCR 967 in prices to cover.

Addendum	Addendum Question No.	Bidder's Question	Response
9	145	Refer to the Bid Sheets, Item PK-ESCR937D, Planting Soil for Seeded and Sodded Lawn - Where is this item used? It does not appear in the details on sheet 8/LSL700.	Drawing LSL700 has been revised to include a callout for PK-ESCR 937 D in Detail 8. Refer to Addendum 9, Article 4.
9	146	Item T-3.18, 'Post to be Removed & Replaced', as noted on sheet 553 does not appear in the Bid Schedule. Please clarify.	Drawing F100 has been revised to replace the reference to item T-3.18 with items 6.82 A and 6.82 B. Refer to Addendum 9, Article 4.
9	147	Items NYCT-7A.1, NYCT-7A.2, 'Fill Leveling Cement Mortar' and 'Membrane Waterproofing', as noted on sheet 568 do not appear in the Bid Schedule. Please clarify.	Items NYCT-7A.1 and NYCT-7A.2 have been removed from revised drawing F124. Refer to Addendum 9, Article 4.
9	148	Item 4.11 CA, 'Clean Fill', as noted on sheet 568 does not appear in the Bid Schedule. Please clarify.	Drawing F124 has been revised to replace the reference to item 4.11 CA with item ESCR-4.11 CA for the fill. Refer to Addendum 9, Article 4.
9	149	Item ESCR-2.GI, 'Ground Improvements', as noted on sheets 873 through 897 does not appear in the Bid Schedule. Please clarify.	Item ESCR-2.GI has been removed from the WS600 drawing series. Refer to drawing WS320 for the correct item numbers for ground improvements. Refer to Addendum 9, Article 4.
9	150	With respect to question 15, above, Ground Improvement Tip Elevation vary from El. -30.00 to El. -55.00, while Top El. drops from El. 6.00 to El. 2.25. The mechanics of Ground Improvements need be more explanatory. It would be very beneficial if DDC design team conducts a presentation of key elements of the job design, target parameters, objectives of construction phasing, etc., so the contractors and subcontractors could have more informative approach to the project while analyzing the job in front of them.	The ground improvement tip elevation is varied throughout the park to match the varied subsurface conditions. Stability requirements, settlement mitigation, and liquefaction mitigation all contribute to the differences in tip elevations found in the ground improvement (GI) program. The top elevation for most of the GI program is at +6' NAVD88 with certain locations at +2' NAVD88 where the tie rod elevation is lower.
9	151	In the overall cross section of the esplanade D-6A (as example) drawings set "0533-1066 Flood Protection (Addendum 3 Update)", sheet 880A of 2791 (WS607A) it is shown the Expansion Joint as Bid item "ESCR-567.LG". However, in the detail page for these joints, sheet 966 of 2791 (WS761) it is called part of bid item 565.14200008 instead of ESCR-567.LG. Please clarify.	Drawing WS607A has been revised to include item 565.14200008. Refer to Addendum 9, Article 4.
9	152	Regarding Pay Item ESCR-6.27 TP, Removal of Existing Timber Pile. The plans show timber piles being removed or cut off in various esplanade demolition sections, shown on plan sheet WS140, 141, 143, 146. Please confirm that the removal of the piles shown on the esplanade/embayment demolition plan sections are to be included in Pay Item ESCR-6.27 TP, and not paid in the related sections and their pay items.	The removal of timber piles is paid under item ESCR-6.27 TP. Timber piles being cut off is included in the related sections and their pay items.

Addendum	Addendum Question No.	Bidder's Question	Response
9	153	Regarding Pay Item 582.06, REMOVAL OF STRUCTURAL CONCRETE-REPLACEMENT WITH CLASS D CONCRETE. Locations and details for this item can not be located on the plans. Please provide details for this work.	Refer to drawing WS002 notes under "Repair of Existing Elements to Remain." Item 582.06 is intended for the repair of existing pile caps following demolition of the existing esplanade deck. Location and extent of repairs will be determined in agreement with the Engineer in accordance with the requirements of the NYSDOT Standard Specification Section 582.
9	154	Reference to bid item number 537 - "JB 100.1 (CABV) - UTILITIES CROSSING TRENCH FOR CATCH BASIN CHUTE CONNECTION AND/OR TEST PIT (TYPE .1) Unit price bid shall not be less than: \$ 525.00". Please clarify what "Type.1" means and where we can find details for this. Additionally, please provide a schedule for different "types" mentioned in several of the JB bid items. Bid items 538-578, 588-591, 612-617 have similar wording. This information cannot be found on the drawings and without it crossings cannot be assigned to a pay item.	Refer to "Method of Measurement" in specification sections JB 100 – 116, JB 330E, and JB 410 for information on the "Type" designations for the referenced bid items.
9	155	Reference to Utility Crossing Schedule than can be found on sheet 607 and 608 (Pages F710 and F711). Please clarify which pay item each crossing ID refers to. The missing information about depth or details do not permit these items to categorize under existing pay items. Additionally, pay items make reference to a "type" of utility crossings (type 1, type 2, etc.). Schedule does not follow same characterization. Conflicting information make it difficult to assign each crossing to a pay item.	Each crossing ID represents utility lines crossing the line of flood protection, requiring special details, based on the Type. The Types of crossings (A - G) are detailed in drawings F700-F706. There is no reference to any numbered types of utility crossings on F710 and F711, they are all lettered.
9	156	Reference to Utility Crossing Schedule than can be found on sheet 607 and 608 (Pages F710 and F711). Please clarify what "Crossing Type A" (and other letters) mean. Where can we find details for crossing type A, B, D, F, G?	Crossing types A through G are located on drawings F700 through F706. Drawings F710 and F711 have been revised with an added reference. Refer to Addendum 9, Article 4.
9	157	Reference to Utility Crossing Schedule than can be found on sheet 607 and 608 (Pages F710 and F711). Please provide clarification for crossings with missing location, station number, assumed depth and detail.	The approximate stationing locations of the utility crossings have been added to the utility schedule. Drawings F710 and F711 have been revised. Refer to Addendum 9, Article 4.
9	158	Clarify if Structural Steel Note 13 that specifies the interior surface of box members accessible by hand holes are intended to "receive the full 3 coat paint system" or if that area was intended to be metalized along with the rest of the structural steel as indicated in Note 1.	Limits of 3 coat paint system shall extend at least 3 feet of edge of handholes. If the 3 foot distance from handhole is obstructed by a diaphragm, the limits shall extend to the diaphragm as applicable. At a minimum, a prime coat of paint shall be applied to all box member interior sections regardless of distance from a handhole or diaphragm.
9	159	Per Structural Steel Note 13, please provide required limits of the coating (3 coat paint or metalizing) within the interior of the box from the edges of hand holes.	Limits of 3 coat paint system shall extend at least 3 feet of edge of handholes. If the 3 foot distance from handhole is obstructed by a diaphragm, the limits shall extend to the diaphragm as applicable. At a minimum, a prime coat of paint shall be applied to all box member interior sections regardless of distance from a handhole or diaphragm.
9	160	Per Structural Steel Note 13 and previous RFI question: please clarify, if the box member interior is intended to be metalized, whether a top coat is required and if so, is that required to be "GWB Gray" as indicated in Structural Steel Note 2 or can be a clear coat.	The interior of the box member need not be metalized but shall be painted. Top coat is required. Top Coat color need not be GWB Gray and may be clear coat.

Addendum	Addendum Question No.	Bidder's Question	Response
9	161	Pay item 202.120003, Removing Existing Superstructures and Obstructions. Kindly clarify what work exactly this bid item covers that is not included in 2 previous bid items.	Item 202.120003 covers Corlears Hook Pedestrian Bridge. The limit of demolition is shown on sheet BC101 and BC101A
9	162	<b>REDACTED</b>	<b>REDACTED</b>
9	163	The section for Moveable TL4 Stainless Steel Jersey Barrier specifies all materials per 4.01.4 to be SS Grade 316 and 4.01.6 limits the barrier weight to 50lbs/LF without the wheel system. The manufacturer of the barrier system that most closely matches the specifications has indicated that due to the increased density of Stainless Steel the barrier system as dimensioned and specified is ~ 64lbs/LF. Please increase the allowable weight/LF or reduced the dimensions of the barrier system.	Specification Section ESCR-4 has been revised. Refer to Addendum 9, Article 3.
9	164	Sheet 1197 shows two proposed 12" Storm DIP runs, one is crossing the FDR (64 LF) another is running along the East Side of the FDR and connecting into an existing Catch Basin (212 LF) please provide the invert for each of these runs so proper Excavation/SOE can be figured	Drawing DS310 has been revised and the referenced storm pipes have been deleted. Refer to Addendum 9, Article 4.
9	165	Please refer to Spec Section JB-123, A.1.5 requires a mandatory site visit. Can you provide a date and time for the site visit?	A mandatory site visit is not necessary, and will not be held.
9	166	Please refer to Spec Section JB-123, A.2.2 states that the feeders have repair barrels of varying diameters, lengths and locations. Can you provide the number of barrels, locations, lengths and diameters? If that information does not exist, will Con Ed provide a standard barrel design to bid as an extra per barrel?	Con Edison cannot respond to the exact number and location of barrels. These feeders in the park do not have a major leak history. Refer to attached document CE-TI-3356 as reference.
9	167	Please refer to Spec Section JB-123, A.2.5 discusses trenching for access to the feeders. What are the minimum clearances around the feeders required for trenching?	Con Edison requires a 1-ft minimum clearance around the oil-o-static and return lines, but 2-ft is preferred. Refer to JB-405A for trench excavation requirements for carbon fiber wrapping existing utility facilities.
9	168	Please refer to Spec Section JB-123, A.2.7 requires the contractor to install a low-profile mechanical clamp at all leak locations. Is Con Ed providing the clamps? If not, does Con Ed have an approved clamp to use?	Con Edison will provide clamps for leaks. The Contractor must notify Con Edison for these clamps.
9	169	Please refer to Spec Section JB-123, B.2.13.1 states that the work site shall be thoroughly examined prior to the work starting. Will the entire trench be exposed prior to starting the work? If not will the examination be allowed as each section is exposed?	The Contractor must submit their work plan stating how much will be exposed at a time, along with other details as part of their means & methods. Con Edison, in coordination with the City, will review the work plan and provide comments/approval.

Addendum	Addendum Question No.	Bidder's Question	Response
9	170	Please refer to Spec Section JB-123, B.4.1 states that all composite materials shall be on site prior to the start of the job. Does Con Ed expect that all material to be purchased and stored throughout the project prior to the start of the job? This would require a very large warehouse with significant climate controls. Would proof of purchase order and delivery date/schedule from the OEM suffice?	The Contractor does not have to order all materials on site prior to the job start. Contractor must be responsible to have enough to start/continue work and should have enough materials on site so that there is no work stoppage/delays on certain construction activities that have a time limit.
9	171	Please refer to Spec Section JB-123, B.7.1.1. Does Con Ed have an approved alternate system? If one is approved by Con Ed will all bidders be given an opportunity to bid on the new system?	Currently there is no alternative system/method.
9	172	Please refer to Spec Section JB-123, B.7.1.1. If a contractor has an alternate system that meets ASME PCC-2 should they bid that system as well as the system described in JB 123?	No.
9	173	Please refer to Spec Section JB-123, E.2.6 requires a Third-Party NACE Level III Inspector, Contractor QA/QC Manager, Certified OEM Representative and a Company Representative be present prior to work proceeding. E3.4 references a Third-Party QC Inspector. It is our understanding that the contractor needs to hire an OEM Representative, a NACE III Inspector reporting to him, a QC Manager reporting to him and must hire an additional Third-Party NACE III Inspector for Con Ed reporting directly to Con Ed. Is this correct?	Contractor is responsible for Third-Party NACE Level III Inspector, Contractor QA/QC Manager, and Certified OEM Representative.  Con Edison is responsible for NACE Inspector and Field Engineer.
9	174	Please refer to Spec Section JB-123, Appendix IV 7.2.1 requires that the FRP 120HT cures for a minimum of 8 hours before moving to the next step. Is this just for high hats or is an 8-hour cure required every time FRP 120HT is used?	8-hr cure is necessary prior to continuing on to the next step. But the Contractor can also move to another work location.
9	175	Please refer to Spec Section JB-123, Are there any restrictions on hours or days of work?	The City's work restrictions set precedence. Con Edison's restrictions are based on existing and/or anticipated system conditions.
9	176	Please refer to Spec Section JB-123, How many trench feet can be open at one time?	The Contractor must submit their work plan stating how much will be exposed at a time, along with other details as part of their means & methods. Con Edison, in coordination with the City, will review the work plan and provide comments/approval.
9	177	Please refer to Spec Section JB-123, Can trenches be left open during non-working times?	Trenches can be left open at the discretion of Con Edison and Resident Engineer, but Con Edison facilities must be supported and protected at all times when exposed. Refer to JB-405A. Safety is of utmost importance.
9	178	JB123 installation of composite carbon fiber systems section A2.2 states to repair barrels of varying diameters, lengths and locations. Please provide a barrel map and or a list of the qty, diameter and length of barrels located within the scope of the project.	Con Edison cannot respond to the exact number and location of barrels. These feeders in the park do not have a major leak history. Refer to attached document CE-TI-3356 as reference.

Addendum	Addendum Question No.	Bidder's Question	Response
9	179	There is a conflict between the cut-off wall profile and the deadman profile matchline station denoted on Contract Drawings WS430 and WS431. Please clarify which station is correct.	Drawings WS430 and WS431 have been revised. Refer to Addendum 9, Article 4.
9	180	Please clarify that the bottom of COMBI-PILE cut-off wall elevation of -32 on Contract Drawing WS432 is correct. WS431's bottom elevation was modified under previous addendum to -33.	The bottom of combi-pile cut-off wall elevation is -34.0'. Drawings WS431 and WS432 have been revised. Refer to Addendum 9, Article 4.
9	181	Contract Drawing WS 438 denotes both EL -50 and EL -61 as bottom of COMBI-PILE cut-off wall elevation. Please clarify which elevation is correct.	Tip elevations are -85.0' and -61.0'. Drawing WS438 has been revised. Refer to Addendum 9, Article 4.
9	182	Several of the Waterfront Structures drawings refer you to Sheets WS539A-WS539H for locations of the proposed deck drains along the Esplanade. These drawings do not appear to be included in the contract documents. Please provide these drawings.	Drawings WS539A to WS539H were provided in Addendum 7, Article 2.
9	183	The Waterfront Esplanade Prestressed Concrete Beam Details on Sheets 935-939 call for the drilling of a 1-3/4" diameter hole for the bearing anchors of the AASHTO Girders to be paid under Item 586.0201, while the #8 anchor rod and epoxy be paid under Item 565.1925. The Waterfront Esplanade Typical Sections at the piers on Sheets 913-920 call for the same drilling, anchor rods and epoxy to be all paid for under Item 586.0201. Please clarify as to under which item the anchor rods and epoxy are paid for.	The work for the anchor rods to be drilled and epoxy anchored into the cap falls under item number 586.0201, as shown on drawings WS660-WS667. This is a separate bid item from the bearings, which includes the anchor rods themselves but not the installation. For the diaphragm rods, the material and epoxy are included in pay item 565.1821 and a separate item number is provided for the drilling as 586.0201. These are in accordance to NYSDOT Standard Specifications Section 565.
9	184	Contract Drawing F601, "Section at STA. 22+43", denotes proposed 24" diameter steel pipe piles/Item # ESCR-551.24.05C. Referring back to drawing F301 is not clear where this items start and end station is located. Please clarify.	Please refer to the F300s, F400s and FM300s drawings for quantifying the number of proposed pipe piles in each reach. The pipe piles are required where there are many utility crossings and installation of a sheet pile is not feasible. After location of utilities in field, pipe pile quantity may change as approved by Engineer.
9	185	In reference to Sheet 853 (Drawing WS513), in both of the details for the Pier 166 & Pier 167 Pedestal Reinforcement, what is the spacing of the #6 epoxy rebar dowel which is to be drilled and grouted into the existing pile cap?	The #6 epoxy rebar dowels that are drilled and grouted into the existing pile cap at the Pier 166 and 167 Pedestals shall be spaced at 6" to match the proposed bars in the pedestals that they are lapped to. Drawing WS513 has been revised. Refer to Addendum 9, Article 4.
9	186	In reference to Sheet 854 (Drawing WS514), each of the three backwall details calls for a #6 epoxy bar @ 6" to be embedded 2'-0" into the existing pile cap and be paid for under Item 565.0201. This bid item is not included in the bid item list for this contract. Should this work be paid under Item 586.0201? If not, please provide the correct bid item.	586.0201 is the correct item number. Drawing WS514 has been revised. Refer to Addendum 9, Article 4.

Addendum	Addendum Question No.	Bidder's Question	Response
9	187	Reference: Existing Deadman cut elevations; Drawing WS140, Sheet 708 Waterfront Demolition Section, Sheet 1 of 10, Flood Wall; Drawing WS 100 Waterfront Demolition Plan, Sheet 670; Drawing WS 101 Waterfront Demolition Plan, Sheet 671; Note No. 3 on Drawing WS140 reads: "The top of the existing deadman should be cut down to El. +3.41' NAVD88 in specific locations. Refer to Drawings WS100 and WS101 for exact locations." However, per Drawing WS 100, between bents 1 and 4 existing sheet pile deadman will be partially demolished to El. +3.0' and between bents 4 and 5 sheet pile deadman will be partially demolished to El. -5.0' and per Drawing WS 101 between bents 35 and 38 existing sheet pile deadman will be partially demolished to El. +3.0' and between bents 38 and 39 sheet pile deadman will be partially demolished to El. -6.0'. Please clarify location where the existing deadman will be cut down to El. +3.41?	Elevations shown on WS100 and WS101 are correct. Drawing WS140 has been revised. Refer to Addendum 9, Article 4.
9	188	Reference: Corlears Hook Bridge Deck Sections, Drawing BC 140, Sheet 150. Note on Drawing BC 140 reads: "Refer to architectural drawings for handrail and guardrail section (Item No. NYC-607.064 AA)." This item is not part of the bid breakdown. Please clarify.	Drawing BC140 has been revised to remove reference to the item. Refer to Addendum 9, Article 4.
9	189	Is there an Elevation to show the Pattern/Design for 'Perforated' SS Door - Type 'D' ? - on Door Schedule a. (Same applies to Type 'E' on the Track & Field Building Door Schedule)	Perforation is to match clerestory window MPS-01 perforated metal, refer to Detail 5 on drawing A-672.00 and Detail 5 on drawing A-582.00. See revised notes on door schedule/types on drawings A-580.00 and A-670.00. Refer to Addendum 9, Article 4.
9	190	Door Type C is Labelled Perforated SS - but on the Door Schedule as HM - which is correct ?	The door schedule is correct. See revised note under door C on drawing A-670.00. Refer to Addendum 9, Article 4.
9	191	Contractors Pollution Liability - The scope of work includes watermain work, Con Edison utility work, earthwork and demolition. Schedule A includes a limit of \$5,000,000 however it does not make CPL a required line of coverage. Can you please consider to include the coverage in Schedule A for this?	Refer to Addendum 6, Article 3
9	192	Seq No. 0009, Item 203.12030017 "Prefabricated Vertical Drains" has an engineer's estimated quantity of 2,341,219 L.F. whereas the quantity derived from the drawings amount to a approximately 55% of that quantity. Please clarify this apparent discrepancy.	The quantity for this item has been reduced. Refer to Addendum 9, Article 2.
9	193	Seq No. 0011, Item 203.12430017 "Preparing Surface for Prefabricated Vertical Drains" has an engineer's estimated quantity of 633,918 S.F. whereas the quantity derived from the drawings amount to a approximately 55% of that quantity. Please clarify this apparent discrepancy.	The quantity for this item has been reduced. Refer to Addendum 9, Article 2.
9	194	Seq No. 0416, Item ESCR-4.11 AS "Earth Excavation for Structures" has an engineer's estimated quantity of 4,442 C.Y. whereas the quantity derived from the drawings amount to less than 50% of that quantity. Please clarify this apparent discrepancy.	Item ESCR-4.11 AS includes earth excavation for areas with structures including, but not limited to, floodwall, floodgate foundations, and concrete security wall. Item number has been added to revised drawings F610, F702, and SB701. Refer to Addendum 9, Article 4.

Addendum	Addendum Question No.	Bidder's Question	Response
9	195	[Item 8.22 D] Can you confirm that the Bid Item Quantity is in SF and not SY, as we are getting the quantity like 10 times bigger. Please clarify	Item 8.22 D has been removed and replaced by item 595.50000018. Refer to Addendum 9, Article 2 for the current bid schedule.
9	196	The specs (ESCR-2) call for precautions during the installation of Jet grouting to prevent movements, settlement or heaving and damage to existing structures, roadways, utilities, etc. The specs call also for drilling equipment and drill bits capable of advancing through obstructions such as concrete, brick, stones, timber piles, seawalls, cobbles, and boulders. Please note that it is not to drill through obstructions without vibrations and movements on the existing utilities and adjacent structures. The jet grouting system, especially the double and triple fluid methods, with compressed air are likely to cause movement in the ground. Please clarify how much movement (settlement and/or heave) will be allowed; threshold values have been established for monitoring of all the structures and/or utilities?	Permissible settlement and vibration levels are addressed in Specification Sections ESCR 76.11 and 76.21.
9	197	As per specification ESCR-2, the Unconfined Compressive Strength (UCS) for treated jet grouted soil varies between 250-750 psi (in 28 days) which may be difficult to achieve. Please confirm UCS within a range of 250-350 psi is acceptable?	It is the Engineer's expectation that the specified range is achievable and the Contractor shall develop their bid based upon the design as specified. However, following completion of the initial demonstration test program, the Engineer will review results of the program and may reassess requirements prior to commencement of full grouting program.
9	198	As per specification ESCR-2, the minimum unit weight of jet grouted soil varies between 110 to 120 pcf, which may be difficult to achieve. Please confirm unit weight of jet grouted soil within a range of 90-110 pcf is acceptable?	It is the Engineer's expectation that the specified range is achievable and the Contractor shall develop their bid based upon the design as specified. However, following completion of the initial demonstration test program, the Engineer will review results of the program and may reassess requirements prior to commencement of full grouting program.
9	199	As per specification ESCR-2, a permeability of Jet grouting of 10-6 cm/sec is required; there is a conflict with the value shown in the drawing F002 "flood protection general notes" which says 10-7 cm/sec. Please confirm the minimum acceptable value for the permeability of jet grouted treated soils.	1x10^-6 cm/sec is the correct value for the minimum hydraulic conductivity. Drawing F002 has been revised. Refer to Addendum 9, Article 4.
9	200	As per specification ESCR-2 a minimum of one in-situ wet grab sampling per day is needed consisting of 3 sampling depths. The possibility to push a sampler inside the fresh column is limited in general up to 20 ft in depth. Please confirm if wet grab samples taken up to 20-ft depth from top of JG is acceptable?	Wet grab sample obtained from 20 ft from the top of the jet grouting column is acceptable.
9	201	As per specification one vertical alignment profile for jet grouted elements is needed per day, while at page 12 it is indicated to perform borehole deviation measurements on the 5% of the jet grouted columns. Please confirm one vertical profile per day for Jet Grouted Columns is acceptable.	We confirmed that the primary requirement is that one vertical alignment profile for the jet grout columns is required per day. Refer to revised specification ESCR-2 in Addendum 9, Article 3

Addendum	Addendum Question No.	Bidder's Question	Response
9	202	Specification Section 203.99010039: Point C – Mix design: Specification for DSM call for a water to binder ratio 1:1. Please clarify if this ratio is referred to the grout or to the total water to binder ratio?	Total water to binder ratio.
9	203	Specification Section 203.99010039:Point D – Soil-Binder Mixing. Specification for DSM call for predrilling of soil with a plasticity index PI greater than 20 to prepare the soil for modification. Please clarify the term prepare the soil for modification.	Prepare the soil for modification means to auger the soil first before injecting slurry.
9	204	Drawing # ESC104 and ESC107: Ground improvement areas are indicated as both DSM and Stone Columns. Please clarify only DSM is needed in these stated areas.	See revised General Note 8 on drawing ESC002. Refer to Addendum 9, Article 4.
9	205	Drawing # ESC110 (reach E, F and G): Ground improvement areas are indicated as DSM. Please clarify only DSM is needed in these stated areas.	See revised General Note 8 on drawing ESC002. Refer to Addendum 9, Article 4.
9	206	Drawing # SM310: Typical Deep Soil Mixing columns detail show 2 ft of DSM spoil at the top of the DSM columns. Please confirm the DSM columns to be installed from the existing grade and the top of the DSM columns is approximately two feet below the existing grade.	Confirmed. Excavate 2 feet, then install DSM columns.
9	207	Is the Contractor permitted to ship any Materials by barge directly to the project site, without utilizing the Facility in Specification section ESCR-7.13 WF-1?	Yes. Provided that all of the QA/QC procedures, material pre-inspections and acceptance of materials are completed prior to delivery to the project site. Materials without approval paperwork will not be permitted to be installed.
9	208	Will the Contractor be permitted to utilize other waterfront facilities of their choosing that are more appropriate for a particular use?	Yes, items such as stone (by barge, bulk) and similar items loaded directly to barges is not necessarily expected to go to the waterfront facility. Note that all of the QA/QC procedures, material pre-inspections and acceptance of materials are completed prior to the delivery to the project site. Materials without approval paperwork will not be permitted to be installed.
9	209	Controlled Inspections are referenced as an activity to be performed by the City at the Facility specified under Section ESCR 7.13 WF-1. Is it the City intention to accept or reject materials such as Pipe, Piles, Sheets, Aggregates, Pre-Cast Concrete ,etc that have already been Submitted through the approval and or design processes, purchased and delivered to the facility. Will the City not perform inspection of materials prior to delivery to confirm acceptance and compliance with specifications, long before any materials reach the Facility in specification Section ESCR 7.13 WF-1?	The contractor shall give the Engineer, in writing, sufficient notice in advance of any manufacture or fabrication of materials that will become permanent parts of the work, to allow the Engineer's representative the opportunity to provide inspection of said material(s) before shipping. The intent of the facility for inspections is that the material(s) delivered meet what was approved and signed off on at the fabrication plant prior to delivering to the job site, that there is no damage, and that the material(s) are signed in and logged. Note that this same procedure will apply for materials delivered directly to the project site. Additionally if there are any components of the installations that will be assembled by the contractor BEFORE coming to site, this yard is intended to be that location.

Addendum	Addendum Question No.	Bidder's Question	Response
9	210	Waterfront Cut Off Wall Platform 5, sheet 1021 A of 2791 (WS885A), show the Battered Pipe Piles as Item ESCR-551.245.05, however in the same sheet these are called as Item ESCR-551.30.01.C. Please clarify.	Item ESCR-551.30.01.C is correct. Drawing WS885A has been revised. Refer to Addendum 9, Article 4.
9	211	Waterfront Cut Off Wall Platform 2, sheet 1006 of 2791 (WS860) the Piles are assigned to two items, ESCR-511.3605.CS and ESCR-511.3605.CSD. Please clarify what range (wall length) of the wall correspond to one item and what to the other item.	Approximately 50% of the cut-off wall piles from piers 164-167 correspond to ESCR-551.36.05.CS and 50% to ESCR-551.36.05.SD. The cut-off wall pile schedule on drawing WS441A has been revised. Refer to Addendum 9, Article 4.
9	212	Waterfront Cut Off Wall Platform 3, sheet 1011 of 2791 (WS870) the Piles are assigned to two items, ESCR-511.3605.CS and ESCR-511.3605.CSD. Please clarify what range (wall length) of the wall correspond to one item and what to the other item.	Approximately 50% of the cut-off wall piles from piers 164-167 correspond to ESCR-551.36.05.CS and 50% to ESCR-551.36.05.SD. The cut-off wall pile schedule on drawing WS441A has been revised. Refer to Addendum 9, Article 4.
9	213	Drawing PCH308 refers to BT189 FOR CONTINUATION OF CONSTRUCTION. However, BT189 details the ARCH. CONC. FINISH PATTERN. Please clarify.	Drawings PCH306, PCH307, and PCH308 have been revised. Refer to Addendum 9, Article 4.
9	214	Re Bid Item Quantity for Bit Item 6.75 grind existing Asphaltic Concrete wearing course of 1975 cy. This amount to 320,000 sf of Pavement at 2". Kindly identify where this pavement is located. We believe the quantity is incorrect.	Item quantity has been revised. See highway plans for 10th Street, Delancey Street and FDR Drive reconstruction at the flood gate. Refer to Addendum 9, Article 2.
9	215	Please confirm if this project has a Buy America requirement?	The Buy America provision is not a HUD requirement and does not apply to this project.
9	216	Schedule A, Article 24, states guarantee period for tree planting of 24 months. When does the 24 month period begin? At the time of planting or substantial completion?	Refer to Article 24 of the Standard Construction Contract, in Volume 2.
9	217	Please clarify that the 700 +/- feet of the FDR Drive Service Road/On Ramp depicted on Contract Drawing PH002 as "CLOSED IN PHASE" is a long term closure. If yes, has the NYDOT been made aware and approved this long term lane/ramp closure?	Work on Montgomery Street between South Street and the Northbound FDR drive entrance ramp shall be performed in accordance with OCMC stips dated 2/13/20, Section II, Subsection B.
9	218	Please provide locations of 12" x 0.54" Micropiles	There are no 12" micropiles.
9	219	Please provide locations of 18" x 0.54" Micropiles	There are no 18" micropiles.
9	220	Addendum #5 has Item ESCR-552.11 20CT as both a new item and also a item to be removed. The quantity is the same. Please clarify if item ESCR-552.11 20CT is part of the bid or is to be removed.	Item ESCR-551.11 20CT was shown twice in Addendum 5 Attachment B in error—it should not have appeared in either section. The item is included in the bid schedule. Refer to Addendum 9, Article 2.
9	221	Addendum #05 Q&A #30 addressed all as-builts for existing structures are in Addendum #03-Article 3. Please provide location of the pedestrian bridge as-builts.	Refer to revised drawing G018 in Addendum 9, Article 4. Material added to Appendix A, which includes pedestrian bridge as-builts, is attached to Addendum 9.
9	222	Referencing Sheet 2217 of M&O Area 1 plans, note for bollard states "Steel Pipe Bollard, See Specs ESCR 737, Typ.". On Sheet 2219, note for bollard states "SS Pipe Bollard, See Specs ESCR 737, Typ.". Please clarify if these are galvanized powder coated steel or stainless steel bollards.	Bollards are galvanized powder coated steel. Drawings A-120.00 and A-130.00 have been revised. Refer to Addendum 9, Article 4.

ENGINEERING INSTRUCTION

CE-TI-3356

PROCEDURE FOR WELDING AND INSPECTION OF  
REPAIRS ON PRESSURIZED 69, 138 AND 345 kV  
HIGH PRESSURE PIPE TYPE FEEDERS

REVISION 06

AUGUST 2018

Prepared By: Arnold Wong 8/13/2018  
Transmission Engineering/Date

SME Concurrence By: Ronald Pietrowski, approved by email 8/13/2018  
Mechanical Engineering/Date

SME Concurrence By: Mark Bauer, approved by email 8/13/2018  
Transmission Operations/Date

Approved By: Thomas Villani 8/15/2018  
Section Manager, Transmission Engineering/Date

Effective Date: 8/15/2018

**TABLE OF CONTENTS**

<b><u>SECTION</u></b>	<b><u>SUBJECT</u></b>	<b><u>PAGE</u></b>
1.0	SCOPE	3
2.0	TEST EQUIPMENT, SPECIALTY TOOLS AND SUPPLIES	3
3.0	PRECAUTIONS	3
4.0	PREREQUISITES	3
5.0	INSTRUCTIONS	3
5.1	INITIAL RESPONSE AND SPILL CONTAINMENT	3
5.1	TEMPORARY REPAIR METHODS	4
5.2	PERMANENT REPAIR METHODS	4
5.3	WELDING AND NON-DESTRUCTIVE TESTING	4
5.4	PRESSURE TESTING AND RECOATING	5
5.5	RECORDS	5
6.0	EXHIBITS	5
6.1	SPLIT SLEEVE REPAIR	5
7.0	REFERENCE	5

**1.0 SCOPE**

- 1.1 This instruction provides the general requirements for the repair and welding procedures for 69, 138 and 345 kV high pressure pipe type feeders owned by the Consolidated Edison Company of New York, Inc., hereafter, the "Company" and:
  - 1.1.1 Identifies all equipment and materials to be supplied and installed by the Contractor.
  - 1.1.2 Identifies all equipment to be supplied by others and installed by the Contractor.
  - 1.1.3 Identifies the location where the equipment and materials are to be installed by the Contractor.
  - 1.1.4 Describes the conditions to be met for the installation of the equipment and materials.

**2.0 TEST EQUIPMENT, SPECIALTY TOOLS AND SUPPLIES**

- 2.1 None.

**3.0 PRECAUTIONS**

- 3.1 None.

**4.0 PREREQUISITES**

- 4.1 Repair welds on the pipe lines of 69 kV, 138 kV, and 345 kV high pressure pipe type feeders may be done with the feeders energized.
- 4.2 High speed circulation at full line pressure may be maintained during welding repairs provided the existing verified operating pressures are equal to or less than the following:

Pipe Dia. (in.)	Wall Thickness (in.)	Pressure (psig)
5-9/16	.258	1000
8-5/8	.250	600
10-3/4	.250	500

**5.0 INSTRUCTIONS**

- 5.1 Initial Response And Spill Containment

5.1.1 When dielectric fluid is spilled into the environment, the organization making the initial response shall use every means possible to contain the spill and report it to the proper agencies. Catch basins, sewer inlets, manholes and other such openings shall be protected from the spill product by use of sandbags, temporary berms, or other dielectric fluid spill containment products. Dielectric fluid absorbent booms shall be deployed if there a possibility of such fluid entering a waterway.

## 5.2 Temporary Repair Methods

5.2.1 Upon location of the leak, a clamp shall be installed immediately. A clamp such as an Adams or Plidco clamp shall be used *where feasible*.

5.2.2 If repairs cannot be made immediately, the clamp shall be inspected on a *periodic* basis to determine its effectiveness.

## 5.3 Permanent Repair Methods

### **CAUTION**

Permanent repair sleeves must be long enough to completely cover the corroded area. In no case shall welding be performed on a pressurized carrier pipe where the wall thickness at the point of welding is less than 3/16".

5.3.1 If the repair welding area shows signs of corrosion, the pipe wall thickness shall be *visually inspected to determine if adequate thickness remains for welding*. Any areas found having *an apparent* wall thickness less than 50% of the original pipe wall thickness must be encased with a permanent repair sleeve. *If adequacy of the wall thickness cannot be determined based on visual inspection, the pipe wall thickness shall be ultrasonically tested in accordance with Con Edison's Specification CE-MS-1111, Ultrasonic Examination (latest revision)*.

5.3.2 The following two types of sleeves *are the preferred* permanent repairs *for feeder pipes and associated return lines*:

- a. A Dresser Style 220 *split* repair sleeve with minimum wall thickness of 3/8 in.
- b. A fabricated split sleeve, which is designed to span the leak area to an area of sound pipe material. *Details and requirements are* shown on Exhibit 1.
- c. See Exhibit 2 for Barrel Weight Chart and General guidance on safe lifting limits.

**NOTE:**

*Other unique repair configurations may be required based on field conditions.*

**5.4** Welding And Non-Destructive Testing

- 5.4.1 All welders making welds on any *pipe type* cable pipe or return line shall be qualified in accordance with Con Edison Specification G-1065, "Qualifications of Welders and Welding Procedures," latest revision.
- 5.4.2 All welding shall be done using the shield metal arc process as per Con Edison Specification G-1064, "Shield Metal Arc Welding Procedure for Welding Steel Pipe and Fitting," latest revision.
- 5.4.3 All completed fillet welds and butt welds **on repair sleeves welded over a leak** shall be both visually and magnetic particle inspected in accordance with the requirements of API 1104, "Welding of Pipelines and Related Facilities". The Inspection shall be performed by a qualified NDE Contractor using procedures meeting the requirements above. Inspector qualifications and inspection procedures should be submitted for Engineering approval prior to use.
- 5.4.4 Any defect revealed by the visual or magnetic particle inspections shall be repaired and retested in accordance with Paragraph 5.4.3.

**5.5** Pressure Testing And Recoating

- 5.5.1 **All** repair sleeves shall be pneumatically pressure tested to minimum of 50 psig. All welds are then to be examined by applying a water soap mixture and visually inspecting the welds for leaks. After testing, the small hole used for pressure testing shall be seal welded close.
- 5.5.2 Prior to backfilling, the repair shall be field cleaned and recoated in accordance with Con Edison Specification G-8209, *Field Coating of Steel Pipe and Fittings for Buried Installation*, latest revision.

**5.6** Records

- 5.6.1 The following record of the leak and repair shall be made and stored by the Transmission Operations Department:
  - a. Feeder
  - b. Date leak is found and location
  - c. Time to clamp
  - d. Date leak is repaired, welder and inspectors identification.

- e. Repair method
- f. NDE Inspection records
- g. *Leak Critique Report***
- h. Date feeder is returned to service

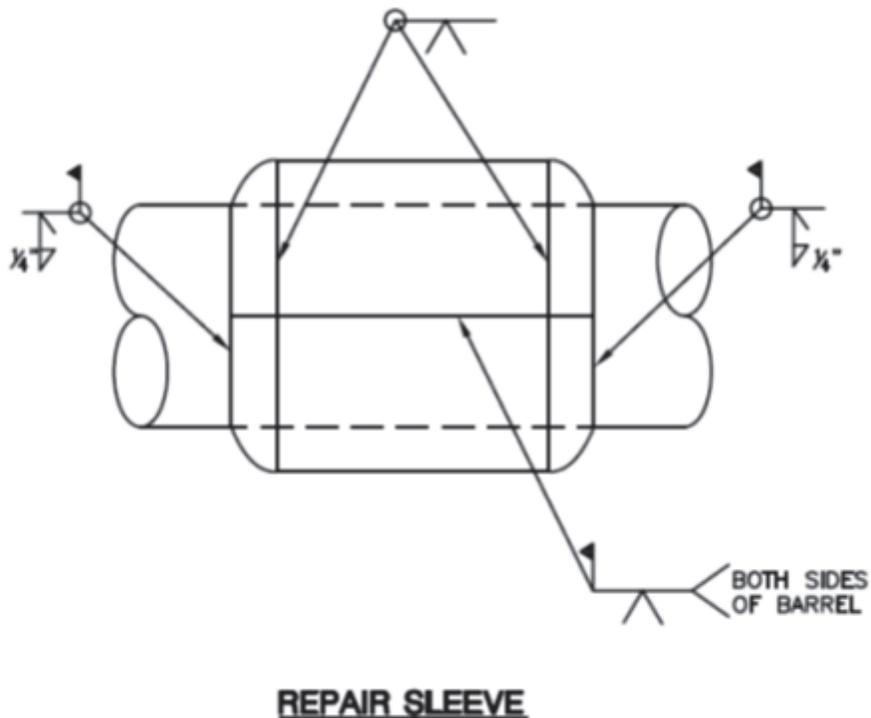

## 6.0 EXHIBITS

- 6.1 Exhibit 1 – Split Sleeve Repair

## 7.0 REFERENCES

- 7.1 ***CE-MS-1111*** Ultrasonic Examination – Thickness Measurements for Flow Accelerated Corrosion and General Erosion and Corrosion
- 7.2 G-1064 ***Shield Metal Arc Welding Procedure for Welding Steel Pipe and Fitting***
- 7.3 G-1065 ***Qualifications of Welders and Welding Procedures***
- 7.4 G-8209 ***Field Coating of Steel Pipe and Fittings for Buried Installation***
- 7.5 API 1104 - Welding of Pipelines and Related Facilities

**EXHIBIT 1**  
**SPLIT SLEEVE REPAIR**

**COMMON BOILER CAP SIZES AND BORE SIZE**

1. 12" Boiler cap with 10 -7/8" bore for 10" feeders
2. 10" Boiler cap with 8-3/4" bore for 8" feeders
3. 6" Boiler cap with 5-5/8" bore for 5" feeders

**Materials:**

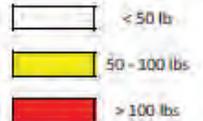

1. Boiler cap in accordance with ASTM A105 SCH 40
2. Pipe in accordance with ASTM A53 SCH 40

EXHIBIT 2

**Barrel Weight Chart**

		Linear Footage of Barrel (pipe section) with boiler caps									
Size	lb/ft	1	2	3	4	5	6	7	8	9	10
4	5.395	9.145	14.54	19.935	25.33	30.725	36.12	41.515	46.91	52.305	57.7
5	7.31	14.06	21.37	28.68	35.99	43.3	50.61	57.92	65.23	72.54	79.85
6	9.485	19.235	28.72	38.205	47.69	57.175	66.66	76.145	85.63	95.115	104.6
8	11.18	29.18	40.36	51.54	62.72	73.9	85.08	96.26	107.44	118.62	129.8

18	35.295	116.295	151.59	186.885	222.18	257.475	292.77	328.065	363.36	398.655	433.95
20	39.3	151.8	191.1	230.4	269.7	309	348.3	387.6	426.9	466.2	505.5

General guidance on using the chart is to perform the listed steps based on the color code identified below.

- White:** Barrel under 50 pounds that can be lifted by an individual.
- Yellow:** Barrels between 50 and 100 pounds will require a team approach to lift. To facilitate handling, these barrel should have handles welded on opposite sides.
- Red:** Barrels that exceed 100 pounds introduce a high risk when handling. These barrels should have an eye welded at top-center to facilitate lift. When practical, loading and unloading should be via mechanical means.

Addendum	Addendum Question No.	Bidder's Question	Response
10	1	Section A Description refers to drawings dated October 17, 2019 can the owner please provide these drawings associated with JB 117 and JB 118?	The JB pages have been revised to updated drawing reference to February 21, 2020. Refer to Addendum 10, Article 2.
10	2	Reference drawings TC184-194 – Construction of Floodwall and all work associated with it, from sta 95+00 – 102+34.87 – Will the agency consider giving the contractor extended weekend lane closures, utilizing the barrier configurations provided in the plans (2 lanes open to traffic in each direction), starting from Fri 10 PM straight thru to Monday 6 AM? If so, please provide the number of weekends allowed for bidding purposes.	The stipulations included in the bid documents will not be updated prior to bid. Note that the contractor must obtain all roadway closure permits from OCMC .
10	3	Vol. 3 of 3; ESCR 551-Steel Pipe piles require predrilling for the waterfront structure and along the FDR. The contractor is also expected to remove any bulkhead that interferes with steel pipe piles. Will the contractor, be paid under 551.03950017 for predrilling, and ESCR-6.27 TC for removal of timber cribbing rock-filled bulkhead when piles encounter obstructions?	<p>The predrilling through the historic timber cribbing is included as part of the pile installation items, refer to items ESCR-551.24.05.CT, ESCR-552.11 20CT, ESCR-552.11 46CT for examples of items that include predrilling through timber cribbing.</p> <p>The partial demolition of the timber cribbing (paid under ESCR-6.27 TC) is only for tie rod or deadman installation and is shown on WS162.</p> <p>The predrilling through existing obstructions along the waterfront are included as part of the pile installation items, refer to items ESCR-551.36.05.CD, ESCR-552.11 4219CD, ESCR-551.36.05.CSD, ESCR-551.42.06 D for examples of items that include predrilling through waterfront obstructions. Any elements of the existing bulkhead that need to be removed are part of the corresponding esplanade type demolition numbers shown on WS140-WS149.</p> <p>As per the Construction Notes from the contract drawings, "Any obstructions encountered in the top 30' of site clearance shall be removed by the contractor at no additional cost to the client".</p> <p>The predrilled holes (Item 551.03950017) for the pedestrian bridge H-piles are intended to mitigate disturbance to adjacent existing utilities from pile driving.</p>
10	4	Note #4 on SHT 2107 states "The 2" and 4" PVC Schedule 80 Conduit for the Grand Street Ferry Ductbank shall be paid for under unit price item PK-ESCR 675...." This conflicts what is said in Note #1 on SHT 2062 which states "Payment item PK-ESCR 658 is for electric service & distribution work at Grand Street Ferry. Shall include all service and distribution work, grounding rods, exothermic welds, service cabinet, trans 'S' 400 amp CT cabinet, service switch concrete duct bank with reinforcing steel, temporary electric and telephone service and all miscellaneous items & components required for complete installation" please advise where the Ductbank is to be included.	Item PK-ESCR 658 covers the complete installation of the Grand Street Ferry Electric service and associated work. See revised Note 4 on drawing PUE702. Refer to Addendum 9, Article 4.

Addendum	Addendum Question No.	Bidder's Question	Response
10	5	Please reference Bid Item 559.1690118. This bid item is only referenced on a few sheets, and is seemingly only utilized at the tops of the abutments and piers for the three pedestrian bridges, on Sheets BC122, BD140, and BT132. With the limits defined on these sheets, the bid item quantity is significantly low. Please indicate if the penetrating sealant is to be applied to all exposed vertical surfaces for all bridge abutments, piers, wing walls and structural walls.	The limits and quantities for Delancey, East 10th, and Corlears Hook are correct. This item shall also be applied to the existing pile caps along the esplanade. See drawing series WS600 to WS629.
10	6	Please reference Bid Item 567.50. This bid item does not appear in any of the drawings. Please indicate what this bid item pertains to.	Item 567.50 has been deleted. See Item 567.60 on drawing BC140. Refer to Addendum 10, Article 1.
10	7	Please provide the location for item No. 585.01 Structural Lifting Operations-Type A in the contract drawings.	Item 585.01 has been deleted. Note 9 on drawings BD001 and BT001 has been revised to clarify that the cost for transporting and installing the tied arches will be included in the lump sum steel cost (items 564.0501 and 564.0502) as per specifications. Refer to Addendum 9, Article 2 and Addendum 9, Article 4.
10	8	Waterfront structure cross sections C-1, C-2, D-5, D-5A, D-6, F-2, F-4, G-6, and H-1 show the Combi Wall assigned to two items, ESCR-552.11 4219C "COATED PAZ42/NZ19 OR EQUAL COMBI-WALL INSTALLED" and ESCR-552.11 4219CD "COATED PAZ42/NZ19 OR EQUAL COMBI-WALL INSTALLED IN PREDRILLED LOCATIONS". Please clarify what range (wall length) of the wall correspond to one item and what to the other item.	WS441A shows wall lengths and corresponding predrilling percentages. Contractor and Engineer must mutually agree on predrilling criteria before any predrilling operations occur.
10	9	Waterfront structure cross sections E-2, F-4 and F-6 show the the Pipe Pile Wall assigned to two items, ESCR-551.36.05.C "COATED 36 IN. DIAMETER X 0.5 IN. WALL THICKNESS STEEL PIPE PILE INSTALLED" and ESCR-551.36.05.CD "COATED 36 IN. DIAMETER X 0.5 IN. WALL THICKNESS STEEL PIPE PILE INSTALLED IN PREDRILLED LOCATIONS". Please clarify what range (wall length) of the wall correspond to one item and what to the other item.	The Cutoff Wall Schedule on drawing WS441A provides information for wall lengths and corresponding predrilling percentages. Contractor and Engineer must mutually agree on predrilling criteria before any predrilling operations occur.
10	10	Sheet 2272 for M&O Area 2 shows canopy foundations supported by HP 12x53 piles. Since we do not see a separated pay item for this size pile we assume they are to be included in the Lump Sum price for item PK-ESCR 50B M+O Canopy Structure, Area 2. Please provide pile tip elevations.	The piles are in the lump sum price for item PK-ESCR 50B, and the estimated tip elevation of HP12x53 piles are -65'-0".
10	11	Please refer to Spec Section JB-123, A.1.2 states that the feeder pipes are 10" diameter and smaller. A.2.2 states that the feeder pipes are 5" and 10". Drawing number 2782 shows four 6" pipes but does not give the dimensions of the other feeder pipes. Can you please provide the size of each feeder and return pipe?	The JB-123 specification has been revised. Refer to Addendum 10, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
10	12	Please refer to Spec Section JB-123, B.2.4.1, please clarify this statement regarding the presence of ACM on the existing Transmission Feeders is the Contractor to assumed that each of the (8) Feeders and Return lines contain ACM?	The Contractor should always be aware of the possibility of the presence of ACM. Refer to attached document Con Edison Blanket Variance and the revised JB-123 specification in Addendum 10, Article 2.
10	13	Please refer to Spec Section JB-123, C.2.2 states that there is a time frame for completion in the Special Conditions. I could not find a time frame indicated in the Special Conditions. Can Con Ed provide the location/title of the file that this information is provided or provide the information as an answer to this question?	The JB-123 specification has been revised. Refer to Addendum 10, Article 2.
10	14	Please refer to Spec Section JB-123, D Method of Measurement references contract drawings dated December 2, 2019 under Project ID SANDRESM1. I did not find any drawings with that date. Can you provide the location of these prints or the files?	This reference is to older contract drawings. The JB-123 specification has been revised. Refer to Addendum 10, Article 2.
10	15	Please refer to Spec Section JB-123, Appendix IV Air Bubbles Repair 4 appears to be missing information. Can you please provide the information?	The JB-123 specification has been revised. Refer to Addendum 10, Article 2.
10	16	Please refer to Spec Section JB-123, Appendix IV Item 4 references attached drawings and SDS sheets for HDPE transitional wedges and caps. The drawings and SDS sheets were not attached, can you provide them?	The JB-123 specification has been revised. Refer to Addendum 10, Article 2.
10	17	Please refer to Spec Section JB-123, Appendix IV 8 refers to feeders and manholes that do not appear to exist on any of the prints we received. Are there additional prints of these areas? Are there manholes and high hats associated with this repair? If so, please provide the locations and details?	Conduit plates were provided as part of the joint-bid package by Con Ed. No further details about manholes and high hats related to repairs are available.
10	18	Please refer to Spec Section JB-123, Custom NCR Repairs Repair 4 references procedure CE-MS-3313, Rev 0 Appendix 4 Item 3. Can you please provide this information?	The JB-123 specification has been revised. Refer to Addendum 10, Article 2.
10	19	Section A.2.5 requires the contractor to follow an Inspection Test Plan (ITP). Please provide a copy of the project ITP.	See attached ITP.
10	20	Pay item 0580; JB-123(CE); Installation of Composite Carbon Fiber System Encapsulation of Underground Transmission Feeder and Return Lines. Please provide any anticipated additional cost associated with this minimum bid price of \$24,000 per linear trench foot, not inclusive of the contract documents, specifications, approved installer, fabricator, and support operations required by the contractor.	Any additional costs would be caused by the Contractor's means & methods.

Addendum	Addendum Question No.	Bidder's Question	Response
10	21	<p>The bid document provides minimal remedies for unforeseeable conditions which may be encountered during construction. Since this is not a Design-Build Project and Contractor is relying on the information provided by NYCDDC, we request allowance items be added to the schedule of values to address excessive risk items such as subterranean obstructions during pile installation and others. We can provide suggested allowance items at DDC's request and strongly believe this will result in a more competitive bid, where NYCDDC can keep and manage the contingencies more efficiently.</p>	<p>Additional items for addressing obstructions have been added via addendum. For example, the following new items were added: ESCR-203.12 PVD, ESCR--203.99 DSM, ESCR-2.FDO, and ESCR-5.1 OB.</p>
10	22	<p>Items ESCR WF1, WF2, WF3 and WF4 all has an Engineer's Estimate Quantity of 24 months, whereas the project duration is approximately 60 months. We understand that these facilities will not be needed for the entire 60 months project duration, however, 24 months appears to be grossly under estimated. Please clarify these apparent discrepancies.</p>	<p>Quantities for ESCR 7.13 WF2 and ESCR 7.13 WF4 have been revised. Refer to Addendum 10, Article 1.</p>
10	23	<p>Please confirm if Bid Item 44900 (ESCR-551.24.05.CT) "COATED 24"DIAXO.5"WALL STL PIPE PILE IN JET GROUT" should be in pre-drill location and if this pre-drill work is incidental to this Bid Item or is other pay item.</p>	<p>In reference to item ESCR-551.24.05.CJG, refer to drawing FG272 for 14th Street crossing gate pile schedule. Refer to drawing F023, Note 2 for method of installation. All incidentals for installation shall be paid under item ESCR-551.24.05.CJG.</p>
10	24	<p>Bid Item ESCR-551.30.1 ST "STATIC COMPRESSION TESTING" was added in Addendum 6, but couldn't find it in the drawings. Can you Provide Details?</p>	<p>Item ESCR-551.30.1 ST can be found on drawing WS850. An additional test will be added at Pile location A-23 on drawing WS880.</p>
10	25	<p>Please clarify if ground improvement works (i.e. jet grouting, soil inclusions, stone columns, etc.) that require pre-drilling through the existing timber bulkhead as a prerequisite to installation, shall have their costs allocated in Item No. ESCR-6.27 TC?</p>	<p>Contractor shall confirm extent and existence of historic bulkhead structures. No ground improvement within areas designated on drawings is to be installed within the footprint of existing historic bulkhead structures after confirmation by contractor. In the event the contractor does not find historic bulkhead structures in areas as indicated on the drawings, ground improvement operations need to be included and will be paid under the standard ground improvement pay items; Item ESCR-5.1 for stone columns or item ESCR-5 for rigid inclusions.</p>
10	26	<p>There are conflicting lengths for Lintel L2 on Sheet No. 2480 and 2524. Please clarify.</p>	<p>Follow structural drawings for lintel lengths. Architectural drawings will be revised to match structural drawings.</p>
10	27	<p>On the Assembly Schedule of Sheet 2473, the description for F-01 indicates a different assembly from detail 1 on Sheet 2525. Please clarify which holds.</p>	<p>Please use the structural slab thickness, insulation, crushed rock, compacted soil. Please refer to architectural drawings for water proofing (WPS-01/02).</p>

Addendum	Addendum Question No.	Bidder's Question	Response
10	28	Please confirm that the Load Transfer Platform (LTP), also referred to as the working pad in Specification Section ESCR-5.1 and pay item ESCR-5.1-LTP, is to be installed prior to Rigid Inclusion installation. Please clarify the elevation of the top of the LTP working pad.	There is flexibility regarding when the LTP gets constructed. The Contractor must use engineering judgement as to when to install the LTP. If the Contractor's preference is to install the rigid inclusions and then place the LTP, that would be acceptable. The top elevation of rigid inclusions is typically at +6' NAVD88, and the minimum thickness of the LTP is provided in the specification.
10	29	Detail C on Dwg. SM310 shows natural grade 2' higher than natural soil. Is natural grade the same as existing grade? Is intent to first excavate 2' below the existing grade across the entire soil mix area footprint, so that soil mix is installed from a working subgrade 2' lower? The spoils could then be used to bring the site back up to natural grade.	Yes, natural grade is existing grade. Intent is to excavate 2' below existing grade before installing DSM columns.
10	30	Is DSM intended on this project for mitigating heave-related soil movement, as discussed in Section B.3 of the specification? If not, can the laboratory mix design and production work delete the consolidation, free vertical swell, and linear shrinkage strain sampling/testing requirements?	Yes, those tests can be excluded, as the DSM option is NOT related to heaving mitigations.
10	31	Reference: Pier Type G, new backwall and existing pile cap. Per Drawings WS663 and WS514 (Pier Type G, Col. L. 13, 14, 98, 99), width of proposed backwall is 2'-0" or 2'-6" and width of existing pile cap is 4'-0" or 4'-10". Please clarify locations of different width of backwalls and existing pile caps.	Proposed piers 13, 14, 98, and 99 are type G piers. Existing piers 14, 98, and 99 are 4'-10" wide and will therefore have a 2'-6" wide backwall. Existing Pier 13 is 4'-0" wide and will therefore have a 2'-0" wide backwall.
10	32	Reference: Pedestal Elevations. Per Pedestal Elevation Summary Table on Drawing WS513, Piers 164(N) to 166(S), pedestal P1 elevation is 3.86, pedestal P2 elevation is 3.70 and pedestal P3 elevation is 3.55. However, per Drawing WS627 Top of Pile Cap Elevation is +5.36. Please confirm if this is correct.	Pier 164 has two different top of pile cap elevations (Reference drawing WS461). The south side (P164(S)) has a top of pile cap Elevation of 5.36' and the north side (P164(N)) has a top of pile cap Elevation of 3.36'. The pedestal elevations shown on WS513 are therefore correct. The "Top of Pile Cap El." Callout on WS627 should note, "3.36' at P164(N) only".
10	33	Please provide locations and depths for pay item 551.92000008: Removal of Piles	This information can be found in the Houston Street As-Builts.
10	34	Please define locations of pay item 552.13: Temporary Steel Sheeting	Location is shown on Excavation Support and Protection plans and sections drawings for Delancey, East 10th, and Houston. Drawings BC110 and BC111 will be revised to indicate temporary sheeting along the FDR Drive walkways and existing sewers.
10	35	Specification ESCR 559 Protective Coating for Waterfront Structure; please confirm only the esplanade, floodwall, and flood gate sheet and piles are the only foundation systems that require coating. Additionally, there is no coating for other pile-supported structures in the contract documents.	Refer to specification Section ESCR-559 for details on the structures that shall have protective coating for the waterfront and flood protection structures.
10	36	BID ITEM# 565.142000008 Please provide a Material Spec for the 1" Thick PTFE?	The material specifications for 565.142000008 can be found in the special NYSDOT specification as well as sections 565-2.01, 565-2.04 and 565-2.05. NYSDOT specifications are located online as described in the NYSDOT specification section of the Description Pages page PD-9.

Addendum	Addendum Question No.	Bidder's Question	Response
10	37	Addendum #5 revised the top of proposed cut-off wall pile elevations on the sewer crossing detail sheets WS770 and WS771 for NCM-60 and NCM-59, but no changes were made on the cut-off wall profile drawings W5400 series. Please clarify the extents of the new top of pile cutoff elevations shown from the sewer crossings.	Drawings WS400 to WS402 and WS770 will be modified to show a pile cap top elevation of 9.15' +/- from piers 2 to 5 and 12.07' +/- from piers 5 to 13. Drawings WS406 to WS407 and WS771 will be modified to show a pile cap top elevation of 7.77' +/- from piers 27 to 28 and 7.27' +/- from piers 28 to 29.
10	38	L-Wall Platform 5 drawings WS885A shows elevations that differ from Sewer Crossing Detail sheet WS776 and Cutoff Wall Profile WS425. Please clarify which elevations are to be used.	Elevations shown on drawing WS885A are correct. Drawings WS776 and WS425 will be modified to match drawing WS885A.
10	39	Please clarify which item shall be used for lightpole foundations. Some WS903 drawings indicate ESCR-4.06 HP ES. Specification for PK-ESCR-662 calls for foundations to be included in the LED Lights. There are also SL pay items for lightpole foundations	Regarding the .106 esplanade light pole foundations shown on drawings WS329A through WS329H, and summarized in the bid schedule on drawing WS903A, bid items shall be in accordance with drawings WS903E through WS903I callouts. Appropriate bid items include: ESCR-4.06 HP ES, ESCR-4.14, ESCR-551.42.06, and ESCR-551.42.06.D, as appropriate and shown. For the new street lights found on the SL series drawings, please use item SL-20.02.10 for the foundations.
10	40	What Pay Item is to be used for the M & O Area 1 Canopy Steel and M & O area 2 Canopy Steel?	Item PK-ESCR 50A for Area 1 and item PK-ESCR 50B for Area 2.
10	41	See the "Sequence of Construction Single Stage Adjacent Beams or Slab Units" on sheet 944 of the contract drawings. Are the transverse tendons to be grouted into the 3" diameter precast tendon tube after being tensioned?	The transverse tendon ducts are to be grouted after tensioning. Grout to be placed inside the 3" dia. Precast tendon tube after tendons are tensioned with a grout meeting the requirements of section 4.6.4 and placed in accordance with section 8.6 of the Prestressed Concrete Construction Manual (PCCM). Drawing WS717 will be revised to include this note.
10	42	Plan sheets 224 and 350 show both the Delancey Street and East 10th Street bridges to be removed under item 202.120001. Are both of these bridges to be removed under the same pay item or should one of these bridges be removed under item 202.120002? NOTE: The Corlears Hook bridge is to be removed under item 202.120003.	Please note that the item numbers will be as follows: Item 202.120001 shall be for the Delancey St. Bridge and item 202.120002 shall be for the East 10th St. Bridge.
10	43	Drawings FG270 & FG271 indicate limits of excavation and controlled low strength material placed around the existing double barrel sewer. Please confirm the bid item under which this excavation is to be paid.	Excavation for structures shall be paid for under item ESCR-4.11 AS.
10	44	Addendum #05 added bid item ESCR-551.24.05 RS; Cutoff Wall L-Wall Platform drawings (e.g. Sheet 1016) has a 30" piles with a 24" Rock Socket, but the rock rocket is paid under ESCR-551.30.01 RS. Which locations of the 24" piles requires rock sockets?	Item ESCR-551.30.01 RS covers the installation of 24" diameter rock sockets inside the 30" diameter pipe piles. Drawing WS880 will be revised with correct item ESCR-551.30.01 RS.
10	45	Addendum #05 added bid item ESCR-551.42.06; please provide locations of this new bid item	Refer to drawing WS903I for item ESCR-551.42.06.
10	46	There are existing contour lines shown on both site grading plans LG300 & LG301 and erosion control plan ESC101, for reaches A & B, in the Pier 42 park project site. These contour lines do not match, please advise which is the correct plan.	The site grading drawings LG300 & LG301 are correct and match the anticipated/actual grading at Pier 42. Drawings LG300 and LG301 should be referenced for site grading drawings in Reaches A & B at the Pier 42 park project site.

Addendum	Addendum Question No.	Bidder's Question	Response
10	47	Refer to plan SM318. The detail states that the target settlement value for the pre-loading is shown on drawings SM302-SM309. However, these plans do not show any target settlement value. Will the target settlement value be provided?	Settlement contours will be added to drawings SM302 to SM309.
10	48	New Rock Socket pay items for 30IN and 36IN pipe pile in Addendum #05 and #06, please clarify in what circumstances rock socket is required for pipe pile, please state the location and detail for rock socket.	Item ESCR-551.30.01 RS can be found at the L-wall locations; refer to drawings WS619A, WS625, and WS627 to WS629. Item ESCR-551.36.05 RS can be found at the cut-off wall segment in front of the Williamsburg Bridge; refer to drawing WS610.
10	49	Sheet 585 and Sheet 597 ; Addendum #05; Stationing for Independent Floodwall in Reach C starts at 28+00. Sheet 585 stipulates that all floodwall from 23+82 - 31+25 is now AZ46 Press In Method, has this system changed? Additionally Sheet 597 is not legible.	F402 is correct. From STA. 23+82 to 28+00, the floodwall is AZ46 Press In Method. Drawings F402 and F603 show AZ20 for the sheeting between STA 28+00 and STA 31+25. Additionally, the installation method is not required to be press in for the AZ20 sheeting installed within the park. F603 (Sheet 597) was replaced in Addendum 10, Article 3.
10	50	Sheet 827 states Interlock sealant applied to cutoff wall starting at sta 58+52. Sheet 695 states Interlock sealant applied from sta 61+20. Which detail is correct?	Any mention of interlock sealant on WS126-WS127 will be removed. Refer to WS433 (Sheet 827) for correct limits of interlock sealant, as well as WS441A Cutoff Wall Schedule for detailed breakdown of interlock sealant extents.
10	51	Ref Dwg WS607A. The item PK-ESCR 937 Horticultural Drainage Layer has been deleted from every section except the one shown on WS607A. Is this item deleted? Or do the labels need to be added back into the sections? Please clarify and adjust bid item quantity as necessary.	PK-ESCR 936 has been removed from the estimate and drawing WS607A will be revised to remove item PK-ESCR 9337A and callout for the horticultural drainage layer.
10	52	Special Provisions; Article B15 Us Army Corps of Engineers Requirements; paragraph D states pile driving activities that occur during the presence of ESA - listed species, the permittee shall ensure the use of a vibratory hammer. If the use of an impact hammer is practical, 20-minute soft starts will commence. Will the approved Army Corp permit now state no water work unless inside a cofferdam from March 1st – June 30th?	USACE Provisional Permit Special Conditions (B) requires that installation of cofferdams in areas shallower than 6 meters is avoided between January 15 - May 31. There are no seasonal in-water work restrictions for pile driving, sheet pile installation, or other in-water construction activities. Contractors shall comply with requirements regarding pile driving activities and turbidity controls specified in Special Conditions (C) and (D) and further discussed in correspondence with NOAA NMFS dated 9/19/2019. Contractors should be advised that there may be additional conditions attached to the forthcoming NYSDEC Section 401 Water Quality Certification or waiver.
10	53	The contract documents and specifications do not stipulate any cofferdam installation (other than outfalls) for the demolition or construction of the Esplanade, Cutoff wall, or any other elements of the Waterfront Structure. Will new drawings show the anticipated cofferdams for these activities?	No, no additional drawings will be provided for cofferdam installation for demolition or construction for the waterfront structures. Contractor shall determine the necessity of use of cofferdam as part of their means and methods. Costs for installation shall be accounted for in their bid.

Addendum	Addendum Question No.	Bidder's Question	Response
10	54	Will the new Army Corps permit allow the contractor to perform any in-water activities outside potential cofferdams from January to June? E.g., spudding of barges, movement of barges, material delivery, any work disturbing the mudline such as the cutting of timber or steel piles, or any other requirements for the project?	USACE Provisional Permit Special Conditions (B) requires that installation of cofferdams in areas shallower than 6 meters is avoided between January 15 - May 31. There are no seasonal in-water work restrictions for pile driving, sheet pile installation, or other in-water construction activities. Contractors shall comply with requirements regarding pile driving activities and turbidity controls specified in Special Conditions (C) and (D). Contractors should be advised that there may be additional conditions attached to the forthcoming NYSDEC Section 401 Water Quality Certification or waiver.
10	55	Special Provisions; Article B15 Us Army Corps of Engineers Requirements; paragraph E, O, P, and R explicitly states the requirements of turbidity management for all in-water work. In Addendum 2 issued by the NYC DDC, sheet 666, the agency deleted all in water-sediment control measures. As the contractor is required to abide by the US Army Corps permit stipulations, the agency has removed all specific notes associated with maintaining these requirements. What was the intent of eliminating these notes?	Please follow specification section ESCR 9.30 for erosion and sediment control. Notes were eliminated to avoid conflicts.
10	56	Please verify that the installation of the proposed cut-off wall is not considered a cofferdam; therefore all work associated with the sheeting wall is excluded from the restrictions outlined in Special Provisions; Article B15 Us Army Corps of Engineers Requirements; paragraph C and D. It is the bidder's understanding that a turbidity curtain is all that is required, but this assumption requires the clarification requested in the previous question.	Installation of the proposed cut-off wall is not considered a cofferdam. Contractors shall comply with requirements regarding pile driving activities and turbidity controls specified in Special Conditions (C) and (D). Contractors should be advised that there may be additional conditions attached to the forthcoming NYSDEC Section 401 Water Quality Certification or waiver.
10	57	Please note that drawing PUD705 in the "Park Utilities- drainage & sanitary details" indicates we have mini-piles below various structures and pipes. The notes indicate we refer to NYCDEP standard drawing SE6 for details on the foundation. However, this NYCDEP drawing contains information on timber piles. Please provide the quantity and size of mini-piles along with the grout material for structures and pipes shown in PUD001. In addition, the depths are provided on PUD705, however, please confirm we are to use these depths for drilling.	Please refer to the NYCDEP Standard Drawing SE6 for reference, but substitute the timber pile for the mini pile.  Please refer to NYCDEP Specification 70.13 MN for materials.  Yes, use depths provided on PUD705.
10	58	On drawing PUD004, network 1200 shows both STR-1202 and STR-1203 have a FDS and HDS structure type. As per note # 5 on the same page, these structures are installed on pipe supported caps. However, drawing PUD703 shows a cross section detail of these two structures but does not show any foundation elements. Please clarify.	Drawing PUD703 will be revised to show piles.
10	59	Addendum #06; Please provide locations of Rock Socket for 36" Diameter x 0.5" piles, along with limits of ESCR-551.36.05 C Pipe Piles	Rock sockets for 36" dia x 0.5" piles are installed between piers 46 to 51. Refer to drawing W5441A for pile schedule along cut-off wall.
10	60	Addendum 6 added pay items 4.02 CA, 7.07B, but these items cannot be found on the drawings. Please clarify where they are used.	Item 4.02 CA is for FDR Drive pavement reconstruction, see drawing FG245. Item 7.07B is for the East River Housing Parking Lot, drawing BD207B, and Montgomery Street parking lot FG139.

Addendum	Addendum Question No.	Bidder's Question	Response
10	61	Drawing BD207A labels removal of existing landscaping as needed and existing street tree pit under item PK-ESCR- 1190 Clear and Grub. No such item exists, and Addendum #6 removed item PK-ESCR 190 Clear and Grub. Please clarify which pay item is to be used.	Use item 6.01 AC.
10	62	Drawing BC171 refers to "PC Series" for highway sidewalk improvements at Corlears Hook along the FDR. No such drawings exist. Please clarify restoration for this area.	The PC series is covered under a separate contract. This work is not included in the SANDRESM1 contract. Drawing BC171 will be revised from "PC Series" to "under a separate contract".
10	63	In reference to the proposed 3'x5'-6"RCFT Combined sewer in Reach G detailed by DS411 connecting the existing Junction Chamber to JC-G01. Can further detail be provided of the existing sewer that this sewer ties into?	The existing Junction Chamber (S014M) is to be removed per drawing DS106. The proposed 3'-0" x5'-6" will be connected to a new, proposed junction chamber JC-G01. There is an existing sewer shown on the survey feeding into the existing junction chamber from the North that does not exist. This was confirmed by recent dye test. The proposed junction chamber only services the 3 proposed sewers shown on drawing DS411 and detailed further on drawings DS537 to DS538.
10	64	Reference drawings BD207E and BD207F. The 8ft chain link fence shown has 3 strands of barbed wire. However, in the specifications for item PK-ESCR 712 and PK-305 for chain link fence items it does not mention this. Please clarify applicable pay items for 8ft fence with 3 strands of barbed wire as shown on BD207E and BD207F	See drawing BD207B-01 that calls out the 8 ft high fence with barbed wire to be paid for under item 6.34 AD. The barbed wire on the gate is paid for under the gate item PK-ESCR 715A
10	65	Please note we cannot locate any 18 inch micropiles as indicated in bid item ESCR-551.993.1800 or the pile load tests required for such piles. Please clarify where these piles are	Please refer to Addendum 10, Article 1 for the current bid schedule, which does not contain item ESCR-551.993.1800.
10	66	Please note we cannot locate any 12 inch micropiles as indicated in bid item ESCR-551.993.1200 or the pile load tests required for such piles. Please clarify where these piles are	Please refer to Addendum 10, Article 1 for the current bid schedule, which does not contain item ESCR-551.993.1200.
10	67	Please clarify what cost is to be included in bid item ESCR-5.TP, Stone Column Test Program. Do we include the SPT testing for stone columns here? The specifications are also not clear on whether we have to install test stone columns. If there are, where and how many are there?	The cost to be included in item no. ESCR-5.TP is to include the installation of approximately six stone columns initially. These are requested to be installed close to the water edge at Reaches C, D, E, or F at an agreed upon area between the Contractor and the Engineer, so potentially they will be production stone columns. Refer to ESCR 5.08 (H). After the installation, the Contractor will be required to perform either SPT borings or CPTs as required by ESCR 5.12 (B), and will be required to prepare a report with the results as required by ESCR 5.06 (D) and (E).
10	68	On Sheet 1487, for Structure STR-11005, does Structure Type MH-4 refer to NYC DEP SE-25 or -27 for pile details?	Structure Type MH-4 refers to the NYC Parks Standard structure. Refer to Drainage/Sanitary Structure Pile Cap Detail on PUD705 for Pile Details.

Addendum	Addendum Question No.	Bidder's Question	Response
10	69	<p>Specification Section ESCR-5.1 – Ground Improvement with Rigid Inclusions, section 5.1.1.1.D calls for Pile Integrity Testing (PIT) on 25% of all installed Rigid Inclusions. Since the RI top elevation is below the LTP/working platform, exposing the RI will require slow and careful digging through said platform to prevent cracking or damaging the column. The RI must then be grinded smooth and level before PIT testing can occur. The 25% requirement is an extremely high testing percentage that will create logistical challenges and inflate costs. Will a lower percentage, like 5%, be accepted?</p>	<p>As discussed in PBQV-07, there is flexibility regarding when the Contractor constructs the LTP. If the preference is to place the LTP after the rigid inclusions construction, that will be an acceptable option. If the Contractor uses this approach, then the top of the rigid inclusions can be leveled with a trowel after completion of the construction, while the grout is still wet.</p> <p>PIT testing must be performed on 25% of the rigid inclusions as specified, however, the Contractor may submit a VECP per the requirements of the S-Pages for a revised level of PIT Testing.</p>
10	70	<p>The Area Replacement Ratios for both the Stone Columns and Rigid Inclusions is extremely high for mass treatment. Are the designs prescriptive or performance based?</p>	<p>The design is prescriptive, however, we do ask the Contractor to verify the adequacy of the constructed ground improvement.</p>
10	71	<p>Specification Section ESCR-2 Part 2.04 (C) alludes to more than one (1) test section, which is reasonable given the amount of jet grout that is to be installed across a site extending over 2.5 miles. Please provide a quantity of test sections that shall be performed for bidding purposes only. Presumably, there should be one (1) test section for every one (1) to two (2) reaches, depending on the quantity of jet grout columns to be installed in each reach.</p>	<p>Ideally, the jet grouting test area will be performed in the general area of 14th and 15th Streets. However, since this area is very congested, performing the jet grout test area in the park at an area agreed upon between the Contractor and the Engineer will be the most reasonable approach.</p> <p>It is anticipated that the test area will be in Reach I or J. It is anticipated that only one test area is necessary.</p>
10	72	<p>Thermal Integrity Profiling (TIP) is an alternative method of testing Rigid Inclusion integrity that does not require exposing or leveling the top of the RI and produces more consistent and accurate results than PIT. Will TIP testing be an acceptable alternative to PIT, and if so, will a lower testing percentage, like 5%, be accepted?</p>	<p>The Contractor may submit a VECP per the requirements of the S-Pages for a revised level of PIT Testing. The testing to be performed, whether PIT or TIP, shall be performed on 25% of the rigid inclusions, unless a VECP is submitted to revise the level of testing.</p>
10	73	<p>Are driving shoes required on steel pipe piles? They are not referenced in spec ESCR-551 or shown on drawings.</p>	<p>Predrilling at various locations is assumed where obstructions may be encountered and has already been accounted for in the cost estimate by assumed predrilling percentages found on the Contract Drawings. Driving shoes are not required. It is up to the contractor to stiffen the piles as they see fit if necessary after preauguring. Contractor shall provide method of installation to be approved by Engineer.</p>
10	74	<p>Dwg. WS141 calls out cutting some timber piles to elevation -8.0' and some to mudline (as does WS111, although it's not clear which get cut to mudline and which to -8.0 from this drawing). Does this timber pile demo fall under bid item ESCR-6.27 TP or bid item ESCR -6.27 PRSE? Note there is no mention of piles of any type in Note 5 on WS141.</p>	<p>Existing timber piles that are cut at mudline or above are to be paid under item ESCR-6.27 PRSE. Any existing timber piles to be pulled out completely shall be paid under item ESCR-6.27 TP.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
10	75	Dwg. WS165 shows pile caps 71, 105 & 114 for partial demolition and repair of pile caps. In the corresponding plan view drawings WS102 (pile cap 71) WS104 (pile cap 105 & 114) pile caps differ from details shown on WS165, please clarify pile cap numbers.	"The Waterfront Demolition drawings (WS100 through WS107) show the existing (as-built) pier numberings. Drawing WS165 shows the proposed pier numberings (Renumbered to account for pier demolitions and additions). Note 2 will be added to drawing WS165 with information on pier number conversion: -Existing pier 81 = Proposed pier 71 -Existing pier 122 = Proposed pier 105 -Existing pier 128 = Proposed pier 114.
10	76	Dwg. WS 166 shows pile cap 77 for partial demolition and repair. The corresponding plan view drawing WS103 the pile differs from detail shown on Dwg. WS166. Single bent supported pile cap shown on plan view drawing not two pile bents supporting as shown on Dwg. WS166. Please clarify pile cap number.	"The Waterfront Demolition drawings (WS100 through WS107) show the existing (as-built) pier numberings. Drawing WS165 shows the proposed pier numberings (Renumbered to account for pier demolitions and additions). Note 5 will be added to drawing WS166 with information on pier number conversion: -Existing pier 86 = Proposed pier 77 -Existing pier 87 = Proposed pier 78
10	77	Dwg. WS147 Section H is taken from WS 104 at Pile Cap 112 and depicts 12 plumb timber piles and 3 battered timber piles. 3 of the 12 plumb timber piles are shown under an existing concrete deck inshore of existing cutoff wall. However, at pile cap 112 Drawing WS121 shows 9 plumb timber piles and 3 batter timer piles and only two plumb timber pile under the concrete deck. Please clarify these discrepancies and whether in general the plan views or sections should govern for timber pile removals.	The estimated existing timber piles are based on historical record which may contain discrepancies with existing site conditions. Contractor shall verify number and location of existing timber piles in the field. Please refer to the plan views. Historical drawings suggest the existing timber pile layout is 3 batter + 12 plumb south of the fire boat house and 3 batter + 9 plumb at and north of the fire boat house.
10	78	Drawing WS718 detail C shows an Elastomeric Bearing Pad Type E.P. between the concrete deck slab and the cut-off wall and indicates to see detail 3 on WS681. When looking at detail 3 on WS681, that bearing is indicated as a sliding joint (more detail on WS761), not an Elastomeric Bearing Pad Type E.P. Please verify.	Elastomeric bearing type E.P callout will be removed from Drawing WS718. See detail 3 on drawing WS681 for more information on the sliding joint.
10	79	Please specify the size of the hole to be drilled into the superstructure for the #8 bearing anchor rod in pier types J and K (Dwg. WS665).	Hole size is specified on drawing WS665 as 1.75" DIA.
10	80	Please specify the diameter for the #10 diaphragm rod that is embedded into the Type E.P. Bearing and pile cap because it is not stated in drawings WS708-713.	The #10 diaphragm rod that is embedded into the Type E.P. Bearing and pile cap is a standard #10 rebar with a nominal diameter of 1.27".
10	81	There are no anchor details for the tide pool armor, does it just get laid in place?	Yes, the tide pool armor is surrounded by riprap armor stone and does not need to be anchored.
10	82	WS619 (and similar cross sections) – show 2 layers of 110-154 lbs stone for overall mat thickness of 1'-11". This density will likely require 15" stone, so achieving the thickness may not be physically possible. Confirm if smaller stone is acceptable or if thicker mat is necessary.	The armor layer thickness (1'-11") was based on the rock sizing stability calculation of 2 layers of D50 nominal armor size of about 11.2".
10	83	What are the lengths of the eco sea pillars, if they vary please provide bathymetric survey so we can estimate the lengths.	Estimated mudlines are provided in the WS600 drawing series. For the south embayment, refer to WS603. For the north embayment, refer to WS618.

Addendum	Addendum Question No.	Bidder's Question	Response
10	84	Are the historical/previous borings available (for example W-3 on page B-WS-001)	Historical borings were provided in Addendums 3 and 9.
10	85	Confirm hanging leads are acceptable as they are a standard industry practice in waterfront/marine construction. Spec section 551.05.A states fixed leads are required.	Specification Section ESCR-551.05.(A) provides for conditions and requirements for the use of hanging leads, refer to the 6th paragraph. It is expected that waterfront and marine piles may not be able to be installed using fixed-lead type driving equipment.
10	86	It is not possible to estimate the amount of each type a or type b, quantity of excavation, or quantity of specific details required for the anode installation. Please provide additional information as to the anticipated quantity of each type to be installed and provide a separate bid item for underwater excavation by CY.	Note 3 on W5901 will be revised as to include an assumed excavation quantity of 422 CF. This minimal excavation shall be included in the payment item 60.29 for anode installation. No separate bid item is provided. In general, excavation for anodes is not required except in rare cases where a deep-water pile-mounted anode needs an additional 6" or 12" to fit. Similarly, anode installation types A and B are both paid under item 60.29 and have the same unit cost.
10	87	Confirm that every single pile is bonded with a bonding strap, it is unclear if that is the intention in all bents.	<p>"The following notes will be added to the drawings to clarify the bonding requirements:  Drawing W5900:  5. SEE DRAWING W5901 FOR METHOD OF BONDING PILES TO EACH OTHER.  Drawing W5901  6. ALL PIER PILES SHALL BE BONDED TOGETHER AS SHOWN ON THIS DRAWING. SEE W5902 FOR DETAILS.  7. ALL LAND-SIDE PIER PILES ("C" OR "E"), WITH THE EXCEPTION OF PIERS 30-51 AND PIERS 128-163, SHALL BE BONDED TO A BULKHEAD PILE. SEE DRAWING W5902A THRU W5902C FOR BONDING METHOD OF PIER PILES WHICH ARE NOT BONDED TO THE BULKHEAD.  Drawing W5902A  2. ALL LAND-SIDE PIER PILES FROM PIER 30 TO 51 AND FROM PIER 128 TO 163 SHALL NOT BE BONDED TO THE BULKHEAD PILES."</p>
10	88	Addendum 3 did not provide any historical drawings about location and details of timber crib wall from E4th St to E15th St. Can you please provide?	Historic drawings are only available up to 4th Street. The existing crib bulkhead line is assumed to be timber crib following the bulkhead line prior to construction of the park in the 1930s.
10	89	<p>On Sheet 520, Load Testing Note #1 references one uplift load test and one compression load test on an instrumented sacrificial pile located between Sta. H 104+04 - Sta. H 107+00 and Sta. H 111+50 - Sta. H 113+00.</p> <p>a) Does this mean a total of 2 sacrificial test piles, 1 between Sta. H 104+04 - Sta. H 107+00 and 1 between Sta. H 111+50 - Sta. H 113+00?</p> <p>b) Is 1 of the 2 test piles to be used for the compression load test only, while the other test pile is used for the uplift load test only?</p>	<p>a. Yes, total of 2 sacrificial test piles, 1 between Sta. H 104+04 - Sta. H 107+00 and 1 between Sta. H 111+50 - Sta. H 113+00.  b. Yes, one test shall be a compression load test, and the other an uplift load test.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
10	90	Static pile load testing is paid for under Item 551.50220017. A total of 3 load tests are listed under the bid quantities for this item. The uplift load test at Pier 2 at Delancy Street constitutes 1 load test (uplift). This would leave a total of 2 tests at Houston Street Bridge. Does this mean only 1 compression test and 1 uplift load test will be performed at the Houston Street Bridge, since 1 of each is required in Load Testing Note #1 on Sheet 520?	Yes, only 1 compression test and 1 uplift load test will be performed at the Houston Street Bridge.
10	91	Sacrificial test piles shall be paid under Item 551.99301239. Typically, reaction piles are installed in combination with the test pile as part of a compression load test. Are the reaction piles to be sacrificial as well, and are they paid under the same Item 551.99301239?	Yes, reaction piles are to be sacrificial as well and will be paid under the same item 551.99301239.
10	92	Micropile Note 7 on Sheet 520 addresses micropile casing splices. It is the state of the practice to use flush-joint threaded casing for micropiles. Since the casing ends are machined by removing material to create the threads, the threaded casing joint does not have the same cross-sectional area as a full casing section and calculations cannot show these threaded joints to have equal or better structural capacity in bending. Is an inner casing (or equivalent added steel section) required in the upper 30' of cased pile length to supplement the threaded joints?	Yes, inner casing (or equivalent added steel section) is an acceptable alternative in the upper 30' of the cased pile length to satisfy Micropile Note 7 on Sheet 520.
10	93	Micropile Note 3 on Sheet 520 allows for use of domestic mill secondary casing (non-prime casing) as the permanent casing for Houston Street Bridge micropiles. However, Bid Item 551.99450017, which references permanent casing for micropiles, is the complementary bid item to Bid Item 551.99301239. Under the Specification Section for Bid Item.99450017, Part 'Materials', Paragraph A, it explicitly states that 'Mill secondaries cannot be used for permanent casing'; thus domestic prime pipe can only satisfy this requirement. Please confirm whether domestic prime pipe with mill certificates or domestic mill secondary casing with coupon tests is to be used as permanent casing for Bid Item 551.99450017.	Micropile Note 3 on Sheet 520 shall take precedence and therefore, the contractor may elect to use domestic mill secondary as the permanent casing for item 551.99450017.
10	94	Refer to material index on drawing G502- the table mentions specification 09 32 00 for Norman EB think brick units- BRK-02. However we could not find specification 09 32 00 in contract specification. Please provide this specification.	Specification call out on drawing is incorrect, refer to specification section 04 00 00. Note on drawing G502 will be revised.
10	95	Please confirm stay-in-place formwork is acceptable for forming the soffit of the cast-in-place esplanade deck shown on typical sections on WS680-82.	The Contractor must follow the requirements found in specification section ESCR-4.06. Stay in place forms are not acceptable as per the 4.06 Concrete in Structures specification. A VECP per the requirements of the S-Pages may be submitted for stay-in-place falsework.
10	96	Specification ESCR 3.05 calls for Marine concrete to have 5/8" or ¾" coarse aggregate. Please confirm if 3/8" aggregate is acceptable for pile infill.	No, the Contractor must bid as shown.

Addendum	Addendum Question No.	Bidder's Question	Response
10	97	Drawing W5539E shows bents 105-107 as a "two span – 5 girder", but drawing W5539F shows bents 105-107 as a "two span – 6 girder". Please clarify.	Estimated mudlines are provided in the W5600 drawing series. For the south embayment, refer to W5603. For the north embayment, refer to W5618.
10	98	For esplanade demolition (all ESCR 6.27... bid items) please provide record design and/or as-built drawings of the existing esplanade so means and methods for demolition can properly be estimated. For example, how is existing concrete seawall end cap tied into the rest of the structure? What are bearing details for hollow core slabs, is there rebar from pile caps tying them in to rest of structure, etc.?	Refer to Addendum 3 for esplanade as-builts.
10	99	For bidding purposes, please confirm what load rating during construction is for portions of completed esplanade deck.	See revised Note 12 in esplanade design criteria section of drawing W5002 for construction loading. Refer to Addendum 9, Article 4.

RE: File No. 19-1211

Dear Sir/Madam:

**STATE OF NEW YORK  
DEPARTMENT OF LABOR  
DIVISION OF SAFETY AND HEALTH**

The attached is a copy of Decision, dated, 9/16/2019, which I have compared with the original filed in this office and which I DO HEREBY CERTIFY to be a correct transcript of the text of the said original.

If you are aggrieved by this decision you may appeal within 60 days from its issuance to the Industrial Board of Appeals as provided by Section 101 of the Labor Law. Your appeal should be addressed to the Industrial Board of Appeals, State Office Building Campus, Building 12, Room 116, Albany, New York, 12240 as prescribed by its Rules and Procedure, a copy of which may be obtained upon request.

WITNESS my hand and the seal of the  
NYS Department of Labor, at the City of  
Albany, on this day of 9/16/2019.

Edward A. Smith, P.E.  
Professional Engineer 2 (Industrial)

Variance Petition

of

Consolidated Edison Company of New York, Inc.  
Petitioner

in re

Premises: Consolidated Edison Utilities  
Electrical Feeders – System Wide  
Locations Throughout New York City and  
Westchester County, New York

**Coal Tar Wrapped Electrical Feeders**

File No. 19-1211

SYSTEMWIDE  
DECISION

Cases 1- 5

ICR 56

The Petitioner, pursuant to Section 30 of the Labor Law, having filed Petition No. 19-1211 on September 13, 2019 with the Commissioner of Labor for a variance from the provisions of Industrial Code Rule 56 as hereinafter cited on the grounds that there are practical difficulties or unnecessary hardship in carrying out the provisions of said Rule; and the Commissioner of Labor having reviewed the submission of the petitioner dated September 06, 2019; and

Upon considering the merits of the alleged practical difficulties or unnecessary hardship and upon the record herein, the Commissioner of Labor does hereby take the following actions:

Case No. 1  
Case No. 2  
Case No. 3  
Case No. 4  
Case No. 5

ICR 56-8.8(a)  
ICR 56-11.6(b)(2)  
ICR 56-8.8(c)  
ICR 56-8.8(i)  
ICR 56-8.8(k)

VARIANCE GRANTED. The Petitioner's proposal for wrapping coal tar wrap on electrical feeders from system-wide locations throughout New York City and Westchester County of New York State in accordance with the attached 19-page stamped copy of the Petitioner's submittal, is accepted; subject to the Conditions noted below:

### **THE CONDITIONS**

1. As written with modifications as noted.
2. Usage of this variance is limited to those asbestos removals identified in this variance or as outlined in the Petitioner's proposal.

In addition to the conditions required by the above specific variances, the Petitioner shall also comply with the following general conditions:

### **GENERAL CONDITIONS**

1. A copy of this DECISION and the Petitioner's proposals shall be conspicuously displayed at the entrance to the personal decontamination enclosure.
2. This DECISION shall apply only to the removal of asbestos-containing materials from the aforementioned areas of the subject premises.
3. The Petitioner shall comply with all other applicable provisions of Industrial Code Rule 56-1 through 56-12.
4. The NYS Department of Labor Engineering Service Unit retains full authority to interpret this variance for compliance herewith and for compliance with Labor Law Article 30. Any deviation to the conditions leading to this variance shall render this variance Null and Void pursuant to 12NYCRR 56-12.2. Any questions regarding the conditions supporting the need for this variance and/or regarding compliance hereto must be directed to the Engineering Services Unit for clarification.

5. This DECISION shall terminate on **September 30, 2021.**

**Re: Petition for System-Wide Blanket Variance  
Consolidated Edison Company of New York, Inc.  
Enclosure Abatement Method for Use on Coal Tar Wrapped Electrical Feeders.  
Locations throughout New York City and Westchester County, New York**

Dear Sir or Madam:

Consolidated Edison Company of New York, Inc. ("Con Edison") respectfully requests a variance of Industrial Code Rule 56 (12 NYCRR 56) for the enclosure of asbestos-containing coal tar wrap on electrical feeders. This is a renewal of Variance No. 16-1044, approved on September 12, 2016.

### **BACKGROUND**

The abatement of asbestos-containing coal tar wrap is necessary in order to refurbish Con Edison Electric Feeders. Historically, when refurbishing our electrical feeders, we have removed the coal tar wrap outright. Going forward, Con Edison anticipates greatly increasing the rate of feeder refurbishment and consequent coal tar wrap abatement. The current manual removal methods are proving inefficient for the higher quantities, and we have been researching alternative methods that will allow for the feeder refurbishment to be completed in a timely manner. We therefore propose to enclose, rather than remove the coal tar wrap using the means and methods described in the next section.

### **PROPOSED ABATEMENT METHODS**

#### **CON EDISON'S PROPOSED ABATEMENT PROCEDURES**

We propose using the following procedures for the enclosure of Coal Tar Wrap for use with the refurbishment of electrical feeders:

1. A regulated area shall be established around the excavation containing the exposed coal tar wrapped feeder. A remote mobile decon will be utilized. All work with exposed coal tar wrap shall be performed by NY State-certified asbestos handlers and/or supervisors.
2. A six-mil poly drop cloth shall be installed beneath the coal tar wrapped electrical feeder to be abated on the current shift.
3. Abatement workers shall remove any loose coal tar wrap that may interfere with properly enclosing the remaining wrap, using our previously approved procedures for coal tar wrap under NYS DOL File No. 18-0706 attached). The coal tar wrap on the feeder will then be wet wiped to remove dust and debris that could interfere with the enclosure process.
4. A band of coal tar wrap, up to four feet in length, shall be removed to expose bare steel on both ends of the coal tar wrap subject to the enclosure procedure. This is necessary in order to complete subsequent steps of the feeder refurbishment process. This removal shall be done in a

- non-friable manner using methods per our existing NYSDOL blanket variance for removal of coal tar wrap (NYSDOL File No. 18-0706, attached).
5. Certified asbestos handlers shall then apply a layer of epoxy sealant using manual methods over the coal tar wrap (direct manual application using appropriate protective gloves and/or with brushes).
  6. Once the coal tar wrap is coated and air tight, the asbestos abatement portion of the work is complete. Further steps in the feeder refurbishment process may be conducted by non-asbestos certified workers.

In order to conduct the abatement in the manner described, Con Edison requests relief from the subparts of ICR 56 described in the table below:

**VARIANCE JUSTIFICATION FOR REGULATORY RELIEF**

<b>Regular ICR 56 Requirements</b>	<b>Justification for Relief</b>	<b>Alternative Proposal</b>
<b>56-8.8(a):</b> All enclosure abatement projects shall be conducted within a regulated work area per Subpart 56-7.	The coal tar wrap is non-friable and located in an exterior excavation.	As this enclosure abatement involves exterior, non-friable material, we request to establish a regulated work area per Subpart 56-11.6(b) in lieu of the normally required subpart for enclosures, except for 11.6(b)(2), as noted below.
<b>56-11.6(b)(2):</b> Regulated abatement work area preparation shall be in compliance with...section 7.4  <b>56-7.4(c):</b> Posting of Asbestos Warning Signs	The coal tar wrap is non-friable and located in an exterior excavation. Posting of warning signs at entrance(s) to the work area will create undue alarm to the public.	Asbestos warning signs as required by OSHA shall be posted inside the clean room of the remote decontamination vehicle
<b>56-8.8(c):</b> Loose or hanging ACM...shall be removed in accordance with Subpart 8.4	The coal tar wrap is non-friable and located in an exterior excavation.	Any loose coal tar wrap on the section to be enclosed, and, as noted in the proposed procedures, a 1-linear foot band of coal tar wrap shall be removed on either side of the enclosed section, utilizing our previously-approved DOL coal tar wrap blanket variance procedures (File No. 15-0774, attached).
<b>56-8.8(i):</b> Encased/enclosed asbestos material shall be conspicuously marked or labeled in order to warn persons of its presence.	The coal tar wrapped material is located in exterior excavations. Upon final completion of the overall feeder refurbishment project, the excavation will be backfilled and the work site returned to regular usage. The refurbished feeders shall remain buried underground indefinitely. Any labeling is unlikely to remain intact in the event of a future excavation project, rendering labeling of ACM impractical.	Non-certified workers conducting post-abatement refurbishment activities shall have OSHA asbestos awareness training and be notified of the presence in ACM beneath the epoxy enclosure.  All Con Edison equipment in excavations is assumed to contain asbestos unless confirmed otherwise.

Regular ICR 56 Requirements	Justification for Relief	Alternative Proposal
56-8.8(k): Final cleaning and clearance sampling for all enclosure projects shall be in accordance with 56-9.	The coal tar wrap is non-friable and located in an exterior excavation.	<p>As this enclosure abatement involves exterior, non-friable material, we request to comply with the following two subparts in lieu of the normally required subparts for enclosures:</p> <p>Subpart 56-11.6(a) – no air sampling required, unless material is rendered friable</p> <p>Subpart 56-11.6(e) – one stage of final cleanup procedures</p>

Con Edison believes that following these proposed alternative methods and procedures will comply with the spirit and intent of Industrial Code Rule 56, and should not in any way compromise the health and security of the general public, facility employees, or workers involved with the removal of these materials.

Thank you for your consideration of this request. If you have any questions or require additional information to process this application, please do not hesitate to contact me by telephone at (212) 460-1132 or by e-mail at [morrisonw@coned.com](mailto:morrisonw@coned.com).

Sincerely,

William H. Morrison

**Re: Request for Extension of System-Wide Variance File #16-1044  
Expires September 30, 2018**

Premises: Con Edison Utility Systems  
Throughout New York State

Coal Tar-Wrapped Electrical Feeders

Dear Mr. Smith:

Consolidated Edison Company of New York, Inc. ("Con Edison") respectfully submits this letter to request a one-year extension for the system-wide variance referenced above.

The abatement of asbestos-containing coal tar wrap is necessary in order to refurbish Con Edison Electric Feeders. Con Edison anticipated greatly increasing the rate of feeder refurbishment and subsequent coal tar wrap abatement. The enclosure of coal tar wrap in-place has proven effective in completing the refurbishment of our electrical feeders with while reducing the disruption of high vehicle traffic volumes in the affected locations.

Con Edison thanks the New York State Department of Labor for their consideration in this matter. Should you have any questions concerning this project, or if anything contained in this letter does not meet with your approval, please call me at (212) 460-1132, or via e-mail at [morrisonw@coned.com](mailto:morrisonw@coned.com)

Sincerely,

William H. Morrison

Locations throughout New York City and Westchester  
County, New York

**Coal Tar Wrapped Piping/Conduits**

File No. 18-0706

SYSTEMWIDE  
DECISION

Cases 1-12

ICR 56

The Petitioner, pursuant to Section 30 of the Labor Law, having filed Petition No. 18-0706 on June 5, 2018 with the Commissioner of Labor for a variance from the provisions of Industrial Code Rule 56 as hereinafter cited on the grounds that there are practical difficulties or unnecessary hardship in carrying out the provisions of said Rule; and the Commissioner of Labor having reviewed the submission of the petitioner dated May 29, 2018; and

Upon considering the merits of the alleged practical difficulties or unnecessary hardship and upon the record herein, the Commissioner of Labor does hereby take the following actions:

Case No. 1	ICR 56-1
Case No. 2	ICR 56-2
Case No. 3	ICR 56-3
Case No. 4	ICR 56-4
Case No. 5	ICR 56-5
Case No. 6	ICR 56-6
Case No. 7	ICR 56-7

Case No. 8	ICR 56-8
Case No. 9	ICR 56-9
Case No. 10	ICR 56-10
Case No. 11	ICR 56-11
Case No. 12	ICR 56-12

**VARIANCE GRANTED.** The Petitioner's proposal for removal of coal tar wrap on gas, steam, fuel oil and electrical piping/conduit from system-wide locations throughout New York City and Westchester County of New York State in accordance with the attached 10-page submittal (including the attached Con Edison procedure), is accepted; subject to the Conditions noted below:

### **THE CONDITIONS**

1. In addition to the submission of the notification form as required for large projects by ICR 56, Con Edison shall submit the appropriate notification fee, as required by Article 30, Section 904-2 of the New York State Labor Law.
2. A copy of the notification information supplied to the New York State Department of Labor for each asbestos project shall be maintained by the Petitioner for a minimum period of 30 years.
3. The petitioner shall maintain from the date of issuance of this decision, as part of its permanent business records, the quantities and original location of all removed pipe and pipe abandoned in place where coal tar coating is or was used as a pipe covering.
4. The petitioner shall keep as part of its permanent records, a roster of the names and employee identification numbers of all supervisors and employees who have any function relating to abatement of coal tar coating from coal tar coated gas/water pipes. Such records shall be kept available for a minimum period of 30 years.
5. All affected workers conducting coal tar pipe coating removal operations pursuant to the provisions of OSHA 29 CFR 1926.1101, shall be required to wear hard hats, protective glasses, construction type gloves and any other personal protective equipment as required by OSHA 29 CFR 1926 while performing the work. Workers shall also be instructed, as follows:
  - a. Construction rags and gloves used in the removal of coal tar coating gas/water pipe removals shall not be allowed to commingle with similar materials on vehicles used in conjunction with the removal process.

- b. All tools utilized in this activity shall be kept clean and in good repair.
  - c. When gloves and rags used in removal projects are no longer ultimately needed or useful, such items shall be properly disposed of as asbestos waste in accordance with ICR 56.
6. Worker training shall be in accordance with the requirements of OSHA 29 CFR 1926.1101 for all personnel performing this type of abatement work.
7. All workers and supervisory personnel of Con Edison who conduct activities involving the removal or disturbance of coal tar pipe coating shall receive further training, prior to commencement of such work, relating to the nature of the coal tar coating. The minimum training shall be a four (4) hour oral presentation, and shall include the nature of the coal tar coating, mandated removal efforts, scope of the previous coal tar coating removal study, and the conclusions reached in this study. A copy of the conclusions reached in previous study shall be supplied to all trainees attending the training and a copy of the entire study shall be made available to trainees upon their request.
8. Records identifying all personnel receiving such training outlined above shall be maintained by the petitioner for a period of 30 years.
9. All abatement or maintenance operations performed by Con Edison personnel, shall be in accordance with all provisions of OSHA 29 CFR 1926.1101 for this type of abatement work
10. The Petitioner shall require by contractual provision that all outside contractors providing services related to the removal of, or providing services affecting coal tar pipe coating, observe all requirements, including recordkeeping, relative to the removal and/or maintenance of coal tar coating as instituted for employees of said petitioner.
11. All outside contractors shall comply with all requirements of OSHA 29CFR 1926.1101 for the removal or disturbance of coal tar pipe coating.
12. The Petitioner shall require by contractual provision that all outside contractors provide worker training in accordance with the requirements of OSHA 29 CFR 1926.1101 for all personnel performing this type of abatement work.
13. Coal tar coated pipes which are removed from below ground shall be disposed of as asbestos-containing material by appropriate legal method.

14. Coal tar coating removed from below ground facilities shall be disposed of as asbestos-containing material by appropriate legal method.
15. Coal tar coating and coated pipelines removed from aboveground (bridge) locations shall be disposed of as asbestos-containing material by appropriate legal method.
16. Aboveground coal tar coated pipelines and coal tar coating removed from above ground locations shall be removed from the work site as soon as practical soon so as to avoid unnecessary material damage.
17. Usage of this variance is limited to those asbestos removals identified in this variance or as outlined in the Petitioner's proposal.

In addition to the conditions required by the above specific variances, the Petitioner shall also comply with the following general conditions:

#### **GENERAL CONDITIONS**

1. A copy of this DECISION and the Petitioner's proposals shall be conspicuously displayed at the entrance to the personal decontamination enclosure.
2. This DECISION shall apply only to the removal of asbestos-containing materials from the aforementioned areas of the subject premises.
3. The Petitioner shall comply with all other applicable provisions of Industrial Code Rule 56-1 through 56-12.
4. The NYS Department of Labor Engineering Service Unit retains full authority to interpret this variance for compliance herewith and for compliance with Labor Law Article 30. Any deviation to the conditions leading to this variance shall render this variance Null and Void pursuant to 12NYCRR 56-12.2. Any questions regarding the conditions supporting the need for this variance and/or regarding compliance hereto must be directed to the Engineering Services Unit for clarification.

5. This DECISION shall terminate on June 30, 2020.

Date: June 5, 2018

**Re: Petition for General Variance  
Consolidated Edison Company of New York, Inc.  
Coal Tar Wrapped Pipe Insulation and Conduits  
Gas Mains, Steam Mains, and Electrical Conduit – Systemwide  
Locations throughout New York City and Westchester County, New York**

Dear Sir or Madam:

Consolidated Edison Company of New York, Inc. ("Con Edison") would like to re-apply for our system-wide coal tar wrapped pipe insulation and conduits abatement process that was previously approved by the New York State Department of Labor (NYSDOL) per file # 15-0774. The said approval will expire on June 30, 2018. Specifically, Con Edison would like to ask for relief from the same Industrial Code Rule (ICR) 56 (12 NYCRR § 56) subsections previously granted:

- ICR 56-1
- ICR 56-2
- ICR 56-3
- ICR 56-4
- ICR 56-5
- ICR 56-6
- ICR 56-7
- ICR 56-8
- ICR 56-9
- ICR 56-10
- ICR 56-11
- ICR 56-12

Con Edison would like to note that this request is for our Gas, Steam, Fuel Oil Piping, and Electrical Distribution/Transmission System, as reflected in your previous Decision (#15-0774).

Con Edison respectfully requests and would appreciate an expeditious review of this petition. If you have any questions or require additional information to process this application, please do not hesitate to contact me by telephone at (212) 460-1132 or by e-mail at [morrisonw@coned.com](mailto:morrisonw@coned.com).

Con Edison procedure for Coal Tar Wrap Removal  
Decision of Variance Approval 15-0774, dated June 26, 2015  
Required Fee

	<b>Asbestos Management Manual</b>	<b>SECTION</b> <b>6.04</b>
	<b>Chapter 6—Con Edison Asbestos Work Procedures</b> <b>Section 6.04 Coal Tar Wrap Removal - Gas, Electric, And Fuel Oil and deluge piping</b>	<b>Revision 9</b> <b>12/12/2014</b>

### Coal Tar Wrap Removal - Gas, Electric, And Fuel Oil and deluge piping

#### 6.4.1 Applicability

This procedure applies to the removal of coal tar wrap (CTW) from Con Edison equipment. All wrapping is to be handled as asbestos-containing material (ACM) unless testing has been performed and establishes that the material is not ACM. This procedure applies only to projects involving abatement of 25 linear feet or less of CTW on one block within New York City and less than 260 linear feet of CTW outside of New York City. The total amount of ACM removed includes any quantity removed intact on piping as well as material removed from the pipe.

Coal Tar Wrap is considered contaminated with PCBs in addition to asbestos unless sampling proves otherwise. For coal tar wrap in Transmission Operations manholes, additional precautions may be needed if the piping is painted. See your Asbestos Coordinator or local EHS staff for further guidance.

#### 6.4.2 Pre-work Requirements

At a minimum, workers require OSHA Asbestos Awareness/Hands On Coal Tar Wrap Removal Training.

In New York City, a certified NYS/NYC asbestos supervisor must be available to respond to the site if required; a NYS asbestos supervisor must be available in Westchester.

A copy of the Con Edison variance package must be available for review on the primary vehicle being used at the abatement location. This package includes:

1. Letter of Application to NYCDEP and the NYSDOL for Coal Tar Wrap
2. Current NYCDEP and NYSDOL Approvals for Coal Tar Wrap
3. Current Con Edison New York State Asbestos Handling License

Any removal of CTW must follow the NYC DEP and NYS DOL variances.

191211  
180706

150774

	<b>Asbestos Management Manual</b>	<b>SECTION 6.04</b>
	<b>Chapter 6—Con Edison Asbestos Work Procedures</b> <b>Section 6.04 Coal Tar Wrap Removal - Gas, Electric, And Fuel Oil and deluge piping</b>	<b>Revision 9 12/12/2014</b>

#### 6.4.3 Personal Protective Equipment

For situations where the possibility of contact is possible, the use of protective clothing is recommended. Both asbestos containing arc proof material and polychlorinated biphenyl (PCB)-containing oil may be encountered in electrical manholes and other areas. Before beginning work, determine what potential hazards may exist. Refer to GEHSI S5.01—Selection of Personal Protective Equipment to determine the minimally acceptable personal protective equipment based on the potential hazards present at the work site.

In addition CTW abatement requires that the following PPE be used:

- Disposable coveralls, i.e., Tyveks or equivalent
- Head and foot covers
- Eye protection
- Disposable gloves (latex or nitrile)
- For CTW with PCBs, skin contact should be avoided.

**NOTE:** Employees shall contact their supervisor if they are uncertain about the selection of proper PPE.

#### 6.4.4 Tools and Materials

- Amended water solution
- 6-mil (minimum) plastic sheeting
- 6-mil (minimum) plastic asbestos disposal bags
- Disposable rags or wipes
- Mastic sealer and/or duct tape
- Hand tools (chipping hammer, chisel, scraper, or putty knife)
- Abrasive pads
- barrier tape

**CAUTION:** Do not use any type of power tool, grinder, sander, or burning apparatus to remove CTW

#### 6.4.5 Work Procedure

- Set up the stanchions, telescoping rails, barricades, or barrier tape around the perimeter of the manhole or excavation.
- Place 6-mil plastic sheeting under the work area (main, conduit or cable) to collect loose debris.
- Wet down CTW with amended water.

191211  
180706  
150774

	<b>Asbestos Management Manual</b>	<b>SECTION</b>
	<b>Chapter 6—Con Edison Asbestos Work Procedures</b>	<b>6.04</b>
	<b>Section 6.04 Coal Tar Wrap Removal - Gas, Electric, And Fuel Oil and deluge piping</b>	<b>Revision 9 12/12/2014</b>

- Use hand tools only to break away the large chunks of wrap. Place the removed wrap in a plastic asbestos disposal bag.
- Remove only the amount of wrap necessary for the work operation.
- Ensure that the intact CTW on the pipe is not damaged when removing the pipe from the excavation. In order to ensure that this does not occur, do not use chains to remove a CTW covered main or pipe.
- Likewise, ensure that intact CTW is not damaged when moving or transporting pipe.
- For pipe left in the ground, seal all ends of exposed wrap with mastic sealer, wax tape, or duct tape. Plastic wrap and duct tape all coated pipes that will be removed from the site.
- In the event that some wrapping material did not fall onto the plastic sheeting (e.g. during a severe leak episode) collect these pieces and place them on the sheeting.
- Once the CTW removal is completed and the exposed ends are sealed, fold the plastic sheeting in on itself and place it in a properly labeled asbestos disposal bag.
- Wet-wipe all equipment with amended water and rags before removal from the work area.
- Place used rags and old work gloves in asbestos disposal bags.
- Ensure that bagged ACM is wet before transporting.

6.4.6 Disposal

For Asbestos-only CTW (non PCB):

- Double-bag all waste materials. The outside bag must have an asbestos label with the work location identified.
- Complete an asbestos waste tracking form and attach it to the bag.
- Place double-bagged waste and removed pipe in a truck and transport to workout location.
- Bring double-bagged waste and tracking forms to Stores. Ensure that the bags are placed in a properly labeled 55-gallon drum for disposal as asbestos waste.
- Place the removed pipe into a bin labeled "INDUSTRIAL WASTE - CONSTRUCTION AND DEMOLITION LANDFILL ONLY". The pipe shall then be sent to a New York State landfill that will accept such material as construction debris.

	<p><b>Asbestos Management Manual</b></p> <p><b>Chapter 6—Con Edison Asbestos Work Procedures</b></p> <p><b>Section 6.04 Coal Tar Wrap Removal - Gas, Electric, And Fuel Oil and deluge piping</b></p>	<p><b>SECTION 6.04</b></p> <p><b>Revision 9 12/12/2014</b></p>
---	---	--

**Additional Considerations for PCB/Asbestos CTW**

- Follow instructions above, however, the removed wrap shall be disposed of at your workout location as PCB/Asbestos waste. CTW Pipe may be disposed of as either PCB/Asbestos Waste or Bulk Product Waste; contact your local EHS staff for assistance prior to disposal.

**6.4.7 Advice and Counsel**

Contact the area Asbestos Coordinator for advice and counsel regarding this procedure and other asbestos related concerns prior to the start of any projects.

	<b>Asbestos Management Manual</b>	<b>SECTION 6.05</b>
	<b>Chapter 6—Con Edison Asbestos Work Procedures</b> Section 6.05 Coal Tar Wrap Removal – Steam	Revision 9 11/28/2014

**Coal Tar Wrap Removal – Steam****6.5.1. Applicability**

This procedure applies specifically to the removal of coal tar wrap (CTW) from the housing of the spiral weld steel casing utilized by Steam Operations. All such wrapping is to be handled as if it is asbestos containing material (ACM) unless testing has been performed and establishes that the material is not ACM.

This procedure provides an overview of, and is not intended to replace the requirements of the Steam Engineering Department's Procedure S-11924.

This procedure only applies to the removal of less than or equal to 25 linear feet of CTW material on one city block or as specified by NYC DEP approved procedures. The amount of material removed includes any quantity removed intact on piping as well as material removed from the pipe.

**6.5.2. Pre-work Requirements**

At a minimum, workers require NYC/NYS handler certification.

A copy of this Con Edison procedure must be available for review in the decon vehicle being used at the abatement location. This package includes:

1. Copy of Current Con Edison New York State Asbestos Handling License

The asbestos supervisor must be on-site for all asbestos activities and must be familiar with and must thoroughly understand the requirements of the Steam Engineering Dept. Procedure S-11924 including its attachments

**6.5.3. Personal Protective Equipment**

For situations where the possibility of contact is possible, the use of protective clothing is recommended. Both asbestos containing arc proof material and polychlorinated biphenyl (PCB)-containing oil may be encountered in manholes. Before beginning work, determine what potential hazards may exist. Refer to GEHSI S5.01 – Selection of Personal Protective Equipment to determine the minimally acceptable personal protective equipment based on the potential hazards present at the work site.

**NOTE:** Employees shall contact their supervisor if they are unsure about the selection of proper PPE.

	<b>Asbestos Management Manual</b>	<b>SECTION 6.05</b>
	<b>Chapter 6—Con Edison Asbestos Work Procedures</b>	<b>Revision 9</b>
	<b>Section 6.05 Coal Tar Wrap Removal—Steam</b>	<b>11/28/2014</b>

#### 6.5.4 Tools and Materials

- Amended water solution
- 6-mil (minimum) fire-retardant plastic sheeting
- 6-mil (minimum) plastic asbestos disposal bags
- Disposable rags or wipes
- Mastic sealer, spray glue, duct tape or wettable cloth lagging
- Hand tools required to perform the task (e.g. chipping hammer, chisel, scraper or putty knife)
- Asbestos warning signs

**CAUTION:** Do not use any type of power tool, grinder, sander, or burning apparatus to remove CTW

#### 6.5.5 Work Procedure

- Establish a regulated area, using opaque plastic sheeting to prevent public access.
- Personal air monitoring shall be performed in accordance with the requirements of the OSHA standard 29 CFR 1926.1101.
- Wet down CTW with amended water.
- Remove CTW using hand tools only (that is, hammer and scraper) and amended water.
- Dispose of CTW as ACM in a properly labeled bag.
- Once the CTW removal is completed and the exposed ends are sealed, fold the plastic sheeting in on itself and place it in a properly labeled asbestos bag.
- Wet-wipe all equipment with soapy water and rags before removal from the work area.
- Place used rags and old work gloves in asbestos waste bags.

To remove steel casing after the CTW removal, worker shall:

- Cut a small hole in casing.
- Insert water hose and thoroughly wet insulation.
- Cut steel casing.

191211  
180706

150774

	<b>Asbestos Management Manual</b>	<b>SECTION 6.05</b>
	<b>Chapter 6—Con Edison Asbestos Work Procedures</b>	<b>Revision 9</b>
	<b>Section 6.05 Coal Tar Wrap Removal – Steam</b>	<b>11/28/2014</b>

Workers shall then don the following PPE if not already being worn:

- Disposable coveralls
- Disposable head and foot covers
- Disposable gloves (latex or nitrile)
- Half face respirator with HEPA filters
- Eye protection

The following steps shall then be followed:

- Remove steel casing.
- Thoroughly wash the steel casing within the excavation.
- Inspect the steel casing to ensure that there is no insulating material adhering to it.
- Dispose of shoe covers, coveralls, and respirator filters as ACM. Clean respirators with amended water.
- Wet down and double bag all waste materials. Ensure that all ACM waste is wet before transporting.

#### 6.5.6. Disposal

- Ensure that the outside bag has an asbestos label affixed that identifies the work location.
- For waste going to a Con Edison facility, complete an Asbestos Waste Tracking Form.
- Place double-bagged waste in the Con Edison vehicle and transport it to the temporary storage area at a Con Edison facility.
- Return Asbestos Waste Tracking Form to the Asbestos Coordinator with monitoring data.

	<b>Asbestos Management Manual</b> <b>Chapter 6—Con Edison Asbestos Work Procedures</b> <b>Section 6.05 Coal Tar Wrap Removal – Steam</b>	<b>SECTION 6.05</b> <b>Revision 9</b> <b>11/28/2014</b>
---	--	---

**Dispose of the casing as follows:**

- If strips of CTW were removed to cut casing, seal disturbed CTW with duct tape, double wrap and label the casing in 6-mil fire retardant plastic sheeting.
- Dispose of casing as ACM following the steps provided above, or dispose of cleaned casing (all CTW removed) as construction debris.

**For Contractor Abatement Crews:**

- Complete a Waste Disposal Manifest which will be used to track ACM.
- Bagged ACM must be removed from the work site by a licensed waste transporter.

The ACM waste must be disposed of in accordance with all applicable federal, state, and local laws and regulations.

**6.5.7. Advice and Counsel**

Contact the area Asbestos Coordinator for advice and counsel regarding this procedure and other asbestos related concerns.

Addendum	Addendum Question No.	Bidder's Question	Response
11	1	Please refer to Contract Drawing JB-68 it is unclear where the proposed new 8" STL Gas Main transitions to 3" STL please clarify.	All locations of fittings are approximate and indicated on the Gas Cost Sharing plans and Gas Capital Plan Non-Gas Cost Sharing plans in the JB-Pages.
11	2	Reference: Delancey Street Removable Bollards. Three (removable) bollards are shown at start of West Ramp on drawings BD104, Sheet 231, and BD114, Sheet 241. However, on drawing BD182, Sheet 309 are shown two (removable) bollards. Please clarify.	Drawing BD182 has been revised to show three bollards. Refer to Addendum 9, Article 4.
11	3	Pay items for construction report/Monitoring & post construction report for reach D, E, F, G, H, & I are missing. These were included in the specs vol 3 page 823 Spec 76.11.5. Please provide these pay items.	Item Numbers for 76.11 and 76.21 series have been updated in the bid schedule with an ESCR prefix. Pay items for Reaches D-I have been added. Refer to Addendum 10, Article 1 for the current bid schedule.
11	4	Please provide the "Pier 42 Contract" contract drawing as one of the reference documents since the project will fall in close proximity to the SANDRESM1 work area.	The Contractor must obtain Pier 42 documents from the NYC EDC.
11	5	Please provide the locations for the following Pay items which we have not been able to find on the plans: 50.21C5E048D - 48" R.C.P. Class V Combined Sewer, Encased In Concrete, 50.31CC15 - 15" E.S.V.P. Combined Sewer, On Concrete Cradle, 51.22RM.A05, 51.22RM.A06, 51.22RM.A07, 51.22RM.A08, 51.22RM.A10, 51.22RM.A11, 51.22RM.A12, - 51.22RM.A13, 51.22RM.A14, 51.22RM.A15, 51.22RM.A16, 51.22RM.A17, 51.22RM.A18, 51.22RM.B01, - 51.22RM.B03, 51.22RM.B05, 51.22RM.B08, 51.22RM.B10, 51.22RM.B11, 51.22RM.C05, 51.22RM.C06, - 51.22RM.C07, 51.22RM.K13 - Reconstruction Of Existing Manhole On Existing Sewer(s), 51.71C00M22 - Modification Of Existing Chamber M-22, 51.71C00M23 - Modification Of Existing Chamber M-23	All items have been removed. Refer to Addendum 10, Article 1.
11	6	On sheet 1186 the proposed New Manhole MH-B14 is shown to be paid under Pay item 51.21S0A1000C.B14 which is not currently part of the Bid Schedule; Please revise this note or provide the Pay item.	Item 51.21S0A1000C.B14 has been deleted and replaced by item 51.11P004.B14. Refer to Addendum 10, Article 1.
11	7	Item 6.36 DR, 'Con Edison Electrical Manhole...', as noted on sheets 553, 554 does not appear in the Bid Schedule. Please clarify.	Item 6.36 DR is in the bid schedule with a generic title for adjusting utility structures.
11	8	In regards to JB item 123(CE) "INSTALLATION OF A COMPOSITE CARBON FIBER SYSTEM ENCAPSULATION OF UNDERGROUND TRANSMISSION FEEDERS AND RETURN LINES" Who will be responsible for 3rd party testing.	Please refer to PBQ response #173 in Addendum 9. The Contractor is responsible for third party testing.
11	9	Regarding Pay item 583.03, REMOVAL OF STRUCTURAL CONCRETE- REPLACEMENT WITH SHOTCRETE, WITH REINFORCEMENT BAR ENCASEMENT. Locations and details for this item can not be located on the plans. Please provide details for this work.	Item 583.03 has been deleted. Refer to Addendum 10, Article 1.
11	10	Sheet 278 of 2791 drawing CW600 portrays a cross-sectional view of the electrical feeders and the return piping. Please provide pipe outside diameters for the 138KV,345KV and 69KV feeders. The drawing shows a scale of 1"=30' please confirm the scale is accurate.	The scale has been revised on drawing CW600. Refer to Addendum 9, Article 4. The diameters provided from Con Ed shows both 128KV and the 345KV to be approximately 10". The diameter of the 69KV is approximately 8".

Addendum	Addendum Question No.	Bidder's Question	Response
11	11	Reference: Precast Seawall Connection Detail; Addendum No. 3 01 - 2013 As Built Record Drawings, Drawing S-47A, Sheet No. 50 of 117. Please confirm that ½" plate shown on Drawing S-47A, Elevation of Precast Seawall and Section 2-2, illustrate connection detail between the existing Precast Seawall and existing concrete cap beam?	This detail comes from the existing esplanade "As-Built" drawing which were developed by others, and the Contractor must interpret it accordingly.  We interpret this detail as likely showing the connection between the existing seawall and the existing pile caps through built-in angles as shown on SC-12D.AB
11	12	Referencing Sheet 2215 of M&O Area 1 there is a note to see Elec Drwg E-401 for info on the EV Charging Station. The only E-401 drawing we see is with M&O Area 3 and it is labeled Building Electrical Power Plan. Please clarify.	Correct. Electrical sheet is PUE410. Drawing A-100 will be revised with a correct note.
11	13	Marine Coverage's - A large component of this project is the raising of the shoreline several feet by placing approximately 800,000 plus cubic yards of fill material. There is limited vehicle access into the park areas, so it is anticipated that the fill materials and some equipment will be brought to the site via barges and maritime transportation. The wet work is likely to require; spud barges, jack-up barges, construction trestles, temporary piers, temporary wharves, gangways, moorings, floating moorings, fendering, and vessels that will be used at the Project Site. Can you please consider to include the coverage in Schedule A for this?	Refer to revised Schedule A in Addendum 10, Article 2.
11	14	Items ESCR-4.25 RW and WESCR-4.25 PFT are for a base price of wells installed to 35 feet below grade and for additional/reduced well foot (beyond/less than the base 35 foot) respectively. However Specifications pages HAZ-9 and HAZ-10 states that the prices are for wells installed to 60 feet below grade and for additional/reduced well foot (beyond/less than base 60 foot) respectively. Please clarify this apparent discrepancy.	Refer to Addendum 10, Article 2 for revised specifications.
11	15	Following bid items are present in Bid Schedule but we are unable to locate scope of work on contract drawings. Please clarify exact locations and provide necessary drawings so we could quantify.  1. 564.0503 – Structural Steel Type 3 – 24000 LB 2. 565.1420008 – Non-Guided PTFE Sliding Bearings – 1209 Each 3. 567.50 – Armored Joint System with Preformed Elastic Strip Seal – 60 LF 4. 585.01 – Structural Lifting Operations Type A – 400 Each	1. Item 564.0503 has been deleted. 2. For locations and details of item 565.1420008, refer to drawing WS761. 3. Item 567.50 has been deleted and replaced by item 567.60 as shown on drawing BC140. Refer to Addendum 10, Article 1. 4. Item 585.01 has been deleted. Refer to PBQ response #7 in Addendum 10.
11	16	Bid item 595.50000018 "SHEET-APPLIED WATERPROOFING MEMBRANE" was added in Addendum 5, but couldn't find any detail on the drawings that show this item. Can you provide details or location where this item should be applied?	Refer to drawing WS691B for waterproofing membrane details. Drawings WS600 to WS629 also show the extent of the waterproofing membrane on the esplanade deck.

Addendum	Addendum Question No.	Bidder's Question	Response
11	17	There is a conflict between the cut-off wall profile and the deadman profile matchline station denoted on Contract Drawing WS412. Please clarify which station is correct.	Drawing WS412 has been revised with a corrected matchline station. Refer to Addendum 9, Article 4.
11	18	Sheet No. 2521 and Sheet No. 2522 indicate that there is a transition from 8" CMU block into 12" CMU block on the east side of the tennis building. However, no cross sections are shown. Please provide.	See architectural drawing A-654, details 3 and 4.
11	19	Bid items 4.01RAE, 4.02AB-R, 4.02CB, 4.04H, 4.05A, 6.03DD, 6.05DP, and 6.75 do not appear on any of the drawings. Please indicate where these items are used.	<p>Items 4.01RAE, 4.05A, 6.03DD, and 6.05DP have been deleted from the contract. For item 4.02AB-R, refer to drawing FG245.</p> <p>Item 4.02CB is used for temporary trench restoration.</p> <p>Item 4.04HC, 8" base, is used at Delancey and E. 10th Streets.</p> <p>Item 4.04HD, 9" base, is used at Montgomery, 13th and 14th Streets, FDR north entrance ramp, floodwall pavement restoration, sign structure pavement restoration.</p> <p>Refer to revised drawings F110, F122, F123, and FG245, along with Delancey and E. 10th Street drawings for item 6.75.</p> <p>Refer to Addendum 9, Article 4 and Addendum 10, Article 1 for the current bid schedule.</p>
11	20	Reference: Pier 166(N) pedestal height: Per S-1, Pier Pedestal Reinforcement on Drawing WS513 and Drawing WS667 Typical Section for Pier Type N, Pier 166(N) pedestal height is 5'-0 3/8". However, per Drawing WS629, Pier 166 (N) pedestal is 4'-0" ... Top of Pile Cap Elevation +3.36, Top of Precast Conc. Solid Slab Elevation +9.36, and precast slab is 24" thick. Please clarify what is correct.	<p>The 5'-0 3/8" pedestal height dimension shown on WS513 and WS667 is correct. See the latest version of WS629 which shows a revised Top of Precast Conc. Solid Slab Elevation of +10.48. The 4' dimension on WS629 is the height of the existing pile cap to remain. The 5'-0 3/8" tall pedestal mentioned in this comment actually sits on top of this 4'-0" tall existing pile cap (Although the 5'-0 3/8" dimension is not explicitly dimensioned on WS629). 5'-0 3/8" = 10.48' top of slab-2' slab-1.25'/12' bearing-3.36' top of pile cap+1/8'/12' slope correction = 5'-0 3/8" : Note that Note 2 on the latest version of WS513 is applicable to this pedestal height as well. Refer to Addendum 9, Article 4.</p>
11	21	Pay item ESCR.24.05 RS: Is this pay item for 24" rock sockets at the 30" x 1" piles at the L-Wall?	<p>No, the pay item for the 24" rock sockets at the L-wall is ESCR-551.30.01 RS. Drawing WS880 will be revised.</p> <p>Item ESCR-551.24.05 RS has been removed from the cost estimate. Refer to Addendum 10, Article 1.</p>
11	22	Contract Drawing WS368 depicts two L-Walls with pipe piles (vertical and battered) providing additional support for the proposed sewer outfall penetration in the Combi-Wall between stations 65+32.46 and 65+92.92. The corresponding profile for the combi-wall is depicted on drawing WS438 with a tip elevation for the combi-wall of -61. Additionally, a tip elevation of -85 is depicted on drawing WS880 for the same exact location which produces a conflict. Clarify which tip elevation is correct for all elements (combi-wall king pile, combi-wall sheet pile, L-Wall vertical pipe piles and L-Wall battered pipe piles and rock socket).	<p>Drawing WS438 has been revised as part of Addendum 9, Article 4, to show the correct tip elevation of -85' for the vertical pipe piles as part of the combi-wall. The intermediate sheet pile requires a tip elevation of -50' as shown on drawings WS438 and WS880. The battered pipe piles shall be rock socketed and details can be found on drawing WS880.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
11	23	On Plan Sheets 135 ( BID ITEM# 565.1523 & 565.1723 ), 279 & 391 ( BID ITEMS# 565.1522 & 565.1722 ) of 2791: Are the loads labeled as VERTICAL DESIGN LOADS located in the tables Service Loads or Strength Loads?	Loads are results of multiple load cases/combinations per AASHTO load combinations.
11	24	"On Plan Sheet 135 ( BID ITEM# 565.1523 & 565.1723 ) of 2791: The Lateral Loads for the Fixed Bearings are substantially high compared to the Vertical Loads. According to AASHTO LRFD : Section C 14.6.1, Bearings are not recommended for Horizontal to Vertical Load Ratios over 40% unless intended to act as fuses or irreparable damage is permitted. Based on this statement, how should the high Lateral Loads be handled by the Pot or Disc Bearings?"	Please see the following revised bearing loads: For the west and east abutments the Vertical Loads are DC - 255 KIPS, DW - 20 KIPS, LL - 95 KIPS For west abutment Design Loads; Vertical 509 KIPS, Longitudinal 159 KIPS, Transverse 219 KIPS For east abutment Design Loads; Vertical 509 Kips, Longitudinal 0 KIPS, Transverse 206 KIPS Note that the transverse loads on bearings is mainly from temperature. By providing a gap of 1/8" between the guide and bearing, the transverse force due to temperature can be eliminated.
11	25	Bid items 203.02, 304.11, 6.60B, 6.67, PK-197, and PK-ESCR824A do not appear in any of the drawings. Please indicate where these items are.	Items 203.02 and 6.60B have been deleted, and item PK-197 only exists in the Con Edison joint bid scope. Refer to Addendum 10, Article 1 for the current bid schedule. Item PK-ESCR 824 A can be found on revised drawing LD810 (details 1-4). Refer to Addendum 9, Article 4. Item 304.11 is used under the approach slab, see drawing BC149.
11	26	Please clarify the foundations at the M+O prefabricated buildings, tennis house, track and field building, and comfort station. 1) Architectural drawings seem to imply vapor barrier extends to the vertical faces of the footings, but is not shown on the structural drawings. Please clarify if vapor barrier and insulation are to wrap around all footings.2) Detail on structural drawings show vapor barrier, insulation, 4in or 6in crushed stone and 3ft minimum structural fill below the slab on grade. Please confirm it is 3ft minimum of structural fill as the detail and section drawings are scaled to imply 3in, and that the detail applies to below footings.	1. M&O pre-fab structures shall have a vapor barrier at the underside of the slab and foundation and at all vertical surfaces below grade; Tennis/track and Comfort Station to have WPS-01 and WPS-02. 2. Structural Fill is 3' Minimum.
11	27	SB drawings reference item ESCR-61CW as pay item for concrete security wall, but this item is not a bid item. Please clarify.	Item ESCR-61CW has been added. Refer to Addendum 10, Article 1 for the current bid schedule.

Addendum	Addendum Question No.	Bidder's Question	Response
11	28	Reference: Existing Deadman cut elevations; Drawing WS140, Sheet 708 Waterfront Demolition Section, Sheet 1 of 10, Flood Wall; Drawing WS 100 Waterfront Demolition Plan, Sheet 670; Drawing WS 101 Waterfront Demolition Plan, Sheet 671; Note No. 3 on Drawing WS140 reads: "The top of the existing deadman should be cut down to El. +3.41' NAVD88 in specific locations. Refer to Drawings WS100 and WS101 for exact locations." However, per Drawing WS 100, between bents 1 and 4 existing sheet pile deadman will be partially demolished to El. +3.0' and between bents 4 and 5 sheet pile deadman will be partially demolished to El. -5.0' and per Drawing WS 101 between bents 35 and 38 existing sheet pile deadman will be partially demolished to El. +3.0' and between bents 38 and 39 sheet pile deadman will be partially demolished to El. -6.0'. Please clarify location where the existing deadman will be cut down to El. +3.41? 1. Reference: Precast Seawall Connection Detail; Addendum No. 3 01 - 2013 As Built Record Drawings, Drawing S-47A, Sheet No. 50 of 117.	Drawing WS140, Note 3, has been revised to refer to WS100 & WS101 for deadman removal extents. The callouts on WS100 & WS101 are correct and should be used for deadman removal elevations. Refer to Addendum 9, Article 4.
11	29	Please confirm that ½" plate shown on Drawing S-47A, Elevation of Precast Seawall and Section 2-2, illustrate connection detail between the existing Precast Seawall and existing concrete cap beam? Reference: Corlears Hook Bridge Deck Sections, Drawing BC 140, Sheet 150. Note on Drawing BC 140 reads: "Refer to architectural drawings for handrail and guardrail section (Item No. NYC-607.064 AA)." This item is not part of the bid breakdown. Please clarify.	See revised drawing BC140. Refer to Addendum 9, Article 4.
11	30	Refer to Detail 1 on sheet 2238 and Section C on sheet 2272 of the Contract Drawings. The Detail and Section on these sheets call for the anchor bolts to be 1 ½" diameter. Note 1 on both of these sheets calls for the anchor bolts to be 2" diameter. What is the correct size of the anchor bolts?	Anchor Bolts are 2" DIA. Drawing will be updated accordingly.
11	31	Refer to sheets 2238 and 2272 of the Contract Drawings. What is the thickness of the embedded anchor bolt plate?	Thickness of Embedded Plate is 1". Drawing will be updated accordingly.
11	32	Please define locations of Steel H-Piles 18x181 locations	Item 551.018181 has been removed. Refer to Addendum 10, Article 1 for the current bid schedule. Refer to Addendum 10, Article 3.
11	33	Sheet 597 was re-issued in Addendum #05. Information on the drawing is invalid and not legible, please re-issue revised drawing.	
11	34	Sheet 10251; Addendum #05; Please provide and identify pay item ESCR 551.42.06 D	Drawings with item ESCR-551.42.06 D include WS9031. The item has been added to the bid schedule. Refer to Addendum 10, Article 1. A note will be added to WS9031.
11	35	Sheet 811 and Sheet 686 state at bent 81 the Combo Wall system becomes a 42" Interlock Pipe system, not a typical PAZ42NZ19. Additionally Sheet 769 shows the typical PAZ42NZ19 combowall system. Please clarify.	Drawing WS347 is correct. Drawing WS417 has been revised. Refer to Addendum 9, Article 4. Drawing WS118 will be revised to match.
11	36	There are missing sections of the gate / micropiles from drawing FG110 at the Montgomery gate. Please provide the missing sections	Drawing FG110 has been revised. Refer to Addendum 9, Article 4.

Addendum	Addendum Question No.	Bidder's Question	Response
11	37	Section B4 of Drawing F601 indicates that the 24" steel pipe is coded to ESCR-551.24.05.C. Other cross sections and profiles, for example on drawing F401, indicate that the same 24" pipe is coded to ESCR-552.24.05-CJG. Please verify which cost code is correct.	Drawing F601 has been revised. Refer to Addendum 9, Article 4.
11	38	WS160-WS161; Both items have respective removals paid under items ESCR 6.27 S and ESCR 6.27 TC. Does this pay item include predrilling into existing concrete and timber structures for floodwall installation.	Please refer to revised drawings WS160 and WS161 for correct item numbers. Refer to Addendum 7, Article 2 and Addendum 9, Article 4. Predrilling for floodwall installation through concrete bulkhead is paid for under item ESCR-552.11 20CB. For locations where timber cribbing is found, predrilling for floodwall installation is paid under item ESCR-552.11 20CT.
11	39	Addendum 6 removed pay item 6.03P. Waterfront Demolition Section drawings (WS140 series) still show pavers as removed under that item. Please clarify where the removal is to be paid under.	Please refer to revised drawing WS140 series in Addendum 9, Article 4 for updated item 6.02AAN locations.
11	40	Drawing F100 identifies clear and grub at Gouverneur Gardens as item 6.01 AC. Drawing PDS120 identifies the same area of as removal of lawn or planting under ESCR 6.01 AB. Please clarify which pay item is to be used.	F100 has been revised to refer to PDS120. Refer to Addendum 9, Article 4.
11	41	The contract has limited information on the existing sewers west of the FDR. This information is needed to determine how to maintain via bypass dry and wet weather flows during construction of new outfalls. Please provide DEP area sewer drawings.	Sewer maps will be provided to the Contractor after contract registration.
11	42	Please note that "Site grading" drawings show various mini-piles under utility structures. The bid item given to these is "70.13MN", for example on drawing PUD404. However, there is no such bid item. It is assumed these refer to "71.13MIN". Please confirm.	The correct item number is 70.13 MN. Refer to Addendum 10, Article 1 for the current bid schedule.
11	43	In the "overhead sign structures" drawing OS159, the embedment for shafts 3N and 8N is shown as 30 feet. In OS166, the table indicates that the embed depth is 42 lf. Please verify which embedment is correct for these sign structure shafts.	Embedment for Shafts 3N and 8N is 42' as shown on the table on drawing OS166. Drawing OS159 will be revised to match the table.
11	44	Structural Steel Note 7 on WS001 states "all welding shall conform to AWS D1.1". But Welding Note 2 on same drawing states "structural welds shall be inspected using ultrasonic testing in accordance with ANSI/AWS D1.5". Furthermore, specification ESCR-551 paragraph 551.05(E) states "Perform welding in accordance with requirements for shielded metal arc welding of AWS D1.1 for buildings of other structures". But then it goes on to say "AWS provisions for bridge construction [i.e. D1.5] shall apply where applicable. Please clarify what requirements of D1.5 (if any) apply to the welding of steel pipe piles. It seems the intent is that this welding should be performed according to D1.1, but it is not clear based on passing references to D1.5.	AWS D1.1 is sufficient. Drawing WS001 will be revised to include only AWS D1.1. Specification Section 551.05 (E) has been revised accordingly. Refer to Addendum 10, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
11	45	Drawing WS501A calls for 3 ea. 24" x 75" piles to undergo dynamic testing under item ESCR-551.24.75.DT. Drawing WS812 also calls for pile P4 to undergo dynamic testing under the same item (so 4 tests total). The quantity listed on bid sheet for ESCR-551.24.75.DT is 3 per test. Please confirm correct quantity for this item.	Two additional dynamic tests for the 24" inch piles have been added (item ESCR-551.24.75 DT quantity is now 5) to account for tests at proposed embayment platforms (P4 on drawing WS812 & P3 on drawing WS816). Refer to Addendum 10, Article 1.
11	46	Pile Schedule on dwg. W885A calls for piles A-27, D-27, and D-28 to be 30" x 1". Section B on same drawing references bid item ESCR-551.24.05 which covers 24" x 0.5" pipe. Please confirm correct pipe size and bid item for the 3 referenced piles in this location. Furthermore, pile schedule gives tip elevation as -85 whereas Section B shows Tip -70. Please clarify.	Refer to revised drawing WS885A as part of Addendum 9, Article 4, for corrected item numbers and tip elevations. Piles A-27, D-27, & D-28 shall be 30" x 1". Tip elevation has been corrected to -70' in the pile schedule to match Section B.
11	47	NYCDOT Standard Specification Section 565-Bridge Bearings states that "Anchor dowel holes shall be core drilled." However, drilling/installing the anchor rods falls under Bid Item No. 586.0201-Drilling and Grouting Bolts or Reinforcement Bars NYCDOT Standard Specification Section 586-3.01 states that "All holes shall be drilled by means of a rotary impact drill." Please specify how the #8 and #10 bearing anchor rods are supposed to be installed (drawing WS708-713). Can they be either core drilled or drilled with a rotary impact drill?	For the bearings, the anchor rods shall be core drilled and filled with material specified in Note 1 on drawing WS660. Item 565.1821 includes drilling of the anchor rods for the bearings. Associated drawings WS708 to WS713 will be revised accordingly. The bid schedule has been updated to move quantity from item 586.0201 to item 565.1821. Refer to Addendum 10, Article 1.
11	48	Spec section 6.20.5.g states a tolerance of 0.7 feet +/- but drawing WS619 says +/- 6" (0.5 ft), which one governs?	Drawing WS619 governs - please use +/- 6" deviation tolerance. Specification section 6.20 has been revised to match. Refer to Addendum 10, Article 2.
11	49	Spec Section 6.20, with respect to survey frequency: (a) Subpart 3 says cross section are every 50 ft. (b) Subpart 5 says cross section every 25 ft. Which one governs?	The cross sections should be taken every 25 FT. Specification Section 6.20 has been revised accordingly. Refer to Addendum 10, Article 2.
11	50	Are the piles for the embayment platforms 24x0.500 or are they 24x0.750?	The north embayment platform piles should have a thickness of 0.75". See revised drawing WS617 for corrected item number. Refer to Addendum 9, Article 4.
11	51	Note that bid item 522 ESCR 60.29 - Cathodic Protection (anodes) shows a bid quantity of 1386, but the drawings state 1,771 are required	Drawing WS903 is correct. The bid schedule has been revised to reflect the updated quantity. Refer to Addendum 10, Article 1 for the current bid schedule.
11	52	Can you confirm that the minimum unit price of \$24,000/lb is correct? Bid item JB 123 (CE): Installation of a Composite Carbon Fiber System Encapsulation of Underground Transmission Feeders and Return Lines.	Correct, but note that the unit of measurement is Linear Trench Foot.
11	53	Please provide a bid item for demolition shown on drawing WS146, Section G (item ESCR-6.27 G is referenced on this drawing but not on bid form).	Item ESCR-6.27 G has been added. Refer to Addendum 10, Article 1 for the current bid schedule.
11	54	Most recent bid form gives quantity of 153 LF for bid item 563.0101. By adding up the first nine girders on WS702 (230+ LF) it is already apparent this quantity is significantly off from drawings. Same goes for taking tabulated values for bid item 563.0105, 563.03, and ESCR-557.44. Please provide a reconciled bid form updated based on Addendum 7 quantities.	The quantities for items 563.0101, 563.0105, 563.03, and ESCR-557.44 have been updated. Refer to Addendum 10, Article 1.

Addendum	Addendum Question No.	Bidder's Question	Response
11	55	Specification ESCR-3.05 calls for a maximum slump of 4 inches for esplanade structures. Please note marine concrete with 4" slump will not be able to be pumped or finished reliably due to accelerating nature of corrosion inhibitor regardless of amount of retarder added. Please confirm a slump of 8" is acceptable for cast-in-place esplanade structures.	Specification ESCR-3.05 has been revised. Refer to Addendum 10, Article 1.
11	56	[Item ESCR-551.24.75C] The quantity derived from the Drawings is considerably less than the bid quantity. Please clarify this apparent discrepancy	The quantity for item ESCR-551.24.75.C has been revised to 5,472 LF to match quantities shown on the pile schedule found on drawing WS501. Refer to Addendum 10, Article 1.
11	57	[Item 565.1821] The quantity derived from the Drawings is considerably less than the bid quantity. Please clarify this apparent discrepancy	The quantity of item 565.1821 has been revised to 761 bearings to match quantities shown on the drawings WS450 to WS461. Refer to Addendum 10, Article 1.
11	58	[Item 586.0201] The quantity derived from the Drawings is more than double the Bid Quantity. Please clarify this apparent discrepancy.	The quantity of item 586.0201 has been revised to 3,025 anchors to match quantities shown on drawings WS708 to WS712 and F880 drawing series. Refer to Addendum 10, Article 1.
11	59	Please reference Drawings WS330 (sheet 752), WS400 (sheet 794) and WS600 (sheet 873). The cross section on WS600 shows Items ESCR-552.11 4219C and ESCR-552.11 4219CD in the same location (i.e. overlapping). The profile shown on WS400 does not clarify which pay item number is applicable. This ambiguity repeats on every cross section and profile. Items ESCR-552.11 4219C, ESCR-552.11 4219CD and ESCR-552.11 4219CI all have a Unit of Measure of square feet. Drawing WS400 depicts the tip elevation of combi-pile at -55, while the intermediate sheet pile tip is at -32. Regarding the pay square footage: 1. Please define the upper and lower pay limits for items ESCR-552.11 4219C, ESCR-552.11 4219CD and ESCR-552.11 4219CI as the specification does not address these differing elevations.	Refer to the Cutoff Wall Schedule found on WS441A for stationing extents and breakdown of each pay item. For the predrilling assumed percentage for bidding purposes, if the table lists multiple item numbers, apply the predrilling percentage to capture quantity for the predrilling pay item. Square footage quantities to be calculated as described in PBQ response #60, below.

Addendum	Addendum Question No.	Bidder's Question	Response
11	60	<p>Please reference Drawings WS330 (sheet 752), WS400 (sheet 794) and WS600 (sheet 873).</p> <p>The cross section on WS600 shows Items ESCR-552.11 4219C and ESCR-552.11 4219CD in the same location (i.e. overlapping). The profile shown on WS400 does not clarify which pay item number is applicable. This ambiguity repeats on every cross section and profile.</p> <p>Items ESCR-552.11 4219C, ESCR-552.11 4219CD and ESCR-552.11 4219CI all have a Unit of Measure of square feet. Drawing WS400 depicts the tip elevation of combi-pile at -55, while the intermediate sheet pile tip is at -32. Regarding the pay square footage:</p> <p>2. Does the bottom pay limit for these items follow the tip elevations of BOTH the combi-pile and the sheet piles shown on WS400 (i.e. varying elevations), or is it one horizontal line along the tip elevation of the combi-pile pipe?</p>	<p>The total square footage is calculated assuming the specified tip elevations for the pipe pile and the intermediate sheet pile as shown on the contract drawings, i.e. varying elevations. Refer to Addendum 10, Article 2 for revised language in FW-Pages Section 552.06 on vertical measurement.</p>
11	61	<p>Please reference Drawings WS330 (sheet 752), WS400 (sheet 794) and WS600 (sheet 873).</p> <p>The cross section on WS600 shows Items ESCR-552.11 4219C and ESCR-552.11 4219CD in the same location (i.e. overlapping). The profile shown on WS400 does not clarify which pay item number is applicable. This ambiguity repeats on every cross section and profile.</p> <p>Items ESCR-552.11 4219C, ESCR-552.11 4219CD and ESCR-552.11 4219CI all have a Unit of Measure of square feet. Drawing WS400 depicts the tip elevation of combi-pile at -55, while the intermediate sheet pile tip is at -32. Regarding the pay square footage:</p> <p>3. Using the elevation on WS400 through WS441, or the plan views on WS330 through WS371, please indicate the limits of Items ESCR-552.11 4219C, ESCR-552.11 4219CD and ESCR-552.11 4219CI.</p>	<p>Refer to the Cutoff Wall Schedule found on drawing WS441A for stationing extents and breakdown of each pay item.</p>
11	62	<p>Per Bid Booklet page A-23, Pre-Award Process: Section (B) Copy of License: A general contractor is not required to hold a license in New York State to perform work. However, JV will provide the license of subcontractors for the following contracts: Plumbing Work, Electrical Work, and Asbestos Work, if they have been identified at the Pre-Award process stage. Is there any other license you are looking for from General Contractor (JV)?</p>	<p>No other licenses are anticipated to be required, but it remains the responsibility of the Contractor to obtain all required licenses.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
11	63	Addendum 7 Sht 592 - Dwg F409 shows AZ20-700N sheet pile with pay item no ESCR-552.11 46CT which is for AZ-46-700N sheeting. Can you please clarify which is one is correct?	The callout on F409 will be corrected to AZ46-700N SHEET PILE. The item number is correct.
11	64	Addendum 7 Sht 592 - Dwg F409 shows ESCR-552.11 46C pay item that doesn't exist. Can you please clarify?	The item number on F409 will be corrected to ESCR-552.11 46CP.
11	65	Per Dwg. No. W5713 (Sheet 940/2791) in the detail labeled "AASHTO Type I and Type V Beam End Zone Reinforcement", please provide a table or detailed information for the "H" min. horizontal dimension(s) that are required for all Type I and Type V precast/prestressed AASHTO girders.	"H" refers to the girder height (5'-3" for type V and 2'-4" for type 1.
11	66	Per Dwg. No. W5713 (Sheet 940/2791) in Details C-1 and C-2, threaded inserts are to be cast into the ends of the girders, please provide an acceptable Dayton Superior, AL Patterson or equal Model # and the design criteria required to properly determine the required threaded inserts for the filed installed #5 epoxy coated rebar. Also what finish (i.e. plain, epoxy coated, e-galv, or stainless steel) is required for the cast in threaded inserts.	W5713 will be revised to include the following information about the threaded inserts in the callout: PROPOSED THREADED INSERT CAST INTO GIRDER (TYP), SEE NOTE 4 NOTE 4: Threaded inserts used to connect reinforcing steel to precast concrete shall be non-corrosive and shall have a tensile capacity of at least 50% of the yield strength of the reinforcing steel. Threaded inserts shall be stainless steel 1/2" Dayton Superior F-63 flared thin slab coil insert, SS 1/2" MeadowBurke FX-19 ferrule insert, or approved equal.
11	67	According to Article 29 Omitted Work, Commissioner has the right to delete Work from the Contract and Contractor has no right to loss of overhead, indirect cost, or profit with regard to the deleted Work. Section 33 Unit Price Contracts, Part (B) Variations from Engineers' Estimate, in Volume 2 of 3 Bid Booklet states if "the quantities actually required to complete the contract work may be less or more than so estimated, and if so, no action for damages or for loss of profits shall accrue to the contractor for reason thereof." Given the size of the project and vast number of bid items, over a thousand, the referenced provision removes any remedies for underruns and forces bidders to unbalance the bid. While this issue can be managed on smaller projects, given the magnitude of this project, it results in an unmanageable risk exposure because the Contractor does not have any ability to mitigate changes in a unit price contract. Please advise how we should proceed to allocate all fixed indirect costs that are not related to quantities. We recommend a more transparent approach where underruns and omitted work can be partially compensated, when applicable, according to an open book basis, similar to the approach used in federal contracts.	Please refer to the new S-Pages Article B16 Omitted Work in Addendum 11, Article 2.
11	68		REDACTED

Addendum	Addendum Question No.	Bidder's Question	Response
12	1	Contractor requests the City to include in the contract a mutual waiver of consequential damages clause similar to the following: To the fullest extent permitted by law, each party waives against each other any and all claims for or entitlement to special, incidental, indirect, punitive or consequential damages arising out of, resulting from, or in any way related to the project.	Please refer to Addendum 12, Article 2.
12	2	Project documents shows the traffic signs to be powder coated white. Per MUTCD, traffic signs must be reflective. Can you please clarify? If reflective is acceptable, can you please provide the type of sheeting, e.g. HIP, DG3, etc..	Traffic signs shall be in accordance with NYCDOT Standard Highway Specification, Section 6.83.
12	3	<p>Junction Chambers JC-D01 and JC-G01 are detailed on Drawings DS535 to DS538. Their locations are shown on Drawings DS303 and DS306. Note 3 on these drawings states that both of these chambers are to be covered under Bid item 51.11V000.</p> <p>a. The Bid Item quantity for 51.11V000 is listed as 14.</p> <p>b. We have found the locations for only JC-D01 and JC-G01 on the drawings.</p> <p>c. Please clarify the Bid Item quantity for this item.</p>	Refer to PBQ response #71 in Addendum 8. All connections (12) and junction chambers (2) are to be paid under Item No. 51.11V000. Connection details can be found on sheets DS710-DS721.
12	4	One of the doors is missing in the Door Schedule in sheet 2415 / dwg A-580. Can you please provide details on Roll up Door OHD-02 - Track Building Sheet 2377 .	The overhead roll-up door #123 is a type D door and tracked in the door schedule under #123. Refer to Detail #1 and 2 on drawing A-565 for additional information.
12	5	Can you please provide how many lockers are needed in Track Building, Tennis Building and Comfort Building?	For locker sizes and finishes refer to specifications: specialty items. Track: 81 double stacked, Tennis: 6 double stacked, Comfort: None; Total lockers: 87 double stacked
12	6	Please provide more details for pay item 551.30 RS for 24" rock sockets at L-Wall locations. This item is shown in Esplanade Cross Section I-2 sheet W5625, however the details for Platform 1 through 5 sheets WS850 to WS885 A show pay item ESCR-551.30 RS. Please can you clarify.	WS625 will be corrected to show item ESCR-551.30 RS. The pay item ESCR-551.30 RS is for 24" diameter rock sockets within 30" pipe piles at the L-wall locations and details can be seen on drawings WS852, WS862, WS872, WS882, and WS885C.
12	7	Addendum 9 Bid Item Schedule shows Items ESCR-564, ESCR-564.CT, and ESCR-564.G, however the Cross Sections for the Esplanade and Cut Off wall from sheets WS600 to WS629, still are calling all this waler system as Bid Item ESCR-564. Please can you clarify.	The wale system shall be paid under ESCR-564 as uncoated structural steel where stated as such in the WS600 drawing series. ESCR-564.CT is coated structural steel and can be found on drawing FM711. ESCR-564.G is galvanized structural steel and can be found on drawing WS902C.
12	8	Refer to page B-139 (revision #4), Items PK-ESCR 906 A, B, C, D & E - The bid unit on these pages is L.F. The specifications for these items (page PARKS-48R3) specify a pay unit per each. Please clarify.	Please refer to Addendum 12, Article 2.
12	9	Refer to page FW-49R2, section ESCR-4.06 - Concrete in Structures - In section 4.06.1 it specifies that this item is to be used for "curbs". In section 4.06.02 it excludes "curbs". Please clarify. If this is not the payment item for curbs, what is?	As noted in ESCR-4.06.3.(B), ESCR-4.06 covers curbs that are part of "park features." For clarity, this includes all curbs within the park. The exclusion in ESCR-4.06.2 is for roadway elements (curbs, sidewalks, concrete base, and pavement) on roadways outside of the park. These curbs will be paid under the appropriate 4.08 or 4.09 item.

Addendum	Addendum Question No.	Bidder's Question	Response
13	1	Note 4 on Drawing No. 469A of 2791 states that the 18" casings must be installed to a tolerance of 0.25" horizontally and 0.25" vertically. This tolerance is not achievable due to the likelihood of encountering wood debris as described in the boring logs. The best case tolerance for this diameter pipe is 1" on grade and 2" on line. Will this tolerance be acceptable?	The tolerances in the Contract Documents are constructable, however the City will consider VECP proposals for deviations and/or substitutions of the microtunneling design criteria, including upsizing the 66" casing or eliminating the 18" casing. The following criteria will not be permitted to be modified by a VECP: 1) surface settlement criteria, 2) line and grade of the tunnel carrier pipe (42" DIP). The VECP proposal must be submitted in accordance with the requirements of the S-Pages.
13	2	As stated on Note 3 of the same drawing, the proposed design will NOT "prevent excessive movement and assist steering for the 66" MTBM". The installation of the 18" casings will disturb AND weaken the surrounding soils. The casings are too small for manned- entry. Also post-installation contact grouting will NOT be possible either. Without an opportunity to stabilize the disturbed soil of the 18" casings, the weakened ground will remain that way; preventing the installation of the 66" casing on line and grade. Finally, the requirement for a maximum of 1" space between the 66" casing and the proposed installation of the 18" casings is not achievable. According to ASCE publication 36-15, Standard Design and Construction Guidelines for Microtunneling, the vertical installation tolerance for a 66" pipe is +/- 2" for this diameter pipe. Coupled with the difficulties described above and the overlapping overcuts, no microtunneling contractor will be able to install the system successfully as currently designed. Will the NYCDDC consider deleting the 18" casings and permit alternate mitigation measures?	The microtunnel is constructable as described in the Contract Documents, however the City will consider VECP proposals for deviations and/or substitutions of the microtunneling design criteria, including upsizing the 66" casing or eliminating the 18" casing. The following criteria will not be permitted to be modified by a VECP: 1) surface settlement criteria, 2) line and grade of the tunnel carrier pipe (42" DIP). The VECP proposal must be submitted in accordance with the requirements of the S-Pages.
13	3	In addition, will the NYCDDC consider upsizing the 66" casing to allow greater variability in the casing grade installation? A larger diameter casing would allow the contractor to build an invert within the installed casing that conforms to the plan grade. Then the 42" DIP can be installed to the design grade.	The City will consider VECP proposals for deviations and/or substitutions of the microtunneling design criteria, including upsizing the 66" casing or eliminating the 18" casing. The following criteria will not be permitted to be modified by a VECP: 1) surface settlement criteria, 2) line and grade of the tunnel carrier pipe (42" DIP). The VECP proposal must be submitted in accordance with the requirements of the S-Pages.
13	4	Drawing W302, W5341 and W5342 show PAZ42/NZ19 combi-wall between Piers 46 and 51. Profile on drawing W5411 and W5412 shows pipe-pile wall with bottom of pipe-pile cut-off wall ei. -66. Drawing W5610 shows 36" steel pipe pile with rock socket. Please clarify type of wall.	Please see latest amended drawings W5302, W5341, and W5342 that were revised in Addendum 7, Article 2, to match drawings W5411 thru W5412 and W5610. The segment between Piers 46 to 51 is a continuous 36" steel pipe pile wall with alternating rock sockets as shown on revised drawing W5302.
13	5	North and south Embayment platforms and Piers 72 through 76 and 106 through 113 are supported on 24" pipe piles, Bid Item ESCR-551.24.75 C. Bid Item ESCR-551.24.75 DT Dynamic Pile Load Tests has a bid quantity of 5. No axial compression capacity for these piles is provided. Drawing W5500 shows pier piles installed to bedrock. Please clarify if these piles have to be installed to a capacity, the minimum tip elevation provided or seated onto bedrock. If piles will have to extend deeper than the minimum tip elevation to achieve capacity or to be seated onto bedrock will the Contractor be compensated for additional pipe pile splices to advance piles deeper?	Dynamic Pile Test locations and Allowable Compressive Pile Loads for the piles to be installed at the existing north and south embayment esplanade sections are provided on Drawing W5501A. Refer to Section ESCR-551, Sub-section 551.06 for details on pile length measurement for payment.
13	6	Wall turn cutoff-wall configuration on drawing W5417 is different from configuration shown on profile drawing W5347.	Please refer to latest revised amended drawings W5417 and W5347, in Addendum 7, Article 2, and Addendum 9, Article 4. The wall turns occur at STA. 35+77.56 and at STA. 35+95.78 on both W5417 and W5347 and the cut-off wall configuration is the same.
13	7	Drawing W5627 and W5850 - Section B shows Bid Item ESCR-551.30.01 C for 30" steel pipe piles. Bid Item is described as "Coated 30 in diameter x 1.0 in wall thickness Pipe Pile placed in Jet Grout Column" in Bid Schedule Form. No jet grouting is shown on W5267 and W5850.	There is no jet grouting at these locations. The bid item description is incorrect and should be "COATED 30 IN DIA. X 1.0 IN WALL THICKNESS PIPE PILE." The bid item number is correct as shown on the drawings.
13	8	Drawing W562, W5850 and W5852. 30" steel pipe pile. Drawing W5627 states "Proposed 24" Diameter 5'-0" Deep Rock Socket". Drawing W5850 and W5852 show 10'-0" rock socket.	The rock socket on drawing W5627 should be a 10 FT deep rock socket. Drawings W5850 and W5852 are correct.
13	9	Drawing W5852. Details for batter piles shows a 12' concrete plug above the rock socket and a 12' concrete plug below cutoff elevation. Please clarify if pipe pile are to be backfilled with gravel, filled with water, left dry, or other between the upper and lower plug	Drawing W5852 specifies an 8FT concrete plug above the rock socket and a 12FT concrete plug below cutoff elevation. Between the concrete plugs, no special treatment is required - the pipe pile is not required to be backfilled and may be fully or partially full of water.
13	10	Drawing W5628, W5629, W5860 and W5870 lists Bid Items ESCR-551.36.05 CS and ESCR-551.36.05 SD for 30"x .05" pipe pile wall. These Bid Item are not included in the Bid Schedule Form.	Pay items should be ESCR-551.36.05 CSD and ESCR-551.36.05 CS. Drawings W5628 to W5629 will be revised to include the correct item ESCR-551.36.05.CSD instead of item ESCR-551.36.05 SD where applicable. Item ESCR-551.36.05 CS is correct, however, and shall be used for 50% of the quantity of pipe pile wall, as described in drawing W5441A. Refer to Addendum 13, Article 2.

Addendum	Addendum Question No.	Bidder's Question	Response
13	11	Drawing FG272, Note 4 calls for a lateral and compression pile load test. No lateral or axial pile capacity is provided. Also Note 2 on Drawings FO22 and FO23 states: "Steel pipe piles shall be vibrated into the jet grout before the jet grout cures or the jet grout shall be drilled and steel pipe piles installed after the jet grout cures." Please clarify load test requirements and provide lateral and axial pile capacity.	The axial load capacity for the pipe piles at 14th street, including pipe piles installed in jet grout, are 100 tons compression and 50 tons tension. This information will be added to drawing FG272.
13	12	Reference Specification ESCR-551 Steel Pipe Piles. Paragraph 551.03 (C) and Bid Schedule Form Bid Item ESCR-551.24.75 C, ESCR-551.42.06 C and ESCR-551.42.06 D. Please clarify if these bid items require coating.	ESCR-551.24.75 C includes coating. ESCR-551.42.06 D is the predrilling pay item for ESCR-551.42.06 and these two items do not include coating.
13	13	Subsurface information provided for Reach I and J shows that the upper 40 feet of the soil layers are contaminated with tar/diesel, gasoline and NAPL contaminants. We understand remediation work is being carried out at the site of these layers. However, we are not clear about what the current status of the site is in terms of remediation. a. Is the site clear of these contamination in the DSM work area? What method of remediation was used? b. What is the extent of the NAPL contamination we need to consider for the DSM work? c. What environmental aspects need to be considered during the drilling of these layers during DSM work?	The current status of the contamination is as presented in the bid documents. This represents the conditions anticipated for construction, no remediation has been conducted and none is anticipated in advance of construction. a. The contamination as presented in the bid documents remains beneath the subsurface within the DSM work area. b. The entirety of the DSM area shall be considered to be impacted with NAPL contamination, with vertical contamination becoming more prevalent near the groundwater interface to depths of 40 feet or more. c. DSM work will occur throughout the area of contamination. Spoils generated will likely be impacted with MGP contaminants; however, they are to remain at the surface within Reaches I and J for use as part of the transfer platform. Workers shall be OSHA HAZWOPER trained. Material handling shall comply with the MGP Waste Management Plan and Health and Safety Plan included as Appendices B and C of the Mitigation Work Plan.
13	14	Please provide the pH, sulphate and chloride content values for each stratum identified in Reach I and Reach J.	These analytes were not sampled for during previous subsurface investigations. Thus, this data is not available. Any pre-characterization sampling for waste characterization or for other purposes is the Contractor's responsibility.
13	15	Are there any Laboratory Bench Scale tests conducted with these soils to determine possible mix designs for the DSM work?	No
13	16	Is there a maximum clear/unsupported spacing requirement between the DSM columns that must not be exceeded?	Yes, the maximum is two soil mix column's diameter spacing from center-to-center of the soil mix columns.
13	17	What is the height of the Fill in the DSM Areas?	Fill height varies (El. 9.0'-24.0'). See sheet LG308-309 for site grading.
13	18	What is the maximum depth expected for the DSM equipment?	The maximum depth for the DSM equipment is approximately 68 feet.
13	19	We are currently assuming a DSM working platform elevation of +7.5 ft. The bottom elevations of DSM provided in Project Area 1, Reaches I and J, are El. -40 ft, El. -52 ft, and El. -60 ft. Please confirm that the bottom of DSM column is not expected to key into the bedrock.	It is confirmed that it is not expected to key into the bedrock.
13	20	Will special handling be required for the DSM spoils? Will the DSM spoils be treated as hazardous waste?	Yes, special handling will be required for the DSM spoils. Workers shall be OSHA HAZWOPER trained. Material handling shall comply with the MGP Waste Management Plan and Health and Safety Plan included as Appendices B and C of the Mitigation Work Plan. DSM spoils will not be treated as hazardous waste.
13	21	DSM Spec 203.99010039 C. Mix Design, Table 1. in Page 2/5, is the DSM acceptance criteria based on wet grab samples or core samples? Please clarify.	Wet grab samples.
13	22	DSM Spec 203.99010039 C. Mix Design Page 3/5 mentions 'Grout soil mixing shall be performed using minimum binder injection volume of 35%. Please confirm that 35% is the volume of grout with respect to the volume of in-situ soil not the volume of dry binder with respect to the volume of in-situ soil.'	Yes, confirmed.
13	23	DSM Spec 203.99010039; Please confirm that the Acceptance criteria is an average UCS of 200 psi at 28-days and that 70% of the core samples per full depth core should have UCS greater than 115 psi at 28-days.	Yes, the wet grab samples shall have an average UCS of 200 psi after 28 days and 70% of the core samples per depth full depth core shall have a minimum UCS of 100 psi after 14 days.
13	24	DSM Spec 203.99010039; Unit weight of the soil-cement is controlled by the unit weight of the in-situ soil and the unit weight of the grout. A unit weight of 105 pcf does not seem to be obtainable. e.g. For the stratum 2 clay in Reach I, the total unit weight is 105 pcf and if we use a grout of w:c 1:1, the unit weight of grout is 95 pcf, this will bring the unit weight of the soil-mix to lower than 105 pcf. Therefore, we request this unit weight requirement be waived.	This requirement will be waived for soils that are shown in the provided boring logs to have a unit weight less than 110 pounds per cubic foot.

Addendum	Addendum Question No.	Bidder's Question	Response
13	25	DSM Spec 203.99010039.D. Soil-Binder Mixing Page 3/5 mentions use of Predrill for soil with a plasticity index PI>20 to prepare the soil for modification at no additional cost. Is this a requirement even if the DSM contractor based on their experience and equipment determines that predrilling on these soils may not be required?	It is not required, if proven in the demonstration program.
13	26	DSM Spec 203.99010039.D. Soil-Binder Mixing Page 4/5, first paragraph mentions that the grout injection should be continued while removing the mixing equipment from the bottom of the holes to the top. Is this still a requirement when designed volume of grout is injected on the way to the bottom?	It is not required, if proven in the demonstration program.
13	27	Concerning item PK-ESCR 650-Temporary Power for Fire Boat House. The bid schedule per Addendum #12 says that 1 month of temporary service is required but according to the attached specification temporary power is required from September 1st to March 31st (6 months). Can you please confirm if you need 1 month of temporary power or 6 months? Or is temporary power needed for multiple years between September 1st to March 31st during the duration of the contract?	18 months are required. The bid schedule has been revised. Refer to Addendum 13, Article 2.
13	28	Under what pay item is 4" HDPE paid under? (reference drawings PUE300-PUE301).	4" conduit on drawings PUE300 & PUE301 is Hot Dipped Galvanized Rigid Steel Conduit, Item PK-ESCR 674.
13	29	Under what pay item is 25' Aluminum shaft with 12' aluminum arm paid under? (reference drawings BT206).	There is no 4" HDPE conduit. All aluminum arms shall be 8', payable under item SL-24.02.02
13	30	On the streetlighting drawings (SI300-SI310) what pay items does the removal of the overhead cable, removal of the existing wooden utility pole, and the installation of the 17'-10 3/4" aluminum shaft with 8' aluminum arm on structure get paid under?	The payment for removal of the overhead cable shall be under Item No. SL-21.09.05. The payment for installation of the 17'-10 3/4" aluminum shaft shall be included under Item. No. SL-21.04.14. The payment for installation of the 8' aluminum arm shall be included under SL-24.02.02.
13	31	On drawing TS300, under what pay item does the installation of the 12" traffic signals on mast arm get paid under?	See revised bid schedule form, Addendum 13, Article 2.
13	32	On drawings PUEW301- PUEW 303 what pay items does the removal of the wires from existing underground conduit and the cleaning of the conduit get paid under?	Payment for all electrical removals shall be included under item ESCR 6.01 AB, clearing and grubbing.
13	33	On drawing PUE706 under what pay item does the 1 1/2" innerduct get paid under?	There is no 1 1/4" innerduct on drawing PUE706. See latest revised drawing in Addendum 9, Article 4, that only shows 1" innerduct which will be paid under Item PK-ESCR 786.
13	34	On drawing PUE330 under what pay item does the 1 1/2" innerduct get paid under?	There is no 1 1/4" innerduct on drawing PUE330. See latest revised drawing in Addendum 9, Article 4, that only shows 1" innerduct which will be paid under Item PK-ESCR 786.
13	35	Reference Q&A responses 10-3 "Any obstruction encountered in the top 30' of site clearance shall be removed by the contractor at no additional cost to the client." a. Please clarify if this applies to the waterfront combi-wall/pipe-pile wall. b. Please confirm that this does not apply to timber piles identified on the WS110 series drawings as "Existing timber batter pipe to be pre-drilled along locations of proposed cut-off wall."	The phrase noted "Any obstruction in the top 30' ...." is related to the pedestrian bridge foundation H piles. The note is found on Drawings BD001 (note 17), BT001 (Note 17) and BH001 (Note 16). It does not apply to the esplanade structure.
13	36	Reference drawing WS003. Note on cross section states "intermediate sheet pile to be driven until it hits existing timber piles." Please confirm that this statement applies to all intermediate sheets piles of the combi-wall.	Please refer to WS600-WS629 for detailed cross sections and where this statement applies. Section shown on WS003 is typical but does not apply everywhere.
13	37	Reference Specification ESCR-552.02 (D) and Bid Item ESCR-552.11.46CPL. No sheet pile splicing details are provided. a. Please clarify if sheet pile splices requires full penetration welds or if splice plates/sheet pile splicer are acceptable. b. Please confirm that sheet pile splices only requires visual inspection of weld.	The following will be added to Section ESCR-552: All pile splices shall be full penetration butt welds with cover plates and shall develop the full strength of the sheet pile. An approved jig or alignment device shall be used to maintain the required straightness of the sheet pile. All splices shall be non-destructively tested by an AWS Certified Welding Inspector (CWI) using both VT and UT for the 100 percent of the weld length.
13	38	Approximate pre-drill percentage Piers 164 to 167, 50%. Drawing WS130 shows all existing timber piles interfering with cut-off wall installation to be removed. Are we to anticipate other obstructions than timber piles?	The plumb and batter piles identified for removal have been identified based upon expected ability to pull timber piles from the mudline. In addition to these piles the drawings identify existing timber batter piles which are not accessible for removal, additionally it may not be possible to remove all piles identified for removal. It is the expectation of the design team that the primary risk for obstructions will be the remaining timber piles of the low-level relieving platfor. However, historic photos and plans indicate existence of pile supported piers along the East River waterfront in this area, which were demolished for construction of the park, no pile plans or records exist for these piers, but it is possible that derelict piles will be encountered.

Addendum	Addendum Question No.	Bidder's Question	Response
13	39	<p>Item No. ESCR-552.11.4219CD - Coated PA242/NZ19 or equal Combi-Wall installed in Pre-Drilled Locations: please clarify measurement terms applicable to this item:</p> <p>-Bid document instructions, for bidding purposes, are to assume 30% of the combi-wall alignment and 50% of the continuous pipe pile alignment (when the alignment crosses through the existing timber piling) will require pre-drilling.</p>	<p>Quantities assumed for predrilling and standard pile, sheet pile, and combi-wall installations are provided for bidding purposes. Prior to commencement of pile installation works the Contractor and the Engineer shall agree upon criteria for pre-drilling. Actual quantities of pre-drilling will be captured in the field and may vary from the assumed quantities used in development of the bids.</p>
13	40	<p>Item No. ESCR-552.11.4219CD - Coated PA242/NZ19 or equal Combi-Wall installed in Pre-Drilled Locations: please clarify measurement terms applicable to this item:</p> <p>-Section 552.06 specifies the horizontal length of wall applicable. What about the vertical length?</p>	<p>Refer to latest Section 552.06, revised in Addendum 10, Article 2: "The vertical height shall be the sheetpile length measured from final cut-off elevation to sheetpile tip elevation."</p>
13	41	<p>Spec section ESCR-552 - Steel Sheet Piling says "The outboard face of sheet piling and king piles shall be coated ... " Please confirm that only one side of the sheet pile is to be coated.</p>	<p>Yes, for instances where the outboard face of sheet piling and king piles are to be coated, this indicates only the waterside of the sheet pile and king pile (inclusive of the welded connectors) is to be coated. Please refer to Section ESCR-559.05 (D) for coating application specifications.</p>
13	42	<p>Specification section 233113 / 1.4 A mentions that "AC unit manufacturer shall approve the air performance and acoustical performance of the A/C units in the location and with the ductwork configuration and construction as shown on the ductwork shop drawings; and A/C unit manufacturer shall indicate its approval directly on shop drawings". Based on our communication with the specified manufacturers, Greenheck and Mitsubishi do not intend to review and approve the contractor's ductwork shop drawings. Please advise if such requirement specifically applies to this project and how it is to be handled, since the manufacturers do not provide such service.</p> <p>Specification section 23 3113 / 3.09 A and B mention that duct distribution system shall be tested for leakage. Reference is to be made to specification section 230593. Such testing section 230593 does not mention any specific guidelines for leak testing the ductwork. The specified air handling equipment (Greenheck and Mitsubishi) is of low operating static pressure. Please advise if the specific project's ductwork requires to be leak tested by including the test's static pressure limit.</p> <p>Duct specification 233113 states:</p> <p>A) Part 1 -----" Ductwork material shall be Galvanized sheet steel 20 gauge, unless otherwise indicated. Contractor shall provide 1" acoustic insulation inside, per drawings".</p> <p>B) Part 1.6C ---"All sheet metal used on the project shall be constructed from Galvanized steel sheets ---".</p> <p>C) Part 2.05 B ---" Galvanized sheet steel ".</p> <p>Drawing M-500.00 M-600.00 General note 15; Drawing M-700.00 General note 13; state that " all new ductwork shall be of size indicated and aluminum duct, 18 gage, with insulation and liner".</p> <p>Are the new ducts supposed to be Galvanized or Aluminum? What gauge 20 or 18?</p> <p>Symbol "AL"; "Acoustic liners" is not shown on the duct layout drawings M-502.00. Only certain duct sections shown on drawing M-602 &amp; M-702 have the dotted line indication of lining.</p> <p>Please confirm that only the duct sections having dotted lines receive acoustic lining.</p>	<p>-The paragraph 1.4A will be removed from the specifications section 233113.</p> <p>-The paragraph 3.09 will be removed from the specifications section 233113.</p> <p>-All new duct shall be galvanized steel schedule 20, Contract Drawings will be updated accordingly.</p> <p>-The lining has been added to drawing M-502, see Addendum 13, Article 4.</p> <p>-Confirmed, duct sections having dotted lines receives acoustic lining.</p>

Addendum Question No.	Bidder's Question	Response
13	43	<p>There is no specs section for HVAC piping insulation. Specification section 238113- 1.01 D refers to section 230719. But this section is missing. Please provide piping insulation section.</p>
13	44	<p>For Refrigerants use flexible Elastomeric Foam 1" thick, Flexible Elastomeric Foam Insulation:                      1. FM tested and approved, meeting the following:                      a.) Maximum Water Vapor Transmission: 0.10 perm - inch based on ASTM E 96, Procedure A.                      b.) K of 0.27 at 75 degrees F based on ASTM C 518 or C 177.                      c.) Fire Spread/Smoke Developed Rating: 25/50 or less based on ASTM E 84.                      For Condensate drain use fiberglass insulation, minimum density 3pcf, ASTM C547.                      For High Density Jacketed Insulation Inserts for Hangers and Supports:                      1. For Use with Fibrous Glass Insulation                      a.) Cold Service Piping: Polyurethane Foam: Minimum density 4 pcf, K of 0.13 at 75 degrees F, minimum compressive strength of 125 psi                      For Jacketing: Laminated Vapor Barrier Jackets for Piping: Factory applied by insulation manufacturer, conforming to ASTM C 1136, Types I and II.                      1. Type I: Reinforced white kraft and aluminum foil laminate with kraft facing out.                      a.) Pipe Jackets: Furnished with integral 1-1/2 inch self sealing longitudinal lap, and separate 3 inch wide adhesive backed butt strips.                      Item ESCR-551.36.05.CS has been added to the bid schedule; refer to Addendum 13, Article 2. Item ESCR-551.36.05.SD is not a valid pay item and should be item ESCR-551.36.05.CSD.</p>
13	45	<p>ESCR-75 will be removed from WS603, WS604, WS618, &amp; WS619. The cost for the pile cap at the proposed embayments shall be paid under ESCR-4.06 HP ES.</p>
13	46	<p>565.14200008 is a standard NYSDOT pay item and the unit of measurement is EA; please refer to the standard specification referenced from the PROJECT DESCRIPTION pages.                      In the scenario when you have an upper and a lower sliding element, as shown in Detail 3 on WS761, these would be quantified individually (so 2 EA).</p>
13	47	<p>WS761 Detail 4 will be revised to include item number ESCR-567.PC for the 1/8" x 2'-3" Protective Steel Plate and will include callouts for the angles and filler plates.</p>
13	48	<p>Yes, piles under pay item ESCR-551.24.75.C require coating. The description for pay item ESCR-551.24.75.C should be "COATED 24 IN. DIAMETER X 0.75 IN. WALL THICKNESS STEEL PIPE PILE," as stated at the end of Section ESCR-551 in the specifications.</p>
13	49	<p>The callout on WS759 Detail 8 will be revised to: "PROPOSED 36"Ø, 1/2" THICK CONTINUOUS PIPE PILE WALL ITEM NO ESCR-551.36.05.C"</p>
13	50	<p>The item description for PK-ESCR 692 in the bid schedule has been revised to read "Electric Cabinet and Panel Work at East River Houses Parking Lot". Refer to Addendum 13, Article 2.</p>
13	51	<p>The item description for PK-ESCR 692 in the bid schedule has been revised to read "Electric Cabinet and Panel Work at East River Houses Parking Lot". Refer to Addendum 13, Article 2.</p>
13	52	<p>Topsoil removal is paid under item 6.02 AAN. Drawing SM318 has been revised. Refer to Addendum 13, Article 4.</p>

Addendum	Addendum Question No.	Bidder's Question	Response
18	1	<p>Reference is made to Q &amp; A #46, Addendum #13. Your answer states that item 565.1420008 is a standard NYSDOT. The closest we could identify is item 565.1421 which is a NYSDOT item for Fixed Bearings. Nonetheless detail on sheet W5761 shows sliding elements that are paid under item 565.1420008. No longitudinal lengths are given for each of the elements. Since the subject item units are given 'EACH' we need to know the units length. Please clarify.</p>	<p>Item 565.1420008 is correct. The specification is available from the NYSDOT Pay Item Catalog (<a href="http://www.dot.ny.gov/pic">www.dot.ny.gov/pic</a>) as noted in the Project Description pages.</p>
18	2	<p>In conjunction with question 58 above, reference is made to Q &amp; A #47, Addendum #13. Your answer states that Detail 4 will be revised to include item number ESCR-567.PC, and to include protective steel plates, etc. As of this moment we have not received drawings showing revisions of Detail 4. Please clarify.</p>	<p>The revised drawing will be provided post bid. W5761 Detail 4 will be revised to include item number ESCR-567.PC for the 1/8" x 2'-3" Protective Steel Plate. Detail 4 will also be revised to include callouts for the angle and filler plate, which are both paid under ESCR-567.LG as shown in Detail 1B.</p>

**PARKS - PAGES**

**SPECIAL PARKS  
SPECIFICATIONS**

---

**SANDRESM1**

The specifications in the PARKS-Pages cover the construction of park amenities within East River Park, including lighting, plumbing, paving, furnishings, plantings, and associated works as well as sewer works.

The PARKS-Pages supplement the specifications shown on the Specifications and Standards of New York City sheet at the beginning of this Volume 3, which apply to the work except as modified in these Contract Documents.

**(NO TEXT ON THIS PAGE)**

## SECTION ESCR-6.01 – CLEARING AND GRUBBING

**6.01.1. INTENT.** This section describes Clearing and Grubbing.

**6.01.2. DESCRIPTION.** Clearing and Grubbing shall include the removal and legal disposal of the following site elements as shown on the Contract Drawings, from within areas shown on the Contract Drawings and where directed by the Engineer:

- Asphalt, concrete, pre-cast concrete, cobbles and stone pavements (excluding pavement base courses to remain)
- Play area pavement and resilient surfacing
- Running track pavement and resilient surfacing
- Curbs and walls
- Piles and concrete pile caps for sports field lighting and amphitheater area structures
- Synthetic turf carpet, padding and associated subsurface drainage piping
- Concrete foundations for benches, light poles, play and exercise equipment, and other site furnishings
- Fences including fence curbing and foundations
- Park area surface drainage utilities including trench drains, slot drains, running track drains, drain inlets, catch basins, manholes, drainage piping (excluding the deep storm sewer and regulator system)
- Park area water service piping and associated structures. Park water features and elements such as drinking fountains, ground hydrants, quick couplers, misting posts, water play features, irrigation pumps, irrigation controls, irrigation heads, control wiring, piping, valves, valve boxes, etc.
- Park area electrical service including coordination with Con Ed, service switches, metering equipment, panels, lighting contactors, time clocks, light fixtures, switches, receptacles, junction/splice boxes, sport field floodlight poles, floodlight fixtures, walkway, light poles, floodlight poles, lighting control relay cabinets and poles, manholes, pull boxes, conduits and wiring
- Park area gas services piping, valves, and coordination with Con Ed.
- Project area communications services including manholes, pullboxes, conduit, wiring and coordination with Verizon.
- Trees and stumps less than six (6") inches in diameter, branches, down timber, snags, brush and other vegetation.
- Debris including, tires, batteries, automobile parts, kitchen appliances, rubbish, stumps, roots and root systems, miscellaneous minor structures, and all other objectionable materials as noted on the Contract Drawings and where directed by the Engineer.

The Contractor must comply with all Federal, State, and City laws pursuant to the handling and disposal of woody organic material that is host material for the Asian Longhorned Beetle. All wood that is host material for the Asian Longhorned Beetle must be chipped, ground, or shredded inside the quarantine zone to a size of less than one (1") inch in at least two dimensions before it is

permitted to leave the quarantine zone. Please refer to the publication entitled Part 139 of the New York State Department of Agriculture and Markets law and contact State personnel for further details. Also see Section 1.06.23.(R), PLANT PEST CONTROL REQUIREMENTS, of the NYCDOT Standard Highway Specifications for additional requirements.

**6.01.3. DISPOSAL OF SALVAGEABLE MATERIAL.** Salvageable fence, including all appurtenances, or other salvageable materials shall be carefully dismantled, removed, cleaned and stored on the site for re-use in the work; delivered, after cleaning, to a designated City-owned Yard, within the five boroughs, or disposed of away from the site of the work, whichever the Engineer shall direct.

**6.01.4. DISPOSAL OF NON-SALVAGEABLE MATERIAL.** Non-salvageable materials shall be legally disposed of away from the site of the work. The disposal of materials resulting from Clearing and Grubbing operations by burning in open fires will not be permitted.

**6.01.5. METHODS.** Coordinate with the Engineer prior to the start of work to mark-out and confirm utilities to be demolished and utilities to remain and be protected within the project area. Confirm that utilities to be remove have been decommissioned and de-powered prior to the start of removal work.

Coordinate existing utility removals with the installation of temporary utilities required at existing buildings to remain. Obtain Engineer approval prior to the disconnection and removal of utility services to buildings to remain.

Carefully cut and protect existing utility service connections to remain including buried conduits and piping at existing buildings to allow for future reconnections. Maintain existing utility service connections extending five (5') feet beyond the foundations of existing buildings to remain.

When removing trees and stumps less than six (6") inches in diameter, trees and all stumps, roots and root systems shall be removed to a depth of three (3') feet below the existing ground surface. Roots and root systems beyond the stumps need not be removed, except as the Engineer shall deem necessary.

In areas where pavements are removed, aggregate subbase materials need not be removed except as the Engineer shall deem necessary. On-site processing of pavement materials for re-use is permissible as approved by the Engineer.

When removing pile supported foundations, remove concrete pile caps in their entirety and cut and remove piles three (3') feet below the bottom of pile foundations unless otherwise indicated on the Drawings or as directed by the Engineer. On-site processing of concrete pile cap structures is permissible as approved by the Engineer.

In areas where curbs, walls, piles and pile caps, drainage, electrical, water or gas utility elements are removed, the contractor shall backfill and compact holes trenches and other excavations to the level of the existing grade with clean fill or existing on-site fill materials from on-site as permitted by the Engineer.

(A) PRUNING

Branches of trees overhanging roadways, or other branches designated by the Engineer, shall be pruned to provide a clearance of fourteen (14') feet above the proposed final surface. Wound treatment shall not be used to cover wounds or pruning cuts, except when necessary for disease, insect, mistletoe, or sprout control, or for cosmetic reasons. Wound treatments that are damaging to tree tissue shall not be used. All trees within the City

Right of Way (canopy, roots, and/or trunk) require a pruning permit from the Department of Parks and Recreation and must be performed according to ANSI A300 Standards.

**(B) ENGINEER'S APPROVAL**

The Engineer, in consultation with NYCDPR, must approve all methods for felling, cutting or pruning trees for all trees which are under NYCDPR's jurisdiction.

**(C) PROTECTION**

Clearing and Grubbing operations shall be progressed in a manner and with equipment which will not damage trees, structures and adjoining grounds or vegetation which are to remain nor create any pedestrian or vehicular traffic hazards. In addition, all clearing and grubbing operations under the drip line of existing trees shall be performed by hand methods only. Tree protection fences shall not be moved or removed without the written permission of the Engineer.

**(D) FENCING**

Approved protective fencing or barricades shall be furnished and erected around or adjacent to individual trees, groups of trees and structures which are to remain, and at other required locations, when and as directed by the Engineer.

**(E) CLEAN UP**

All materials resulting from Clearing and Grubbing operations shall be disposed of, as specified, and the site shall be left in a condition satisfactory to the Engineer.

**(F) REMOVAL OF FENCING**

Protective fencing and barricades shall be removed and disposed of away from the site when directed by the Engineer.

**6.01.6. MEASUREMENT.**

**(A) PER ACRE**

Payment for Clearing and Grubbing will be made at the unit price bid per acre computed to the nearest tenth acre, for work satisfactorily completed.

**6.01.7. PRICES TO COVER.** The contract prices for Clearing and Grubbing shall include the cost of all labor, materials, equipment, insurance, and incidentals required to complete the work, together with all other work in connection therewith and incidental thereto, in full compliance with the Contract Drawings, the specifications and the directions of the Engineer. When there is no scheduled item provided therefor, the cost of the work required for Clearing and Grubbing shall be deemed included in the prices bid for all the scheduled contract items. The removal of trees and stumps over six (6") inches shall be paid for under separate items. The removal of existing buildings and building foundations shall be paid for under separate items. Temporary power to existing buildings to remain shall be paid for under separate items.

Unless otherwise provided for under other scheduled contract bid items, no separate payment will be made for tree pruning required herein to provide a clearance of fourteen (14') feet above the proposed final surface.

*Payment will be made under:*

**ACRE**

**END OF SECTION**

## SECTION PK-227B ADA – GRANITE BLOCK ON SAND – ACCESSIBLE

### **PK 227B.1. INTENT**

This section describes the furnishing and installation of granite cobble over sand in accordance with the plans, specifications and directions of the Engineer.

### **PK 227B.2. DESCRIPTION**

Under this section, the Contractor shall furnish and install granite cobble pavers in accordance with the details indicated on the Contract Drawings, specified, or directed by the Engineer.

### **PK 227B.3. MATERIALS**

(A) GRANITE BLOCK— Blocks shall be of fine or medium grained granite showing an even distribution of constituent minerals. They shall be of uniform quality and texture throughout, and free from seams or disintegrated materials., except that no block shall be less than six (6") inches long, four (4") inches wide and five (5") deep. Granite block may be rejected by the engineer for reuse in relaid wearing courses because of excessive roundness of other objectionable characteristics. All installed pavers shall have a flamed finish.

(B) SAND—Sand for sand setting bed and joint filler shall consist of clean, hard, durable uncoated particles free from lumps of clay and all deleterious substances and shall be so graded that when dry, one hundred percent shall pass a ¼" square opening sieve; not more than thirty-five percent (35%) by weight shall pass a No. 50 sieve. Cushion sand may be rejected if it contains more than ten percent (10%) by weight of loam and/or silt.

(C) MORTAR—The mortar shall be composed of one (1) part of Portland Cement and a maximum of two (2) parts sand, with not more than (5) percent of the cement content of hydrated lime or lime putty.

### **PK 227B.4. METHODS**

Preparation of Subgrade: The Contractor shall trim and roll the subgrade to smooth, uniform lines to the satisfaction of the Engineer, prior to placing the pavement. The Contractor shall place geotextile over the prepared subgrade of structural soil, overlapping edges a minimum of six inches (6") to ensure complete coverage prior to placing the sand base.

Sand Cushion: The blocks shall be laid on a sand cushion of a maximum thickness of one inch (1"). The sand cushion shall be compacted by being rolled with a roller weighing one hundred fifty pounds (150 lbs.) per foot of width or by tamping, as directed by the Engineer.

Setting Blocks: The blocks shall be carefully laid on a sand cushion according to the patterns shown on the plans or as directed by the Engineer. Joints between blocks shall be a maximum of one inch (1") and a minimum of three-quarters inch (3/4") in width. All blocks shall be clean when placed in the pavement. Blocks which, in the opinion of the Engineer, are not satisfactorily clean shall be well washed before being placed. Cutting of blocks to meet pattern requirements will be permitted, subject to the approval of the Engineer.

After a sufficient area of block pavement has been laid, the surface shall be tested with a ten foot straight edge laid parallel with the center line and any depression exceeding one-quarter inch (1/4") shall be corrected and brought to the proper grade. All stones disturbed in making replacements or correcting depressions shall be settled into place by carefully ramming or

tamping to grade by the use of a hand tamper applied upon a two inch (2") board. Each section of pavement must be acceptable to the Engineer before the joints in that section are filled.

Filling Joints: Where sand joints are called for, the joints shall be filled with cushion sand. The sand shall be firmly packed in the joints between the blocks. Immediately after the joints are filled, the pavement shall be swept clean.

Where mortar joints are called for, the joints shall be completely filled with a cement grout mixture. The grout shall be firmly packed in the joints between blocks. Immediately after the joints are filled, the pavement shall be swept clean. The finished surface shall be free of all cement stain and excess grout and shall be acceptable to the Engineer.

Protection: All fresh mortar work shall be carefully protected from freezing and from drying effect of the sun and wind, and if required, it shall be sprinkled with water at such intervals and for such time as may be directed. Stonework shall be protected from injuries of all sorts, and all portions which may become damaged or may be found defective shall be repaired, or if directed, removed and rebuilt. No mortar work shall be laid or relaid when the temperature is below 40 degrees Fahrenheit.

**PK 227B.5. MEASUREMENT**

The quantity of granite blocks to be measured for payment shall be the number of square feet of granite blocks installed, in place, to the satisfaction of the Engineer.

**PK 227B.6. PRICES TO COVER**

The unit price bid per square foot of granite block over structural soils shall cover the cost of all labor, materials, plant, equipment, insurance, and necessary incidentals as required to furnish and install dimensioned granite pavers in accordance with the Contract Drawings, the specifications, and the directions of the Engineer.

*Payment will be made under:*

**END OF SECTION**

## SECTION PK-ESCR 0-05 – TREE REMOVAL

**WORK:** The Contractor shall cut and remove within the contract limits, all trees over six (6") inches DBH, including the root to a depth of three (3') feet below the surface, where shown on the plans or as directed by the Engineer. The Contractor shall cut and remove within the contract limits, all trees over six (6") inches DBH, but the stump shall remain, where shown on the plans or as directed by the Engineer.

**Note:** DBH is defined as Diameter at Breast Height, which is 4'-6" above grade.

**SPECIAL REQUIREMENTS FOR ASIAN LONGHORNED BEETLE QUARANTINE ZONE:** For tree work to be performed within the quarantine zone, the Contractor shall utilize the service of a Contractor certified by the New York State Department of Agriculture and Markets. Due to current Federal, State and NYC DPR policy, any wood waste that is generated must be completely chipped within the Quarantine Zone, by said certified Contractor. Log splitting equipment, where necessary, shall be utilized at no extra cost to the City. For additional information regarding procedures, contact the Engineer. Also, see requirements listed under heading "Submittals".

**METHOD:** The Contractor shall carefully protect against damage to all existing trees, plants and other features to remain. The Contractor shall be liable for any damage to such trees, plants, park features and other property caused by Tree Removal operations and all damaged property shall be replaced or restored to its original condition, to the satisfaction of the Engineer.

The Contractor shall cut and remove all trees designated for removal within the limits of the contract or as directed by the Engineer. The stumps and roots of these trees shall be removed to a depth of three (3') feet below the ground surface. All voids and excavations left after removal of the tree and roots shall be backfilled to grade with clean fill. The fill shall be placed and compacted by acceptable methods to the satisfaction of the Engineer and shall meet the requirements of the NYCDOT Standard Highway Specifications. Chips generated by root removal operations shall be removed prior to backfilling.

For trees designated for removal with stump to remain, the stumps of these trees shall be cut flush to the ground surface.

Cutting of trees shall be done by competent workers only and in a professional manner. All trees shall be "topped" and "limbed" previous to felling unless otherwise directed by the Engineer. All branches, limbs, trunks, stumps, roots and other debris shall be removed from the site or otherwise disposed of to the satisfaction of the Engineer.

No trees are to be removed except as ordered by the Engineer.

**SUBMITTALS:** All submittals shall be as specified in the S-Pages. The Contractor shall submit the following for review and approval prior to performing work.

Qualifications In Quarantine Zone: State Certification- For all contracts within the Quarantine Zone, the Contractor must submit a copy of a valid Compliance Agreement issued by the State of New York Department of Agriculture and Markets, Division of Plant Industry.

**MEASUREMENT AND PAYMENT:** The quantity of **TREE REMOVAL** to be paid for under this Item shall be the number of tree units calculated in accordance with the payment schedule above, completely removed in accordance with the plans and specifications and directions of the Engineer.

The price bid shall be a unit price for **EACH** tree of the over 6" DBH, and shall include the cost of all labor, materials and equipment necessary for removing and disposing trees, including removal of root to 3' depth where required, borrowed fill, and all other incidental expenses necessary to

complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer. The cost of State Certification and chipping wood waste shall be included in the bid price for all Contracts located within the Quarantine zone.

**END OF SECTION**

## SECTION PK-ESCR 028 – EXPOSED AGGREGATE CONCRETE PAVEMENT

### PK-ESCR 028.1. INTENT.

This section describes construction of Concrete Sidewalk with Special Scoring and Exposed Aggregate Surface Treatment (Saw Cut Type Joints).

### PK-ESCR 028.2. DESCRIPTION.

The work shall consist of the construction of Concrete Sidewalk with Special Scoring and Exposed Aggregate Surface Treatment (Saw Cut Type Joints).

- (A) Concrete Sidewalk shall be of the width specified and shall be laid on a foundation as indicated on the drawings.
- (B) Where specified on the Contract Drawings or directed by the Engineer, concrete sidewalk shall be reinforced with wire mesh.

### PK-ESCR 028.3. MATERIALS.

The material requirements of Section ESCR-4.06, as currently amended, shall apply to all concrete sidewalk with special scoring and exposed aggregate surface treatment, along with the following modifications and additions:

- (A) Exposed Aggregate for Surface Seeding and Pavement Finishing shall be as follows:
  - a. Material: Select, hard, and durable; washed; free of material that reacts with the cementitious material or causes staining; from a single source, with fine aggregate and gap graded coarse aggregate as follows:
  - b. Coarse Aggregate (for seeding): Provide angular stone 1/4" to 3/16" maximum in size. Aggregate shall be supplied by
    - i. Geo Schofield 831 Main Street Bridgewater NJ ph: 732.356.0858 f; 732.356.1197
    - ii. Pasvalco Company 108 Bogart Street Closter NJ ph:888.727.8252 f:201.768.5927
    - iii. KAFKA GRANITE, LLC | Mosinee, WI ph: 800.852.7415; kafkagranite.com
    - iv. Or approved equal.
  - c. Size, color, and percent of aggregate seeding mixture to be indicated on drawings:
  - d. Exposed Aggregate Grading: Fine aggregate shall be 25 to 35 percent of total exposed aggregate material as recommended by the Portland Cement Association.
- (B) Expansion Joint Sealant: Joint sealant shall be a two (2) component, polyurethane based, self- leveling, chemically cured elastomeric sealant such as Sikaflex 429 primer with Sikaflex - 2C SL sealant as manufactured by Sika Corporation, Lyndhurst, NJ, or DynaTrol® II - SG, as manufactured by Pecora Corporation, Harleysville, PA, or approved equal. The color of the sealant shall match the color of adjacent pavements.
- (C) Expansion Joint: The expansion joint material shall be one of the following:
  - a. A pre-molded bituminous fiber joint filler, as specified in General Requirements (requires a bond breaker and sealant) or,
  - b. A pre-molded closed cell expanded polyethylene foam joint filler, such as MasterSeal 920 by BASF Inc., (requires only sealant) or,

- c. An approved equal of any of the above.
- (D) Bond Breaker: If bituminous fiber material is used, a bond breaker such as one-half inch (1/2") width polyurethane tape or five-eighth inch (5/8") diameter expanded polyethylene foam backer rod shall be installed as recommended by the manufacturer. A bond breaker will not be required for a pre-molded foam joint or a shredded recycled rubber aggregate joint filler, but sealant is always required.
- (E) Subbase Course Material: The material requirements of PK-ESCR 748, as currently amended, shall apply to all subbase course material for exposed aggregate concrete pavement.

#### **PK-ESCR 028.4. METHODS.**

All work required to install new concrete sidewalk with special scoring, saw cut type joints, and exposed aggregate surface treatment shall be done in accordance with the requirements of Section ESCR-4.06, for installing new concrete sidewalk with saw cut type joints, except with the following modifications and additions:

##### **A. SAMPLES.**

Prior to the start of construction the Contractor shall submit the following to the Engineer for approval prior to ordering of materials and sample panels:

1. Sample of aggregates.
2. Sample of sealant.
3. Intended design mix by percentages.
4. Sample of foundation material.
5. Mock ups:
  - a. The Contractor shall prepare sample test panels at least 4 foot x 4 foot x 4 inch in size of the proposed typical concrete sidewalk with exposed aggregate and saw cut type joints for the approval of the Engineer. These test panels or other approved markups shall be used to assess techniques, surface finish, distribution of aggregates, and consistency of finish.
  - b. As many test panels shall be constructed as are necessary to achieve a sample panel that meets the satisfaction of the Engineer. Once an approved sample panel has been achieved, all previous disapproved sample panels shall be immediately destroyed. The approved sample panel shall be clearly marked with the words "approved sample". All new sidewalk work shall conform in appearance to the approved sample panel to the satisfaction of the Engineer. The approved sample panel shall remain on site until all sidewalk work is complete, after which the Contractor shall dispose of the sample panel unless the sample panel is a part of the finished work.

##### **B. EXPOSED AGGREGATE SURFACE FINISH.**

The minimum temperature required for pouring concrete sidewalk with exposed aggregate shall be 50 degrees F., unless otherwise directed by the Engineer.

The surface of the concrete sidewalk shall have an exposed aggregate finish. The exposed aggregate shall be seeded onto and then embedded into the surface of the concrete. Casting

aggregate over the surface of the concrete and embedding them in the surface of the concrete is referred to as "seeding".

The Contractor is responsible for ordering sufficient concrete mix to fully complete each sidewalk slab section (expansion joint to expansion joint). Cold joints and/or interrupted pours will not be accepted.

Concrete shall be placed and screeded to the finished level, although depending on the size and quantity of aggregate to be added the initial surface level may need to be slightly lower than the finished level. Selected aggregate shall be hand-cast or seeded onto the surface immediately after screeding and then bullfloated into the surface prior to bleedwater appearing, or apply to the surface once all the bleedwater has evaporated and fully embedded by tamping and repeatedly working the surface with wood floats. The top surface of sidewalk shall be finished to a true smooth plane.

Surface retardant shall be applied in the amount and in a manner in accordance with the manufacturer's instructions.

Each rectangular slab shall have all edges neatly rounded with proper tools. Concrete shrinkage control joints shall be evenly and crispy scored or saw cut at designate locations, but not tooled, at locations shown on the Contract Drawings. Unless otherwise shown on the Contract Drawings, the shrinkage control joints in the concrete surface shall be one-eighth (1/8") inch wide and three-quarter (3/4") inch deep and if saw cut shall be done immediately after the concrete has reached its initial set which is typically anywhere from 4 to 8 hours after the concrete has been poured, depending upon the weather, but in no case shall it be later than 12 hours after pouring. All saw cuts are to be straight, clean and of consistent width.

#### **C. PROTECTION AND CURING.**

The Contractor shall carefully protect the concrete from the drying effects of the sun and wind, pedestrian and/or other traffic, or other caused, by means of suitable guards and coverings.

After aggregate has been exposed the concrete shall be cured by covering it with new and unwrinkled, non-staining, high-quality curing paper conforming to ASTM C171, Sheet Material for Curing Concrete.

To seal and protect the exposed aggregate surface after curing, the clear sealer shall be applied as per the manufacturer's instructions.

All exposed aggregate surfaces shall be thoroughly inspected to verify and approve installation and safety, including wet and dry slip resistance, before opening the sealed surface to traffic.

#### **D. EXPANSION JOINTS**

Unless otherwise directed by the Engineer and excluding sign and parking meter posts, expansion joints shall be installed at all joints between the sidewalk slabs and curb, street hardware, wood poles, street light and traffic pole foundations, bollard foundations, hydrant foundation slabs, buildings, bridges, etc. Refer to contract drawings for location of expansion joints.

The top one (1") inch shall be sealed with sealant poured on an approved backer rod in accordance with the manufacturer's instructions.

#### **PK-ESCR 028.5. MEASUREMENT.**

The area of concrete sidewalk with special scoring and exposed aggregate surface treatment in **SQUARE FEET.**

In determining the area of Concrete Sidewalk to be paid for, the areas occupied by the tree wells, bases of columns, manhole heads, gate boxes and similar structures will be deducted from the

measured area of concrete sidewalk when they measure more than one (1) square foot and will not be deducted when they measure one (1) square foot or less.

**PK-ESCR 028.6. PRICES TO COVER.**

The contract price per **SQUARE FOOT** and depth as indicated for **CONCRETE SIDEWALK WITH SPECIAL SCORING AND EXPOSED AGGREGATE SURFACE TREATMENT** shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to construct concrete sidewalk of the thickness specified, exposed aggregate surface treatment, with saw cut joints and sealant, complete in place with subbase course material, in accordance with Section ESCR-4.06, including, but not limited to, curing, excavation (other than rock excavation) and backfilling, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Where Concrete Sidewalk with Exposed Aggregate is designated to be reinforced, the cost of furnishing and installing the welded wire fabric shall be paid for separately under its own contract Item No. ESCR-4.14 Epoxy-Coating Steel Reinforcement.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 028 A</b>	<b>5" CONCRETE SIDEWALK WITH SPECIAL SCORING AND EXPOSED AGGREGATE SURFACE TREATMENT (SAW CUT TYPE JOINTS)</b>	<b>S.F.</b>
<b>PK-ESCR 028 B</b>	<b>6" CONCRETE SIDEWALK WITH SPECIAL SCORING AND EXPOSED AGGREGATE SURFACE TREATMENT (SAW CUT TYPE JOINTS)</b>	<b>S.F.</b>

**END OF SECTION**

## SECTION PK-ESCR 031 – GALVANIZED ESPLANADE SEA RAIL

### PK-ESCR 031.1. INTENT

This section describes the furnishing and installation of esplanade sea railing in accordance with the plans, specifications and directions of the Engineer.

### PK-ESCR 031.2. DESCRIPTION

This Section includes the following:

1. Galvanized Esplanade Sea Rail

### PK-ESCR 031.3. MATERIALS

#### 1.1 METALS

- A. General: Provide metal free from pitting, seam marks, roller marks, stains, discolorations, and other imperfections where exposed to view on finished units.
- B. Round Steel Pipe and posts: Standard weight, Schedule 40, hot dipped galvanized seamless steel pipe complying with ASTM F1083. Comply with ASTM F1043, material Design Group 1A, external and internal Coating Type A consisting of not less than 1.8 oz/sq. ft. zinc.
- C. Steel Plates, Shapes and Bars: ASTM A 36/A 36M.
- D. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as railings and gates, unless otherwise indicated.
- E. Steel Post Caps: Cast metal of same type of material and finish as railings and gates.
- F. Rectangular Tube Steel: Cast metal of same type of material and finish as railings and gates
- G. Miscellaneous Hardware: All miscellaneous hardware including, but not limited to allen set screws, bosses, tamper-proof screws, socket-head screws, flathead screws and clips shall be stainless steel, AISI Type 316.
- H. Cast-in-Place Anchors in Concrete: Anchors of type indicated below, fabricated from corrosion-resistant materials capable of sustaining, without failure, the load imposed within a safety factor of 4, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
  - a. Threaded or wedge type; galvanized ferrous castings, either ASTM A 47 (ASTM A 47M) malleable iron or ASTM A 27/A 27M cast steel. Provide bolts, washers, and shims as needed, hot-dip galvanized per ASTM A 153/A 153M.
- I. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

#### 1.2 WELDING MATERIALS, FASTENERS, AND ANCHORS

- A. Welding Electrodes and Filler Metal: Provide type and alloy of filler metal and electrodes as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.
- B. Fasteners for Anchoring Railings, Panels and Gates to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring

components to other types of construction indicated and capable of withstanding design loads.

- C. Cast-in-Place and Post installed Anchors: Anchors of type indicated below, fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.
  - a. Cast-in-place anchors.
  - b. Expansion anchors.

### 1.3 GROUT AND ANCHORING CEMENT

- A. Nonshrink, Nonmetallic Grout: Premixed, factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for exterior applications.
- B. Erosion-Resistant Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, Patching, and grouting compound. Provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

### 1.4 CHEMICAL EXPANSION ANCHORS

- A. Chemical Anchoring Adhesive shall be a two-component 100% solids epoxy based system supplied in manufacturer's standard side-by-side cartridge and dispensed through a static-mixing nozzle supplied by the manufacturer. Epoxy shall meet the minimum requirements of ASTM C-881 specification for Type I, II, IV, and V, Grade 3, Class B and C and must develop a minimum 12,650 psi compressive yield strength after 7 day cure. Epoxy must have a heat deflection temperature of a minimum 136°F (58°C).

### 1.5 GROUNDING MATERIALS

- A. Grounding Conductors: Bare, solid copper wire for No. 6 AWG and smaller; stranded copper wire for No. 4 AWG and larger.
- B. Grounding Connectors and Grounding Rods: Comply with UL 467.

## **PK-ESCR 031.3.1. REFERENCES**

- A. Except as modified by governing codes and by the Contract Documents, comply with the applicable provisions and recommendations of the following:
  - a. American Welding Society D1.1 "Structural Welding Code – Steel".
  - b. National Association of Architectural Metal Manufacturers "Metal Finishes Manual".
  - c. Industrial Fasteners Institute "Fastener Standards Book".
  - d. American Society for Testing and Materials (ASTM) – ASTM E 935-92: Test Method for Performance of Permanent Metal Railing Systems, ASTM E 985-87: Specifications for Permanent Metal Railing Systems, ASTM A53-96: Specification for Hot-Dipped Galvanized Seamless Pipe, ASTM A 123 Specification for Zinc (Hot-Dipped Galvanized); ASTM A 500-93 Specification for Cold Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes; ASTM E437

and Appendix X4.2 for wire mesh.

- e. American Society of Civil Engineers (ASCE) – ASCE 8-90: Specification for Design of Cold – Formed Stainless Steel Structural Members.

### **PK-ESCR 031.3.2. SUBMITTALS**

- A. Product Data: For manufacturer's product lines assembled from standard components.
  - a. Include Product Data for grout and anchoring cement.
  - b. Include all metal types.
  - c. Include all finish types
- B. Material Certificates: For dimension lumber specified to comply with minimum allowable unit stresses. Indicate species and grade.
- C. Field Measurements: Verify handrail and railing dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Field verify waterfront structures to accept all railing work and mountings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
  - a. Established Dimensions: Where field measurements cannot be made without delaying the Work, advise Engineer in writing and establish dimensions and proceed with fabricating railings and gates without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.
- D. Shop Drawings: Show fabrication and installation of esplanade railing. Include plans, elevations, for entire length of each railing type for all field conditions and typicals for sections, details, attachments, connectors, anchoring and connecting hardware and lightning protection. Indicate field and shop welds. Detail custom corner conditions at non-90° angles, end panels, radiused sections, sloped sections, the corners at Fire Boat House, Houston Embayment, and the Amphitheater Embayment. The end post at ConEd and Embayment corners to have radiused panels.
- E. Verification Calculations
  - a. Shop drawings to be submitted along with the following calculations. Calculations need to be reviewed and approved by the Engineer.

Verify that handrails are capable of withstanding the following structural loads without exceeding allowable design working stresses of materials for handrails, anchors, and connections:

    - i. Top Rail: Capable of withstanding the following loads applied as indicated:
      - 1. Concentrated load of 200 lbf applied at any point and in any direction.
      - 2. Uniform load of 50 lbf/ft. applied horizontally and concurrently with uniform load of 100 lbf/ft. applied vertically downward.
      - 3. Concentrated and uniform loads above need not be assumed to act concurrently.
    - ii. Rails Not Serving As Top Rails: Capable of withstanding the following loads applied as indicated:
      - 1. Uniform load of 50 lbf/ft. applied in any direction.

2. Concentrated and uniform loads above need not be assumed to act concurrently.
    - iii. Infill Area of Rail: Capable of withstanding a horizontal concentrated load of 200 lb/ft applied to 1 sq. ft. at any point in system, including panels, intermediate rails, or other elements composing infill area.
      1. Load above need not be assumed to act concurrently with loads on top rails in determining stress on guard.
      2. Concentrated load of 200 lbf applied at any point and in any direction.
- F. Samples for Finish Verification: Short sections of structural, tubular, angle and plate samples for approval of mechanical finishes. Two (2) 12"x12" samples of all mesh types.
- G. Mock-up: Assembled samples of each of the railing systems, made from full-size finished components, including mesh and all connecting hardware. Show method of finishing members at intersections. Each sample shall be full height, four feet long (minimum) and may be used in final installation if workmanship and finishes are accepted to Engineer. Mock-up must include the following locations and conditions:
  - a. Corners,
  - b. A left and right end panel,
  - c. A radiused section,
  - d. A sloped section,
  - e. A sloped and radiused section,
  - f. The corner at Fire Boat House,
  - g. A Houston Embayment and an Amphitheater Embayment straight and radiused section, and
  - h. The end panel at ConEd.
- H. Qualification Data:
  - a. Railing Manufacturer's qualifications: The railing manufacturer must have successfully completed ten (10) years experience in the manufacture of railings similar in scope to the required work in a timely manner. This experience must include railings with castings. Submit lists of completed projects with project names and addresses, names of addresses of architects and owners, and other information specified.
  - b. Powdercoater's qualifications: Experience in successfully finishing powdercoating of steel fabrications similar in scope to the required work, with sufficient capacity to complete the work in a timely manner. Submit lists of completed projects with project names and addresses, names of addresses of architects and owners, and other information specified.
  - c. Installer's qualifications: the railing installer must have successfully completed (3) years experience in the installation of railings similar in scope to the required work in a timely manner. Submit lists of completed projects with project names and addresses, names of addresses of architects and owners, and other information specified.
  - d. Welder Qualifications: Welders must be qualified per the appropriate AWS code for the process and procedures being used. All costs related to welder qualifications, including retests, are the Contractor's responsibility.
- I. Product Test Reports: From a qualified testing agency indicating products comply with

requirements, based on comprehensive testing of current products.

- J. Product Test Reports: From a qualified testing agency indicating handrail, railing and gate components comply with ASTM E 985, based on comprehensive testing of current products.

**PK-ESCR 031.3.3. QUALITY CONTROL**

- A. Thermal Movements: Provide handrails that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - a. Temperature (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- B. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.
- C. Qualify welding processes and welders in accordance with AWS D1.1 “Structural Welding Code – Steel,” D1.3 “Structural Welding Code – Sheet Steel”, and D1.2 “Structural Welding Code – Aluminum”.

**PK-ESCR 031.3.4. DELIVERY, STORAGE, AND HANDLING**

- A. Schedule installation of handrail, railings and gate to coordinate with varying setting, anchoring and lightening protection requirements. Do not support temporarily by any means that do not satisfy structural performance requirements.
- B. Schedule installation of railings to coordinate with varying setting, anchoring and lightening protection requirements. Do not support temporarily by any means that do not satisfy structural performance requirements.

**PK-ESCR 031.3.5. MANUFACTURER**

Fabricator and powder coater to be submitted for approval by the Engineer.

**PK-ESCR 031.3.6. FINISHES**

- A. Comply with NAAMM’s “Metal Finishes Manual for Architectural and Metal Products” for recommendations for applying and designating finishes.
- B. Galvanizing: All components of the esplanade rail including the posts, and rails shall be hot dipped galvanized in accordance with the provisions of the NYSDOT Standard Specifications. All galvanized surfaces will be given thermo-setting polyester powder finish for extra protection and added aesthetic appeal. The coating shall be lead free and without solvents. The final color shall be black matte as approved by the Engineer, unless otherwise shown on the Contract Drawings.
- C. The Powder coating process shall consist of the following steps unless directed otherwise by the Engineer:
  - 1. The material shall be alkaline cleaned and then rinsed.
  - 2. The material shall be pickled in a bath with inhibited phosphoric acid and then rinsed.
  - 3. An active anti-corrosive layer of zinc phosphate shall be applied and rinsed.

4. The layer of zinc phosphate shall be sealed with a hexavalent chromating agent of very low weight and then the material shall be rinsed.
  5. The material shall be rinsed with e-ionized water to remove any remaining salts which can cause osmosis.
  6. The material shall be dried in the drying oven.
  7. The powder shall be charged to 80,000 volts and then sprayed onto the grounded steel.
  8. The material shall be heated to a temperature between 340-390 degrees F, in accordance with the powder manufacturer's specifications, to melt the resin cores and to
- D. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.
- E. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- F. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

#### **PK-ESCR 031.4. FABRICATION**

- A. General: Fabricate handrails, railings and gates to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage.
- B. Assemble railings and gates in the shop to greatest extent possible to minimize field splicing, welding and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- C. Welded Connections: Where shown on details and approved shop drawings, fabricate railings and gates for connecting members by welding. Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following.
1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove flux immediately.
  4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
- D. Nonwelded Connections: Where shown on details and approved shop drawings, fabricate railings and gates by connecting members with concealed mechanical fasteners and fittings, unless otherwise indicated. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.
- E. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect handrail, railing and gate members to other work, unless otherwise indicated.
- F. Provide inserts and other anchorage devices for connecting railings and gates to concrete.

Fabricate anchorage devices capable of withstanding loads imposed by movement at gates and due to other factors. Coordinate anchorage devices with supporting structure and lightening protection.

- G. Shear and punch metals cleanly and accurately. Remove burrs from exposed cut edges.
- H. Ease exposed edges to a radius of approximately 1/32 inch (1 mm), unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.
- I. Cut, reinforce, drill, and tap components, as indicated, to receive finish hardware, screws, and similar items.
- J. Provide weep holes or another means to drain entrapped water in hollow sections of railings and gates that are exposed to exterior or to moisture from condensation or other sources.
- K. Fabricate joints that will be exposed to weather in a watertight manner.
- L. Close exposed ends of railings and gates with prefabricated end fittings.

#### 1.1 INSTALLATION, GENERAL

- A. Fit exposed connections together to form tight, hairline joints.
- B. Perform cutting, drilling, and fitting required to install railings and gates. Set railings and gates accurately in location, alignment, and elevation; measured from established lines and levels and free from rack.
  - 1. Do not weld, cut, or abrade surfaces of handrail, railings and gates components that have been finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
  - 2. Set posts plumb within a tolerance of 1/16 inch in 3 feet (2 mm in 1 m).
  - 3. Align railings and gates so variations from level for horizontal members and from parallel with rake of steps and ramps for sloping members do not exceed ¼ inch in 12 feet (5 mm in 3 m).
- C. Adjust railings and gates before anchoring to ensure matching alignment at abutting joints. Space posts at interval indicated, but not less than that required by structural loads.
- D. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and gates and for properly transferring loads to in-place construction.

#### 1.2 RAILING CONNECTIONS

- A. Nonwelded Connections: Use mechanical joints for permanently connecting railing components. Use wood blocks and padding to prevent damage to railing members and fittings. Seal recessed holes of exposed locking screws using plastic cement filler colored to match finish of railings and gates.
- B. Welded Connections: Use fully welded joints for permanently connecting components. Comply with requirements for welded connections in "Fabrication" subsection whether welding is performed in the shop or in the field.
- C. Tack-weld all exposed non-tamperproof nuts.
- D. Expansion Joints: Install expansion joints not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches (50 mm) beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6

inches (150 mm) of post.

1.3 ANCHORING POSTS

A. Grounded Posts

- 1. All posts shall have provided a grounded connection to reinforcing bars at intervals not to exceed 150 feet.

B. Non-Grounded Posts

- 1. Fasten posts or anchor posts to surfaces as shown on drawings.

C. Posts and Railing Ends.

- 1. Form or core-drill holes  $\frac{3}{4}$  inch (20 mm) larger than OD of post for installing posts in concrete. Clean holes of loose material, insert posts, and fill annular space between post and concrete with the following anchoring material, missed and placed to comply with anchoring material manufacturer's written instructions:
  - a. Nonsrink, nonmetallic grout.
- 2. Cover anchorage joint with flange of same metal as post, attached to post as follows:
  - a. Welded to post after placing anchoring material.

**PK-ESCR 031.5. MEASUREMENT**

- A. GALVANIZED ESPLANADE SEA RAIL: The quantity of Galvanized Esplanade Sea Rail to be paid for shall be the number of linear feet of each type rail furnished and erected complete, to the satisfaction of the Engineer. Measurement shall be made in place along the centerline of the top rail, from center to center of end posts.

**PK-ESCR 031.6. PRICES TO COVER**

- A. GALVANIZED ESPLANADE SEA RAIL: The price bid shall be a unit price per linear foot of Galvanized Esplanade Sea Rail and shall include the cost of all labor, material, equipment, and incidentals required to furnish and erect rail of the type specified including, but not limited to, shop drawings, gates, excavation, concrete post footings, backfill, and painting as required, all in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

*Payment will be made under:*

PK-ESCR 031	Galvanized Esplanade Sea Rail	L.F.
	END OF SECTION	

**SECTION PK-ESCR 032 – STEEL BLEACHERS**

**WORK:** Under this item, the Contractor shall furnish all labor, materials, equipment, and incidentals necessary to assemble and install **STEEL BLEACHERS** anchored on reinforced concrete slabs to the lengths and sizes shown on the drawings in accordance with the plans and specifications and directions of the Engineer.

Non-elevated bleachers four (4) tiers or higher shall be installed with a non-climbable barrier (minimum 42” high) attached at both sides and rear. Elevated bleachers, such as those used for roller hockey events shall have an additional handrail installed in front of the walkway platform including stairs and entrances. Where an opening between the seatboard and footboard is located more than thirty (30) inches above the finished grade, the opening shall be closed by a kickboard such that a four (4”) inch diameter sphere cannot pass through. Aisles are not required for bleachers that have five tiers or less.

**CRITERIA:** Bleacher design and construction must meet the all applicable requirements from the American with Disabilities (ADA) Standards for Accessible Design and NYC Building Code.

**ADA STANDARDS FOR ACCESSIBLE DESIGN:** In accordance with 28 CFR Part 36 (ADA Standards for Accessible Design), in places of assembly with fixed seating accessible wheel chair location shall comply with Section 221 Assembly Areas and shall be provided consistent with Table 221.2.1.1 – "Number of Wheelchair Spaces in Assembly Areas" as shown below:

<b>Number of Seats</b>	<b>Minimum Number of Required Wheelchair Spaces</b>
4 to 25	1
26 to 50	2
51 to 150	4
151 to 300	5
301 to 500	6
501 to 5000	6, plus 1 for each 150, or fraction thereof, between 501 through 5000
5001 and over	36, plus 1 for each 200, or fraction thereof, over 5000

**BUILDING CODE:** New York City Building Code Chapter 10 – "Means of Egress", Chapter 11 – "Accessibility", and Chapter 16 - "Structural Design" shall apply to bleacher assembly and other portions of the code may apply as well. Bleacher assembly shall also be in accordance with ICC Standard 300 – "Standard on Bleachers, Folding and Telescopic Seating and Grandstands". The following excerpts from the NYC Building Code and ICC Standard 300 shall apply:

- a) **Design Loads:** Bleachers, folding and telescopic seating, and grandstands shall be designed for a uniform live load of 100 pounds per square foot (psf) (4788 Pa). All seat and footboard members shall be designed to support a live load of at least 120 pounds per linear foot.

Stair Treads and aisle stair treads shall be designed to resist a minimum concentrated load of 300 pounds on an area of 4 square inches.

Handrail assemblies and guards shall be designed to resist a load of 50 pounds per linear foot and a single concentrated load of 200 pounds applied in any direction at the top.

Intermediate rails (all those except the handrail), balusters, and panel fillers (including flexible infill components) shall be designed to withstand a horizontally applied normal load of 50 pounds on an area equal to 1 square foot, including openings and space between the rails.

- b) Individual seat space width shall be 18". The space between the back edge of a seat board and the front edge of the seat board behind it shall be a minimum distance of 14 ½".
- c) The width of seat and foot boards shall be minimum 9 ½".
- d) Bleachers having 16 or more tiers require aisles at ends of seat rows, the minimum spacing between seat rows shall be increased to 16" and the required space between rows shall be increased by 1/4" for each seat in excess of seven that it is necessary to pass to reach an aisle. Cross aisles shall be provided at the bottom of each section.

Aisles are not required for bleachers that have more than five (5) tiers where all of the following conditions exist:

1. Seats are without backrests.
2. The rise from row to row does not exceed 6 inches (152 mm) per row.
3. The row spacing does not exceed 28 inches (711 mm) unless the seatboards and footboards are at the same elevation.
4. The number of rows does not exceed 16 rows in height.
5. The first seating board is not more than 12 inches (305 mm) above ground or floor below or a cross aisle.
6. Seatboards have a continuous flat surface.
7. Seatboards provide a walking surface with a minimum width of 11 inches (279 mm).
8. Egress from seating is not restricted by rails, guards or other obstructions.

**MANUFACTURER:** Steel Bleachers shall be manufactured by:

- Custom Fabrication Inc., 2903 NY Route 7, PO Box 43 Harpursville, NY 13787, PH 800-922-0070;
- Seating Solutions, 60 Austin Blvd., Commack, NY 11725, Phone: 888-959-7328;
- MRC, 2130 Route 35, Building B, Suite 222, Sea Girt, NJ 08750, Phone: 800-922-0070
- or approved equal.

**MATERIALS:** Unless otherwise specified all materials shall meet the requirements of the NYCDOT Standard Highway Specifications and shall meet the following minimum:

**Steel:** All structural steel shall conform to ASTM A36 – latest revision and American Institute of Steel Construction for buildings as revised and amended to date.

**Under Structure:** The under structure of each unit shall consist of a series of frames or stringers spaced at intervals and joined by means of cross braces. Each stringer shall consist of vertical members, adequate diagonal braces, and horizontal members for bearing on a level surface supporting seat and foot planks. Frame to frame crossbracing shall be secured at each end of frame and at midpoint with machine bolts.

Frame members are formed and welded from steel tubing, 1 ½" x 1 ½" x 3/16". Supporting brackets made of 3/16" plate steel shall be welded to frame where planks are to be attached. Crossbracing shall be formed from 1 ½" x ¼" flat steel bar.

All welds shall be 3/16" continuous fillet welds wherever separate pieces are joined. Frame members shall be spaced a maximum of six (6') feet on inside bays and five (5') feet on outside bays. The required number of angle supports and support braces shall be securely attached to frame members to support the entire understructure rigidly and securely support under all calculated live and dead loads.

Predrill anchor holes in frame bottom at 32" on center.

**Seatboards:** Seatboards shall be 12 gauge or better plate steel. Seatboards shall be formed into a structural "C" shape, between 10" and 12" wide, with end caps permanently welded in place. Seatboards shall be galvanized and powdercoated as specified below. Color of seats shall be white unless otherwise noted on the drawings.

**Kickboards:** Kickboards, if required, shall be 12 gauge or better plate steel, hot-dipped galvanized. Footboards shall NOT be powder coated unless directed by the Engineer in writing.

**Footboard:** Footboards shall be fabricated from 12-gauge hot-dip galvanized plate steel with perforated or dimpled or other approved slip resistant surface. Footboards shall NOT be powder coated unless directed by the Engineer in writing.

Footboard shall be formed into a structural "C" shape, minimum 10" wide with welded endcaps. Double footboards shall be connected on each row.

**Railing:** Bleachers with four (4) or more tiers shall have safety railing on both sides and back. Railing shall be either steel panel fencing with vertical railing or, welded wire modular panels, or other approved non-climbable railings

Line rails of adequate size, location, and height shall be installed to New York State code requirements and carry required design loads and shall be furnished for back, ends, and front of the bleachers including all exits.

**Tubular Steel Posts:** Tubular steel shall be structural tubing of the sizes and shapes shown in the approved shop drawings. Steel shall meet the specifications for ASTM A500, Grade B which has a minimum tensile strength of 58,000 psi (for round and shaped) and a minimum yield point of 42,000 psi for round structural tubing and a minimum yield point of 46,000 psi for shaped structural tubing. Material shall be load-tested under ASTM 1487 Latest Rev., after fabrication.

**Railing Panels:** Fence panels shall consist of vertical rail that provide enclosure and shall have no gaps greater than 3.5" and less than 9". Tubing used for railing shall have an O.D. between 0.75" to 1.6" and shall meet the same strength requirement as the posts. Railing shall be hot-dipped galvanized as specified below. All welds shall be complete and ground smooth.

**Anchors:** Bleacher framework shall be secured to the reinforced concrete slab using 3/8" x 2 3/4" Red Head or Hilti sleeve anchors. Anchors shall be installed 18" on center through frame bottom.

**Hardware:** Bolts shall be 3/8" – 16 threads per inch, grade 2 zinc-plated steel. Bolts shall have sufficient length to extend a minimum of ¼" beyond the face of the nut after tightening.

Spring lock washers are 3/8" dia. Galvanized or stainless steel. Nuts are tamper-resistant 3/8" - 16 deformed-thread lock nuts.

**FABRICATION:** All fabrication of the bleacher shall, as far as practicable, be completed in the shop. All work shall be plumb and true and in conformity with the details shown on the contract drawings and in accordance with current safety and accessibility standards. All angles, channels,

and plates shall be accurately cut for a close fit at all intersections.

**Welding:** All welds shall be ground smooth, without impairing their strength and shall be done in shop by certified welders conforming to AWS standards as specified under Section “B” and all welds shall be ground smooth. No welding shall be performed on site.

**Corrosion Resistant Treatment:** All bleacher components, except for the seatboards, shall be hotdipped galvanized. Seatboards shall be receive corrosion resistance treatment and be powdercoated as specified below. All fabrication and welding shall be completed prior to application of the corrosion resistant coating. Metal pieces shall be cleaned of all weld spatter, mill scale, varnish, rust, grease, and the like and the surface mechanically or chemically prepared to receive the coating. All metal parts of the bleacher, except the seatboards, shall be hot-dipped galvanized in accordance with ASTM A-123 specifications after fabrication and shall conform to the American Institute of Steel construction for building as amended to date.

For seatboards, and other metal components to receive powdercoating, the corrosion resistant coating shall be either a thermal spray zinc coating with a minimum thickness of 3 mils, or a multistep iron phosphate bath coating process.

**Polyester Powder Coating:** Only seatboards shall be powdercoated unless otherwise directed by the Engineer in writing. A surface coat shall be applied to the thermal zinc or iron phosphate coated metal pieces in such a manner that the coating will not peel off. The manufacturer shall perform all processes required to achieve a smooth material bond. The surface coat shall be an electrostatically sprayed, lead-free, TGIC (triglycidyl isocyanurate) polyester powder coating applied to a minimum of 5 mil thickness which shall be oven cured at temperatures between 400 and 450 degrees Fahrenheit for a period of 20 minutes. The TGIC polyester powder coating shall be similar to Secural by Spraylat, Tiger Drylac Series 49 as manufactured by Tiger Drylac U.S.A., Reading, PA, Clear Polyester TGIC ENVIROCRON Powder Coat, as manufactured by PPG Industries, College Station, TX, or approved equal and shall comply with ASTM standards as follows:

<u>PHYSICAL PROPERTIES</u>	<u>TEST METHODS</u>	<u>ACCEPTANCE CRITERIA</u>
Adhesion cross hatching	D-3359B	5B (0% area removed)
Flexibility conical mandrel	D-522	Pass 3/8” mandrel
Pencil hardness	D-3363	Pencil hardness 2H minimum
Impact resistance	D-2794	140 inch pounds minimum
Overbake resistance- Adhesion	D-2454	5B
Overbake resistance- Hardness	D-2454	Pencil hardness 2H minimum
Overbake resistance- Direct Impact	D-2454	140 inch pounds minimum
Humidity resistance-250 hours	D-4585	No visible change to surface
Weatherability	D-822	No visible change to surface

Colors shall be “white” unless otherwise shown on the drawings. Material surfaces shall be protected during shipment so as to arrive mar and scratch free in the field.

**ERECTION:** Bleachers shall be assembled and erected in accordance with the Manufacturer’s instructions and the approved shop drawings.

The Manufacturer’s Representative shall be present at the site and provide technical support during the initial phase of assembly. It is highly recommended that a subcontractor certified by the Manufacturer be hired to perform this work. All work shall be done by skilled mechanics in a

professional manner.

As parts are assembled, do not tighten hardware until all components are installed, aligned and bleachers are plumbed and leveled. The bleacher shall be assembled with bolts of the proper length, washers and deformed-thread locknuts with the approval of the Engineer. After bleacher is fully assembled, the hex nuts shall be fully tightened to their design torque. The threads of bolts shall be distressed or prick punched after tightening to prevent removal.

Anchor holes of proper size shall be drilled into concrete slab at eighteen (18") inch intervals and frame secured with sleeve anchors.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Shop Drawings:** Shop drawings and erection drawings for bleacher units shall be submitted for approval prior to fabrication. Design calculations for all structural components are required from the Manufacturer. Structural calculations and shop drawings for all bleachers shall be included in submittals.

Shop drawings shall also include hardware schedule, anchors, dimensions and thickness of steel together with drawings showing sizes and details of all members and connection details.

**Document of Acceptance:** An authorized representative of the Bleacher Manufacturer must inspect and approve the completed installation. The bleacher will not be accepted by the Bleacher Manufacturer or the Engineer until they are satisfied with the installation. No additional compensation will be given for any necessary corrective work. A document of acceptance signed by the authorized Manufacturer's representative must be submitted to the Engineer.

**Insurance Certificate:** The Contractor shall furnish the Manufacturer's Certificate of Product Liability Insurance for a minimum of one (1) million dollars.

**Guarantee:** The Contractor shall furnish the original and 4 (four) copies of the Manufacturers' Guarantee. The manufacturer shall guarantee replacement of any items or components found to be defective during the manufacturer's standard guarantee period. The Engineer shall submit the original guarantee certificate to the Engineer at the completion of the project.

**MEASUREMENT AND PAYMENT:** For all **STEEL BLEACHERS** furnished and installed under this item complete in accordance with the plans, specifications and directions of the Engineer, the Contractor shall receive the **EACH** price bid.

The price bid shall be a **EACH** for **STEEL BLEACHERS** of the sizes indicated on the plans and shall include the cost of all work, labor and materials including seat boards, foot boards, kickboards and railings, when required, anchors, hardware, galvanizing, powder coating, delivery, services of a manufacturer's representative and all other incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Reinforced concrete slab and excavation shall be paid for separately under their respective contract items.

**END OF SECTION**

## SECTION PK-ESCR 033 – BOULDERS

### PK-ESCR 033.1. INTENT

Under this Item, the Contractor shall furnish and install LANDSCAPE BOULDERS in accordance with the plans, specifications, and directions of the Engineer.

### PK-ESCR 033.2. DESCRIPTION

- a. This Section includes landscape boulders, stone, and stone veneer.

### PK-ESCR 033.3. MATERIALS

#### Characteristics and Quality:

1. All stone shall be carefully selected from sound stock and shall be free from defects impairing strength, durability, or function, such as cracks, holes, flaws or imperfections which have been patched or filled.
2. Unless otherwise approved or directed by the Engineer, provide matched boulders/blocks from a single quarry / supplier. Landscape boulders shall be from a single location within the quarry especially reserved for Project, unless stones from randomly selected blocks are acceptable to the Engineer for aesthetic effect.
3. Stone Surface Finish: Natural weathered or split face finish with drill or tool marks on no more than one side of boulder.
4. Stone shall be uniformly consistent in color, value, graining texture, and other features to the extent inherent in each stone type.
  - a. Color and value variations shall be within ranges established by approved samples.
  - b. Graining and texture variations, whether highly figured or uniform, shall be consistent in all material supplied.

#### Stone Types:

1. Stone types shall be listed as below. Stone types, sizes indicated by the Stone Schedule in Contract Documents matching grain, and colors of representative stones and boulders as selected by Engineer at stone material source. See drawings for finishes and dowel sizing, spacing, and location.
  - a. Stone Type 2: Sawn cut on bottom, top, and adjoining sides. Thermal finish on sawn cut top face. Natural cleft finish on all exposed vertical faces. 1" chamfer on all exposed horizontal edges. No sharp corners or edges.
  - b. Stone Type 3: No saw cuts. Natural finish on all faces. Roughly rectangular with parallel tops and bottoms, with some variation in shape. No sharp corners or edges.
  - c. Stone Type 4: Rounded irregular shape. Soft forms with no distinct corners or edges.

#### Stone Veneer:

#### STONE VENEER ANCHORING SYSTEM

1. Type 304 Stainless Steel "L", "Z" and "Split-Tail" Anchors 1-1/4"x1/4"
2. Fastener Materials: Unless otherwise indicated, provide the following:
  - a. Stainless-Steel Components: Type 304 stainless-steel fasteners.
  - b. Dissimilar Metals: Type 304 stainless-steel fasteners.
  - c. Anchors, General: Anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

Stone Miscellaneous Materials:

3. Aggregate Base Course
  - a. Unless otherwise herein specified, all materials and methods of construction shall comply with the requirements of the NYCDOT Standard Highway Specifications.
  - b. Material for Foundation shall be a straight run of single size aggregate and shall consist of either all one and one-half (1 1/2") inch stone or all three-quarter (3/4") inch stone in accordance with ASTM C33, free from organic or other deleterious material. In addition, Foundation Material may contain no more than five (5%) percent of fines, defined as aggregates passing a No.4 sieve or smaller.
  - c. The Magnesium Sulfate Soundness loss after ten (10) cycles shall be eighteen (18%) percent or less, as per ASTM C88. Coarse aggregate may be one of the following:
    - i. Broken Stone or gravel of approved quality and conforming to the requirements of the NYCDOT Standard Highway Specifications
    - ii. Recycled Material consisting of at least ninety five (95%) percent by weight of the following:
      1. Recycled Portland Cement Concrete Aggregate or
      2. Recycled Portland Cement Concrete Aggregate mixed with Stone Gravel.
4. Geotextile for aggregate base course
  - a. Fibers used in the manufacture of geotextiles, and the threads used in joining geotextiles by sewing, shall consist of long-chain, synthetic polymers, composed of at least 95 percent by weight polyolefins, polyesters, or polyamides. The geotextile and the threads used in sewing geotextiles, shall be resistant to chemical attack, rot, and mildew. The geotextile shall have no tears or defects which adversely alter its physical properties. They shall be formed into a stable network such that the filaments or yarns retain their dimensional stability relative to each other, including selvages. The geotextile shall have no tears or defects which adversely alter its physical properties.
  - b. Separation application is defined as the placement of a flexible porous geotextile between dissimilar materials so that the integrity and functioning of both materials can be maintained or improved, but where water seepage through used in separation applications shall conform to the following AASHTO-M-288 properties for separation geotextiles:

ASTM Test			
Structure		Woven	Non-Woven
Elongation	D4632	< 50%	≥ 50%
Grab Strength (Minimum)	D4632	1100 N (247 LBF)	700 N (157 LBF)
Tear Strength (Minimum)	D4533	400 N (90 LBF)	250N (56 LBF)
CBR Puncture (Minimum)	D4833	4000 N (900 LBF)	1820 N (410 LBF)
Permitivity (Minimum)	D4491	0.02 / sec.	0.02 / sec.
Apparent Opening Size (Maximum)	D4751	0.6 mm (0.023 inch) Std. No. 30 sieve	0.6 mm (0.023 inch) Std. No. 30 sieve

- c. Geotextile used in separation applications shall be FX-66 (woven) or FX-60HS (nonwoven) manufactured by Carthage Mills, Cincinnati, OH, or 600X (woven) or 160N (nonwoven) as manufactured by Mirafi, Inc., Pendergrass, GA, or TerraTex HD (woven) or TerraTex N06 (nonwoven) as manufactured by Hanes Geo Components, Winston Salem, NC or approved equal.
5. Chinking Stone Gap Filler: Provide angular fractured boulder fragments as required for filling gaps between boulders in place. Fragments shall be of same stone type and source as adjacent Stone Type.
  6. Stone Fines System:
    - a. Stone Fines: Provide stone fines blended with aggregate binder. Stone fines material and mixes with approved color range shall be as selected and approved by Engineer using Field Sample/Mock-ups for stone fines paving material selection.
      - i. Gradation: Provide stone with fines, matching approved office samples and final Field Sample/Mock-up for Stone Screenings Installation, and of the following gradation:

Screen Size	Percentage Passing by Weight
3/8"	100
No. 4	95 to 100
No. 8	75 to 80
No. 16	55 to 65
No. 30	40 to 50
No. 50	25 to 35
No. 100	20 to 25
No. 200	5 to 15

1. Particles shall be clean, hard, durable fragments of ¼ inch minus select crushed stone. Fines shall be evenly mixed throughout the aggregate. When produced from gravel, 50 percent, by weight, of the material retained on a No. 4 sieve shall have one fractured face.
  2. The portion retained on the No. 4 sieve shall have a maximum percentage of wear of 50 at 500 revolutions as determined by AASHTO T96-77.
  3. The portion passing a No. 40 sieve shall have a maximum liquid limit of 25 and a maximum plasticity index of 7, as determined by AASHTO T89-81 and AASHTO T90-81, respectively.
- ii. Available Stone Screenings Suppliers: Subject to compliance with requirements, suppliers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Blue Gray Bluestone Screening, 1/8" minus, by H. Bittle & Sons (516/924-7500).
  2. Light Blue Bluestone Screening, 1/8" minus, by H. Bittle & Sons (516/924-7500).
  3. Gray Trap Rock (122 stone screening), 3/16" minus, by George Schofield Co
- b. Aggregate Binder: The aggregate binder shall be a natural, non-toxic, non-staining, odorless, environmentally safe powder consisting of 95% Psyllium with a 70% mucilliod content. The powder shall be of a size that not more than 10% is retained on a U.S. Standard #40 mesh sieve. The powder binder shall be with color to match stone.
- i. Available Aggregate Binder Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
  - ii. Stabilizer, Inc., 4832 East Indian Lane, Phoenix, Arizona 85018 (800/336-2438 or 602/837-8038). New York Metropolitan Area Representative: Ralph Crosby (914/476-8773).
  - iii. Or approved equal.
7. Dowels: Stainless-Steel Shapes: ASTM A 276, Type 316L.
8. Mortar setting bed, water resistant with pigment

## Mortar

1. Portland Cement: ASTM C 150, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce mortar color indicated.
2. Aggregate: ASTM C 144 and as follows:
  - a. For pointing mortar, use aggregate graded with 100 percent passing No. 16 sieve.
  - b. White Aggregates: Natural white sand or ground white stone.
  - c. Colored Aggregates: Natural-colored sand or ground marble, granite, or other sound stone; of color necessary to produce required mortar color.
3. Mortar Pigments: Natural or synthetic iron oxides, compounded for use in mortar mixes and with a record of satisfactory performance in stone mortars.
  - a. Available Manufacturers:
    - 1) Bayer Corporation; Industrial Chemicals Div.
    - 2) Davis Colors.
    - 3) Lafarge Corporation.
    - 4) Solomon Colors.
    - 5) Or approved equal.
4. Latex additive (water emulsion), serving as replacement for part of or all gaging water, of type specifically recommended by latex-additive manufacturer for use with job-mixed portland cement mortar and not containing a retarder.
5. Thin-Set Mortar:
  - a. Dry-Set Portland Cement Mortar: ANSI A118.1.
  - b. Latex-Portland Cement Mortar: ANSI A118.4.

## **PK-ESCR 033.3.1. SUBMITTALS**

Statement of Qualifications: to be submitted to identify and exhibit landscape boulders installer qualifications as specified in Article "Qualifications" herein.

Product Data: for review and approval prior to ordering of stone material.

1. Submit complete data on quarry facilities for stone boulder type specified. Include information of location, production capabilities, and the nature and character of stone material that can be selected and supplied.
2. Material properties data for stone material type and foundation shall be submitted by the stone suppliers and certified as representative of the properties of stone material that can be supplied for the Project.
3. Submit an affidavit from respective quarry attesting that stone boulders of type required for the Project have been quarried and obtained from one quarry, is of top grade of material specified and conforms to additional requirements in Article "Quality Assurance" herein for Source Limitations for Stone.
4. Submit material product data and samples for each item in "Stone Miscellaneous Materials".

Shop Drawings: Setting Drawings: Submit setting drawings showing the relationship to adjoining construction after final selection.

For stone boulders show location layouts and patterns coordinated with Contract Drawings and related to survey control points and dimensions to confirm alignment with adjacent conditions.

Establish and verify dimensions with concrete work of on-site walls, layouts and patterns of other work, and other like conditions. Include details to confirm how boulder stone units will be installed, including any modification/deviations from conditions indicated by Contract Documents.

1. Include coordination details for related, supporting, and adjoining work; as well as erection/installation diagrams. Show relative layout for all adjacent pavements, walls, foundation materials, etc. all correctly dimensioned. Shop drawings shall illustrate which gaps shall be filled with Chinking Stone Gap Filler and Stone Fines and which shall be filled with topsoil and planted.
2. Shop drawings to include all stone areas, including but not limited to:
  - a. Landscape slope with seating stair at basketball court north of the Delancey Bridge
  - b. Veneer stone wall at Williamsburg Bridge
  - c. Nature exploration water play feature and boulder area
  - d. Stone in landscape slope at Corlears, Delancey and 10<sup>th</sup> Bridges
  - e. 10<sup>th</sup> Street playground seating stair and scramble
  - f. 10<sup>th</sup> Street Water play area
3. Shop drawings that include Stone Type 2 shall include unique stone numbers corresponding to contract documents and cutting drawings including but not limited to:
  - a. Fabrication requirements with shapes, thicknesses, connection to other work
  - b. Typical and special anchoring and support details
  - c. Dimensions
  - d. Setting numbers for each stone unit (piece).

#### Stone Samples and Stone Selection:

1. The Contractor shall make all pre-selection arrangements at the source(s) of supply to ensure a ready supply of materials, equipment and manpower required for an efficient selection procedure.
2. The Contractor shall locate stone materials and be present for inspection at the source and on-site.
3. Stone Samples for Initial Selection: Submit representative unit sample of each stone type and finish, in quantity to indicate the full range of material characteristics, color, and texture specified prior to submittal of sample "For Verification".
4. Stone Samples for Verification (Submitted Prior to Examination of Boulders at Quarry): Submit one (1) set of sample block units, at a minimum size of 12" high x 12" long x 18" depth in quantity to indicate the full range of material characteristics, color, and texture specified.
5. Quarry selection of representative stone types: Contractor shall assume a minimum of two (2) quarry visit by 2 persons each visit to tag and approve representative samples of each Stone Type. Engineer to approve stone types using the Visual Criteria for Stone including, but not limited to, size range, shape, finish, color, veining, and variation.

## **PK-ESCR 033.3.2. QUALITY CONTROL**

Supplier Qualifications: Landscape Stones supplier shall be a firm or firms that have successfully supplied natural stonework of material type and condition, similar to the quality specified, and in the quantity shown for a period of not less than 10 years. Stone shall be obtained from quarries or suppliers capable of furnishing quantity, sizes and character of the stone required.

Installer Qualifications: Installation of natural stone Landscape Stones shall be by a firm that can exhibit proof of a minimum of seven (7) years prior successful experience with stone installations of similar material, design, and extent to that indicated for this Project.

1. Stonework Foreman: Installation firm for Landscape Stones Boulders of this Project shall have on staff a Supervising Foreman assigned to this Project before initial installations, who shall have at least 10 years total stonework installation experience. Submit detailed resume of past experience with dates, duration and scope identification, project name and location, and work function of previous projects worked on.
2. Use numbers of skilled workmen equal to work requirement or occasion. The skilled workmen shall be thoroughly trained and experienced in the necessary crafts and shall be completely familiar with the specific requirements and methods needed for performance of the work in this Section.

### Mock Ups

1. Stones: prepare full size field assemblies for methods to demonstrate aesthetic effects and qualities of materials and execution at each area including:
  - i. Landscape slope with Stone Type 3 and Stone Type 2 seating stair at basketball court north of the Delancey Bridge
  - ii. Stone Type 5 veneer wall at Williamsburg Bridge
  - iii. Nature exploration Stone Type 4 water play feature and Stone Type 3 boulder area
  - iv. Stone Type 3 in landscape slope at Corlears, Delancey and 10<sup>th</sup> Bridges
  - v. 10<sup>th</sup> Street Stone Type 2 seating stair and Stone Type 3 scramble
  - vi. 10<sup>th</sup> Street Water play area Stone Type 2 seating and Stone Type 4
2. For stacked assemblies mockup shall include a minimum of three (3) courses vertical and three (3) courses horizontal.
3. Construct at earliest possible time and at an approved location before proceeding with respective work and after the Engineer's approval of samples for selection and verification. Fabricate and construct to demonstrate aesthetic effects and qualities of materials and execution. Construct to comply with the following requirements, using materials indicated for the completed work, including same base construction, special features for expansion joints, and contiguous work as indicated:
4. Construct representative boulder placement sample/mockup in a location as approved by the Engineer.
5. Notify Engineer seven days in advance of dates and times when field sample/mockup will be constructed. Demonstrate the proposed range of aesthetic effects and workmanship. Obtain Engineer's approval of field sample/mockup before starting boulder installations of Project.

6. Mock ups shall illustrate which gaps shall be filled with Chinking Stone Gap Filler and Stone Fines and which shall be filled with topsoil and planted.
7. Approved mock ups may be incorporated into the final work, if approved by the Engineer.

### **PK-ESCR 033.3.3. DELIVERY, STORAGE, AND HANDLING**

#### Handling and Unloading:

Handle stone to prevent chipping, breakage, soiling or other damage. Do not use pinch or wrecking bars without protecting edges of stone with wood or other rigid materials. Lift with wide-belt type slings wherever possible; do not use wire rope or ropes containing tar or other substances which might cause staining. If required, use wood rollers and provide cushion at end of wood slides.

#### Storage and Protection:

1. Protect stone and other system components during storage and construction against moisture, soiling, staining, and physical damage.
2. Store stone on wood skids or pallets, covered with non-staining, waterproof membrane. Place and stack skids and stones to distribute weight evenly and to prevent breakage or cracking of stones. Allow air to circulate around stone.

### **PK-ESCR 033.3.4. MANUFACTURER/SUPPLIER**

Stone Source: Provide natural BOULDERS materials the following quarries or approved equal.

1. Champlain Stone, 27 Elm Street Warrensburg, NY 12885. Contact: Justin Pellino (518.623-2902). [jpellino@champlainstone.com](mailto:jpellino@champlainstone.com)
2. New York Quarries, 305 County Route 111 Alcove, NY 12007 (518) 756-3138 [info@newyorkquarries.com](mailto:info@newyorkquarries.com)
3. Alverson Boulders as quarried by Greystone Quarries, as supplied by Geo. Schofield Co., Inc. Contact: James Taylor (732/433-4195).
4. or Approved Equal.

### **PK-ESCR 033.3.5. PRODUCTS**

1. Stone Types: The following establishes acceptable stone material, color range, and finish under consideration for selection by the Engineer.
  - a. Stones of sizes as indicated on the drawings matching grain, and colors of representative stones as selected by Engineer at stone material source.

### **PK-ESCR 033.4. METHODS**

Work of this Section includes all labor, materials, equipment, and services necessary to provide selected natural stone Landscape Boulders in patterns and under conditions as shown on the Contract Drawings and/or specified herein, including but not limited to, the following:

Field measurements: Coordinate Landscape stone work and related layouts with trades and work preceding stone installation and take additional field measurements as necessary to accommodate conditions.

Provisions for Examinations at the Quarry: Landscape Stones shall be made available for inspection by Engineer prior to delivery to site. Contractor shall be responsible for arranging the schedule for the inspection trips to quarry sources by Engineer.

Inspection On-Site, At Delivery: The Engineer will inspect stone material upon delivery to site prior to installation. Allow a- time duration on-site, as approved by Engineer, for inspection and layout adjustment prior to installations.

Visual Criteria for Stone: All examinations, selections, and approvals shall be for the purpose of achieving a final appearance of stone with greatest possible uniformity, and will be based upon the following criteria.

1. All stone shall be of sound stock and uniform texture, and shall be free from holes, seams, chips, cracks, shakes, clay pockets, spalls, stains, starts, and other defects that are not natural to the stone specified and that would impair the strength, durability and appearance of the work, as determined by the Architect.
2. Inherent variations characteristic of the stone and the quarry from which the stone is to be obtained shall be brought to the attention of the Architect at the time the samples are submitted for approval and shall be subject to approval of the Architect.
3. Stone shall be selected for background color, veining, marking and matching, shall run in even shades, and shall be set accordingly.

Source Limitations for Stone: Obtain natural stone Landscape Boulders from a single quarry with resources to provide materials and products of consistent quality in appearance and physical properties without delaying the work.

Pre-installation Conference: Pre-installation Conference: Conduct conference at project site in prior to the installation.

1. Contractor, together with the Engineer, must schedule a meeting with the Engineer, the stonework fabricator, and the stonework installer at a time sufficiently in advance of stone installations to permit coordination. In addition, include in appropriate sequence, representatives of other related work.
2. At the meeting, review stone system quality control requirements including details of construction, outstanding submittals, contract drawings and specifications, and on site conditions affecting or which may affect installations.

Stone Fabrication for natural stones:

1. Provide stone units as indicated by Contract Drawings of solid block unit(s) of sizes indicated with natural finish appearance.
2. All corners and exposed faces shall be rubbed or shaped to remove any sharp edges in a manner approved by the Engineer and that will not show drill, grinding, or other tool marks.

Preparation and installation of aggregate base course:

1. Before any concrete is placed upon fine grade, the fine grade shall be prepared to line and grade and compacted where practicable with an approved self propelled roller weighing not less than ten (10) tons. All hollows and depressions developed under rolling shall be filled with acceptable material and rerolled. This process of shaping, filling, and rolling shall be repeated until no depressions develop.
2. The Contractor shall remove from the subgrade all debris, foreign material, and all other undesirable material designated by the Engineer. The fine grade shall not be muddy or

otherwise unsatisfactory when the pavement is placed upon it. If the fine grade becomes rutted or displaced, due to any cause whatsoever, the Contractor shall regrade same without additional payment.

3. Existing foundation material shall be supplemented as required to achieve the required thickness shown on the plans or provide for positive drainage of completed pavement.
4. Foundation material shall be evenly spread on prepared subgrade or existing foundation in the position shown on the plans or as directed by the Engineer. Foundation material shall be laid in four (4") inch layers (maximum) and rolled while wet with a seven (7) to twelve (12) ton tandem roller (or other approved method satisfactory to the Engineer) to the thickness shown on the plans or as directed by the Engineer.

**PK-ESCR 033.5. MEASUREMENT**

The quantity of STONE TYPE 1, STONE TYPE 2, STONE TYPE 3 and STONE TYPE 4 to be paid for shall be the number of TONS furnished and installed complete, in accordance with the plans, specifications, and directions of the Engineer. The method of determining boulder weight must be submitted to the Engineer for approval.

The quantity of STONE VENEER TYPE 5A to be paid for shall be the SQUARE FOOT furnished and installed complete, in accordance with the plans, specifications, and directions of the Engineer.

The quantity of STONE VENEER TYPE 5B, STONE VENEER TYPE 5C, and STONE VENEER TYPE 5D to be paid for shall be the SQUARE FOOT furnished and installed complete, in accordance with the plans, specifications, and directions of the Engineer.

**PK-ESCR 033.6. PRICES TO COVER**

The price bid shall be a unit price per TON of STONE TYPE 1, STONE TYPE 2, STONE TYPE 3, and STONE TYPE 4 shall include the cost of all labor, materials, and equipment required, including sourcing, selective fabrication, delivery to site, and installation of natural landscape stones in size indicated, foundation material for landscape stones and all incidental expenses necessary to complete the work in accordance with the plans, shop drawings, and specifications, to the satisfaction of the Engineer.

The price bid shall be a unit price per SQUARE FOOT of STONE VENEER TYPE 5A and shall include the cost of all labor, materials, and equipment required, including sourcing, fabrication, delivery to site, anchoring system, and installation of landscape veneer stones in size indicated, foundation material for landscape stones, and all incidental expenses necessary to complete the work in accordance with the plans, shop drawings, and specifications, to the satisfaction of the Engineer.

The price bid shall be a unit price per SQUARE FOOT of STONE VENEER TYPE 5B, STONE VENEER TYPE 5C, and STONE VENEER TYPE 5D and shall include the cost of all labor, materials, and equipment required, including sourcing, fabrication, delivery to site, anchoring system, and installation of landscape veneer stones in size indicated, foundation material for landscape stones, and all incidental expenses necessary to complete the work in accordance with the plans, shop drawings, and specifications, to the satisfaction of the Engineer.

*Payment will be made under:*

**END OF SECTION**

## SECTION PK-ESCR 036 – PRE-CAST CONCRETE

### PK-ESCR 036.1. INTENT

This section describes the furnishing and installation of precast concrete assemblies in accordance with the plans, specifications and directions of the Engineer.

### PK-ESCR 036.2. DESCRIPTION

- A. Under this item, the Contractor shall fabricate, furnish and install Pre-Cast Concrete Units as shown on plans and in accordance with the specifications and directions of the Engineer. The footing is described in item Concrete for Structures ESCR-4.06.

### PK-ESCR 036.3. MATERIALS

#### 1.1 MOLD MATERIALS

- a) Molds: Provide molds and, where required, form-facing materials of metal, plastic, wood, or another material that is nonreactive with concrete and dimensionally stable to produce continuous and true precast concrete surfaces within fabrication tolerances and suitable for required finishes.

#### 1.2 REINFORCING MATERIALS

- a) Epoxy Coated Rebar:
  - i. Conforming to ASTM A934 & A775/A775M, Grade 60, Marine Grade Purple Epoxy-coated, clean and free of rust, dirt, grease or oils.
  - ii. Supports: Manufacturer's bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place according to CRSI's "Manual of Standard Practice," PCI MNL 117.

#### 1.3 CONCRETE MATERIALS

- a) Portland Cement: ASTM C 150, Type I (white) or Type III (gray), of same type, brand and source.
- b) Custom precast units:
  - i. General: Comply with PCI MNL-120, PCI MNL-122, PCI MNL-123, PCI MNL-135, and ACI 318.
- c) Concrete:
  - i. Comply with pertinent quality standards in accordance with ASTM C94/C94M.
  - ii. Portland Cement: ASTM C 150/C150M Type 1 (white) or Type 3 (gray). Provide same type, brand and source for all components of each precast fabrication.
  - iii. Mix Design for concrete to attain a minimum compressive strength, of 5000 psi (35MPa) when cured and tested at 28 Days in accordance ASTM C39/C39M and total air content between 4 percent and 6 percent.
  - iv. Aggregates: Clean, washed aggregates as required to produce selected color, pattern and texture. Course and fine aggregates to be from single source throughout the duration of the project.

d) Admixtures:

- i. Chemical admixtures conforming to ASTM C494/C494M Type A and G.
- ii. Color Admixture: ASTM 979, synthetic mineral-oxide pigments or colored water reducing admixtures, temperature stable, nonfading and alkali resistant.
  - a. Synthetic mineral oxide pigments conforming to ASTM C979/C979M.
  - b. Provide specific manufactured color pigments as indicated on the drawings.
  - c. Proportions of color admixtures in concrete are to be determined by the manufacturer to provide proper color or to match owner's samples.
  - d. Mix and consolidate color admixtures per manufacturer's recommendations.
  - e. Owner approved color manufactures:
    - 1) Chromix by Sika Scofield;  
[www.scofield.com](http://www.scofield.com); (800) 800-9900
    - 2) Davis Integral Color by Davis Colors;  
[www.daviscolors.com](http://www.daviscolors.com); (800) 356-4848
    - 3) EA Integral Colors by E & A Supply Corp;  
<http://www.eandasupply.com/>; (888) 222-3573
    - 4) Uni-Mix Integral Concrete Colorant by Butterfield Color;  
[www.butterfieldcolor.com/](http://www.butterfieldcolor.com/); (800) 282-3388
    - 5) Or approved equal.

e) Grout:

- i. For exposed, finished joints; factor blended and packaged mortar containing hydraulic cement, fine aggregates and integral color pigments. Colors to be selected by Engineer. If a specific manufacturer has not been specified on drawings use one of the following approved products:
  - a. Polyblend by Custom Building Products;  
[www.custombuildingproducts.com](http://www.custombuildingproducts.com); (800) 272-8786
  - b. 1500 Series, sanded grout by Laticrete North America;  
<https://.laticrete.com>
  - c. Keracolor by Mapei, [www.mapei.com](http://www.mapei.com); (800) 992-6273
  - d. Or approved equal.

- f) Normal-Weight Aggregates: Except as modified by PCI MNL 117, ASTM C 33, with coarse aggregates complying with Class 5S. Revise subparagraph below to add descriptions of selected coarse- and fine-face aggregate colors and sources if required.
  - i. Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining.
    - 1. Gradation: Gap Graded.
  - ii. Fine Aggregates: Selected, natural or manufactured sand of the same material as coarse aggregate, unless otherwise approved by Engineer.
- g) Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 117.
- h) Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
- i) Water-Reducing Admixture: ASTM C 494, Type A.
- j) High-Range, Water-Reducing Admixture: ASTM C 494, Type F.
- k) Hycrete Waterproofing Admixture

#### 1.4 GROUT MATERIALS

- a) Sand-Cement Grout: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.

#### 1.5 CONCRETE MIXES

- A. Prepare design mixes for each type of concrete required.
  - i. Limit use of fly ash and silica fume to not exceed, in aggregate, 25 percent of portland cement by weight.
- B. Design mixes may be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast architectural concrete fabricator's option.
- C. Limit water-soluble chloride ions to the maximum percentage by weight of cement permitted by ACI 318 (ACI 318M).
- D. Normal-Weight Concrete Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on project, to provide normal-weight concrete with the following properties:
  - i. Compressive Strength (28 Days): 6000 psi (34.5 MPa).
  - ii. Maximum Water-Cementitious Materials Ratio: 0.45.
- E. Water Absorption: 3 to 5 percent by volume, tested according to PCI MNL 117. Manufacturer to have 10 years of experience of producing concrete with a sub 5% water absorption rate. Manufacturer to provide 3 project examples with references for project they have performed with this criterion.
- F. Lightweight backup mixes must be compatible with normal-weight face mixes to minimize bowing or warping. Retain lightweight concrete backup mixes if required or as an option if satisfactory durability and in-service performance are verified by fabricator.

- G. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.
- H. When included in design mixes, add other admixtures to concrete mixes according to manufacturer's written instructions.

### **PK-ESCR 036.3.1. FABRICATION**

#### **A. General:**

- a. Fabricate the work of this section to the sizes and shapes indicated on the drawings as indicated on the approved shop drawings.
- b. Provide color and finishes as indicated on the drawings and to match owner samples.
- c. Make exposed edges and chamfers sharp, straight and consistent. Provide flat surfaces to true planes.
- d. Place and secure in the forms all anchors, clips, inserts, bolts lifting devices, shear ties and other embedded devices required for handling and installing the precast units for attachment of subsequent items as indicated or specified. Provide air bleed holes for embedded items as necessary to ensure voids or honeycombs do not form.
- e. Provide all openings, recesses or block-outs required.
- f. Provide temperature and shrinkage of reinforcement in accordance with ACI 318
- g. Minor patching in plant is acceptable, provide structural integrity and appearance is not impaired.

#### **B. Curing:**

- a. Form-cure the work for a minimum of 24 hours.
- b. Wet cure for not less than 6 days after being removed from forms
- c. Following curing period, allow units to air-dry for not less than an additional 7 days before being loaded for delivery.

#### **B. Casting Tolerances:**

- d. Maintain casting and dimension tolerances within the following units:
  - i. Length and width of precast units 10ft. or less shall not vary more than 1/8 in.
  - ii. Thickness of units to vary not more than 1/8in.
- e. Units 'out of square' more than 6 linear ft. 1/8 in. per ¼ in. total are not acceptable.
- f. Location of cast-in place inserts, sleeves, conduits and electric junction boxes to not vary more than ¼ in. in any direction.
- g. Bowing or warping: length/360; arrange so that the offset between units does not exceed offset tolerance.
- h. Exposed joint dimension: ½ inch, plus or minus 1/8 inch.

#### **C. MOLD FABRICATION**

- a. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes.
- b. Maintain molds to provide completed precast architectural concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances specified.
  - i. Edge and Corner Treatment: Uniformly radiused.

#### D. FABRICATION

- a. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.
- b. Furnish loose steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing precast architectural concrete units for support and adjacent construction.
- c. Cast-in reglets, slots, holes, and other accessories in precast architectural concrete units to receive windows, cramps, dowels, reglets, waterstops, flashings, and other similar work as indicated.
- d. All cast-in anchors, plates or inserts to be made from non-corrosive steel per PCI-ML117.
- e. Reinforcement: Comply with recommendations in CRSI's "Manual of Standard Practice" and PCI MNL 117 for fabricating, placing, and supporting reinforcement.
  - a. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete.
  - b. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
  - c. Place reinforcement to maintain at least 3/4-inch (19-mm) minimum coverage. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
  - d. Install welded wire fabric in practicable lengths. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
- f. Reinforce precast architectural concrete units to resist handling, transportation, and erection stresses.
- g. Mix concrete according to PCI MNL 117 and requirements in this Section. After concrete batching, no additional water may be added.
- h. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units. Comply with requirements in PCI MNL 117 for measuring, mixing, transporting, and placing concrete.
- i. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL 117.
- j. Comply with ACI 306.1 procedures for cold-weather concrete placement.
- k. Comply with ACI 305R recommendations for hot-weather concrete placement.
- l. Identify pickup points of precast architectural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop

Drawings. Imprint or permanently mark casting date on each precast architectural concrete unit on a surface that will not show in finished structure.

- m. Cure concrete, according to requirements in PCI MNL 117, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.
- n. Discard precast architectural concrete units that are warped, cracked, broken, spalled, stained, or otherwise defective unless repairs are approved by Engineer.

#### E. FABRICATION TOLERANCES

- a. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with PCI MNL 117 product tolerances as well as position tolerances for cast-in items.
- b. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with the following product tolerances:
  - i. Overall height and width of units, measured at the face exposed to view:  
As follows:  
10 feet (3 m) or under, plus or minus 1/8 inch (3 mm).
  - ii. Overall height and width of units, measured at the face not exposed to view:  
As follows:  
10 feet (3 m) or under, plus or minus 1/4 inch (6 mm).
- b. Position tolerances: For cast-in items measured from datum line location, as indicated on Shop Drawings.
  - i. Weld Plates: Plus or minus 1 inch (25 mm).
  - ii. Inserts: Plus or minus 1/2 inch (13 mm).
  - iii. Handling Devices: Plus or minus 3 inches (75 mm).
  - iv. Reinforcing Steel and Welded Wire Fabric: Plus or minus 1/4 inch (6 mm) where position has structural implications or affects concrete cover; otherwise, plus or minus 1/2 inch (13 mm).

#### **PK-ESCR 036.3.2. SUBMITTALS**

- A. Product Data: For each type of product indicated.
  - ii. Project reference to substantiate qualifications of manufacturer and installer.
  - iii. Materials listed of items to be provided under this section, including manufacturer's specifications and other data for all manufactured materials and products.
- B. Engineering calculations for all casting types
- C. Design Mixes: For each concrete mix.
- D. Utilize project team's established digital 3D modeling approach to coordinate with design team and other trades.

- E. Shop Drawings: Detail fabrication and installation of precast architectural concrete units. Indicate member locations, plans, elevations, dimensions, shapes, cross sections, limits of each finish, and types of reinforcement, including special reinforcement.
  - iv. Indicate welded connections by AWS standard symbols. Detail loose and cast-in hardware, inserts, connections, and joints, including accessories.
  - v. Indicate locations and details of anchorage devices to be embedded in other construction.
  - vi. Indicate locations and details of joint treatment.
  - vii. Indicate locations and details of stone facings, anchors, and treatment of joints.
- F. Samples: Before fabricating precast architectural concrete units, produce samples to establish the approved range of selections made under sample submittals. Produce a minimum of 3 sets of full-scale samples pieces as chosen by the Engineer, to demonstrate the expected range of finish, color, and texture variations.
  - a. In presence of Engineer, damage part of an exposed-face surface for each finish, color, and texture, and demonstrate materials and techniques proposed for repair of surface blemishes to match adjacent undamaged surfaces.
  - b. Maintain sample pieces during construction in an undisturbed condition as a standard for judging the completed Work.
  - c. Grout Samples for Initial Selection: Color charts consisting of actual sections of grout showing the manufacturer's full range of colors.
- G. Welding Certificates: Copies of certificates for welding procedures and personnel.
- H. Fabricator's Qualification Statement: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of Engineers and owners, and other information specified.
- I. Material Certificates: Signed by manufacturers certifying that each of the following items complies with requirements:
  - i. Concrete materials
  - ii. Reinforcing materials
  - iii. Admixtures
  - iv. Water-absorption test reports

**PK-ESCR 036.3.3. QUALITY CONTROL**

- A. Fabricator Qualifications: A firm with a minimum of 25 years documented experience in the production of decorative architectural precast concrete units similar to those indicated for this project and with a record of successful in-service performance.
  - a. Has a quality control program that is APA or PCI certified by a professional engineer. Must submit program with bid.
  - b. Assumes responsibility for engineering precast architectural concrete units to comply with performance requirements. This responsibility includes preparation of shop drawings and comprehensive engineering analysis by a qualified professional engineer, under the state the project is located and experienced in design of precast units similar to the work of this section.

- c. Fabricator to have minimum 7 years' experience with Rhino computer modeling, 3D CNC modeling and machining.
  - d. Plant shall be designated as PCI Certified for Group A, or as APA certified for production of architectural precast concrete products.
  - e. Operation with an established quality assurance program that complies with the procedures of Manual PCI MNL-116 of the Precast Concrete Institute.
  - f. Sufficient production capacity to produce and deliver required units without causing delay in the work.
  - g. Provide technical field services, trained personnel and required materials to make minor repairs.
  - h. Must have a qualified salesperson or technical representative able to make next-day in-person meetings at the project site to resolve issues.
- B. Installer Qualifications: Installer to have no less than 5 years of documented experiences who has completed precast architectural concrete work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Acceptance Criteria of Precast Unit:
- i. Castings that are not in compliance with specified tolerances shall be rejected.
  - j. Connections not complying with drawings and specification requirements shall cause for rejection if repairs cannot be made to maintain the connections function and integrity.
  - k. Any repair work performed to bring damaged or defective castings with compliance of the drawings and specifications shall be performed to the final satisfaction of the owner or replaced at Owner's discretion.
  - l. The following shall be considered defects and grounds for rejection:
    - i. Castings not matching approved sample for color or finish
    - ii. Non-uniformity of color or finish – including precast concrete units out of color range
    - iii. Ragged or irregular edges or reveals
    - iv. Excessive air voids or rock pockets on exposed surface
    - v. Casting marks, visible form joints or reinforcement shadow lines.
    - vi. Irregular surfaces planes
    - vii. Visible cracks
    - viii. Rust stains, blocking stains or acid stains on finished surface.
    - ix. Foreign material embedded and exposed on finished surface.
    - x. Poorly executed and visible repairs
    - xi. Any damage to panel(s) – including the above – done during shipping, handling and placing/installing
- D. Testing Agency Qualifications: An independent testing agency acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated, as documented according to ASTM E 548.
- E. Design Standards: Comply with ACI 318 (ACI 318M) and the design recommendations of PCI MNL 120, "PCI Design Handbook--Precast and Prestressed Concrete."

- F. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 117, "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products."
- G. Product Options: Drawings indicate size, profiles, and dimensional requirements of precast concrete units and are based on the specific types of units indicated. Other fabricators' precast concrete units complying with requirements may be considered
- H. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel"; and AWS D1.4, "Structural Welding Code--Reinforcing Steel."
- I. Quality-Control Testing: Test and inspect precast concrete according to PCI MNL 117 requirements.
- J. Strength of precast concrete units will be considered deficient if units fail to comply with ACI 318 (ACI 318M) requirements.
- K. Testing: If there is evidence that the strength of precast concrete units may be deficient or may not comply with ACI 318 (ACI 318M) requirements, owner will employ an independent testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C 42.
  - m. A minimum of three representative cores will be taken from units of suspect strength, from locations directed by Engineer.
  - n. Cores will be tested in an air-dry condition.
  - o. Strength of concrete for each series of 3 cores will be considered satisfactory if the average compressive strength is equal to at least 85 percent of the 28-day design compressive strength and no single core is less than 75 percent of the 28-day design compressive strength.
  - p. Test results will be made in writing on the same day that tests are performed, with copies to Engineer, Contractor, and precast concrete fabricator. Test reports will include the following:
    - xii. Project identification name and number.
    - xiii. Date when tests were performed.
    - xiv. Name of precast concrete fabricator.
    - xv. Name of concrete testing agency.
    - xvi. Identification letter, name, and type of precast concrete unit or units represented by core tests; design compressive strength; type of break; compressive strength at breaks, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed.
- L. Patching: If core test results are satisfactory and precast concrete units comply with requirements, clean and dampen core holes and solidly fill with precast concrete mix that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.
- M. Defective Work: Precast architectural concrete units that do not comply with requirements, including strength, manufacturing tolerances, and finishes, are unacceptable. Replace with precast concrete units that comply with requirements.

#### **PK-ESCR 036.3.4. DELIVERY, STORAGE, AND HANDLING**

- A. Deliver precast architectural concrete units to project site in such quantities and at such

times to ensure continuity of installation. Store units at project site to prevent cracking, distorting, warping, staining, or other physical damage, and so markings are visible.

- a. Lift and support units only at designated lifting and supporting points as shown on shop drawings.
  - b. Lifting or handling equipment: capable of maintaining complete control of units during manufacture, storage, transportation and installation.
  - c. Blocking and lateral support during transport and storage: clean, non-staining, without causing harm to exposed surfaces. Provide support to prevent bowing, warping or cracking.
  - d. Protect units to prevent staining, scarring, chipping or spalling.
- B. Furnish anchorage items to be embedded in or attached to other construction without delaying the work. Provide setting diagrams, templates, instructions, and directions, as required, for installation.

**PK-ESCR 036.3.5. WARRANTY**

- A. Fabricator to provide a one-year warranty against manufacturer's defect
- B. Fabricator to provide a seven-year warranty against the effects of freeze-thaw

**PK-ESCR 036.3.6. MANUFACTURER**

- A. Fabricators: Subject to compliance with requirements, fabricators offering products that may be incorporated into the Work include, but are not limited to, the following:
  - a. QCP, Norco, CA. [www.qcp-corp.com](http://www.qcp-corp.com). Contact: Matthew Houser - (347)931-3142 [houser@qcp-corp.com](mailto:houser@qcp-corp.com)
  - b. Southside Precast Products, NY - (716) 825-9300
  - c. David Kucera, Inc., Gardiner, NY - (845) 255-1044
  - d. Jersey Precast, NJ - (609) 587-6068
  - e. Blakeslee Prestress Inc. Branford, CT - 203-481-5306
- B. Fabricator must submit a sample piece representative of at least one of the types of precast products on the project for approval to be pre-approved. Approval is at the sole discretion of the owner and the Engineer

**PK-ESCR 036.3.7. FINISHES**

- A. Finish exposed-face surfaces of precast architectural concrete units to match approved design reference sample and as follows:
  - i. Textured-Surface Finish: Impart by form liners or inserts to provide surfaces free of pockets, streaks, and honeycombs, with uniform color and texture. Any air-pocket in the surface of the precast must be sacked or filled to match.
  - ii. Finish unexposed surfaces of precast architectural concrete units by float finish.

**PK-ESCR 036.4. METHODS**

**A. EXAMINATION**

1. Examine substrates and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

2. Do not install precast concrete units until supporting concrete has attained minimum design compressive strength.

#### B. INSTALLATION

1. Anchor precast architectural concrete units in position by bolting, welding, grouting, or as otherwise indicated. Remove temporary shims, wedges, and spacers as soon as possible after anchoring and grouting are completed.
2. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.
3. Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are filled. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces. Keep grouted joints damp for a minimum of 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.
  - i. Camber, as Erected, between Adjacent Members of Same Design: 1/4 inch (6 mm).

#### C. REPAIRS

1. Repair exposed exterior surfaces of precast architectural concrete units to match color, texture, and uniformity of surrounding precast architectural concrete if permitted by Engineer.
2. Remove and replace damaged precast architectural concrete units if repairs do not comply with requirements.

#### D. CLEANING

1. Clean exposed surfaces of precast concrete units after erection to remove weld marks, other markings, dirt, and stains.
  - i. Wash and rinse according to precast concrete fabricator's written recommendations. Protect other work from staining or damage due to cleaning operations.
2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes.

**PK-ESCR 036.5. MEASUREMENT** Precast concrete units, seatwalls, and skate deterrents shall be measured for payment by each unit installed or by the linear foot, as noted below, to the satisfaction of the Engineer.

#### **PK-ESCR 036.6. PRICES TO COVER**

The price bid for Pre Cast Concrete Units shall be a unit price for each precast concrete assembly and shall include the cost of all labor, materials, equipment and expenses necessary to furnished, erected in accordance with the plans, specifications and directions of the Engineer. For Foundation Material for Concrete and Reinforcement see ESCR-4.06.

Payment will be made under:

**END OF SECTION**

## SECTION PK-ESCR 039 – BENCH, 1939 WF RPL SLATS

**WORK:** Under these Items, the Contractor shall furnish and install various types of **BENCH, 1939 WORLD'S FAIR W/RPL SLATS** in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

Benches shall be model No. 6737, 6737-E (armless) or 6736 (backless), as manufactured by Kenneth Lynch & Sons, Oxford, CT, "Liberty Bench" as manufactured by Kevin G. Lindelow Quality Site Furnishings, Frenchtown, NJ, or "World's Fair Bench" as manufactured by All City Play Equipment, Inc., Metuchen, NJ, or approved equal. There are minor variations from the standard detail dimensions among manufacturers.

**STANDARDS:** Bench standards shall be of cast ductile iron. The tensile strength shall meet a minimum of 65,000 psi, in accordance with ASTM A536, Grade 65-45-12. Standards shall be either painted or powdercoated, as per this specification.

**Steel Back Supports, Seat Supports and Cross Bars:** Shall be steel bar and channel of sizes as indicated on the drawings, formed to the curve of the back and seat and secured to the recycled plastic slats with vandal-resistant stainless steel screws.

**Finishes:** The Contractor shall supply either powdercoated or painted metal surfaces, including cast ductile iron bench standards, brace rods, steel back supports, seat supports, and cross bars. Color shall be Black. Both types of finishes are outlined below:

**Powdercoating:** All metal surfaces shall be powder coated with a polyester thermosetting powdercoating such as manufactured by Tiger Drylac U.S.A., Reading, PA, or approved equal. Standards, brace rods, steel back supports, seat supports, and cross bars shall be Gloss Black.

Powdercoating shall be applied to the metal in such a manner that the coating will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. All surfaces shall first receive phosphating and chromating treatments to improve the adhesion of the surface coating.

Powdercoating shall be applied to a film thickness of 3 to 4 mils by electrostatic spray process and bake finished per manufacturer's directions. It shall be applied without voids, tears, or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point. All visible nuts, washers, and ends of all bolts shall be painted with touchup paint as described below.

**Touchup and Repair:** For minor damage caused by installation or transportation, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of six feet (6').

**Laboratory Test For TGIC-Polyester Powder Coat:** At the discretion of the Engineer, a sample TGIC-Polyester powder coated bench standard may be laboratory tested for bonding of the powdercoating to the metal. The test shall be the Cross Hatch test per ASTM D3359, Method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**Painting:** All metal surfaces shall receive three (3) coats of shop applied paint. Immediately prior to painting, all surfaces shall be thoroughly clean. All surfaces that are rust free shall be cleaned in accordance with SP-1, Solvent Cleaning. Cleaning shall be performed with a solvent such as mineral spirits, xylol, or turpentine to remove all dirt, grease, and foreign matter. Surfaces that show evidence of scale and rust shall be cleaned in accordance with SP-2, Hand Tool Cleaning,

a method generally confined to wirebrushing, sandpaper, hand scrapers, or hand impact tools, or SP3, Power Tool Cleaning, a method generally confined to power wirebrushes, impact tools, power sanders, and grinders in order to achieve a sound substrate. After the standards have been cleaned and prepared, they shall be painted as follows:

First Coat: Universal Metal Primer, M07, White, as manufactured by Benjamin Moore & Co. or approved equal. The Primer is a phenolic alkyd flat finish coating having a dry film thickness of 2 mils. Paint requires one (1) to two (2) hours drying time before recoating.

Second and Third Coats: D.T.M.(Direct to Metal) Alkyd semi-gloss, Safety Black, as manufactured by Benjamin Moore & Co., or approved equal. The coating is a modified alkyd having a dry film thickness of 2 mils for each coat. Paint requires eight (8) hours drying time before recoating.

All three (3) coats shall be shop painted. All paints shall be applied when the ambient air temperature is forty five (45) degrees F. and rising and when surfaces to be painted are moisture free. No painting will be allowed below the minimum ambient air temperature. In addition, no painting will be allowed below the temperature at which moisture will condense on surfaces; the ambient temperature must be 5 degrees above the dew point.

BENCH SLATS – RECYCLED PLASTIC LUMBER: Recycled plastic lumber slats shall be fabricated from a minimum ninety percent (90%) post-consumer recycled high density polyethylene (HDPE). HDPE resins shall meet the requirements of ASTM D1248 for Type II or IV (high density), Grade G7. Materials shall contain no toxic substances. Recycled plastic lumber shall contain UV inhibited pigment and shall not absorb moisture, corrode, rot, warp, splinter, or crack and shall not contain fiberglass or any material that will be irritating in contact with skin. Color to be Cedar, Brown or Weathered Wood unless otherwise indicated on the plans.

Recycled plastic lumber slats shall be internally reinforced or externally supported with additional steel bar and channel supports. The Contractor shall submit shop drawings showing all external supports if non-reinforced plastic lumber is used. Both types of plastic lumber shall meet the requirements specified below.

Recycled plastic lumber slats (without reinforcement) shall comply with or be tested in accordance with provisions of the following:

ASTM D6108	Standard Test Method for Compressive Products of Plastic and Shapes
ASTM D6109	Standard Test Method for Flexural Properties of Unreinforced and Reinforced Plastic Lumber
ASTM D6111	Standard Test Method for Bulk Density and Specific Gravity of Plastic Lumber and Shapes by Displacement
ASTM D6112	Standard Test Methods for Compressive and Flexural Creep and Creep Rupture of Plastic Lumber and Shapes
ASTM D6117	Standard Test Methods for Mechanical Fasteners in Plastic Lumber and Shapes
ASTM D1248	Standard Specifications for Polyethylene Plastics

Composition and mechanical properties shall be as follows:

Minimum Recycled Content	90%
Minimum High Density Polyethylene	70%
Maximum Percentage of Materials other than Polyolefins	5%
Minimum Specific Gravity (ASTM D6111)	0.02 lbs-in <sup>3</sup>
Minimum Flexural Modulus (ASTM D6109)	85,000 psi
Minimum Nail Pull-out Strength (ASTM D6117)	700 lbs

Flame Spread, Class C or better, tested in accordance with ASTM E84.

Coefficient of Thermal Expansion (ASTM D6341), in the range of -10C to 30C, shall not exceed 70 x 10<sup>-6</sup>/°F.

The City reserves the right to independently test samples of slats from the job site. Random samples to be supplied to the Engineer for identification, at the request of the Engineer. Should the slats provided on the job site not be as previously approved, the Contractor shall replace all the incorrect slat lumber at no extra cost to the City.

Reinforced Plastic Lumber: Reinforced plastic slats shall be precision machined to receive the internal steel support bars and allow expansion and contraction of the slats, such as Second Site Systems slats, Patent No. 5,660,907, as manufactured by Victor Stanley, Inc., Dunkirk, MD, or approved equal. The slats, with supports on minimum forty six inch (46") centers and a one and one-half inch by one-quarter inch (1-1/2" x 1/4") steel support strap midway between the legs, shall be capable of bearing a five hundred pound (500 lb.) load for a minimum twenty four hours (24 hrs.) with a maximum deflection of one-quarter inch (1/4") with the weight in place and one-sixteenth inch (1/16") with the weight removed. As-equal submittals will require test data confirming this tolerance.

The different coefficients of expansion require sufficient play in the slot and spacing of fasteners to prevent cracking and splitting. Internal steel reinforcement bars shall be made of A36 electric furnace mild steel from recycled steel scrap. Steel dimension shall be one quarter inch by one inch (1/4" x 1"), secured with stainless steel set screws, countersunk, with the resulting cavity filled with recycled plastic plugs.

The steel bars shall be hot dipped galvanized and powdercoated to match the color of the recycled plastic lumber slats.

Fabrication Tolerances: Ends shall be smooth with clean cuts, cross-sections shall not have voids greater than 1/2" dia. Voids of 1/2" dia. or less shall be filled with a matching color of silicone caulk, as per manufacturer's specifications. All edges shall be eased. Maximum variation from flat surface across section shall be 1/8".

Delivery and Storage: Keep materials protected at all times against exposure to extreme heat or impact. All material shall be bundled and fully supported during shipping and storage to prevent creep. Any lumber that is damaged or excessively scratched will be rejected and replaced with new. All slat material must be straight and true when bolted to the standards.

Hardware: Bolts, locknuts, and washers used to secure slats to standards shall be stainless steel. Bolt or wood screw used for mid section steel support strap (RPL only) shall be a vandal resistant type, either stainless steel or hot-dipped galvanized. Type and dimensions of all bolts, nuts, and washers shall be as indicated on the plans. Anchor bolts used to secure the benches to pavements may be either stainless steel or hot-dipped

galvanized steel. Bolts for securing slats shall be provided with nylon lock nuts so as to render the connection vandal resistant. Steel support straps shall be secured with (3/8") hot dipped galvanized or stainless steel screws with vandal resistant heads.

Concrete: Concrete for slabs or footings shall be class B-32 concrete per the NYCDOT Standard Highway Specifications, *Section ESCR-4.06* and shall be of the dimensions indicated on the plans.

**ASSEMBLY AND INSTALLATION:** Benches shall be pre-assembled before being installed in their final location and properly secured in place by anchor bolts drilled into concrete footings or slab, as indicated on the plans.

**SUBMITTALS:** All submittal shall be as per the S-Pages.

Shop Drawings: The Contractor shall submit shop drawings showing all additional steel supports if unreinforced plastic lumber slats are proposed.

Foundry Certificates: Certifying Ductile Iron used in bench standards shall be submitted. The certificate shall be on foundry letterhead, dated and signed by the manufacturer with the Contract No., Contractor name, and Class of Ductile Iron provided.

Sample: The Contractor shall submit a twelve inch (12") sample of the recycled plastic lumber slat for surface and color approval. Required test results shall be submitted for unreinforced recycled plastic lumber slats.

Paint Substitution: A written request for any paint substitution must be submitted to the Engineer. The Contractor shall submit manufacturer's Data Sheets and installation instructions for approval of any proposed as-equal product no less than two (2) weeks prior to application.

**MEASUREMENT AND PAYMENT:** The quantity of **BENCH, 1939 WORLD'S FAIR W/RPL SLATS** to be paid for under this Item shall be the number of **LINEAR FEET** of each type, measured in place along the top slat, installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of each type bench furnished and installed and shall include the cost of all labor, materials, equipment, and incidentals necessary to complete the work, including recycled plastic lumber (R.P.L.) slats, steel supports, hardware, submittals, and all finishes, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation and Concrete for footings or concrete slab shall be paid for under their respective contract items.

## **SECTION PK-ESCR 042 – SITE FURNISHINGS**

### **PK-ESCR 042.1. INTENT.**

This section describes the products and installation of Site Furnishings in accordance with the plans, specifications and directions of the Engineer.

### **PK-ESCR 042.2. DESCRIPTION.**

- A. Under this Section, the Contractor shall furnish and install the followings Site Furnishings, in accordance with the Contract Drawings, specifications and directions of the Engineer:
  - 1. Circular Tables and Chairs Type 1
  - 2. Circular Table and Chairs Type 1, Accessible
  - 3. Circular Table and Chairs Type 1, with Umbrella Hole
  - 4. Circular Table and Chairs Type 1, Accessible, with Umbrella Hole
  - 5. Steel Umbrella Surface Mount
  - 6. Steel Umbrella Sleeve and Bracket
  - 7. Steel Umbrella Table Mount
  - 8. BigBelly Bin
  - 9. Hot Coal Bin
  - 10. Circular Tables and Chairs Type 2
  - 11. Circular Tables and Chairs Type 2, Accessible
  - 12. Circular Tables and Chairs Type 2, with Umbrella Hole
  - 13. Circular Tables and Chairs Type 2, Accessible, with Umbrella Hole

### **PK-ESCR 042.3.1. REFERENCES.**

#### A. ASTM Testing Standards

- 1. ASTM B 117 – Standard Practice for Operating Salt Spray (Fog) Apparatus.
- 2. ASTM D 522 – Standard Test Methods for Mandrel Bend Test of Attached Organic Coatings.
- 3. ASTM D 523 – Standard Test Method for Specular Gloss.
- 4. ASTM D 2247 – Standard Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
- 5. ASTM D 2794 – Standard Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
- 6. ASTM D 3359 – Standard Test Methods for Measuring Adhesion by Tape Test.
- 7. ASTM D 3363 – Standard Test Method for Film Hardness by Pencil Test.
- 8. ASTM G 155 – Standard Practice for Operating Xenon Arc Light Apparatus for Exposure of Non-Metallic Materials.

#### B. ISO Testing Standards:

- 1. ISO 1520 – Paints and Varnishes – Cupping Test.
- 2. ISO 2815 – Paints and Varnishes – Buchholz Indentation Test.

#### C. ANSI/BIFMA Testing Standards:

- 1. ANSI/BIFMA X5.4-2005 – Standard Test for Lounge Seating.

**PK-ESCR 042.3.2. SUBMITTALS.**

- A. Product Data: Submit manufacturer's product data, storage and handling requirements and recommendations, installation methods and available colors, styles, patterns and textures.
- B. Shop Drawings: Submit manufacturer's shop drawings, including plans and elevations, indicating overall dimensions for approval by the Engineer.
- C. Samples: Submit manufacturer's samples of materials, finishes, and colors, including three (3) samples of specified color as applied to an 8 inch by 8 inch square of specified metal for approval by the Engineer.

**PK-ESCR 042.3.3. DELIVERY, STORAGE, AND HANDLING.**

- A. Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.
- B. Storage: Store materials in clean, dry area in accordance with manufacturer's instructions. Keep materials in manufacturer's original, unopened containers and packaging until installation.
- C. Handling: Protect materials and finish during handling and installation to prevent damage.

**PK-ESCR 042.3.4. WARRANTY.**

- A. Warranty Information:
  - 1. Products will be free from defects in material and/or workmanship for a period of three years from the date of substantial completion.
  - 2. The warranty may exclude damage resulting from accident, misuse, tampering, negligence, or abuse.
  - 3. Products shall be repaired or replaced to the satisfaction of the Engineer any items found defective upon inspection by an authorized manufacturer service representative and Engineer.

**PK-ESCR 042.3.5. MANUFACTURER.** Manufacturer for Circular Table and Chairs Type 1, Accessible-Circular Table and Chairs Type 1, with Umbrella HoleSteel Umbrella Surface MountSteel Umbrella Sleeve and Bracket

**PK-ESCR 042.3.7. MATERIALS AND FINISHES.**

- A. Circular table and chairs type 1 and type 2 shall be Catena Stainless Steel
- B. Circular table and chairs type 1 and type 2 accessible shall be Catena Stainless Steel
- C. STEEL UMBRELLA SURFACE MOUNT: Aluminum, Powderdercoated Custom Color
- D. STEEL UMBRELLA SLEEVE AND BRACKET: Aluminum, Powderdercoated Custom Color
- E. STEEL UMBRELLA TABLE MOUNT: Aluminum, Powderdercoated Custom Color

**PK-ESCR 042.4. METHODS.**

The following methods of installation shall be used.

- A. Examination:
  - 1. Examine areas to receive the Site Furnishings.
  - 2. Notify Engineer of conditions that would adversely affect installation or subsequent use.
  - 3. Do not begin installation until unacceptable conditions are corrected and acceptance verified in writing by Engineer.
- B. Installation:
  - 1. Install Site Furnishings in accordance with manufacturer's instructions at locations indicated on the Drawings.
  - 2. Locate Site Furnishings as directed by Engineer.
  - 3. Install Site Furnishings plumb and level.

C. Adjusting:

1. Finish Damage: Repair minor damages to finish in accordance with manufacturer's instructions and as approved by Engineer.
2. Component Damage: Remove and replace damaged components that cannot be successfully repaired as determined by Engineer.

D. Cleaning: Clean Site Furnishings promptly after installation in accordance with manufacturer's instructions. Do not use harsh cleaning materials or methods that could damage finish.

E. Protection: Protect installed Site Furnishings to ensure they will be without damage or deterioration at time of Substantial Completion.

**PK-ESCR 042.5. MEASUREMENT.**

The quantities of Site Furnishings to be measured for payment shall be the quantity of each type Site Furnishing installed at the site to the satisfaction of the Engineer.

**PK-ESCR 042.6. PRICES TO COVER.**

The prices bid shall be the unit price per EACH type site furnishing Item covered under this Section and shall include the cost of furnishing all labor, materials, equipment, insurance, and incidentals necessary to furnish, assemble and install the Site Furnishings including, but not limited to, chair arm rests and glides, and hardware, all in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

*Payment will be made under:*

**END OF SECTION**

## SECTION PK-ESCR 044 – PNEUMATIC EXCAVATION AROUND TREES

### PK-ESCR 44.1. INTENT

Work covered under this section shall be performed at the locations indicated on the Plans, in accordance with the contract documents, and as directed by the Engineer.

### PK-ESCR 44.2. DESCRIPTION

- A. The intent of this section is to perform pneumatic excavation and backfilling work at locations where trees exist within the work area and are required to remain, requires the protection of tree roots during excavation and backfilling, and implements, as needed, a temporary excavation support system.

### PK-ESCR 44.3. MATERIALS

- A. Materials shall meet the following requirements, as modified by any supplemental landscape specifications or special notes included in the contract documents. Where indicated, refer to the latest revision/edition of Standard Specifications of the New York State Department of Transportation (NYS DOTSS):

1. PNEUMATIC EXCAVATING TOOL. Excavation shall be performed through the use of a pneumatic excavation tool with the following requirements:
  - a) The high air velocity excavation tool shall be specifically designed to fracture, pulverize, and displace
  - b) and semi-porous soils without harming or causing damage to tree roots, existing subsurface utilities or other non-porous objects.
  - c) The Contractor shall submit catalog cuts from the manufacturer verifying that the Pneumatic excavation tool meets the following criteria:
    - Rated Operating Pressure: 6.2 – 7.0 bar
    - Air Stream Velocity at Cutting Head: 2,200 – 2,500 km/hr
    - Air Displacement: 4,000 – 5,000 L/min
2. AIR COMPRESSOR. The air compressor may be either a portable or truck mounted unit and shall be adequately sized as required to power the pneumatic excavation tool in accordance with the manufacturer's recommendations for the pneumatic excavating tool.
3. VACUUM TRUCK. A vacuum truck should be used to collect excavated spoil directly from the trench or pit.
4. CONTAINMENT STRUCTURE. To prevent the spread of excavated soil onto adjacent roadways and areas beyond the designated work zone limits, the Contractor shall provide a mobile structure or barrier to contain the material dislodged by the pneumatic excavation tool from the trench or pit. Timber or corrugated metal shields, tents supported on tubular frames or other structures as approved by the engineer may be used.

5. ROOT PROTECTION. The following are required for root protection:

<u>Item</u>	<u>NYSDOTSS Section</u>
Quilted Covers	711-02
Burlap	711-06

6. BACKFILL. The following are required for backfill material:

<u>Item</u>	<u>NYSDOTSS Section</u>
Topsoil	713-01
Limestone	713-02
Fertilizer	713-03
Mycorrhizal Funghi	713-09
Compost	713-15

**PK-ESCR 44.3.1. SUBMITTALS**

- A. The Contractor shall supply the ISA Certified Arborist with information as needed for the Arborist to prepare periodic reports to the Engineer summarizing the number, type, and condition of trees adjacent to each area of pneumatic excavation; indicating the duration of open excavation; and identifying any root damage and actions taken.

**PK-ESCR 44.4. EXCAVATION PROCEDURES AND METHODS**

The Contractor shall meet all requirements of this section, including transmitting any required submittals.

(A) DUST CONTROL

The work area shall be watered thoroughly at least twenty-four (24) hours in advance of, but no more than forty-eight (48) hours prior to the start of any pneumatic excavation to reduce the incidence of airborne dust resulting from the pneumatic excavation operation.

(B) EXCAVATION – GENERAL

All excavation using the pneumatic excavation tool shall be performed in accordance with the manufacturer's recommendations to remove soil without damage to the roots of trees, buried structures, and/or utilities either in or adjacent to the excavation. The Contractor shall excavate within limits designated for pneumatic excavation shown on the Contract Plans, or as directed by the Engineer, using the pneumatic excavating tool. When working near utilities, the Contractor shall be responsible to locate underground facilities as required under 16 NYCRR Part 753.

(C) EXCAVATION – TEMPORARY EXCAVATION SUPPORT SYSTEM

Approved sheeting and bracing shall be used where necessary to support the sides of the excavation, in order to: prevent damage to subsurface structures and adjacent buildings; safeguard persons and property; minimize inconvenience to traffic and the public; protect the structure to be installed; support the adjacent tree(s); and provide suitable and safe working conditions. Except as otherwise provided, deviations from the above will be permitted only where, in the judgment of the Engineer, such exception will not result in any of the hazards described above.

In cases where sheeting and bracing will not adequately protect adjacent structures from damage and settlement, the Contractor will be required to use such measures as are necessary to safely support and maintain adjacent and abutting property and structures, support the tree without causing damage to the tree, and to maintain the work safe to life, limb, and property.

All sheeting and bracing systems that the Contractor elects to use or that are ordered to use by the Engineer of the Department shall comply with the requirements of the NYCDEP Standard Sewer and Water Specifications, and must receive the approvals stated therein.

Unless otherwise specified in the Contract Drawings or these Specifications or specifically permitted in writing by the Engineer, the Contractor shall be required to withdraw and remove all sheeting and bracing simultaneously with the backfilling of trenches and excavations.

#### (D) ROOT PROTECTION

The Contractor shall place wet burlap or cotton mats upon both the fibrous and structural roots immediately after they have been exposed by the pneumatic excavating tool. The burlap or cotton covering may be removed to perform inspection or utility installation operations, but the Contractor shall be required to keep the burlap or cotton towels wet and the roots moist until backfilling is complete.

The Engineer shall be immediately informed of any damaged tree roots. No tree roots may be pruned except as specifically authorized by the Arborist. In the case that the concentration of roots obstructs the placement of utilities, footings, or other structures, limited pruning may be necessary as directed by the Arborist. Tree roots in excess of one (1) inch in diameter, measured at the edge of the excavation, shall be cut cleanly at the edge of excavation using a sharp cutting tool. All root pruning shall be performed under the direction of the ISA Certified Arborist.

#### (E) UTILITY INSTALLATION

Utilities shall be installed as shown on the drawings, including bedding materials. In order to facilitate backfilling on an expedited basis, the Contractor shall install the materials for utilities in a continuous operation along with the pneumatic excavation operations to allow for backfilling of the trench within the same work shift.

Exposed root systems may impede utility installation within an open trench. Therefore, workers shall pass each individual item of utility construction carefully through the root system for placement and assembly within the excavated trench.

#### (F) BACKFILLING OPERATIONS

Excavations containing exposed tree roots shall be backfilled immediately after the Engineer inspects and approves the required construction work. The Contractor shall provide adequate work crews to backfill the excavated area within twenty-four (24) hours of excavation. Upon completion of inspection of installation work, the Contractor shall remove the burlap or cotton matting and commence backfilling operations.

Suitable excavated material may be used as backfill up to a depth of twelve (12) inches below finished grade. The existing soil shall be amended with humus, peat, peat moss, or source-separated compost in the ratio of one part organic to seven parts excavated soil. If required, provide additional clean backfill material. The Contractor shall properly dispose of excess and unsuitable excavated materials.

Backfilling shall be performed with care not to damage the exposed roots. The Contractor shall compact the backfill material under the direction of the ISA Certified Arborist. The Contractor shall compact the backfill material to be commensurate with the density of the undisturbed adjacent soils unless otherwise directed by the ISA Certified Arborist. Surface restoration including backfilling the twelve (12) inches of the excavation with approved topsoil, shall be performed separately under the appropriate items.

**PK-ESCR 44.5. MEASUREMENT**

The contract price for "PNEUMATIC EXCAVATION AROUND TREES" shall be the unit price bid per cubic yard to perform the work described herein, at the locations and to the limits indicated on the Plans.

**PK-ESCR 44.6. PRICES TO COVER**

The unit price bid per cubic yard shall include the cost of all labor, materials, plant, equipment, professional engineering design services, and insurance needed to perform the work, including all other work incidental thereto all in accordance with the specifications and as directed by the Engineer.

No separate payment will be made for replacement trees required by the Engineer that the Contractor shall acquire and plant as a result of damage to trees caused by the Contractor's excavation and/or backfilling methods.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 044</b>	<b>PNEUMATIC EXCAVATION AROUND TREES</b>	<b>C.Y.</b>

**END OF SECTION**

## SECTION PK-ESCR 077 – PIPE RAIL FENCE

**WORK:** Under these Items, the Contractor shall furnish and erect powder coated pipe rail fences of the various types and sizes where shown on the plans or directed by the Engineer, in accordance with the plans and specifications.

**MATERIAL:** All posts, rails and dowels shall be galvanized steel pipe in accordance with A.S.T.M. Specification F-1083 and ASTM A-53 schedule 40. All material as delivered shall be in condition for erection without field fitting or cutting.

Castings shall be fabricated from ductile iron grade 65-45-12. Finials for PIPE RAIL FENCE (TYPE A), and posts for PIPE RAIL FENCE (TYPE C) (foundry certificate must be supplied) shall be cast ductile iron ASTM A-536-84 as manufactured by Wemco Castings, Bohemia, NY, or approved equal.

**WELDING:** Welding shall be done by competent mechanics as specified in the NYCDOT Standard Highway Specifications and all welds shall be ground smooth. All welds shall be spot primed immediately after welding in the shop with a protective zinc-rich metal primer.

**SURFACE COATINGS:** After welding, all posts, rails and castings shall be powdercoated with either polyvinyl chloride (PVC) or TGIC-Polyester, (PVC coating shall be 10 to 15 mils thick, TGIC-Polyester shall be 3 to 6 mils thick).

Galvanizing of all components shall provide an acceptable substrate for applied powdercoatings. No lacquer, urethane or other coatings which would prevent proper adhesion of powdercoating shall be applied to the pipe.

The powdercoating shall be applied to the galvanized surfaces in such a manner that the coating will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. All coated parts shall first receive phosphating and chromating treatments to improve the adhesion of the surface coating.

Color to be black unless otherwise indicated on the plans. The entire fence installation shall be coated with one of the two following types of powder coating. All fence components shall be coated on all surfaces.

**TYPE I - Polyvinyl Powdercoating:** PVC Powdercoating shall be applied to the galvanized steel or iron by the fluid bed method to a preheated base which has been cleaned and primed prior to submersion in vinyl, resulting in a firm bond between the PVC and the metal. PVC shall be applied to a film thickness of 10 to 15 mils without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

**TYPE II - TGIC-Polyester Powdercoating:** TGIC-Polyester Powdercoating shall be applied to the galvanized steel or iron in such a manner that the coating will not peel off. The TGIC-Polyester shall be applied at a film thickness of 3 to 6 mils by electrostatic spray process and bake finished per manufacturer's directions. The TGIC-Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

### **TESTS:**

**Field Test For PVC Powdercoating:** As per ASTM F668, three sample sections of the PVC powdercoated fence shall be tested for bonding of the powder coat to the metal. Each test will consist of making two cuts parallel to the axis of the pipe or casting through the coating, approx. 1/16 inch (1.6mm) apart, at least 1/2 inch (12.7mm) long. With a knife, peel back a section of the coating between 1/8 inch (3.2 mm) and 1/4 inch (6.4 mm) long to produce a tab. Attempt to remove

the 1/16 inch (1.6 mm) strip of coating by pulling tab. The fence shall be deemed acceptable if the coating breaks rather than separates from the metal on all three samples.

Laboratory Test For TGIC-Polyester Powdercoating: At the discretion of the Engineer, a sample of the TGIC-Polyester powdercoated fence shall be laboratory tested for bonding of the powdercoating to the metal. Test shall be the Cross Hatch test per ASTM D3359, Method B. Failure to satisfactorily pass this test shall be a basis for rejection.

Touch-up & Repair: For minor damage caused by installation or transportation and field welded metal powder coated surfaces, clean welds, bolted connections, and abraded areas;

1. On damaged galvanized surfaces, apply organic zinc repair paint complying with ASTM A780. Galvanizing repair paint shall have 65 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of six feet (6').

**ERECTION:** The posts shall be set in holes which shall have been formed in the concrete curbs or footings, as shown on the plans or directed by the Engineer. After the posts have been set in place and properly supported to hold them to line and grade, the remaining space shall be neatly filled with a grout consisting of one (1) part of cement and two (2) parts sand. All dowels shall be pinned as shown on the drawings.

**SUBMITTALS:** All submittals shall be submitted in accordance with the requirements of the S-Pages.

Shop Drawings: Contractor shall submit shop drawings including complete details of fence construction, height, post spacing layout, dimensions, and concrete footing detail prior to manufacture.

Foundry Certificate: Where type 'A' or type 'C' is specified, a foundry certificate verifying authenticity of ductile iron supplied in this Item shall be submitted. Certificate shall be on foundry letterhead, dated and signed by Foundry President with Contract No., Contract Name, specific part(s) purchased, Contractor Name, and Class of Ductile Iron provided.

Certificate: Contractor to submit certification that material used complies with this specification.

Samples: Submit one twelve-inch (12") section of galvanized, powder coated pipe for approval.

**MEASUREMENT AND PAYMENT:** The quantity of pipe rail fence of each type to be paid for under this Item shall be the number of LINEAR FEET of fence, furnished and erected complete in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per LINEAR FOOT of pipe rail fence of each type and shall include the cost of furnishing all labor, materials and equipment necessary to erect fence complete, including powder coating and powder coating touch-up and all incidental expenses necessary to complete the work in accordance with the plans and specifications to the satisfaction of the Engineer, except excavation and concrete which will be paid for separately under their respective Items.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 077</b>	<b>PIPE RAIL FENCE TYPE B 2 RAIL</b>	<b>L.F.</b>
<b>PK-ESCR 714</b>	<b>PIPE RAIL FENCE TYPE B 3 RAIL</b>	<b>L.F.</b>

END OF SECTION

## SECTION PK-ESCR 081 – CLAY STORAGE BOX

**WORK:** Under this item, the Contractor shall furnish and erect a CLAY STORAGE BOX in accordance with the plans and specifications and directions of the Engineer.

**MATERIALS:** All materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications

**Lumber:** All wood stakes and boards shall be manufactured of No. 1 common Douglas Fir or Yellow Pine. The stakes and boards shall be manufactured in accordance with the drawings. All exposed corners and faces shall be free from damage, dog holes, pike or cant holes.

**Fastenings:** All fasteners shall be hot-dipped galvanized or stainless steel.

**PRESERVATIVE TREATMENT:** Wood shall be seasoned, either by air-drying or kiln drying, and the moisture content prior to treatment shall be not more than 25%. Wood shall be treated to a net retention of .40 pounds per cubic foot with ACQ (ammoniacal copper quaternary), Copper Azole preservation, or approved equal. The preservative shall penetrate 2.5 inches or 85% of the sapwood. All details of treatment methods, quality, control and product testing shall be in accordance with the appropriate AWPA standards. In accordance with New York State Environmental Conservation Law section 37-109, CCA (chromated copper arsenate) treatment is prohibited as a wood preservative treatment material.

If any other preservative treatment is proposed, the Contractor shall submit documentation that such treatment conforms to the AWPA Standards for treatment of the wood for the intended use.

Posts shall be dried at least thirty days after treatment, prior to installation. All fabrication shall be performed prior to treatment. Where field cuts have to be made, the cut ends shall have two coats of concentrated preservative brushed on.

**INSTALLATION:** Clay Storage Box shall be constructed and installed according to the Contract Drawings, or as directed by the Engineer. Clay Storage Box location shall not interfere with the positive drainage of the field.

For stabilization during emplacement, a 2"x 4" (8'-6") long wood board shall be nailed to the front of the clay storage box. After emplacement the 2" x 4" shall be removed from the front of the clay storage box.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Wood Treatment Affidavit:** The Contractor shall provide at the Contractor's own expense, a sworn affidavit as to the type, grade and quality of preservative treatment provided. The net final retention in pounds per cubic foot of wood impregnated shall conform to the requirements of the specifications.

**Shop Drawings:** The Contractor shall submit complete shop drawings indicating all dimensions and materials. Drawings must be approved by the Engineer prior to beginning construction.

**MEASUREMENT AND PAYMENT:** For furnishing and erecting Clay Storage Box complete in accordance with the plans and specifications and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Clay Storage Box and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work including unclassified excavation, pressure treated lumber and fastenings installed in accordance with the plans and specifications to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 081</b>	<b>CLAY STORAGE BOX</b>	<b>EA</b>

**END OF SECTION**

## SECTION PK-ESCR 097 – PLAY EQUIPMENT – 10<sup>TH</sup> STREET

**WORK:** Under this item, the Contractor shall furnish and install all STEEL PLAY EQUIPMENT in accordance with the plans, specifications and directions of the Engineer. In addition, the Contractor shall furnish incidental materials to the Engineer, as specified under the heading INCIDENTAL MATERIALS.

**NOTE:** Final installation of the steel play equipment (concrete footings) shall not proceed until the Contractor has demonstrated to the satisfaction of the Engineer that the use zones comply with ASTM 1487-Latest Rev., and CPSC guidelines. The safety surfacing shall be installed as soon as possible after the play equipment installation is complete. The Contractor shall be responsible for temporarily barricading the Play Equipment prior to completion of the safety surfacing installation.

**GENERAL:** Play Equipment shall be as shown on the drawings. All play equipment shall be Powerscape® and Xscape®, as manufactured by Gametime, Fort Payne, AL; or PlayBooster® and Evos® as manufactured by Landscape Structures Inc., Delano, MN, or Metro Collection and Unity® Connect as manufactured by Playworld Systems, Lewisburg, PA, City Park Series® (Urban Playgrounds), as manufactured by Miracle Recreation Equipment, Monett, MO, or approved equal.

**STANDARDS:** All play equipment design and construction shall meet or exceed the requirements as published in the Handbook for Public Playground Safety issued by the U.S. Consumer Product Safety Commission, the Consumer Product Safety Improvement Act (CPSIA) of 2008, and ASTM Designation F1487-Latest Rev., "Standard Consumer Safety Performance Specification for Playground Equipment for Public Use." Play equipment design and construction shall also comply with "Guide to ADA Accessibility Guidelines for Play Areas", Final Ruling (ADA).

**MATERIALS:** Unless otherwise specified herein, all materials shall conform to applicable portions of shall meet the requirements of the NYCDOT Standard Highway Specifications

Footings: Concrete for footings shall be per Item ESCR-4.06 PF.

Steel Members:

Posts: Posts and vertical members shall be Schedule 40 pipe or Structural Steel tubing as specified below. Tubing for posts shall have a minimum thickness of 0.120" (11 gauge).

Railings and Fixtures: Railings and fixtures shall be schedule 40 pipe or structural tubing of such thickness that the railings shall not sag or bend during use. Any tubing that bends, sags or does not meet ASTM F1487-Latest Rev., Section 12.5 shall be replaced and upgraded by the manufacturer at no additional cost to the City.

Tubular Steel: Tubular steel shall be structural tubing of the sizes and shapes shown in the approved shop drawings. Steel shall meet the specifications for ASTM A500, Grade B which has a minimum tensile strength of 58,000 psi (for round and shaped) and a minimum yield point of 42,000 psi for round structural tubing and a minimum yield point of 46,000 psi for shaped structural tubing. Material shall be load-tested under ASTM 1487-Latest Rev., after fabrication.

Pipe: Pipe for climbers, ladders, shall be Schedule 40 or structural tubing steel pipe conforming to the requirements of ASTM A53 and shall be of the same sizes, indicated on the plans. Steel pipe shall be load tested under ASTM F1487-Latest Rev., requirements after fabrication. The outside diameter of all hand gripping components including rungs on horizontal ladders, climbing bars, handrails, etc. shall comply with the anthropometric dimensions as listed in the ASTM 1487-Latest Rev. standards.

Pipe Caps: All exposed ends of steel members shall be plugged with metal caps riveted in place with self-sealing rivets or spot welded.

Fittings and Clamps: All fittings and clamps shall be as indicated on the approved shop drawings and as may be required to complete the installation. All fittings shall be of the best quality malleable iron, drop-forged steel or steel plate as indicated. Clamp fittings shall be cast aluminum or 12 gauge drawn quality or better steel and finished to match vertical components and shall be smoothly constructed with no projections or sharp edges. All clamps shall have tamper resistant fasteners. Clamps used on component subjected to vertical loads shall be pinned to prevent slipping and twisting.

Fasteners: All fasteners including, but not limited to, bolts, lag screws, tie rods, threaded rods, nuts, and washers, shall be of the sizes indicated on the approved shop drawings. Fasteners shall be either stainless steel per ASTM F879 or carbon steel treated with a corrosion resistant coating per applicable ASTM plating specifications. All threaded fasteners shall include a locking patch-type material that will meet the minimum torque requirements of Industrial Fastener's Institute (IFI)-125 "Test Procedure for the Locking Ability Performance of Chemical Coated Lock Screws". The play equipment Manufacturer shall provide special tools for pinned tamperproof fasteners. All protruding bolts, screws and other threaded connectors shall be cut off to within two threads of nut, washer, etc., then satisfactorily peened to prevent removal by unscrewing, and filed completely smooth to remove all sharp edges.

Chain: Chain for climber shall be stainless steel, minimum size 7/32", 4/0 welded link chain.

Plastic Lumber: Plastic lumber shall be made from UV stabilized recycled high density polyethylene. Recycled lumber shall be protected during transportation. Unless otherwise specified, color shall be "Natural". Recycled plastic lumber may not be used on spans greater than two (2') feet unless additional structural support is provided. An engineering analysis of structural integrity based on ASTM F1487 shall be submitted upon request. Plastic Lumber shall be smooth on all sides and ends. Plastic Lumber shall be free from all but minor marks, blemishes, discolorations, warp, wane, twist, quirk or other imperfections. The intersection of all planes of faces, edges and ends shall be eased to one-eighth (1/8") inch radius.

Rotationally Molded Polyethylene: Parts shall be rotationally molded from color-compounded, first quality, linear low-density polyethylene with a tensile strength of 2,500 psi per ASTM D638 and with color and UV-stabilizing additives. Dry-blended or molded-in resins are not acceptable. Polyethylene shall be ultraviolet stabilized to UV-8 and have anti-static additives. Wall thickness shall vary by component and as shown on the approved shop drawings.

Sheet Plastic Parts: Sheet plastic parts shall be manufactured from three-quarter (3/4") inch high density polyethylene that has been specially formulated for optimum UV stability and color retention. Products shall have a minimum density of 0.933 G/cc in accordance with ASTM D1505 and a minimum tensile strength of 2,400 psi in accordance with ASTM D638. All edges shall be free of burrs, sharp edges, and points.

**STEEL FABRICATION:** All steel components to be welded shall be welded in complete accordance with the standards of the American Welding Society. All welds shall be continuous around the entire perimeter. All welds shall be ground smooth. NO TACK WELDING AND NO FIELD WELDING SHALL BE PERMITTED.

**Corrosion Resistant Treatment:** All fabrication and welding shall be completed prior to application of the corrosion resistant coating, metal pieces shall be cleaned of all weld spatter, mill scale, varnish, rust, grease, and the like and the surface mechanically and chemically prepared to receive the coating. This corrosion resistant coating shall be a thermal spray zinc coating or electrostatic applied primer with a minimum thickness of 3 mils. All metal pieces, including welds, shall receive the coating.

**Polyester Powder Coating:** A surface coat shall be applied to the thermal zinc coated metal pieces in such a manner that the coating will not peel off. The manufacturer shall perform all processes required to achieve a smooth material bond. An epoxy or acrylic polymer primer shall be applied prior to application of powdercoating. The surface coat shall be an electrostatically sprayed, lead-free, superdurable TGIC (triglycidyl isocyanurate) polyester powder coating applied to a minimum of five(5) mil thickness which shall be oven cured. The TGIC polyester powder coating shall comply with the ASTM standards below:

<u>PHYSICAL PROPERTIES</u>	<u>TEST METHODS</u>	<u>ACCEPTANCE CRITERIA</u>
Adhesion cross hatching	D3359B	5B (0% area removed)
Flexibility conical mandrel	D522	Pass 3/8" mandrel
Pencil hardness	D3363	Pencil hardness 2H minimum
Impact resistance	D2794	80 inch pounds minimum
Overbake resistance- Adhesion	D2454	5B
Overbake resistance- Hardness	D2454	Pencil hardness 2H minimum
Overbake resistance- Direct Impact	D2454	80 inch pounds minimum
Humidity resistance-250 hours	D4585	No visible change to surface
Weatherability	D822	No visible change to surface
Salt Spray Resistance	B117	1000 Hours
Corrosion Resistance	D1654	Rating 6 or greater
UV Exposure	G154, 340 bulb	2,000 hours, rating delta E of 2 90 percent gloss retention

Colors shall be as shown on the drawings. (Submittals required). Material manufacturer's directions for storage and use shall be adhered to. Material surfaces shall be protected during shipment so as to arrive mar and scratch free in the field.

**SPECIFIED COMPONENTS AND ATTACHMENTS:** All components and attachments used for the steel play equipment shall be validated by the IPEMA Third Party Process, or an approved equal third party validation process, to demonstrate compliance with ASTM F1487.

**Steel Decks/Steps:** Steel decks and steps shall consist of a single piece of low carbon, 12 gauge (0.105") minimum thick sheet steel conforming to ASTM A1011. The steel sheet shall be perforated with a return flange formed on the perimeter to provide necessary reinforcement to

ensure structural integrity. Steel decks and steps shall be reinforced and cross-braced as necessary to prevent any noticeable deflection. Perforation shall be small enough to eliminate potential finger entrapment. Decks shall be flush with the outside edge of the supporting posts. There shall be no unsupported area larger than four (4 sf) square feet.

Decks and steps shall be coated with a hot dipped polyvinyl chloride (PVC) system or thermoplastic polyethylene coating with a gritty non-slip surface. Deck/Step surface must be slip resistant in both wet and dry conditions. The PVC coating shall have a hardness of Shore A 83 +/-5 normal durometer range. The material shall be classed as "Self Extinguishing", meets or exceeds DOT MVSS 302 or UL 94HB, and contains ultraviolet inhibitors to help prolong the life of the coating. The PVC coating shall meet all applicable phthalate levels as specified under CPSIA.

Plastic Lumber Decks. Plastic lumber decking shall be sized as shown on the drawings and shall be affixed to supporting members in a tamper resistant method with spacers as necessary to prevent potential pinching.

Safety Railings: Safety rails shall provide enclosure and shall have no gaps greater than 3.5" and less than 9". Tubing and pipe used for safety rails shall not exceed 1.54" in outer diameter and shall have corrosive protection and powder coating as specified above. All welds shall be complete and ground smooth. These requirements shall conform to ASTM F1487-Latest Rev. standards.

Tire Swing: Tire swing shall consist of an overhead beam, reinforcing insert, connector plates, automotive type universal joint assembly with protective rubber bellows or an universal joint assembly with bearings, swing chain, 'tire' type swing seat and all required hardware for assembly. 'Tire' type swing seat shall be designed and manufactured especially for playground use. Standard fiberglass and/or steel belted automobile tires are not acceptable. The 'tire' type swing seat shall have a twenty eight (28") inch minimum outer diameter and a fourteen (14") inch minimum inner diameter and shall be fitted with a reinforcing ring. Chain attachment area shall minimize the likelihood of fingers becoming caught. Drainage holes shall be provided in the underside of the tire.

Slides: Spiral and straight slides shall be constructed of either stainless steel or rotationally molded polyethylene as shown on the approved shop drawing. Rotationally molded polyethylene shall meet the specifications above. Stainless steel slides shall be constructed of 16 gauge or better stainless steel with a 2B finish. The underside of the stainless steel slide shall be constructed such that there are no projections or sharp or rough edges. Slide bed and enclosure shall conform to CPSC guidelines for spiral slides. The slide bed and sides shall be shaped and dimensioned such that the rider will not tip or slide over outside edge of the slide. Gaps between the slide and main support post are not acceptable. Gaps shall be closed through either mechanical fasteners, welding, or methods approved by the Engineer. Spiral slide chutes shall either installed by manufacturers factory trained certified installers, or completely assembled at the factory and shipped to site ready for field erection.

Flex Bridges: Flex Bridges shall be constructed with metal straps or steel reinforced rope/cable. Flex Bridges constructed with chains are not acceptable components under this specification.

Climbing Cable (Rope): Cable shall comprise of six-stranded and tempered steel reinforced rope. The galvanized steel wire cores of the six strands shall be inductively fused to the polyamide or polyester outer coating. The coating shall be abrasion-resistant and colorfast to ultraviolet degradation. The breaking strength of the cable shall exceed the applicable load applied to the net climber. The climbing cable net shall be completely factory assembled in a configuration that is ready for attachment to the frame on site.

**Age Appropriate Signage:** In accordance with CPSC Handbook for Public Playground Safety, Sections 2.2.5 and 2.2.6 and ASTM F1487, play equipment units shall have age appropriate signage in a clearly conspicuous place near or on the equipment platform at the entry point. This signage shall state one of the following: 1) "This play equipment is designed for Preschool Children Ages 2 to 5 years. Adult supervision is recommended"; or 2) "This play equipment is designed for School Age Children ages 5 to 12 years. Adult supervision is recommended". Unless otherwise shown on the Drawings, the sign shall be routed two color sheet plastic, or approved equal.

**Manufacturer Identification Sticker:** The play equipment shall have an identification sticker placed in an inconspicuous place on the equipment for NYCDPR M&O reference. (For example, under a slide bed at the lowest point). The sticker shall identify the manufacturer's address and a toll-free phone number.

**QUALIFICATIONS:** The entity who will perform the installation work shall be either a trained and certified installer by the specified play equipment manufacturer OR have a minimum of three (3) years of experience working on installation of play equipment similar to the work specified in scope and complexity in accordance with ASTM F1487-Latest Rev. and CPSC guidelines.

**INSTALLATION:** All play equipment shall be installed by a qualified installer, experienced in erecting steel play equipment and meeting the qualifications specified above. Final installation of the steel play equipment (concrete footings) shall not proceed until the Contractor has demonstrated to the satisfaction of Engineer that the use zones comply with ASTM F1487-Latest Rev. and CPSC guidelines.

Asphalt pavement shall be neatly saw-cut prior to excavation for footings. All tubular steel posts shall be set square and plumb in concrete footings as shown on the approved shop drawing to grade required assuring level installation of platform angle frames and rails. Footings shall have the top surface finished so as to provide sheet drainage away from steel uprights, level and free of surface fluctuations that could contribute to an uneven surface in overlying safety surfacing.

Equipment shall be assembled to configuration as shown on the approved shop drawings. All fastenings shall be made as shown on the drawings and shall be securely tightened with an impact and/or torque wrench (as per manufacturer's specification). The Contractor shall take precautions while trimming bolt projections, if necessary, to prevent metallic contamination (rust bloom) of the corrosion resistant bolts to the satisfaction of the Engineer. These precautions include the use of previously unused grinding wheels, and applying zinc rich paint on trimmed galvanized bolts. All work shall be done so that no hazardous projections or rust bloom shall be left in the finished work.

**FIELD INSPECTION:** An authorized manufacturer's representative, who is not the qualified installer, shall inspect and approve the installation of the play equipment prior to acceptance by the engineer. The play equipment representative shall certify that the play equipment was correctly installed in accordance with the manufacturer's written instructions, all fastenings are securely installed meeting the manufacturers' maximum torque value, and meeting all requirements set forth in ASTM F1487- Latest Rev. A Document of Acceptance shall be provided by the manufacturer's representative stating that a field inspection was conducted and the installation is accepted by the manufacturer's representative (See Submittals).

**THIRD PARTY RESOLUTION:** If a disagreement arises between the Engineer and the play equipment manufacturer regarding the safety of a particular play component, the Contractor shall

be directed to hire an independent Certified Playground Safety Inspector (CPSI), as part of the bid price of this item, to assess if the play equipment component complies with the safety standards referenced above. The Contractor shall submit the qualifications of the CPSI for approval by the Engineer prior to hiring. The independent CPSI shall inspect the play equipment on site and submit a final report detailing the determination of their inspection. If the play component is deemed to be unsafe by the independent CPSI, the Contractor shall make all necessary corrections at no additional cost to the City based on the CPSI's recommendation. If the Engineer wishes to modify a play component after the independent CPSI deemed it to be meeting all safety standards, all materials and methods necessary to perform the requested modification shall be eligible for a change order extra.

**INCIDENTAL MATERIALS:** The Contractor shall furnish and deliver, to the Engineer, incidental materials obtained from the approved play equipment manufacturer. Contractor shall also furnish to the Engineer any catalogs, invoices, statements, etc. for verification that a complete set of all maintenance and operations manuals, tools, extra paint, materials, etc. have been furnished. All furnished material shall be properly identified with the name of park and contract number. Incidental new materials shall include the following:

192 oz. - Graffiti Remover, for polyester powdercoated steel surfaces - One hundred ninety two (192) ounces in spray bottles: six (6) thirty two (32) ounce spray bottles; or twelve (12) sixteen (16) ounce spray bottles. Graffiti Remover shall be Go-Away graffiti remover, as manufactured by Nexgen, North Hollywood, CA; Erase Graffiti Cleaner as manufactured by Landscape Structures, Delano, MN; or Gametime Graffiti Remover as manufactured by Gametime, Fort Payne, AL, or approved equal. Each container shall be clearly labeled, using a minimum of 1/4-inch high lettering: "For Play Equipment".

90 oz. - Touch-Up Paint, complete for all color surfaces, as provided by manufacturer. Twenty (20) cans of custom spray paint 4.5 oz. each can or a minimum of 90 ounces of paint (total all colors) shall be provided.

1 (One) - Tools And Hardware Maintenance Repair Kit, complete with tool box, special tools for tamper proof fasteners, fastener wrench and hardware (nuts, bolts screws etc.), to be provided by manufacturer. The repair kit shall be clearly marked with the Contract Number and the Playground name. Marking shall be done with permanent magic marker or other method approved by the Engineer.

**SUBMITTALS:** All submittals shall be submitted and approved prior to manufacture and in accordance with the requirements of the S-Pages.

Shop Drawings: The Contractor shall submit shop drawings no later than three (3) months prior to the scheduled completion of the project. The shop drawings shall indicate as a minimum: the play equipment layout, the required minimum limits of the use zone, elevations, footings layout, and compliance with ADA requirements including access details and the ratio of elevated versus ground level events. The shop drawings shall show the distance in linear feet from outside edge of the safety surfacing to a minimum of three (3) closest adjacent fixed outside structures such as curbs, fences, benches or trees. The Contractor shall submit the following information if required by the Engineer: materials, finishes, supports, hardware, fastener torque schedule, fittings and accessories.

Qualifications: The Contractor shall submit play equipment installer qualifications as specified above for approval prior to installation of play equipment.

Deviations From Layout: Any deviations from the contract drawings must be submitted for review and approval by the Engineer.

Color Samples: Color samples shall be submitted for approval by the Engineer before any powder coating is done.

Document of Acceptance: An authorized representative of the play equipment manufacturer must inspect and approve the completed installation. The play equipment will not be accepted by the play equipment manufacturer or the Engineer until they are satisfied with the installation. No additional compensation will be given for any necessary corrective work. A Document of Acceptance signed by the authorized Manufacturers' representative must be submitted to the Engineer before the final 20% payment is made to the Contractor for this item.

Third Party Resolution: If arbitration is required, the Contractor shall submit qualifications for the independent CPSI for approval prior to hiring. The Contractor shall also submit a final report prepared by the independent CPSI detailing the result of the inspection.

Insurance Certificate: The Contractor shall furnish the Manufacturer's Certificate of Product Liability Insurance for one (1) million dollars.

Warranty: The manufacturer shall warranty replacement of any items or components found to be defective during the manufacturers' warranty period. The Contractor must submit the original guarantee certificate to the Engineer at the completion of the project. The Contractor shall furnish the original and 4 (four) copies of the manufacturers' warranty.

Manual: One (1) copy of the Installation and Maintenance (or Owner Information) manual complete, as provided by manufacturer.

**MEASUREMENT AND PAYMENT:** For furnishing and installing all PLAY EQUIPMENT AT 10<sup>th</sup> STREET in accordance with the plans, approved shop drawings, specifications and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

The price bid shall be a **LUMP SUM** for all steel play equipment and shall include the cost of all labor, materials, equipment and incidentals necessary to complete the work, including unclassified excavation, concrete footings, the cost of hiring of an independent CPSI, if required, and all submittals, in accordance with the plans, approved shop drawings and specifications, to the satisfaction of the Engineer.

Upon submission and approval of the required shop drawings the Contractor shall receive three (3%) percent of the total bid price. Partial payment for stored materials may be granted in accordance with NYCDOT Standard Highway Specifications, **Section 1.06.35**. Twenty (20%) percent of the total bid price for this Item shall be withheld until the insurance certificate and Document Of Acceptance have been submitted.

In addition, the Contractor shall deliver INCIDENTAL MATERIALS as outlined above to the Engineer. No additional payment shall be made for incidental materials. Contractor shall include cost in the bid price.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 097</b>	<b>PLAY EQUIPMENT – 10<sup>th</sup> STREET</b>	<b>L.S.</b>

**END OF SECTION**

## SECTION PK-ESCR 103 – SIGNAGE AND WAYFINDING (BIKEWAY)

**PK-ESCR 103.1 WORK:** Under this Item, the Contractor shall furnish and install signs, in accordance with the plans and as directed by the Engineer.

**PK-ESCR 103.2 MATERIALS:** All signs shall conform to all applicable City, State and Federal Highway regulations.

Signs shall be weather-resistant, and following cleaning shall show no appreciable discoloration, cracking, blistering, or dimensional change, and retain not less than 80% of the specified minimum brightness values when exposed to accelerated weathering in accordance with ASTM D822-60.

Signs shall be made of thermally stabilized aluminum alloy sign blank .080" thickness, powder coated white. Each sign blank shall be cut from one piece of aluminum, and shall be free from wind, buckle, dents or twist. Welded or jointed sign blanks will not be accepted.

The face shall be substantially a plane surface. Surface finish shall be smooth, free of mill marks or other imperfections. All edges shall be filed or ground smooth, leaving the entire blank free from sharp edges and burrs. All corners shall be rounded with one half (1/2") inch radius corner or as indicated on the plans.

All signs shall be punched with three-eighths (3/8") inch diameter brackets and the heads of exposed fasteners shall match sign color specified. Mounting hardware shall be fully concealed except as approved by the Engineer. Attachment and installation methods shall be in accordance with best practices using devices and fasteners to suit the conditions of the surface to receive the installation.

All fasteners and hardware shall be vandal-proof.

For all types of signs used to convey "cautionary" messages, as defined by the Manual on Uniform Traffic Control Devices (MUTCD), shall be yellow/gold color with one-half (1/2") inch white border all around.

A. Horizontal Sign Clearance: Horizontal sign clearance shall be as shown on the plans and in accordance with the following manuals.

B. Vertical Sign Clearance: Vertical sign clearance shall be as shown on the plans and in accordance with the following manuals.

C. Sign Face Layout: Sign face layout shall be as shown on the plans and in accordance with the following manuals.

1. The AASHTO Manual for Signing and Pavement Marking of the National System of Interstate and Defense Highways, latest edition including revisions and interpretations.
2. Manual of Uniform Traffic Control Devices for Streets and Highways, latest edition.
3. New York State Manual of Uniform Traffic Control Devices, latest edition.

**PK-ESCR 103.3 INSTALLATION:** Ground mounted signs shall normally be erected so that the sign face is truly vertical and the intersection angle measured between the sign face and the centerline of the travel lane which the sign serves shall be 93 degrees. Where lanes divide or on curves, sign faces shall be oriented so as to be most effective both day and night, and to avoid the possibility of specular reflection.

The erection of the sign shall include all work necessary to secure the signs in the prescribed positions on the supports including the installation of clamps and brackets; the attachment of signs to the supports; any work necessary to locate the signs in the prescribed locations; the supplying of bolts, nuts, clamps, brackets, strapping, and other necessary appurtenances, as indicated on the plans, or as directed by the Engineer.

Sign Installation Method I: Method I shall be used for the installation of sign or sign assembly mounted on "EL" columns, street light posts, traffic signal posts, etc. Method I shall use a *Plus 4* stainless steel flared leg sign bracket or a *Minus 4* stainless steel straight leg sign bracket per NYC DOT standards.

Sign Installation Method II: Method II shall be used for the installation of sign or sign assembly edge mounted on sign post of the steel rail type. Method II shall use machine bolt, cadmium-plated 5/16-18NC, 2" x 3/4" hexhead, 1/2" across flats and elastic stop nuts cadmium-plated 5/16-18T, 9/16" across flats. Two machine bolts and nuts shall be used for each sign mounted on sign post of the steel rail type.

Installation of Sign on Sign Post: Installation of sign on a sign post of the steel rail type comprises the attachment of appropriate sign by Method II. The work shall be done so that the sign faces are plumb and at a 45 degree angle with the curb facing the direction of traffic with the bottom of sign at seven (7') feet from finished grade.

Installation of Sign on "EL" Column, Lamppost, Traffic Signal, Etc.: Installation of sign on "EL" column, lamppost, traffic signal, wood pole, etc. comprises the attachment of appropriate sign by Method I in accordance with the contract documents. The work shall be done so that the sign faces are plumb and at a 45 degree angle with the curb, facing the direction of traffic with the bottom of sign at seven (7') feet from finished grade.

Sample Installations: The Contractor shall install at least one sample of each typical sign for approval. Upon such approval, they shall form the standard for the installation of all signage included in this contract.

Sign Locations: Prior to installation, the Contractor shall stake out the locations of all signs as shown on the plans. The Contractor shall verify sign locations with the Engineer prior to installation.

**PK-ESCR 103.4 SUBMITTALS:** The Contractor must submit the following to the Engineer for approval:

1. Shop drawings to include, but not be limited to, layout of sign fabrication showing sizes and shapes of members.
2. Production prototype samples of graphics. Submit all camera-ready proofs of typography, symbols and/or graphics prior to making screens or patterns for approval.
3. Samples of all materials and products, color samples, and all finishes shall be submitted for approval prior to fabrication.
4. A finished sample of each type of sign for approval prior to fabrication of all signs.
5. Two (2) samples each of the stainless steel strap and the two (2) piece sign bracket.

**PK-ESCR 103.5 MEASUREMENT AND PAYMENT:** The quantity of **SIGNAGE AND WAYFINDING (BIKEWAY)** shall be the number of **SQUARE FEET** of sign provided and installed (measured on one side only) in accordance with the plans, specifications, and directions of the Engineer.

PARKS-73

## SECTION PK-ESCR 105 – THERMOPLASTIC EXTRUDED LINES

**WORK:** Under this item, the Contractor shall furnish and apply hot extruded reflectorized **THERMOPLASTIC EXTRUDED LINE 4" WIDTH (WHITE/YELLOW)** to define lanes and center lines all in accordance with the plans, specifications, directions, and approval of the Engineer, MUTCD and NYCDOT.

**INTENT:** It is the intent of this item to pay for thermoplastic extruded white or yellow lines four (4") inches width in any quantity.

**MATERIAL:** The markings shall be a thermoplastic compound which is hot extruded directly onto the pavement, and shall contain a minimum of 20% glass beads as part of the aggregate in the material to act as the basic reflective material. Color of lines to be as indicated on the plans.

The thermoplastic material shall be 100% virgin stock, using no reprocessed materials. Pigments, beads and filler shall be uniformly dispersed in the resin. The material shall be free of all skins, dirt and foreign materials.

Immediate reflectance shall be supplied by dropping additional glass beads upon the line during application at a rate of 6 lbs. per 100 sq. ft.

The manufacturer has the option of formulating the thermoplastic material according to the manufacturer's own specifications. However, the manufacturer shall meet the minimum requirements specified herein, including but not limited to; composition, physical characteristics, etc. The physical and chemical properties contained in this specification shall apply regardless of the type of formulation used.

The Contractor shall furnish a laboratory report of the material, consisting of the following tests:

- |  |                    |
|--|--------------------|
| 1. Color Retention                             | ASTM D620-57       |
| 2. Indentation                                 | ASTM D2240-68      |
| 3. Flexibility                                 | ASTM D747          |
| 4. Binder Content                              | ASTM D4797         |
| 5. Titanium Dioxide Content X-Ray Fluorescence | ASTM D476 - Type 2 |
| 6. Glass Beads                                 | ASTM D1155         |

The following physical specifications shall be strictly adhered to:

### (a) Color

- (1) White: Initially white: as demonstrated by a standard color difference meter such as the Gardner Color Difference Meter. The material shall show a deviation from a Magnesium Oxide standard not greater than the following: Reflectance (RD) 70min.
- (2) Yellow: Yellow color shall reasonably match color chip numbers 13538 of Federal Standard number 595 and be lead free.

Color Characteristics: The thermoplastic material without glass beads shall meet the following:

White: Daylight reflectance at 45 degree / 0 degree of 80% minimum.

Yellow: Daylight reflectance at 45 degree / 0 degree of 45% minimum.

(b) Color Retention:

The retention of the initial color shall be determined as follows:

Specimens shall be prepared and tested from samples submitted in accordance with ASTM designation D620-57T, "Tentative method of test for color fastness of plastic; Ultra Violet Light and Condensate Exposure, ASTM G53, 300 hours total, alternate 4 hours condensate exposure at 40 deg.C, 4 hours UV exposure at 60 deg. C.

(c) Indentation Resistance

The reading of the shore durometer, Type A2, as described in ASTM designation D2240-68, after fifteen seconds shall not be less than 95 when the material is tested after heating for four hours at 400 deg. F, and cooled at 75 deg. F.

(d) Cracking Resistance

At low temperatures after heating the thermoplastic material for 4 hours at 218 deg.C (425 deg.F), applied and cooled to -9.4 +/-1.7 deg.C (15 +/-3 deg.F) the thermoplastic material shall show no sign of cracking or chipping.

(e) Glass beads

The glass spheres shall be colorless, clean, transparent, free from milkiness or excessive air bubbles and essentially clean from surface scarring or scratching. They shall be spherical in shape and at least 70% of the glass beads shall be true spheres when tested in accordance with ASTM D1155.

The refractive index of the spheres shall be a minimum of 1.50 as determined by the liquid immersion method at 25 deg.C.

(f) General Characteristics

The thermoplastic material shall be readily applicable at temperatures between 400 & 450 deg.F from the approved equipment to produce lines and symbols of the required thickness as described in the contract document.

The thermoplastic material shall not deteriorate or discolor when held at the application temperature for periods of time up to 4 hours or upon repeated reheating (a minimum of 4 times). The color, viscosity, and chemical properties versus temperature characteristics of the thermoplastic material shall remain constant for up 4 hours at the application temperature and shall be the same from batch to batch.

The compound shall not deteriorate by contact with sodium chloride, calcium chloride, or other chemicals used against formation of ice on roadways or streets, or because of the oil content of pavement materials, or from oil droppings from traffic. Deposits of dirt, tar, road material, tires, or other foreign material shall not adhere to the installed line. The line shall not blacken or discolor after vehicles pass over the line.

### (g) Other Requirements

Thermoplastic material shall not emit fumes that are toxic or injurious to persons or property when it is heated to application temperature. The material shall not emit excessive smoke during heating or application.

**STRIPING MACHINE:** The required lines shall be installed with a striping machine, (also known as a hand liner) of a type approved by the Engineer. The line shall be installed by making one pass over the designated length, and producing a continuous, well-defined line 4" or 8" in width, not less than 3/32 inches in thickness, and uniform in cross-section. The end of the line shall be a straight edge. The machine shall be capable of installing an acceptable line over existing thermoplastic lines, and on roadway surfaces existing in the City of New York.

### **INSTALLATION**

The Contractor will be required to spot and install the lines in accordance with NYCDOT Bureau of Traffic Operations and any other details or information to be provided by the Engineer.

Plastic material is not to be applied below +50 deg. F, or on wet pavements, or during periods of high humidity, except with special permission of the Engineer. Before proceeding to mark any line, the Contractor shall clean the area of the surface to be marked, and make certain that the pavement is free of dirt, foreign material, oil, etc.

On pre-existing pavements, the installer shall pre-warm the pavement prior to placing markings, per the manufacturer's instructions.

The work included herein shall be done in a neat, professional manner, pleasing to the eye, and shall be kept straight so far as total alignment is concerned. To assure alignment, the Contractor shall snap guidelines. Spotting, spilling, or other marking of the roadway with marking material will not be tolerated, especially if due to carelessness or lack of skill on the part of the Contractor, and must be removed by the Contractor. The line or portion thereof shall be protected from both vehicular and pedestrian traffic by use of adequate warning devices as mentioned hereinbefore, until thoroughly past the point of tracking or smearing.

When raised reflective pavement markers exist, special care shall be taken to prevent the reflector from being covered by the thermoplastic material. Any reflectors so damaged shall be replaced by the Contractor at no cost to the City.

The Engineer's decision as to the acceptability of any installed line shall be final and binding on all parties to the contract. The Engineer may, at the Engineer's discretion, require the Contractor to remove all extraneous marks on the pavement made by the agents or employees of the Contractor, or made by others due to improper control or protection of the line by the Contractor, the Contractor's agents or employees. Any lines, or group of lines which, in the opinion of the Engineer, are not acceptable, whether by reason of poor workmanship, poor appearance, poor performance, poor materials, improper width or improper alignment shall be reworked by the Contractor at no cost to the City to the satisfaction of the Engineer, within fifteen (15) days after written notification of the rejection of such completed work is received.

### **DESCRIPTION:**

**Lane and Center Lines:** Shall be four (4") inch wide. Cross walk lines shall be as required by NYCDOT or to match existing lines.

**SUBMITTALS:**

All submittals shall be in accordance with the requirements of the S-Pages and be submitted prior to manufacture.

Samples: The Contractor shall submit two eight inch (8") by twelve inch (12") extruded samples of material to be used in this contract. One sample shall contain surface beads, the other without surface beads.

**MEASUREMENT AND PAYMENT:** The quantity of **THERMOPLASTIC EXTRUDED LINE 4" WIDTH** to be paid for under this item shall be the number of **LINEAR FEET** of lines, painted in accordance with the plans, specifications and directions of the Engineer. Payment for lines other than 4" wide will be based upon the equivalent of four inch lines, (for example, an eight inch line would be paid at two linear feet for each one foot of line).

The price bid shall be a unit price per **LINEAR FOOT** and shall include the cost of all labor, materials and equipment, and incidentals necessary to complete the work in accordance with the plans and specifications to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 105</b>	<b>THERMOPLASTIC EXTRUDED LINE 4" WIDTH</b>	<b>L.F.</b>

**END OF SECTION**

## SECTION PK-ESCR 106 – THERMOPLASTIC HFPRM LINES, SYMBOLS

**WORK:** Under the items the Contractor shall furnish and install various Thermoplastic Heat Fused Preformed Reflective Markings, (hereafter known as Thermoplastic HFPRM) of various types in accordance with the plans, specifications and directions of the Engineer. The markings include symbols and word messages.

**DESCRIPTION:** Typical symbols and word messages are shown on the plans. Markings shall include, but not be limited to the following word messages and symbols:

**Word Messages:** Shall be white and include, but not be limited to: PED ONLY, SLOW, CAUTION.

**New York City DOT Designations:** The following codes are the applicable NYC DOT codes for the respective symbols:

Bicycle Lane Arrow:	MG-550
Designated Bicycle Lane Symbol-Class II:	MG-532
Bicycle Trail Symbol-Class I:	MG-533
In-Line Skater Symbol:	MG-551
Pedestrian Symbol:	MG-549

**MATERIAL:** The Preformed Markings shall be capable of adhering to asphaltic concrete and cement concrete pavements by means of heat fusion. Adhesives, primers or sealers shall not be used prior to the preformed markings application on pavements. They shall be very durable, oil and grease impervious and provide immediate and continuing retroreflectivity. Hot tape products are not acceptable. Preformed markings shall be similar to PreMark with ViziGrip as manufactured by Ennis-Flint, Thomasville, NC, Crown Technology, LLC, Woodbury, GA or approved equal.

The Preformed Marking material shall consist of a resilient white, green and yellow polymer thermoplastic with uniformly distributed glass beads throughout its entire cross section, and shall conform to the current edition of the Manual of Uniform Traffic Control Devices for Streets and Highways as issued by the U.S.A. Federal Highway Administration.

The preformed markings shall conform to pavement contours, breaks and faults through the action of traffic at normal pavement temperatures. The markings shall have resealing characteristics and be capable of fusing to itself and previously applied worn hydrocarbon and/or alkyd thermoplastic pavement markings.

The Preformed Markings shall be capable of application on new, dense and open graded asphalt concrete wearing courses during the paving operation in accordance with the manufacturer's instructions. After application, the markings shall be immediately ready for traffic. The preformed markings shall be suitable for use for one (1) year after the date of receipt when stored in accordance with the manufacturer's recommendations.

The Preformed Markings shall not be brittle and must be sufficiently cohesive and flexible at temperatures exceeding 50 degrees °F for one person to carry without the danger of fracturing the material prior to application. They shall be highly durable retroreflective pliant polymer thermoplastic materials designed for transverse, longitudinal, legend and symbol markings subjected to high urban traffic volumes and particularly severe wear conditions such as repeated shear action from crossover or encroachment on typical configurations such as crosswalks, edge lines and lane lines.

Composition: The markings shall consist of a homogeneous mixture of high quality polymeric thermoplastic binders, pigments, fillers and glass beads. The thermoplastic material must conform to AASHTO designation M249-79(86) with the exception of the relevant differences due to the material being preformed. They shall contain a minimum of 30% glass spheres which shall conform to AASHTO M247-81 Type 1, except that glass spheres shall have a minimum of 70% true spheres on each sieve and 80% true spheres overall. The glass beads must be homogeneously blended throughout the material with a securely bonded protruding exposed layer of beads that provide immediate and continuous retroreflectivity; no additional glass beads shall be dropped on the material during application. Curved arrows must be available without protruding glass beads if reversibility is needed.

Retroreflectivity: The preformed markings shall, upon application, exhibit uniform adequate nighttime retroreflectivity. At 86 degree 30' incidence angle and 1 degree 30' divergence angle, the markings shall have average minimum intensities of 350 millicandelas for white and 175 millicandelas for yellow as measured with a MiroLux retroreflectometer.

Color Characteristics: The thermoplastic material without glass beads shall meet the following:

White: Daylight reflectance at 45 degree/ 0 degree of 80% minimum.

Yellow: Daylight reflectance at 45 degree/ 0 degree of 45% minimum.

The daylight reflectance shall not change significantly when the preformed thermoplastic is properly applied to the roadway surface. Yellow material shall not degrade when exposed to heat placed by appliance torch.

For highway use, the white markings shall contain a minimum of 8% by weight of Titanium Dioxide pigment. Yellow color shall reasonably match color chip number 13538 of Federal Standard number 595 and be lead free.

Green shall be American Reflective Products- (Magna code #912-1), or approved equal.

Skid Resistance: The surface of the preformed thermoplastic markings shall provide a minimum skid resistance value of 55BPN when tested according to ASTM E303-74.

Thickness: The width of the supplied material shall have a minimum average thickness of .090 inch (2.3mm), (Expressed as 90 mils), except for lanes markings and symbols for Park paths which shall be 60 mils.

Tensile Strength and Elongation: The preformed thermoplastic film shall have a minimum tensile strength of 150 lbs. per square inch of cross section, at 90 mil (2.3mm) thickness, when tested according to ASTM-D-638-76 except that a sample 6" by 1" shall be tested at a temperature between 70 degrees °F and 80 degrees °F using a jaw speed of 10" to 12" per minute. The sample shall have a maximum elongation of 20% at break when tested by this method.

Environmental Resistance: The applied markings shall be resistant to deterioration due to exposure to sunlight, water, oil, diesel fuels, gasoline, pavement oil content, salt and adverse weather conditions.

Effective Performance Life: When properly applied, in accordance with manufacturer's instructions, the pavement markings shall be neat and durable. The markings shall remain retroreflective and show no fading, lifting, shrinkage, tearing, roll back or other signs of poor adhesion and shall not dissolve or smear after rubbing a small amount of motor oil on a small piece of preformed thermoplastic for two (2) minutes.

**INSTALLATION:** The markings shall be applied in strict accordance with the manufacturer's recommendations on clean and dry surfaces. New concrete surfaces must be sandblasted to entirely remove curing compound. No additional payment will be made for said sandblasting, the cost therefore shall be considered part of the price bid for this item.

Marking configuration shall be in accordance with the "Manual on Uniform Traffic Control Devices".

The work included under this item shall be done in a neat, professional manner, pleasing to the eye, and shall be kept straight so far as total alignment is concerned. To ensure alignment, the Contractor shall snap guidelines. Spotting, spilling, or other marking of the roadway with marking material will not be tolerated, especially if due to carelessness or lack of skill on the part of the Contractor, and must be removed by the Contractor.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Samples:** The Contractor shall submit the following for approval:

One four inch (4") by four inch (4") sample of the HFPRM material along with manufacturers specification clearly illustrating that product meets the minimum skid resistance requirements.

One drawing, at a reasonable scale, of each symbol to be used in this contract.

One drawing of a typical letter to be used in this contract.

**MEASUREMENT AND PAYMENT:** The quantity of **THERMOPLASTIC HFPRM LINES, SYMBOLS** to be paid for under this item shall be the number of **EACH** type furnished and installed complete in accordance with plans and specifications and directions of the Engineer.

For furnishing and installing **THERMOPLASTIC HFPRM-WORD MESSAGES**, the Contractor shall be paid for **EACH** letter of word message furnished and installed in accordance with the plans, specifications and directions of the Engineer.

The prices bid shall be a unit price for **EACH** Arrow or Symbol and **EACH** letter included in each word message and shall include the cost of all labor, material and equipment necessary, including preparing pavements for application, and all incidental expenses necessary to complete the work in accordance with the plans, specifications and directions of the Engineer.

Lane and Center lines (where shown on the drawings) shall be paid under the item "Thermoplastic Extruded line-4" Width".

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 106</b>	<b>THERMOPLASTIC HFPRM LINES, SYMBOLS</b>	<b>EA</b>

**END OF SECTION**

## SECTION PK-ESCR 109 – SOD NEW LAWN

**WORK:** Under this Item, the Contractor shall furnish and install **SOD NEW LAWN** areas including preparation of sod bed and shall maintain new lawn areas in accordance with the plans, specifications, and directions of the Engineer.

**INTENT:** This specification is intended for rototilling and sodding new lawn of any size on either new or existing topsoil.

### **MATERIALS:**

**Sod:** The approved Sod is superior sod grown from high quality seed of known origin. Seed is to be inspected by a Certification Agency to assure satisfactory genetic identity and purity, overall high quality, and freedom from noxious weeds at time of harvest.

The blend/mix of grass in sod shall meet the specifications set below and shall be harvested from one field to ensure a uniform color and texture. Percentages of each grass type by weight are to be within the given range for that type:

- |         |   |
|---------|---|
| 65%-85% | TALL FESCUE - One or more of the following varieties: Apache II, Arid3, Conchise III, Coronado Gold, Falcon IV, Jaguar III, Lancer (SH), Masterpiece, Rebel IV, Rebel Jr.(SH), Rebel Sentry, Rembrandt, Tomahawk E+, RTF or approved equal. |
| 15%-25% | BLUEGRASS - One or more of the following varieties: Able I (SH), Blacksburg, Glade (SH), Moonlight, Midnight, America (SH), Brilliant, Ram (SH), Touchdown (SH), Warren's A-34 (SH), Bristol (SH), Lofts 1757 (SH) or approved equal.       |
| 0 - 10% | PERENNIAL RYEGRASS - One or more of the following varieties: Brightstar II, Manhattan 4, Citation Fore, Elfkin, or approved equal.  |

NOTE: The cultivars followed by "(SH)" exhibit better shade tolerance than other varieties, under moderate shade. Sod shall be machine cut to a uniform soil thickness of five-eighth inch (5/8"), plus or minus one-quarter inch (1/4") at the time of cutting. Measurement for thickness shall exclude top growth and thatch.

Individual pieces of sod shall be cut eighteen inches (18") wide by sixty inches (60") long (7 1/2 sq.ft.) or rolls four feet (4') wide by fifty feet (50') long (200 sq.ft.). Standard sections of sod shall be strong enough to support their own weight and retain their size and shape when suspended vertically. Sod shall not be harvested or transplanted when moisture content may adversely affect its survival.

Sod shall be harvested, delivered, and transplanted within a period of thirty six (36) hours. Before cutting, Sod shall be mowed uniformly at a height of one and one-half inches (1 1/2"). The Engineer may inspect the Sod before it is harvested, but reserves the right to reject, on or after delivery, any Sod which, in their opinion, does not meet with the specifications.

When sod is delivered with monofilament (plastic or similar) backing, the backing shall be removed after rolling out the sod and discarded in an approved manner.

Ground Limestone: (Calcium Carbonate) shall have the following analysis: at least fifty percent (50%) shall pass a 200 mesh sieve; at least ninety percent (90%) shall pass a 100 mesh sieve; and one hundred percent (100%) shall pass a 10 mesh sieve. Total carbonates shall not be less than eighty (80) percent or 44.8% Calcium oxide equivalent. Pelleted limestone may be substituted at the discretion of the Engineer, when wind conditions exceed five (5) miles per hour.

The Contractor shall, at the direction and discretion of the Engineer, furnish a certified report of chemical analysis of representative samples of the Limestone which he proposes to use. All samples are to be taken by the Engineer and delivered to the laboratory: the price bid shall include inspection and laboratory charges. Limestone shall not be delivered until samples have been approved by the Engineer, but such approval does not constitute acceptance of the material. The Engineer reserves the right to reject on or after delivery any material which does not, in the Engineer's opinion, meet these specifications.

All limestone shall be delivered in standard size bags of the manufacturer showing weight, analysis, and name of the manufacturer. It shall be stored in such a manner that its effectiveness will not be impaired, as directed by the Engineer.

The rate of application of limestone per thousand (1,000) square feet shall be as follows, depending on the Hydrogen Ion concentration (pH) shown by a pH test (pH test to be provided by the Contractor at no additional cost to the City).

<u>pH</u>	<u>RATE (LBS.)</u>
Below 5.0	160
5.0 to 6.0	80
Over 6.0	0

Commercial Fertilizer Low Phosphorus (Slow Release): shall have the following composition by weight: Nitrogen (N) shall be min. 4% - max. 10%, of which min. of 50% is slow-release; available Phosphorus (P) shall be 0.67% or less (unless soil test indicates a need for additional phosphorus); and soluble Potash (K) shall be min. 4% - max. 12%.

Fertilizer shall be a pesticide free (no weed-and-feed) product such as Safer Ringer Lawn Restore II 10-0-6 as manufactured by Woodstream corp., Lifitz, PA; "Healthy Turf (8-1-9)" as manufactured by Plant Health Care, Inc., Pittsburgh, PA; Nutrients Plus (7-2-12) as manufactured by Nutrients Plus, Virginia Beach, VA; or approved equal.

All Commercial Fertilizer Low Phosphorus (Slow Release) shall be delivered in standard size bags of the manufacturer, showing weight, analysis, and name of manufacturer. It shall be stored as directed by the Engineer in such a manner that its effectiveness will not be impaired.

Application of any fertilizer on lawns or non-agricultural turf within 20 feet of a water body or on paved surfaces is restricted and may not be applied unless there is a buffer at least 10 feet wide of planted or naturally occurring vegetation, such as shrubs, trees and plants between the area receiving fertilizer and the water. Fertilizer shall not be applied between December 1 and April 1.

The rate of application: Two (2) applications of acceptable commercial fertilizer shall be applied by machine, each application at the rate of ten (10) pounds per 1,000 square feet or as recommended by the manufacturer. The first application shall be made at the time installation of Sod as specified.

The second application shall be made approximately six (6) months after the first application. This treatment shall take place during the next appropriate fertilizing season, the following Spring or Fall, and shall be subject to the direction of the Engineer.

The second application shall be applied to the surface only. Incorporation shall be achieved by thoroughly watering the entire area after application. The Contractor shall provide all labor and materials, including water, if not available from NYC sources.

**PREPARATION OF SOD BED:** Before any sod is placed, all areas to receive sod shall be thoroughly loosened with a rototiller to a depth of six inches (6"). All sticks, stones, roots, vegetation, or other objectionable material which might interfere with the formation of a finely pulverized sod bed shall be removed from the soil and a smooth uniform surface grade shall be established. Hollows, depressions, and gullies shall be filled by raking to level and topsoil added as necessary to provide a smooth surface prior to sodding. Topsoil shall be spread over the area to receive sod to the depth indicated on the drawings and as required to achieve the designated finished grade.

Compost (where required, paid separately): shall be thoroughly incorporated into the top five inches (5") of soil, where sod will be installed on existing topsoil and where soil testing indicates low levels of organic matter. Where required, the compost shall be spread at the rate of one (1) cubic yard per one thousand (1,000) square feet unless otherwise directed by the Engineer. Where seed will be installed on new topsoil, compost shall not be added.

Amendments: After the compost has been incorporated into the existing soil, limestone (where required) and Commercial Fertilizer Low Phosphorous (Slow Release) shall be worked into the top three inches (3") of soil as directed by the Engineer.

All amendments must be submitted for approval, see SUBMITTALS: The Contractor shall notify the the Engineer three (3) days prior to application of amendments.

**INSTALLATION:** All areas to receive sod shall then be compacted using a two hundred pound (200 lb.) roller. The area shall then be thoroughly watered prior to the placement of Sod. After drying out sufficiently, the area shall be considered ready to receive the sod.

Sod is not to be delivered or placed in a frozen condition. Sod shall be harvested, delivered, and installed within a period of thirty six (36) hours. No sod shall be harvested, delivered, or placed when, in the opinion of the Engineer, high temperatures may adversely affect the survival of the Sod.

The first row of sod shall be laid in a straight line with subsequent rows placed parallel to and tightly against each other. Lateral joints shall be staggered, each piece butted close together with no voids between the pieces. Care shall be exercised to ensure that the sod is not stretched or overlapped. Where mechanical equipment is used to lay sod, flotation tires are to be used. The sod shall be rolled immediately after placement and then thoroughly watered.

Sod shall be laid a minimum of four (4) weeks prior to the Substantial Completion date to allow the sod to thoroughly knit before being turned over to the City. All dead sod shall be replaced prior to the Substantial Completion. All extra sod and/or plant debris remaining from the preparation procedure shall be removed from the site. The Contractor shall be liable for any damage to property caused by their sodding operations. All areas and construction disturbed shall be restored to their original condition, to the satisfaction of the Engineer.

**WATERING AND MAINTENANCE:** The Contractor shall maintain all sodded areas until Substantial Completion of the contract. The Contractor shall properly water as required to maintain optimum growing conditions for the new stand of grass until Substantial Completion. Where water is supplied from City hydrants, the Contractor shall obtain a hydrant permit from the Department of Environmental Protection. The Contractor is responsible for keeping the permits current. The permits are available from each borough office. To obtain a permit, the Contractor should bring a copy of their contract with a general description of the hydrant location(s) they propose to access. The addresses of borough offices are:

Manhattan: 1250 Broadway (8th floor)  
Brooklyn: 250 Livingston St. (8th floor)  
Bronx: 1932 Arthur Avenue (6th floor)  
Queens: 96-05 Horace Harding Ex., Corona  
Staten Island: 60 Bay St (6th floor)

If water is not available from NYC sources, the Contractor is responsible for supplying water from their own source.

In absence of adequate rainfall, watering shall be performed daily or as often as necessary and in sufficient quantities to maintain moist soil to a depth of at least four (4") inches. Watering shall be done during the heat of the day to prevent wilting.

The first mowing shall not be attempted until the Sod is firmly rooted and secure in place. Not more than forty percent (40%) of the grass leaf shall be removed by mowing. The grass height shall be maintained between one and one-half inches (1 1/2") and three inches (3"), as directed by the Engineer, until Substantial Completion. Any unsatisfactory sod shall be removed and replaced at the Contractor's expense.

**SUBMITTALS:** Submittals shall be as per the S-Pages.

**Sod Mix:** The Contractor shall submit a document from the sod source for approval prior to delivery of sod to the site showing the seed composition and percentages of each grass type proposed.

**Amendments:** The Contractor shall submit proposed soil amendments for approval prior to delivery.

**Invoices:** The Agency reserves the right to request Contractor's invoices for all products used in this item.

**MEASUREMENT AND PAYMENT:** The quantity of **SOD NEW LAWN** to be paid for under this Item shall be the number of **SQUARE FEET** of sod furnished, placed, and maintained in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be a unit price per **SQUARE FOOT** of Sod and shall include the cost of all labor, materials, and equipment necessary or required to prepare the sod bed, incorporating Limestone (where needed), Commercial Fertilizer Low Phosphorous (Slow Release), dispose of surplus materials, furnish, lay, maintain, and water Sod and all work incidental thereto, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Topsoil shall be paid for separately. Compost (where required per test results for existing soil) shall be paid for under its respective contract item. The price of water, regardless of the source, shall be considered part of the bid price.

Payment for work performed under this item shall be made as follows:

40% - after preparation of sod bed

30% - after sodding and rolling

10% - after second application of fertilizer

20% - at Substantial Completion, to the satisfaction of the Engineer.

**END OF SECTION**

## Section PK-ESCR 110 – INSTALL PLANT MATERIAL

**WORK:** Under this Item, the Contractor shall excavate all plant pits and install, plant, maintain, and replace all **PLANT MATERIAL** specified in the Plant Schedule, in accordance with the plans and specifications, or as directed by the Engineer.

The Contractor shall be liable for any damages to property caused by planting operations, and all areas and construction disturbed shall be restored to their original conditions, to the satisfaction of the Engineer.

**NAMES:** Plant names, size, and grading standards shall conform to those prepared by the American Standard for Nursery Stock (ANSI Z60.1- 2014) unless otherwise specified. Genus, species and cultivar are listed in accordance with the International Code of Nomenclature (ICN). No substitutions will be permitted except upon written permission of the Engineer as an approved equal.

**ASIAN LONGHORNED BEETLE QUARANTINE ZONE REGULATIONS:** Due to current Federal, State and NYC DPR policy, the following host species may not be planted in the quarantine zone. Host species are as follows: Acer-Maple, Aesculus-Horsechestnut/Buckeye, Salix-Willow, Betula-Birch, Populus-Poplar, Ulmus-Elm, Albiza-Mimosa/Silk Tree, CeltisHackberry, Fraxinus-Ash, Platanus-London Planetree, Sycamore, Sorbus-Mountain Ash.

In addition, Nurseries located within the quarantine zone shall comply with State and Federal Law and all Contractors and/or Subcontractors shall be Certified by the New York State Department of Agriculture and Markets to perform work within the Quarantine Zone (see Submittals section below).

**QUALITY:** All plants shall be typical of their species or variety. They shall have normal, well developed branches and vigorous fibrous root systems. They shall be sound, healthy, vigorous plants free from defects, disfiguring knots, sun scald injuries, dead or broken branches, abrasions of the bark, plant diseases, insect eggs, borers, and all forms of infestation. All plant material shall be tagged by the Engineer who shall reject all plant materials not meeting the above specifications, and trees having damaged or missing leaders, multiple leaders, Y-crotches, or indications of topping or heading back.

All plants shall be nursery-grown, unless otherwise stated. All trees and shrubs shall have been growing under similar climatic conditions as the project site two (2) years prior to the date of the contract. Plants held in storage will be rejected if they show signs of growth during storage. Collected plants shall be taken from a soil favorable to good root development. All collected material shall be clean sound stock, free from decaying stumps.

Herbaceous plants, vines, and groundcover shall be vigorous healthy plants, a minimum two (2) years old, from cuttings, seed, or division, with well-developed root systems and crowns, as specified in the Plant Schedule. Bulbs, corms, tubers and rhizomes shall be firm, non-desiccated, and certified free of disease and viral infection, of the sizes, grades, and varieties indicated in the Plant Schedule.

**PLANT SOURCES FOR NATIVE PLANTS ONLY, WHERE APPLICABLE:** Native plant material must be derived from the local genotypes of the native Plants specified. For purposes of this native plant material paragraph, "local" shall mean within 150 miles from the planting site. However, a reasonable effort shall be made to obtain sources of plant material as close to the planting site as possible. All plants must have been grown in a hardiness zone no warmer than Zone 7 or colder than Zone 6 as determined by the USDA Agricultural Research Service, Plant Hardiness Zone Map. Plant quality shall be typical of their species. Plant material should exhibit the range of variation typical of local genotypes of the species as determined by the Engineer.

They shall have normal branching and vigorous fibrous root systems. They shall be sound, healthy plants, free from sunscald injuries, or other mechanical injury, plant diseases, insect eggs, borers and all forms of infestations. All plants shall be nursery grown unless otherwise stated. Collected material will not be accepted. Except as may otherwise be specified in this native plant material paragraph, all other sections of this Plant Material specification shall also apply to the Native Plants. The native plant material, subject to availability and adherence to the requirements of this paragraph, may be purchased from the following nurseries or approved equal nurseries as determined by the Engineer in consultation with NYCDPR.

1. Greenbelt Native Plant Center, Staten Island, NY
2. Pinelands Nursery, Columbus, NJ
3. Sylva Native, Glen Rock, PA

**ORDERING PLANT MATERIALS:** The Contractor shall notify the Engineer of the unavailability of any tree, shrub, herbaceous plant, or bulb species designated in the contract, as well as provide confirmation to the Engineer of all orders from all sources of supply. Any request for species substitution due to unavailability must be submitted in writing Engineer, within thirty (30) days of the Order to Work date. The Contractor must include the names and addresses of at least ten (10) nurseries they have contacted in an effort to locate these species, and the list shall be submitted to the Engineer. All nurseries supplying material shall be required to have a certificate from the Department of Agriculture and Markets, Division of Plant Industry, New York, or any other state where plant material is obtained, certifying that plant material is apparently free of injurious insects and diseases.

**DIMENSIONS:** A plant shall be dimensioned as it stands in its natural position. Trees up to and including four-inch (4") caliper size shall be measured six inches (6") above ground level. Trees over four inches (4") in caliper size shall be measured twelve inches (12") above ground level. Stock furnished shall be a fair average of the minimum and maximum sizes specified. Larger plants cut back to sizes specified will not be accepted.

Container grown herbaceous plants, groundcover, and vines shall be well rooted in the container size indicated on the Plant Schedule, grown in the container at least one year prior to planting. Bulbs, corms, tubers and rhizomes shall be Top Size, or as indicated on the Plant Schedule. Annual flowering plants shall be vigorous, well rooted, with no indications of disease or stress.

**PREPARATION OF PLANTS:** All precautions customary in good trade practice shall be taken in preparing plants for moving. Workmanship that fails to meet the highest standards will be rejected. All plants shall be dug immediately before moving unless otherwise specified. All plants shall be dug to retain as many fibrous roots as possible. Balled and burlapped and balled and platformed plants shall have a solid ball of earth of minimum specified size, securely held in place by burlap and stout rope or twine. Oversized or exceptionally heavy plants are acceptable if the size of the ball or spread of roots is proportionately increased, to the satisfaction of the Engineer. Loose, broken, or manufactured balls will be rejected. Bare root plants shall be puddled immediately after digging by immersing the roots in a hydrogel slurry, so as to completely coat the roots.

**DELIVERY:** Plants shall be packed, transported, and handled with utmost care to ensure adequate protection against injury. When transported in closed vehicles, plants shall receive adequate ventilation to prevent sweating. When transported in open vehicles, plants shall be protected by tarpaulins or other suitable cover material. All bare root plants shall be adequately protected from drying out by covering the roots with a plastic bag and planting within 2 weeks of being dug. Balled and burlapped plants shall be set on the ground and the ball covered with soil.

Until planted, all material shall be properly maintained and kept adequately moist, to the satisfaction of the Engineer.

**INSPECTION:** Inspection may be made before digging if the Engineer directs, but no plant material shall be planted by the Contractor until inspected by the Engineer at the site of the work. Plant material will be rejected if delivered with broken or damaged root balls, or if damaged on site by rough handling. All rejected material shall be immediately removed from the site and replaced with acceptable material at no additional cost

## **PLANT SCHEDULE**

The Plant Schedule is located in the Contract Drawings.

### **ABBREVIATIONS**

Cal.	Indicates the caliper of the trunk of the tree.
B & B	Indicates tree or shrub to be "balled and burlapped".
Cont.	Indicates tree, shrub or perennial to be delivered "container".
B.R.	Indicates a tree or shrub to be delivered "bare root".
O.C.	Indicates "on center" or spacing between plants in all direction.
Ht.	Indicates overall height of tree.
*	Indicates plant as being native to the mid-Atlantic region.
(GI)	Recommended for Green Infrastructure / Rain Gardens
(OGI)	Recommended for Green Infrastructure / R.O.W. Bio-swales
Item No.	Indicates specific species of plant material, including a description. Example below: <u>ITEM NO.</u> Genus species, Plant Description

### **PLANT DESCRIPTION**

**TREES:** All trees shall be B&B, major trees branched 6-7' from the ground, minor trees as specified. Caliper size shall be as indicated. Root ball size and height shall correspond to American Standard for Nursery Stock (ANSI Z60.1- 2014) standard for the specified caliper size. Where height is specified, root ball size shall correspond accordingly. Well-branched top and fibrous root system essential.

**SHRUBS:** Height shall be as indicated. Root ball or container size and number of canes shall correspond to American Standard for Nursery Stock (ANSI Z60.1- 2014) standard for the corresponding shrub height. Heavy root system, all shrubs shall be well branched to the ground.

**VINES, GROUNDCOVER, AND HERBACEOUS PLANTS:** Container size shall be as indicated on the plans. All plants shall have vigorous root systems and have grown in the container for at least one year prior to planting.

**PLUGS:** Plugs shall have vigorous root systems.

**ANNUALS:** Annual flowering plants shall be vigorous, well rooted, with no indications of disease or stress.

**BULBS, CORMS, TUBERS AND RHIZOMES:** All bulbs, corms, tubers and rhizomes shall be top size, firm, and non-desiccated.

**PLANT SOURCING, SELECTION, AND INSPECTION:** Contractor shall locate plant material source(s), confirm availability of each plant type in compliance with Contract Documents, and shall submit, as specified, a complete list of all plant material for Project with nursery source identification for each plant. Contractor shall prepare for plant selection by:

1. Make all pre-selection arrangements with and at nursery supply source(s) to insure a ready supply of materials, equipment, and manpower required for an efficient selection and tagging procedure.
2. Request visit of Engineer as applicable at least (14) days in advance of the Contractor's desired inspection date for each type of plant material.
3. As directed by Engineer, plant Installer's Supervisor and nursery representative shall be present for plant inspection and tagging at the nursery source and at applicable times on-site.

Inspection and Selection of Plant Materials: Engineer will inspect plant material and make selection prior to digging at place of growth for compliance with genus, species, variety, size and quality.

1. All trees will be inspected and selected at the nursery sources by Engineer for conformity to the specification requirements.
2. The Engineer may require inspection of representative samples, typical of five (5), of each species of shrub, groundcover, vine, perennial, grass and bulbs.
3. Nursery shall certify, in writing, that all trees tagged are disease and pest free.

Selected plants shall be tagged in the nursery as directed by Engineer. Seals shall be placed by Engineer on selected plants and not removed until the end of the Guarantee period.

Inspection and selection by Engineer shall not affect the right of inspection and rejection during delivery or during and after installation.

Photographs: Furnish photographs of the plant material at the Engineer's option or request.

1. Photographs (using digital camera) shall be taken at the nursery source. A scale figure or measuring device to indicate size shall be in each photograph.
  - a. Tree photographs shall include images of the entire plant and detail photographs showing the following: base of the tree, leaves, branching structure, form and habit.
  - b. Shrub photographs shall include images of the entire plant, and detail photographs showing the following: base of the plant, leaves, branching, structure, form and habit, rootball (for balled and burlap material), and /or roots (for potted material).
2. Each photograph taken shall be labeled with the botanical and common names, nursery name, location and date.

On-Site Inspection at Time of Delivery: Notify the Engineer seven (7) days in advance of any delivery of plant materials to the site.

The Engineer may inspect all plant material upon delivery to the site prior to installation. Plant material inspection on site may be combined with inspection of the staked layout of all plant materials; however, no plants shall be installed prior to this inspection.

Rejected plants shall be removed from the site immediately. Replacements to be provided at no additional cost to Client. Replace promptly as to not delay project schedule.

On-site inspection at time of planting completion: At the completion of the planting installation, the Contractor shall request an inspection by the Engineer of all planting installations.

### **PLANTING OPERATIONS:**

**TIME OF PLANTING:** Unless otherwise directed by the Engineer, deciduous material shall be planted from March 1st to May 1st and from October 15th to December 15th. Evergreen material

shall be planted from April 1st to May 15th and from September 1st to October 15th, or as approved by the Engineer.

**LOCATION:** Site characteristics, such as overhead power lines, existing vegetation, and infrastructure items, such as curbs and sidewalks, shall be considered. Trees that grow taller than thirty feet (30') should not be planted directly under power lines. When the design allows, the tree leader shall be offset from power lines.

**LAYOUT:** The location of plants, as shown on the drawings, is intended only as a guide. Plants shall be delivered to the site and organized as per approved Detailed Work Plan. All species of plants that form a planting composition shall be delivered at the same time, unless otherwise directed. Bed layout and shrub species distribution shall be approved by Engineer prior to any planting installation. Contractor shall provide proper oversight of laborers to ensure shrub mixes are planted as per approved Work Plan and approved layout.

Should extent of planting bed change due to field conditions, Contractor shall notify the Engineer so that plant quantities and layout can be adjusted within the planting beds or shifted to another bed, if required. Such adjustments due to field conditions are the responsibility of the contractor and shall be made at no additional cost to the City. Any such field conditions shall be brought to the Engineer's attention in a timely manner so no adjustments to schedule is required.

Stake tree pit locations, paint irrigation and utility lines and obtain approval by the Engineer before digging. Protect all utilities, irrigation lines, vegetation adjacent to construction and structures during work. Excavate all tree pits and planting areas to depths and dimensions indicated; remove all excavated subsoil from planting area and dispose of legally.

When tree and shrub pits have been dug (see Excavation of Plant Pits), the Contractor shall partially fill with water a representative number of pits in each area of the project to determine if there is adequate percolation in the subgrade at each pit. If not, notify the Engineer as specified above.

**EXCAVATION OF PLANT PITS:** Planting soil shall be unamended existing soil excavated from the planting pit, unless amendments, topsoil, or structural soil are specified elsewhere in the contract. When subsurface obstructions are encountered during excavation, the Contractor shall restore the disturbed area to its original condition.

All plant material in all planting applications should be checked to ensure the root crown has not been buried during containerization or balling and burlapping. If so, the excess soil should be removed and the plant set at the correct finished grade. The top of the root ball shall be set at finished grade.

Each tree shall be planted in an individual pit as specified. Pits for balled and burlapped, container material shall be dug as shown on the Standard Planting Details. The size of the root ball in diameter shall be deep enough so that the root ball sits on undisturbed subgrade, except in situations where curbs and/or adjacent pavements prevent achievement of planting pit dimensions. Sizes of restricted planting pits (i.e. street trees) shall be at the maximum width allowed, and the same depth as the root ball being planted. Any changes in the planting pit sizes shall be broad enough to accommodate the roots fully extended and only deep enough so that the uppermost roots will be just below the original grade.

No plant pits shall be dug until the proposed locations have been staked on the ground by the Contractor and approved by the Engineer. No plant pits shall be backfilled until planting is approved by the Engineer. Where directed, pits shall have sloped sides (or as per the Standard planting Details). Excavated material, when found to be unsuitable, shall be removed from the

site and replaced with topsoil, as directed by the Engineer, and paid for under the Items, 6.02 AAN 'Unclassified Excavation' and 'Topsoil'. Any amendment will be as directed and determined by the Engineer.

Extreme care shall be taken not to excavate to a depth greater than required. The subgrade below the root ball shall be tamped slightly to prevent settlement. Where, in the opinion of the Engineer, the subgrade material is unsuitable, the size of the plant pits shall be dug one-half (1/2) wider than normally required. The bottom and sides of the pit shall be backfilled with the existing soil, without amendments, and thoroughly worked into place to remove air pockets and voids.

Planting beds for Shrubs, Vines, Herbaceous, and Groundcover plants shall be excavated to the dimensions and depths indicated on the plans and backfilled with approved topsoil. Bulbs, Corms, Tubers, Rhizomes and Annuals shall be planted in the existing unamended soil or prepared planting beds with improved soil and/or a water absorbent medium, as designated on the drawings.

Planting beds that are installed within tree protection zones, can only be done in the presence of the Engineer. All excavation and plant installation is to be done by hand, with minimal soil disturbance where shown on plans. No existing tree roots shall be cut without written authorization from the Engineer. Plants shall not be placed within (three) 3 feet of the tree trunk.

Mycorrhizal Fungi Inoculant: Shall be applied by means of a three ounce (3 oz.) premeasured dry formulation packet, such as Mycor Tree Saver Transplant®, as manufactured by Plant Health Care, Inc., Pittsburgh, PA. Rhizanova Tree Transplant, as manufactured by Becker Underwood, Inc., Ames, IA, or approved equal. Packets shall contain, as a minimum: one thousand (1000) live spores of Vesicular-Arbuscular fungi, including: Entrophospora columbiana, Glomus clarum, Glomus etunicatum, and Glomus sp.; seventeen million five hundred thousand (17,500,000) live spores of Ectomycorrhizal fungi (Pisolithus tinctorius); Biostimulant ingredients including Yucca schidigera extract; soluble sea kelp extract derived from Ascophyllum nodosum; humic acids; and acrylamide copolymer gel as a water absorbent medium. Mycorrhizal fungi inoculant shall be added to the top six to eight inches (6-8") of backfill soil in each planting pit and thoroughly mixed to distribute the inoculant. The material shall be applied according to the following chart:

<u>Size of rootball or container</u>	<u>Ounces per plant</u>
1 gallon	1
2 gal.	2
3 gal.	3
5 gal.	3
7 gal.	3
10 gal.	3
15 gal.	3
20" B&B	6
24" B&B	9
30" B&B	9
36" B&B	12
12" B&B	12

Water Retention Additive: Water Retention Additives shall be a granular polyacrylamide polymer of a potassium base and not a sodium base that slowly releases moisture into the root zone such as Terra Sorb, as manufactured by Plant Health Care, Inc., Pittsburgh, Pa., or approved equal. It shall be applied at the time of planting during a dry planting as defined by Parks and Recreation.

When planting trees, each tree shall receive three (3) ounces or amount specified by product instructions.

Half should be added at a depth of 8-10 inches and the other half just below the finished surface. When planting shrubs, perennials or annuals, the product should be applied as per product instructions.

Planting: Shall be performed by a Contractor that is approved by the Engineer for planting work. No planting shall be done except in the presence of the Engineer. All material shall be inspected by the Engineer as it is removed from the truck, prior to placing in an approved storage area or the designated planting site. All rejected plant material shall be removed from the site and replaced with acceptable material at no additional cost to the City.

Bare root material shall be adequately protected from drying out. It shall be removed from its plastic bag and planted immediately after inspection. The bundles of heeled-in plants shall be set upright on the ground, covered with mulch, and kept adequately moist until the time of installation. Until the time of planting, all plant material shall be stored in an approved location, securely fenced and maintained, to the satisfaction of the Engineer, at no additional cost to the City. All plants not planted immediately shall be watered as necessary to maintain optimal health until planting.

Place balled and burlapped material in the prepared planting pit by lifting, and carry it by the rootball. Set the tree or shrub straight and in the center of the pit, with the most desirable side facing toward the predominant view. All material shall set, after settlement, at the same level at which they have grown in the nursery. Care shall be exercised in setting the plants plumb. All ropes, stones, etc. shall be removed from the pit before backfilling. Soil for backfill shall be loose and friable and not frozen or compacted.

Cut and remove rope or wire from the top fifty percent (50%) of the rootball and cut off the burlap back to the edge of the ball. Remove as much woven product and twine as possible. All plastic or synthetic fabric must be removed from the ball at the time of planting. If root ball is enclosed by a wire basket, the Contractor shall cut away at least two-thirds (2/3) of the wire basket from the sides and top of the root ball. Remaining lateral wires must be cut to prevent future root interference. Galvanized or aluminum wire for will not be accepted.

Balled and burlapped plants shall be handled so that the ball will not be loosened. After the soil has been thoroughly firmed under and around the ball, the burlap shall be cut away from the upper half of the ball, and the remaining burlap adjusted to prevent the formation of air pockets. Soil shall be firmed at six to eight inch (6-8") intervals and thoroughly settled with water. Plants with exposed roots shall be placed in the proper position in the center of the pit after the soil in the bottom of the pit has been firmed. Roots shall be arranged in their natural position and existing soil worked in among them, firmed at intervals, and mycorrhizal inoculant and water retention additive worked into the top eight (8") inches of backfill soil in the correct proportions. The plants shall then be thoroughly settled in with water. Care shall be taken to avoid bruising or breaking the roots when tamping the soil. All large and fleshy roots that are bruised or broken shall be pruned, making a clean cut before planting. NOTE: No cuts of any root, including bruised or broken roots, shall be made except in the presence of the Engineer.

Vines, Herbaceous, and Groundcover plants shall be carefully removed from containers or flats immediately prior to planting and set to the same depths as they were grown in the nursery bed or container, to the correct spacing indicated on the plans. Roots shall be arranged in their natural position and topsoil worked in among them, taking care to avoid bruising or damaging the roots, and fertilizer tablets added to the top four (4") inches of backfill soil in the correct proportion for

the respective pot size. No more than one hour after planting, all plants shall be thoroughly settled in with water.

Annual flowering plants shall be carefully removed from the flats or cell-packs to avoid damaging roots or stems and planted in prepared planting beds at the same depth they were growing in the containers. Soil shall be thoroughly firmed around each crown, and plants thoroughly watered in no longer than one hour after planting.

Bulbs shall be planted in the locations indicated on the plans and to the depths and spacing indicated on the Plant Schedule. Spring Flowering Bulbs, Corms, Tubers, and Rhizomes shall be planted in late September or October, no more than six (6) weeks before frost. Summer and Fall Flowering Bulbs, Corms, Tubers, Rhizomes and Plugs shall be planted in spring, after the last killing frost, or as directed by the Engineer. All of the above shall be planted according to best horticultural practice. Prior to planting, bulbs shall be stored in a cool, dry, well-ventilated location for no longer than two (2) weeks before planting.

**FINISHING SURFACE AFTER BACKFILLING:** The Contractor shall cultivate and rake over finished planting areas and shall leave the site in an orderly condition. On level ground or slight slopes in non-paved areas, a shallow basin a little larger than the diameter of the plant pit shall be left around each plant, as shown on the plans, or as directed by the Engineer. On steep slopes, the soil on the lower side of the plant shall be graded in such a manner that it will catch and hold water, as shown on the plans, or as directed by the Engineer. Upon completion of planting, all debris and waste material resulting from the planting operation shall be removed from the project area, and the affected area raked and cleaned as necessary.

All work done in preparing shallow basins or grading of plant pits on steep slopes and regrading and reseeding of plant saucers shall be deemed included in the unit price per plant. All berms raised for shallow basins in level or gently sloping grass areas shall be removed at the end of the guarantee period, as well as tree stakes. This topsoil shall be cast evenly over the surrounding grass areas and grass seed sown over the removed berms.

After the shallow tree basins and plant saucers and shrub beds have been prepared, they shall be mulched, three to four inches (3-4") in depth, inside and along the outside edge of the basins/saucers. Perennial beds shall be mulched to a two inch (2") depth. Mulch shall consist of shredded bark not exceeding three inches (3") in length and one inch (1") in width. Mulch contaminated with leaves, twigs, and/or debris shall not be acceptable. Only mulch derived from tree material, not from wood waste products like sawdust, shall be acceptable. Mulch for tree pits and shrub and/ or perennial beds shall be included in the bid price.

**STAKING:** All staking shall be done immediately after planting and all stakes and nylon tree ties shall be maintained. Plants shall stand plumb after staking. Stakes shall be of white cedar with bark attached. They may have a maximum allowable deflection of ten percent (10%). Stakes of the dimensions shown on the plans and details shall be placed outside the root ball and shall be driven to the depths indicated on the plans and details.

Ties shall be attached to the stake no more than four (4") inches below the top of the stake. Stakes shall be fastened to the tree with re-usable nylon tree ties as manufactured by Zip-It Tree ties, Riverside, CA, or approved equal. Stakes shall be set parallel to the contours, curbs, or walks, unless otherwise directed by the Engineer. The ties shall be tied off firmly at the stake. Trees shall stand plumb after staking. Stakes and nylon ties shall be removed at the end of the guarantee period, unless directed otherwise by the Engineer and shall become the property of

the Contractor. At the time the stakes are removed any holes left by the stake shall be filled with topsoil as specified in the "Topsoil" specification.

**PRUNING:** Dead, injured or diseased wood shall be removed in accordance with good horticultural practice. Crossed branches shall be pruned with a sharp tool in such a manner as to preserve and encourage the plant's natural growth form. Do not cut leaders or use wound paint or dressing to treat cut areas. Additional pruning may be required as determined by the Transplanting Subcontractor to preserve aesthetic balance. Any pruning shall preserve the natural character of each plant and shall be done in a manner appropriate to its particular requirements. Any crown pruning shall be done during the transplanting season and may be performed either before or after transplanting, at the Subcontractor's discretion. If done before transplanting, additional pruning may be required to correct any damage incurred during the transplanting operation. In no case shall leader branches be removed or harmed. The crowns of young trees should not be cut back to compensate for root loss.

**EDGING OF PLANTING AREAS:** The Contractor shall establish a neat edge where planting areas meet grass areas, as shown on the plan or as directed by the Engineer. Edging shall be done by competent mechanics in a professional manner with a spade or edging tool immediately after all planting and seeding is completed. Particular care shall be exercised in edging to establish good flowing curves, as shown on the plan or as directed by the Engineer. Edging shall be maintained by the Contractor until Substantial Completion.

**MAINTENANCE:** At the time of planting, the soil around each plant shall be thoroughly saturated with water, and as many times later as seasonable conditions require, until Substantial Completion. Where water is supplied from City hydrants, the Contractor shall obtain a hydrant permit from the Department of Environmental Protection.

The Contractor must have all tools necessary for using City hydrants in the Contractor's possession at time of planting to ensure that this specification is adhered to. If conditions do not allow the use of New York City water sources, the Contractor must obtain their own source of water. No direct payment shall be made for water obtained from other than city sources, but the cost thereof shall be deemed included in various Items of the contract.

Maintenance shall include watering, weeding, cultivating, edging, control of insects, fungal infections, and other diseases by means of spraying with an approved insecticide or fungicide, pruning, adjustment and repair of stakes, anchors, and wires, repair of minor washouts and gullies up to twelve inches (12") in depth, and other horticultural operations necessary for the proper growth of all trees, as well as replacement of plants stolen or vandalized prior to Substantial Completion, to a degree judged sufficient for replacement by the Engineer. The Contractor shall also be responsible for keeping the entire area within the contract limits neat in appearance until Substantial Completion. All planting areas shall be watered, cultivated, and weeded with hoes or other approved tools within the growing season extending from May 1st to October 1st, and such cultivating and weeding shall be repeated at least once a week. Under no condition shall weeds be allowed to attain more than six inches (6") of growth. The cost of such maintenance shall be included in the bid price.

**REPLACEMENT:** The Contractor shall replace, in accordance with the contract plans and specifications, any plant material that is dead or, in the opinion of the Engineer, in an unhealthy or unsightly condition, and/or have lost their natural shape due to dead branches, excessive pruning, inadequate or improper maintenance, vandalism or other causes, prior to Substantial Completion. Replacement plants shall be installed in the following planting season. The cost of

replacements(s) shall be included in the unit price bid for the various furnished items of the contract.

Where vandalism or related causes are agreed by the Engineer as the cause for plant material replacement, the Contractor shall not be responsible for replacement during the guarantee period.

Where dead plant material has been identified, whether due to natural causes or vandalism, the Contractor shall remove the dead material, including stakes, and wire (if applicable) **within three (3) weeks of notification.**

Where dead plant material has been identified, whether due to natural causes or vandalism, the Contractor shall remove the dead plant material, including stakes, burlap, and wire. Earth will be leveled and new topsoil and seed, or appropriate paving material, added at the direction of the Engineer to eliminate any hazardous conditions.

The Contractor shall maintain Replaced Plant Material to the standards outlined in the "Maintenance" subsection above.

**SUBMITTALS:** All submittals shall be as per the S-Pages.

Nursery: The Contractor must submit the name and address of all nurseries supplying plant material for review and approval prior to performing work.

State Certification (in quarantine zone only): The Contractor shall submit a copy of a valid Compliance Agreement issued by the State of New York Department of Agriculture and Markets, Division of Plant Industry for review and approval prior to performing work.

Invoice: The Contractor shall submit an original invoice for all plant material delivered to the site. The invoice(s) must be on the Nursery letterhead and must indicate genus and species along with the quantity and size for each individual plant material delivered to the site.

Product Data: Submit technical descriptive data for each manufactured or packaged product of this Section including tree staking materials and plant treatment material. Include manufacturer's product testing and certified analysis and installation instructions for manufactured or processed items and materials.

Qualification Data: Submit qualification data for firms and persons to demonstrate and confirm their capabilities and experience as per quality assurance section of this specification. Include lists of completed projects with project names and addresses, names and address of architects and owners, and other information requested.

Plant Inventory Log: Submit a complete inventory log, updated weekly, for all plant material for Project after delivery and transfer. Include in plant list the botanical and common names, size, quantity, plant health, form, root ball, limb height (if applicable), and other requested data. Indicate plants available for planting, plants that have died and sourcing locations for all replacement plant materials. Inventory log shall indicate plant species that are fall dig hazards.

Planting Schedule and Detailed Work Plan:

1. Submit plans indicating anticipated planting schedule and detailed work plan approach for planting areas including but not limited to perennial and grass mix areas, perennial mix areas, grass mix areas, sloped planting beds, and wide planting beds. An approach to coordination with hardscape operations, stone layout and installation, fence installation (all types), floodwall and associated offsets, DEP sewer offsets, erosion control, sodded areas, irrigation, waterfront structures, buildings, bridges and landings, utilities and lighting, and soil installation shall be included in Work Plan. Work Plan to include fall dig hazards and approach to plantings with hazards.

2. Submit plans indicating anticipated planting schedule and detailed work plan approach for planting areas at Gouverneur Gardens.

Delivery Schedule: Provide a written delivery schedule for all plant material to indicate species, quantities and anticipated delivery dates per the construction schedule.

Master Nursery List: Detailed information for each nursery included on Master Nursery List. Include company name, address, phone, fax, email, website, and number of years in business under current ownership, USDA Plant Hardiness Zone in which nursery is located, contact individual, current ownership, any outstanding litigation, soil test(s) indicating soil properties at each relevant growing location within nursery, statement of current practices for use of pesticides and herbicides. If a nursery's share of the bid is greater than 10% total unburdened plant material costs, or if the quantity of plants is greater than 10% of the total number of plants, then provide three (3) references for projects of similar scope (provide contact name, email, telephone and name of project).

Nursery Soil Analysis: Submit nursery soil analysis prior to any tagging trip to such nursery. For each nursery location, furnish soil analysis not less than three (3) months old and a written report by a qualified soil-testing laboratory stating percentages of organic matter; gradation of sand, silt, and clay content; cation exchange capacity; sodium absorption ratio; deleterious material; pH; and mineral and plant-nutrient content of the soil at each growing location.

Testing methods and written recommendations shall comply with USDA's Handbook No. 60.

Tagging Schedule: Tagging schedule to be submitted for all tagging trips at least one month prior to first trip. Provide Engineer with a Draft Tagging Schedule. Revise and update schedule based on Engineer's input and resubmit Final Tagging Schedule. Tagging to take place between January 15th and March 15th or August 15th to November 1st.

### **QUALITY ASSURANCE:**

General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant List and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Plants shall be field grown and tagged while in the ground. At no time will pre-dug, balled and burlapped trees be accepted or considered for use on this project. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

1. Trees with damaged, crooked, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); crossing trunks; cut-off limbs more than 3/4 inch (19 mm) in diameter; or with stem girdling roots will be rejected.
2. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.

Provide plants of sizes, grades, and ball or container sizes complying with ANSI Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to Engineer, with a proportionate increase in size of roots or balls.

Installer Qualifications: Installations of work specified in this section shall be by firm(s) which can exhibit proof of a minimum of ten years prior successful experience with installations of equivalent type and similar scope of this Project.

1. Nursery/Plant Supplier Qualification: Plant Nursery(ies) shall have a nursery facility as an integral part of operation where majority of plants can be grown and reviewed, shall be

reputable, and shall have been in continual operation with a minimum of ten (10) years' experience as a plant grower. Nursery shall be capable of the following as a minimum:

- a. Supplying plant material conforming to the quality standards, visual characteristics, sizes, species cultivars, and quantities indicated by Contract Documents.
  - b. Conformance to cultural practices and maintenance procedures suitable for healthy plant material.
  - c. Ability to hold and care for plants should schedule adjustments be required.
2. Plant Installer Qualifications: Engage an experienced installer who has completed plant installation work similar in material, design, and extent to that indicated for this project with a record of successful landscape establishment.
- a. Installer's Field Supervisor(s) for Installation and Maintenance shall be proficient at speaking English and shall be experienced in tree, shrub, groundcover and plant installation and maintenance.
  - b. Supervisor(s) shall be maintained full-time on Project site when installation or maintenance is in progress.
  - c. Perform installation work with personnel familiar with preparations and exterior plant installation under supervision of an experienced landscape Foreman, with at least ten (10) years' total installation experience and 5 years on project that meet or exceed the scope of this project.
  - d. Provide adequate numbers and types of accessible personnel to meet the scheduling requirements of the exterior plant installation.
3. Use numbers of skilled workers and equipment type equal to work requirement or occasion. The skilled workers shall be thoroughly trained and experienced in the necessary crafts and shall be completely familiar with specific requirements and methods needed for performance of the work of this Section.

Personnel: All landscape work under this Section shall be performed by personnel familiar with planting work and under the supervision of an experienced foreman at all times.

The Planting Contractor shall have on the job, at all times, a foreman knowledgeable in horticultural practice and experienced in planting on steep slopes.

Standards: The names of the plants are required to conform to the nomenclature of "Standardized Plant Names," latest edition, adopted by the American Joint Committee on Horticultural Nomenclature.

Drawings References and Definitions: Refer to Contract Drawings for plant list and planting layouts. Plant list is for guide only. Quantities, sizes, and types of plant material shall be verified by Contractor's review of planting plans and layouts. Where discrepancies are identified and additionally verified with Engineer, the planting plans shall take precedence.

Mock-ups: mockups to set quality standard for fabrication and installation. All mock ups shall be undertaken after completion of pre-cast and soil installation. Build a mockup of all planting of the following areas for review to a minimum size of 12' x 20', including but not limited to:

1. Gouverneur Gardens
2. Tree, shrub, perennial, and grass at Nature Exploration
3. Fire Boat House Planters at Stairs
4. Landscape slope with seating stair at basketball court north of the Delancey Bridge
5. Nature exploration water play feature and boulder area
6. Stone in landscape slope at Corlears, Delancey and 10th Bridges
7. 10th Street Bridge city-side landing
8. 10th Street Playground stone slope between upper and lower playground areas
9. Planting at floodwall crossing within floodwall offset zone

10. Swale area
11. Esplanade planting on structure

All mock-ups with trees shall address height to which limbs shall be pruned including stone scrambles, play areas, and grade changes.

**Plant Material Observation:** Following tagging, Engineer shall observe plant material at place of growth for compliance with requirements for genus, species, variety, cultivar, size, and quality. Engineer retains right to observe trees and shrubs further for size and condition of root systems, pests, disease symptoms, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of work. Observations by Engineer shall not be a substitute for the required Certificate of Plant Health (provided at time of transfer to Landscape Contractor) which shall be provided by each participating nursery for their plant stock.

**MEASUREMENT AND PAYMENT:** The quantity of **PLANT MATERIAL** to be paid for under these Items shall be the number of trees, shrubs, vines, herbaceous plants, groundcovers, and bulbs of each size planted and maintained, in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be a unit price per **EACH** tree, shrub, vine, herbaceous plant, groundcover, bulb, corm, tuber, rhizomes or plug of each size, as specified in the Plant Schedule, and shall include the cost of furnishing plants, excavation, mycorrhizal inoculant, water retention additive, shredded bark mulch for tree pits, shrub beds, and perennial or groundcover beds, inspecting, planting, staking, anchoring, watering, replacing, and maintaining all plant material and all work incidental thereto, in accordance with the plans and specifications, to the satisfaction of the Engineer.

All plant material substitutions must be pre-approved as described in "Ordering Plant Materials". Approved substitutions where size and/or description vary from that listed in the Plant Schedule included herein may result in a monetary credit due to the City.

Horticultural soil, planting soil, biochar, and compost, where called for in the plans or details, will be paid for separately under their respective Items. Shredded bark mulch beyond the tree pit and shrub or perennial bed outlines shall be paid for separately under the Item 'Shredded Bark Mulch'. The price of water, regardless of source, is deemed included in the unit price bid. No extra payment will be made for water coming from the Contractor's own source.

**END OF SECTION**

## SECTION PK-ESCR 111 – SYNTHETIC TURF-INFILL TYPE ON STONE BASE

**WORK:** Under this Item, the Contractor shall furnish and install **SYNTHETIC TURF-INFILL TYPE ON STONE BASE (SPORTS)** with shock pad in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise provided for herein, all materials and methods shall conform to the applicable portions of the NYCDOT Standard Highway Specifications.

**Geotextile:** Shall be a nonwoven, rotproof, heavy weight synthetic geotextile necessary to provide reinforcement, separation of the base aggregate and subgrade soils, and filtration of water from the base aggregate to the subgrade soils. Geotextile used shall conform to the following properties:

Property	ASTM Test	
Elongation	D4595	>50%
Grab Strength (min.)	D4632	665 N (150 lbs)
Tear Strength (min.)	D4533	270 N (60 lbs)
CBR Puncture (min.)	D4833	370 N (85 lbs)
Permitivity (min.)	D4491	1.3/sec
Apparent Opening Size (max.)	D4751	0.212 mm (0.0083 in) Std. No. 70 sieve

Nonwoven geotextile shall be Mirafi® 160N, as manufactured by TenCate, Pendergrass, GA, AEF 880, as manufactured by BOOM Environmental Products, New Bedford, MA, FX-60HS manufactured by Carthage Mills, Cincinnati, OH or approved equal.

**Slotted Polyethylene Pipe:** Pipe shall be either full circular cross-section or a slim line drainage system, whichever is shown on the drawings. A slim line drainage system is a flexible, prefabricated drainage system, with either a series of small interconnected corrugated round pipes or a flat pipe with full horizontal cross-section, wrapped in a non-woven, drainage geotextile. The Contractor shall not have the option of substituting the slim line drainage system where round pipe is shown (or vice versa). The drawings shall strictly be followed. Pipe and fittings of both types shall be made from high density, virgin PE compounds that conform to the requirements of cell Class 324420C, as defined and described in ASTM D3350. Slim line drainage system manufactured for this specification shall comply with the requirements for test methods, dimensions, and markings found in AASHTO Designations M288. Slim line drainage pipe and fittings shall be Multi-Flow Drainage Systems as manufactured by Varicore Technologies, Inc., Prinsburg, MN, or AdvanEdge pipe as manufactured by Advanced Drainage Systems, Inc., Ludlow, MA, or approved equal. The slim line drainage system shall be eighteen (18") inches in width with an outer corrugated perforated pipe wall.

Circular pipe (N-12) manufactured for this specification shall comply with the requirements for test methods, dimensions, and markings found in AASHTO Designations M252 and M294. Pipe shall have an outer corrugated perforated wall and an essentially smooth inner wall (waterway).

Corrugations for these sizes may be either annular or spiral. Size shall conform to the AASHTO classification "Type SP" (which describes pipes with a smooth waterway and Class 2 perforations). Pipe and fitting shall be as manufactured by Advanced Drainage Systems, Ludlow,

MA, or approved equal. The minimum parallel plate stiffness values when tested in accordance with ASTM D2412 shall be as follows:

<u>Diameter</u>	<u>Pipe Stiffness</u>
4" (100mm)	50 psi (340 Kpa)
6" (150mm)	50 psi (340 Kpa)
8" (200mm)	50 psi (340 Kpa)
12" (300 mm)	50 psi (340 Kpa)

Sock: The circular perforated pipe shall have a "DC Sock", a polyester machine knitted envelope factory applied and ready for installation. Sock not required for the slim line drainage system.

Fittings: The fittings shall not reduce or impair the overall integrity or function of the pipeline. Fittings may be either molded or fabricated. Common corrugated fittings include in-line joint fittings, such as couplers and reducers, and branch or complimentary assembly fittings such as tees, wyes, and end caps. These fittings may be installed by various methods, such as snap-on, screw-on, bell and spigot, and wrap around. Couplings shall provide sufficient longitudinal strength to preserve pipe alignment and prevent separation at the joints. Coupling of the pipes shall be performed using Standard ADS (Advanced Drainage Systems) N-12 split coupler PRO LINK ST, or PRO LINK 10.8, or PRO LINK 5, or approved equal. Only fittings supplied or recommended by the pipe manufacturer shall be used. Where designated on the plans, a neoprene or rubber gasket shall be supplied.

Base Aggregate: Shall consist solely of crushed ledge rock and shall be broken stone or gravel as defined in the NYCDOT Standard Highway Specifications, free draining, well graded, uniformly mixed washed stone aggregate. The total thickness of the base stone aggregate shall be six (6") inches minimum. Base aggregate shall be a combination of coarse aggregate with a fine top aggregate. The coarse aggregate shall be four (4") inches in thickness and the fine top aggregate shall be two (2") inches in thickness. Materials shall meet the gradations shown below.

**Base Coarse Aggregate (3/4 inch material)**

<u>Sieve Size</u>	<u>Percent Passing by Weight</u>
1 1/2"	100
3/4"	80 – 90
3/8"	30 – 65
No. 4	10 – 40
No.16	0 – 10
No.200	0 – 5

**Base Fine Top Aggregate (3/8 inch material)**

<u>Sieve Size</u>	<u>Percent</u>	<u>Passing by Weight</u>
1/2"		100
3/8"		85 – 100
No. 4		10 – 30
No.8		0 – 10
No.200		0 – 2

The aggregate must contain three and one-half to four percent (3½ - 4%) moisture content to ensure that fine particles don't migrate and to facilitate proper compaction. The Contractor shall provide certification from the source plant that aggregate meets all requirements. If deliveries of base aggregate show segregation of sizes, material shall be deposited in stockpiles and

thoroughly mixed prior to installation. **Bank run gravel, rounded sands and recycled concrete material shall be rejected for use as base aggregate.**

Shock Pad: A system without a shock pad is NOT acceptable and will be rejected. Pad shall be free draining, constructed from a porous cross link, closed cell polyethylene pad made of 90% recycled HDPE (High Density Polyethylene), minimum twenty (20mm) millimeters thick, such as one of the following:

“Sport Drain Max” as manufactured by Engineered Sportfield Solutions, Baltimore, MD

“ProPlay20 Sport” as manufactured by Schmitz Foam Products, Inc. Coldwater, MI

“SportLite HD20SL-NW3-SG” as manufactured by ThermaGreen Sport products

Toronto, Canada

Or approved equal.

Seam Tape: shall be as recommended by the manufacturer. All seam tape shall be a minimum of twelve (12”) inches wide.

Synthetic Turf: Yarn shall be TenCate Tapeslide XP, Bonar FB Ultra HD, Bonar FB Global or Shaw High Performance Slit Tape, or approved equal twisted parallel long-slit polyethylene tape, minimum ten thousand (10,000) denier, 100 micron, one hundred percent (100%) polyethylene non-abrasive fiber or approved equal. Monofilament fibers are NOT acceptable under this specification. Pile weight shall be between fifty (50) and fifty-two (52) ounces per square yard. The fiber shall be treated with an ultraviolet (UV) inhibitor and guaranteed minimum eight (8) years against UV degradation and fading.

Tuft height shall be one and three-quarter (1 3/4”) inch long fibers with a minimum of one and one quarter (1-1/4”) inches infill or more, to meet required G-max criteria. Turf shall be delivered in minimum twelve foot (12’) width rolls of sufficient length to run from sideline to sideline. Turf color shall be Verde, simulating natural grass, unless otherwise shown on the drawings or approved by the Engineer. The backing shall consist of a perforated primary and secondary backing with a minimum drainage rate of twelve (12”) inches per hour. Primary backing shall be woven polypropylene. Secondary backing shall include a nonwoven membrane system with polyester additive featuring dimensional stability characteristics, such as “Colback” manufactured by Colbond Nonwovens, Enka, NC, or approved equal.

Acceptable turf products are: “Rhino SF50” as manufactured by AstroTurf, Dalton, GA., “PremierXP50” as manufactured by A-Turf, Williamsville, NY, “Classic Eco-E50” as manufactured by Shaw Sports Turf, Calhoun, GA, “Smart Grass” as manufactured by AFS Corporation, Fort Washington, PA, or approved equal. A system without a shock pad is not acceptable and will be rejected. The system must meet all G-max field test requirements.

Synthetic Turf Infill Material: Resilient Infill shall be coated, sanitary, rounded, uniformly sized sand (silicon dioxide SiO<sub>2</sub>) or quartz made from virgin materials for synthetic turf systems. Sieve analysis shall show that material meets requirements for sieve sizes as described below but under no circumstances shall more than 3% pass the No. 30 sieve.

Infill shall be coated or colored sand and shall be one of the following:

- Envirofill infill manufactured by US Greentech, LLC, Cincinnati, OH
- Colorbrite SpectraQuartz colored pigmented quartz infill as manufactured by Fairmount Santrol, Chesterland, OH
- Or approved equal.

Size of infill shall be a blend between No.12 to No. 20 mesh size inclusive. Color of coating or pigment shall be green or light tan in color unless otherwise shown on the plans.

**Tire derived SBR (styrene butadiene rubber) crumb infill product in any percentage will be rejected.**

Infill shall be low thermal absorption and low thermal capacity. The infill mixture composition proposed for the site shall be submitted for approval prior to installation.

**G-max:** The manufacturer shall guarantee that the G-Max rating of the synthetic turf system shall not exceed a reading of 145 at installation and 180 thereafter, as per ASTM F 355, Test Method A, and in accordance with ASTM F1936, for the entire term of the warranty. If readings do exceed 180 within the warranty period, the manufacturer shall be responsible for whatever measures are required to achieve G-Max ratings below 180, at no cost to the City. (See Submittals)

**Goal or Perimeter Playing Lines and Logos:** Shall be as shown on the drawings and shall be painted unless inlaid is specifically shown on the drawings. For primary playing lines, the turf color shall be white. Secondary lines shall be yellow (unless otherwise shown on the drawings). Line painting shall be performed and paid for under item "Paint Lines- 4" Width- Synthetic Turf".

**Recycled Plastic Lumber Edge:** Synthetic turf shall be attached to a recycled plastic lumber nailer placed around the perimeter of the field and the edges of any cutout areas, as designated on the contract drawing. For the nailer, either three by six (3 x 6) or three by eight (3 x 8) RPL is acceptable. Recycled plastic lumber shall be fabricated from one hundred percent (100%) High Density Polyethylene (HDPE) and Low Density Polyethylene (LDPE) recycled polyethylene, including UV-inhibiting pigment, Molded Grade Plastic Lumber as manufactured by Plastic Lumber Yard, Norristown, PA, PolyForce™ Structural Plastic Lumber manufactured by Tangent Technologies, LLC, Aurora, IL, SelectForce as manufactured by Bedford Technologies, Worthington, MN, or approved equal. Composition and mechanical properties shall be as follows:

Minimum High Density Polyethylene: 70%  
Tensile Strength (ASTM D638): 1200 psi  
Compressive Strength (ASTM D6108): 1200 psi  
Flexural Modulus of Elasticity (ASTM D6109): 95,000 psi  
Average Nail Pull Out Strength (ASTM D6117): 280 lbs

The Bulk Density and Specific Gravity of the recycled plastic lumber shall conform to the acceptable standards determined by the standard test method in ASTM D6111. Recycled plastic lumber shall not absorb moisture, corrode, rot, warp, splinter, or crack and the surface shall not be slippery when wet. The recycled plastic lumber shall not contain any material that will be irritating when in contact with skin. Cross sections shall not show wide deep gaps or holes. Plastic lumber shall remain unpainted. Lumber is totally below grade and therefore any color or combination of colors is acceptable.

**Hardware:** Hardware for attaching synthetic turf to recycled plastic lumber shall be minimum two (2") inches in length, stainless steel or galvanized and as supplied by the ic turf manufacturer/installer.

**Reinforcing Bar:** Shall be of the sizes and dimensions shown on the plans. Reinforcement shall meet the requirements of the NYCDOT Standard Highway Specifications.

**Sealant:** Shall be a one part polyurethane elastomeric sealant, such as Sikaflex 1a, as manufactured by Sika, Lyndhurst, NJ or approved equal. Sealant shall be resistant to water, diluted acids, and alkalis and the color shall match the recycled plastic lumber.

**TESTS:** Testing shall be conducted by an accredited independent environmental laboratory in conformance with the National Environmental Laboratory Accreditation Program (NELAP) conference standards. (Submit laboratory for approval: See Submittals paragraph). The proposed synthetic turf materials must meet the following test requirements and criteria:

1. **Infill- Aqueous Test:** After infill material is prepared in accordance with EPA Method 1312 Synthetic Precipitation Leaching Procedure (SPLP), a total analysis shall be performed to determine heavy metal content in accordance with either EPA Method 6010 or EPA Method 6020. Semi-volatile organic content shall be determined under Method 8270C and shall include data for aniline (CAS #62-53-3), phenol (108-95-2) and benzothiazole (9516-9). Heavy metal content shall not exceed NYS DEC Groundwater Standards. Total lead (Pb) content shall not exceed .025 parts per million (ppm), total Chromium (Cr) content shall not exceed .05 parts per million (ppm), total Zinc (Zn) shall not exceed 2.0 ppm.
2. **Carpet Fibers- Solid Digestion Test:** The synthetic turf fiber should be tested as per ASTM F2765 "Standard Specification for Total Lead Content Synthetic Turf Fibers" or latest rev. The total lead (Pb) content measured shall be less than 100 parts per million (ppm) and the total Chromium (Cr) content shall not exceed 25 parts per million (ppm). Testing shall be conducted by an accredited independent environmental laboratory in conformance with the National Environmental Laboratory Accreditation Program (NELAP) conference standards. (Submit laboratory for approval: See Submittals paragraph).

**INSTALLATION:** It shall be the responsibility of the synthetic turf contractor/installer to inspect and certify that the base is ready for the installation of the turf system, and when satisfied with its condition the turf contractor/installer shall notify the Engineer in writing of this acceptance.

Excavation of areas to receive synthetic turf shall be performed in accordance with the item 6.02 AAN "Unclassified Excavation", specified elsewhere in this contract. However, payment for excavation performed in connection with the installation of synthetic turf shall be deemed included in the price bid for this item.

The area to receive the resilient artificial turf shall be excavated to the correct depth, including peripheral drainage trenches, where shown in drawings for slotted polyethylene pipe. The subgrade shall be laser graded and pitched to ensure positive drainage (an average one-half percent (1/2%) from the center to the peripheral slotted pipe drainage lines), as indicated on the drawings, and all finished subgrade elevations verified with laser leveling instruments. The Contractor shall be careful to avoid over excavation. The geotextile shall be rolled directly over the prepared subgrade and the peripheral drainage trench, overlapping all seams a minimum of six inches (6") in all directions.

**SURPLUS:** Excess material excavated by the Contractor shall be legally disposed of as part of the bid price of this item. Disposal of contaminated materials, if present, shall be paid for separately.

All slotted polyethylene pipe shall be laid in reasonably close conformity to line and grade and shall have a full, firm, and even bearing at each joint and along the entire length of pipe and surrounded with the base aggregate drainage material, in accordance with the plans, specifications, and directions of the Engineer. Joint misalignment shall not result in offsets, in the interior smooth liner, greater than one-quarter inch (1/4"). Pipe laying shall begin at the downstream end and progress upstream. Any single run of pipe, excluding end sections, shall consist wholly of the same type material unless otherwise directed by the Engineer. No section of

pipe used shall be less than three feet (3') in length. Installation of the pipe shall be in accordance with ASTM D2321. Connection(s) to drainage system (pipes or structures) shall be deemed included in the price bid for this item.

Recycled Plastic Lumber Edging shall be installed around the perimeter of the field area and the clay cutout areas (if any) on a prepared level surface and drilled to receive the steel reinforcing rods, the rods hammered in place to one-quarter inch (1/4") below the lumber surface and the void filled with approved sealant.

The base aggregate shall be installed in three (3) two (2") inch lifts over the geotextile and compacted to a ninety percent (90%) Proctor Density, maintaining a consistent slope of one-half percent (1/2 %) from the centerline of the field to the sideline, unless otherwise shown on contract drawings. The base aggregate must be free draining, consistent with the vertical draining requirements of the synthetic turf manufacturer, and the surface of the field shall be perfectly level. The Contractor shall employ laser leveling devices to determine the correct subgrade and finished grade elevations.

Prior to beginning installation, the installer of the synthetic turf and pad shall inspect the subbase and supply a Certificate of Subbase Acceptance for the purpose of obtaining manufacturer's warranty for the finished synthetic playing surface. **The synthetic turf manufacturer's representative and the Engineer must approve the permeable base aggregate installation prior to installation of the synthetic turf.** The Contractor shall perform all work necessary to obtain the manufacturer's written approval as part of the bid price of this item.

The shock pad shall be installed directly over the properly prepared base aggregate. The Contractor shall take extreme care to prevent disturbance of the base aggregate in regard to compaction and planarity. Any disturbed areas shall be rerolled with a four to six (4~6) ton roller, to the satisfaction of the Engineer.

The full width rolls of turf shall be laid out across the field and the edges attached to the recycled plastic lumber perimeter attachment with a nail gun, or as per manufacturer's directions, at maximum six inch (6") intervals. Head seams, other than at sidelines, shall not be acceptable.

Synthetic turf shall be installed with no wrinkles, ripples or bubbles. Slits in the fabric to relieve such defects are not permitted.

Seams: Adhesive installations shall be glued down with minimum twelve (12") inch wide textured seam tape. Adhesive shall be applied to entire width of seam tape. Sewing, where used shall have stitches every one-quarter (1/4") inch or less. Thread shall be polyester or nylon, color to be green.

All seams shall be transverse to the field direction; i.e., run perpendicularly across the field. Seams shall be flat, tight, and permanent with no separation or fraying. Permanent playing lines (where shown) shall be laid out and incorporated in the turf as shown on the drawings. Drains shall be marked on the surface with an inlaid white dot two inches in diameter. Perimeter edge details required for the system shall be as shown on the drawings, as recommended by the manufacturer, and as approved by the Project manager.

Synthetic turf adhesive shall be one of the following:

A solvent based, one-part, thixotropic high green strength urethane, similar to NORDOT #34G as manufactured by Synthetic Surfaces, Inc. Scotch Plains, NJ.

A two component, thixotropic polyurethane based adhesive manufactured specifically for use on synthetic turf, such as STA-1000 Synthetic Turf Adhesive as manufactured by Sports Turf Direct, Finleyville, PA, or Ultrabond TurfPU 2K as manufactured by MAPEI, Deerfield Beach, FL.

Or an approved equal.

Rate of application shall be a maximum of thirty (30) linear feet of seam tape per gallon of adhesive unless otherwise recommended by the manufacturer. Hot melt glue is NOT acceptable as an approved equal adhesive. Seams shall be compressed after glue application using a one ton roller or equivalent. Roll each seam a minimum of two times to ensure adhesion.

Weather Restrictions: Where gluing of seams is proposed, the temperature must be 46 degrees °F and rising. Do not deliver or install surfacing material if either ambient air temperature or material temperature is below 32 degrees °F.

Installing Infill: The completed synthetic turf field shall be brushed with a motorized nylon rotary broom and the infill material immediately installed with a minimum four foot (4') width drop spreader. The infill shall be applied in a minimum two (2) lifts to one and one-quarter inch (1 1/4") depth, totaling nine pounds per square foot (9 lbs/sf) of infill material, and the infilled area brushed between each lift. The area shall be wetted as necessary during installation to minimize dust.

Follow-Up Visits: The Contractor shall prepay the synthetic turf manufacturer for two (2) followup visits at six month (6 mo.) intervals after the Substantial Completion date. The visits shall be scheduled by the Engineer to inspect the condition of the synthetic turf, infill material, drainage system, clay skinned areas (if any), and peripheral attachments. Items found to require repair, amendment, or replacement shall be the responsibility of the Contractor. Repairs, except those due to vandalism, shall take place immediately upon notification by the Engineer.

**CLEAN-UP:** At the completion of the work, the Contractor shall remove accumulated debris, tools, equipment, containers, etc. from the site in an approved manner. The entire job shall be left broom clean and acceptable.

**SUBMITTALS:** All submittals shall be as per the S-Pages.

Certificate of Subbase Acceptance: Prior to the beginning of installation, the manufacturer/installer of the synthetic turf and pad shall inspect the subbase and supply a Certificate of Subbase Acceptance for the purpose of obtaining manufacturer's warranty for the finished synthetic playing surface. Acceptance of subbase (see Installation) shall be on synthetic turf manufacturer's representative letterhead.

Shop Drawings: Shop drawings shall be prepared at the scale of the construction documents, or larger, and shall contain all pertinent information regarding installation, including seaming plan, edge detail, field lines, logos, etc. These drawings shall be submitted to the Engineer for approval prior to the manufacturing and shipping of materials.

Installer Qualifications: The synthetic turf contractor must demonstrate experience on at least five (5) installations of infill type synthetic turf. The synthetic turf manufacturer must certify the designated supervisory personnel on the project as competent. The Contractor shall submit for approval, the name and qualifications of the proposed contractor. The Contractor shall submit the following:

1. A letter on turf manufacturer's letterhead affirming the contractor as competent in the installation of the material, including seams and proper installation of their product.
2. Proof of five (5) installations of infill type synthetic turf by the proposed contractor.
3. Name, address, and phone numbers for a minimum of three (3) professional references associated with synthetic turf work performed by proposed contractor.

Synthetic Turf Sample and Test Results: The Contractor shall submit an eighteen inch by twenty-four inch (18" x 24") minimum sample of green turf carpet without infill material showing backing with perforations. Samples of additional turf colors, where shown, shall also be submitted. Sample warrantee shall be submitted for approval prior to approval of turf installer. Certified copies of independent (third Party) laboratory reports shall be submitted certifying the following properties at a minimum:

- Pile Weight and Total Product Weight: ASTM D5848
- Primary and Secondary Backing Weights: ASTM D5848
- Tuft Height: ASTM D5823
- Tuft bind: ASTM D1335
- Grab/Tear Strength: ASTM D5034

Heavy Metal and Semi-Volatile Organic Content Testing: The Contractor shall submit test results from the approved independent laboratory showing that turf fibers and infill meets the requirements specified herein.

Testing shall be conducted by an independent environmental laboratory accredited by the National Environmental Laboratory Accreditation Program (NELAP). The Contractor shall submit certification that the proposed laboratory is NELAP accredited to perform environmental analyses for the metals in question in both (a.) non potable water and (b.) solid and hazardous waste. If the laboratory is situated in the State of New York, NELAP accreditation must be provided by the New York State Department of Health Environmental Laboratory Approval Program (Wadsworth center). Laboratories outside New York State may obtain this accreditation from any State that issues NELAP accreditation.

Infill Samples and Testing: Two (2) samples, one (1) quart in size, of proposed infill material, along with sieve analysis shall be submitted for approval prior to installation.

Adhesive: Product literature shall be submitted prior to installation.

Seam Tape Sample: Contractor shall submit a twelve (12") inch sample of the seaming tape the manufacturer is proposing to use.

Shock Pad Sample: The Contractor shall submit an eighteen inch by twenty-four inch (18" x 24") minimum sample of the shock pad with manufacturer's product information for approval.

Base Aggregate Sample: The Contractor shall submit a five pound (5 lb.) bag of each of the proposed materials, with a sieve analysis and source of supply, for approval.

Geotextile sample: The Contractor shall submit an eighteen inch by twenty-four inch (18" x 24") minimum sample of the geotextile intended for separation and infiltration between subgrade and aggregate, along with manufacturer's product data, for approval.

Warranty: The Contractor shall submit a manufacturer's warranty listing, at minimum, an eight (8) year guarantee against UV fading, degradation, or defects, such as excessive wear or fibrillation, stipulated as more than a forty percent (40%) decrease in pile height, seam rupture, dislodgment, or inadequate drainage. The warranty shall also guarantee a G-Max rating below 145 at the time of installation and below 180 for the remaining term of the warranty. Warranty shall clearly state that if test results show that G-Max rating has not been met, the manufacturer will repair or replace product within the warranty period as necessary to meet those requirements at no cost to the City.

Maintenance Manuals: Prior to acceptance, the Contractor shall submit three (3) copies of Maintenance Manuals, which shall include all necessary instructions for the proper care and preventative maintenance of the synthetic turf system, including any painting or markings.

Independent Field Test for G-Max: After completion of synthetic turf, the Contractor shall engage the services of an independent laboratory capable of performing field tests utilizing ASTM F355 Test Method A, in accordance with ASTM F1936. Tests shall be conducted on two (2) separate visits. The first test shall be conducted after installation, but prior to the acceptance of the work. The second test shall be conducted at one of the two follow-up visits required within the guarantee period. Both tests shall be performed with no visible frost on the ground.

**MEASUREMENT AND PAYMENT:** The quantity of **SYNTHETIC TURF-INFILL TYPE ON STONE BASE (SPORTS)** to be paid for under this Item shall be the number of **SQUARE FEET** furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **SQUARE FOOT** of Synthetic Turf – Infill Type On Stone Base (Sports) and shall include the cost of all labor, equipment, and materials necessary or required to complete the work, including unclassified excavation, laser leveling of subgrade and finished grade, two types of base aggregates, shock pad, synthetic turf carpet, sand infill material, geotextile, slotted polyethylene pipe, filter fabric wrap for perforated pipes, sock, fittings, connection(s) to drainage system, recycled plastic lumber edge, reinforcing rods, sealant, attachments, all necessary testing, two (2) follow-up visits, all delivery charges and submittals, all in accordance with the plans, specifications, and directions of the Engineer.

Ten (10%) percent of the total dollar amount for this item shall be withheld until the first Independent Field conducted G-max Test results are submitted and found acceptable to the Agency.

Detention system including detention pipe, detention tanks, unclassified excavation for detention system and any broken stone beyond the six (6”) inch base aggregate shall be paid under separately under their respective contract items. Painted lines, where shown on the plans, shall be paid for under its own contract item.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 111</b>	<b>SYNTHETIC TURF-INFILL TYPE ON STONE BASE</b>	<b>S.F.</b>

**END OF SECTION**

**SECTION PK-ESCR 1218S – STUMP REMOVAL**

**WORK:** Under this Item, the Contractor shall remove and dispose of designated existing stumps over six (6”) inches in diameter. All work shall be performed in accordance with the plans and specifications by experienced workmen to the satisfaction of the Engineer.

**SPECIAL REQUIREMENTS FOR LONGHORNED BEETLE QUARANTINE ZONE:** For tree work to be performed within the quarantine zone, the Contractor shall utilize the service of a contractor certified by the New York State Department of Agriculture and Markets. Due to current Federal, State and NYC DPR policy, any wood waste that is generated must be completely chipped within the Quarantine Zone, by said certified contractor. Log splitting equipment, where necessary, shall be utilized at no extra cost to the CityFor additional information regarding procedures, the Contractor shall notify the Engineer a minimum of 48 hours in advance of any work. Also, see requirements listed under heading “Submittals”.

**METHOD:** Stumps and roots shall be excavated to a depth of three (3’) feet. All voids and excavations left after the removal of the stump and roots shall be backfilled to grade with clean earth fill. The fill shall be placed and compacted by acceptable methods to the satisfaction of the Engineer. Chips generated by stump removal operations shall be removed prior to backfilling.

If, when removing the stumps, existing walks or curbs are disturbed, the Contractor shall restore and/or reset these walks and curbs, at no additional cost, to the satisfaction of the Engineer. The Contractor is responsible for locating and protecting underground utilities from damage during excavation and/or grinding of stumps.

**PAYMENT SCHEDULE:** The Contractor will be paid at the following rates for the different size groups of stumps removed, based on the unit bid price for removing a stump over 6" to 12" in diameter (base unit).

<u>STUMP DIAMETER</u>	<u>STUMP UNITS</u>	<u>PAYMENT PER STUMP REMOVED</u>
Over 6" to 12"	1.0(base unit)	100% of Unit Bid Price
Over 12" to 18"	1.25	125% " " "
Over 18" to 24"	1.50	150% " " "
Over 24" to 30"	2.0	200% " " "
Over 30" to 36"	2.25	225% " " "
Over 36" to 42"	2.5	250% " " "
Over 42" to 48"	3.5	350% " " "
Over 48"	4.0	400% " " "

**ARBITRARY EXAMPLE:** For example, removal of one (1) 16" diameter stump would receive payment for 1.25 stump units, removal of one (1) 36" diameter stump would receive payment for 2.25 stump units and one (1) 26" diameter stump would receive payment for 2.0 stump units for a total of 5.50 stump units.

The stump diameter shall be measured in the presence of the Engineer.

**SUBMITTALS:** All submittals shall be as specified in the S-Pages. The Contractor shall submit the following for review and approval prior to performing work.

**QUALIFICATIONS IN QUARANTINE ZONE:** State Certification-For all contracts within the Quarantine Zone, the contractor must submit a copy of a valid Compliance Agreement issued by the State of New York Department of Agriculture and Markets, Division of Plant Industry.

**MEASUREMENT AND PAYMENT:** The quantity of **STUMP REMOVAL** to be paid for under this item shall be the number of stump units calculated in accordance with the above payment schedule, completely removed in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be a unit price for **EACH** stump of the over 6" to 12" diameter size group removed and shall include the cost of all labor, materials and equipment necessary for removing stumps, including disposal of any generated material and required fees for disposal, borrowed fill, restoration of walks and curbs disturbed by this operation, maintenance and repair of utilities and all other incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

The cost of State Certification and chipping wood waste shall be included in the bid price for all Contracts located within the Quarantine zone.

**NOTE:** All stumps 6" diameter and less shall be removed under the Item "Clear and Grub".

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 0712S</b>	<b>STUMP REMOVAL 6" TO 12" in DIAMETER</b>	<b>EA</b>

**END OF SECTION**

## SECTION PK-ESCR 132 – COLOR SEAL COAT SYSTEM

**WORK:** Under these items, the Contractor shall apply a color seal coat system, games and park leaf to the asphaltic pavements in accordance with the plans, specifications and directions of the Engineer.

PAINTED GAMES, including Patsy, Skelly, Boxball and Nations, shall conform to Standard Detail "PAINTED GAME LAYOUT" and PAINTED PARK LEAF shall conform to Standard Detail "PARK LEAF OUTLINES", Stencil No.1 Basketball Court Tipoff Circle.

**MATERIALS:** The color seal coat system consists of multiple resurfacer coats, three (3) intermediate coats and one (1) wearing coat. Patching mix shall be installed as necessary and as described under Method.

**PATCHING MIX:** (also known as leveling mixture) The patching mix shall be "California Court Patch Binder", as manufactured by California Sport Surfaces, Andover, MA, "Laykold Acrylic Deep Patch" as manufactured by Advanced Polymer Technology, Harmony, PA, "Acrylic Patch Binder C1480" as manufactured by SportMaster Sport Surfaces, Sandusky, OH, "Action Pave Acrylic Resurfacer" as manufactured by Copeland Coating Co., Nassau, NY, or approved equal. When installed on existing pavement where crack repair is deemed necessary, crack repair shall be Armor Crack Repair System, or approved equal.

**RESURFACER COATS:** Resurfacer coats shall consist of a mixture of acrylic resurfacer and No. 40-60 mesh Silica sand. The resurfacer shall be "California Acrylic Resurfacer", as manufactured by California Sport Surfaces, Andover, MA; "Laykold Acrylic Resurfacer" as manufactured by Advanced Polymer Technology, Harmony, PA; "Acrylic Resurfacer C1300" as manufactured by SportMaster Sport Surfaces, Sandusky, OH, "Action Pave Acrylic Resurfacer" as manufactured by Copeland Coating Co., Nassau, NY, or approved equal.

The sand shall be mixed with the resurfacer at the rate of 600-800 pounds of sand to 55 gallons of undiluted resurfacer, or at such other rate as the manufacturer shall require to meet job conditions. Water shall be added per manufacturer's specifications.

**INTERMEDIATE COATS:** (also known as Filler Coat) The intermediate coats shall be full color acrylic filler coatings consisting of colored acrylic latex emulsion compounded with No. 80-100 mesh Silica sand. The intermediate coats shall be "Plexichrome" or "DecoColor MP", as manufactured by California Sports Surfaces, Andover, MA; "Laykold ColorCoat Concentrate" as manufactured by Advanced Polymer Technology, Harmony, PA; "Color Concentrate" as manufactured by SportMaster Sport Surfaces, Sandusky, OH, "Action Pave Acrylic Filler" as manufactured by Copeland Coating Co., Nassau, NY, or approved equal.

Sand and water shall be added per manufacturer's specifications. Advantage Laykold, DecoColor Plus, Factory Fortified Plexipave or approved equal may be substituted for small areas where sand and latex emulsion pre-mixed in the factory is desired.

**WEARING COATS:** (also known as Finish Coat) The wearing coats shall be full color acrylic latex emulsion. The wearing coats shall be either "Plexichrome" or "DecoColor MP", as manufactured by California Sports Surfaces; "Laykold Colorcoat Concentrate" as manufactured by Advanced Polymer Technology, Harmony, PA; "Color Concentrate" as manufactured by SportMaster Sport Surfaces, Sandusky, OH, "Action Pave Acrylic Finish" as manufactured by Copeland Coating Co., Nassau, NY, or approved equal. Colors shall be as shown on plans. Water shall be added per manufacturer's specifications.

**LINE PAINT:** Line paint to be installed on the color seal coat shall be equal to Fed. Spec. TTP19a. The paint shall be a 100% acrylic emulsion. All line paint to be textured unless otherwise shown

on the drawings. The line paint shall be thinned with water only. The paint shall be suitable for application by brush, spray or roller. Line color shall be white or as shown on the plans.

The paint shall be equal to "Hi Hide Line paint", as manufactured by California Sports Surfaces, Andover, MA, "Laykold Textured White Line Paint" as manufactured by Advanced Polymer Technology, Harmony, PA, "SportMaster Line Paint" as manufactured by SportMaster Sport Surfaces, Sandusky, OH, "Action Pave Acrylic textured White Line Paint" as manufactured by Copeland Coating Co., Nassau, NY, or approved equal.

**METHOD: IMPORTANT RESTRICTIONS:** Before the color seal coat system is applied, the asphaltic surface to receive the system shall have cured for a minimum of Thirty (30) days. The surface temperature shall be taken using a surface thermometer. The Contractor shall take readings every sixty (60) feet in all directions. If the average surface temperature is below fifty-five degrees Fahrenheit (550 °F.) or expected to be below 55 °F degrees within 24 hours, application will not be permitted. If the average surface temperature is above eighty degrees Fahrenheit (800 °F.), the surface shall be water fogged before application will be permitted. Application shall not be permitted during rain events or if a rain event is expected within 24 hours.

**PREPARATION OF SURFACES:** The surface shall be cleaned of all dirt, loose sand, and stone. The Contractor shall power wash the surface clean to the satisfaction of the Engineer prior to applying the color seal coat system. When installed on existing pavement where crack repair is deemed necessary, crack repair shall be performed per manufacturer's instructions prior to application of resurfacer coats.

Before application of each coat, the surface shall be hand scraped and blown free of all dirt and foreign matter and shall be free from standing water and oils.

**APPLICATION OF MATERIALS:** All materials shall be mixed at the site unless otherwise permitted by the Engineer. If the Contractor is granted permission to mix any material off the site he shall arrange with the Engineer to have a representative of the Engineer present during the mixing operations. The mixed materials shall be homogeneous, segregation before or during application will not be permitted.

All materials shall be applied by approved hand or mechanical squeegees. Each completed application shall be smooth, even textured, free from ridges, valleys and tool marks.

**RESURFACER COATS:** The purpose of the resurfacer coats is to fill the surface voids of the asphalt pavement. To this end the resurfacer coat material shall be applied in multiple coats until the surface of the asphalt is free of voids and no telegraphing of the aggregate in the asphalt is visible. A minimum of two coats shall be applied. However, the Contractor shall apply as many additional coats as may be required to fulfill the above requirements. The resurfacer may be diluted with water in accordance with the manufacturer's specifications to obtain workability.

The application of the resurfacing coat shall be parallel in one direction of the courts, a second application may be made at ninety degrees 900 to the first coat.

After the first coat of resurfacer is complete, the entire area shall be flooded with water and allowed to drain. Any areas holding over one-sixteenth inch (1/16") (thickness of a nickel) depth of water shall be leveled with a PATCHING MIX and allowed to thoroughly cure. Patching mix shall be applied in a maximum of (1/4") one-quarter inch lifts. A maximum of (1/2") one-half inch total patch (2 lifts) shall be allowed. This process of water flooding and leveling shall be repeated until all depressions over one-sixteenth (1/16") inch have been eliminated. Surface shall be inspected to ensure all depressions have been filled before application of Intermediate Coats.

INTERMEDIATE COATS: (also known as Filler Coat) Three (3) intermediate coats shall be applied. The total amount of material to be applied shall be .10 to .16 gallons per square yard based on the material prior to any dilution. The acrylic resurfacer may be diluted as recommended by the manufacturer to obtain workability.

WEARING COATS: (also known as Finish Coat) One (1) wearing coat shall be applied. In the case of tennis court application, the wearing coat shall be applied parallel to the net line. The total amount of material to be applied shall be .18 to .30 gallons per square yard prior to any dilution. The material may be diluted as recommended by the manufacturer to obtain workability. Sand shall not be added to the wearing coats.

LINE PAINT: All painted lines shall be carefully laid out and defined on the surface by chalk markings before being painted.

Two (2) coats of line paint shall be applied. At least two (2) hours shall elapse between the painting of the first and second coats. All painted lines shall be accurately painted within the limits shown on the plans. Lines shall be clear and distinct with sharply defined edges.

Guarantee Inspection - At the guarantee inspection if the color seal coat is found to be peeling or fading due to improper installation, the Contractor shall be responsible to re-apply at the Contractor's own expense.

SUBMITTALS: At the time of the Pre-construction meeting, and in accordance with the S-Pages, the Contractor shall be required to submit, for approval, complete details of the color seal coat system the Contractor proposes to use. The specifications of all information (products or systems, manufacturer's names, product description, technical and laboratory data, mixing information, methods of application, rates and all other data) as may be required to demonstrate to the satisfaction of the Engineer that the color seal coat system the Contractor proposes to use meets the requirements of these specifications.

The Contractor shall be required to submit color samples for approval by the Engineer.

MEASUREMENT AND PAYMENT: The quantity of **COLOR SEAL COAT SYSTEM** to be paid for shall be the number of **SQUARE YARDS** of color seal coat applied and accepted in accordance with the plans, specifications, and directions of the Engineer.

For applying **PAINTED GAMES** and/or **PARK LEAF** in accordance with the plans and specifications and directions of the Engineer, the Contractor shall receive the unit prices bid.

The prices bid shall be a unit price per **SQUARE YARD** of COLOR SEAL COAT applied and accepted and shall include the cost of furnishing all labor, materials, equipment and incidental expenses necessary to complete the work, including preparation of surfaces, crack repair (where needed), patching mix, resurfacer coats, intermediate coats, wearing coats and painted lines, in accordance with the plans and specifications to the satisfaction of the Engineer.

Where the painted games and park leaf are to be installed over color seal coat, it shall be paid under the item for "Color Seal Coat System."

Item No.	Item	Pay Unit
PK-ESCR 132	COLOR SEAL COAT SYSTEM	S.Y.
PK-ESCR 132 B	PAINT LINES – 2” WIDTH – COLOR SEAL COAT AREA	L.F.

**END OF SECTION**

**SECTION PK-ESCR 140 – TRANSPLANT TREE**

**WORK:** Under these Items, the Contractor shall **TRANSPLANT TREE UP TO 4” CALIPER and/or TRANSPLANT TREE OVER 4" TO 6” CALIPER** as specified in the Plant Schedule or, in accordance with the plans, specifications, and directions of the Engineer.

**NOTIFICATION:** All trees to be transplanted shall be selected and tagged by the Engineer from existing plant material on the site. The Engineer must be present during all transplanting work. The Contractor shall notify the Engineer a minimum of 48 hours in advance of any work to be done under this item as well as NYC Parks Manhattan Forestry, 212-860-1845.

**NOTE:** Plant shall be dimensioned as it stands in its natural position. Trees up to and including inches (4") in caliper size shall be measured twelve inches (12") above ground level.

**QUALIFICATIONS REQUIRED:** Arborist or Landscape Contractor shall be certified by the New York State Department of Agriculture and Markets to perform pruning work within the Asian Longhorned beetle quarantine zone. All pruning of limbs and roots must be performed by a qualified arborist, trained in proper pruning techniques, tree biology, diagnosis and treatment of plant diseases, and cabling and bracing.

**ASIAN LONGHORNED BEETLE QUARANTINE ZONE REGULATIONS:** Due to current Federal, State and NYC DPR policy, the following host species may not be planted in the quarantine zone. Host species are as follows: Acer-Maple, Aesculus-Horsechestnut/Buckeye, Salix-Willow, Betula-Birch, Populus-Poplar, Ulmus-Elm, Albiza-Mimosa/Silk Tree, Celtis-Hackberry, FraxinusAsh, Platanus-London Plane tree, Sycamore, Sorbus-Mountain Ash.

In addition, Nurseries located within the quarantine zone shall comply with State and Federal Law and all Contractors and/or Subcontractors shall be certified by the New York State Department of Agriculture and Markets to perform work within the Quarantine Zone (see Submittals section below).". Contractor is directed to check with the New York State Department of Agriculture and Markets for the most current host list and quarantine requirements and zone boundaries.

**MATERIALS:**

**Burlap for Root Ball:** Burlap shall be a natural fabric. No nylon burlap shall be permitted.

**Cord or Rope:** Cord or rope shall be sisal twine. Nylon rope shall not be permitted.

**Fertilizer Tablets:** Shall be Healthy Start Macro Tablets®, as manufactured by Plant Health Care, Inc., Pittsburgh, PA, or approved equal. The tablets shall have a nutrient analysis of 12-8-8 and contain a minimum twelve percent (12%) humic acid by weight, as well as biostimulants derived from sea kelp, amino acids, and a wetting agent derived from Yucca schidigera. Tablets shall contain a minimum 650,000 each of the following beneficial bacteria: nitrogen fixing, phosphorus solubilizing, and growth promoting. Twenty one gram (21 gm.) twenty four month (24 mo.) release tablets shall be added to the top four (4") inches of backfilled soil in the rates indicated on the following chart:

<u>Size of rootball or container</u>	<u>Tablets per plant</u>
20-24" B&B	5
30-36" B&B	6
42-48" B&B	8
54-60" B&B	12

For larger trees, use two (2) tablets for each one-half inch (1/2") caliper.

**Mycorrhizal Fungi Inoculant:** Shall be applied by means of a three (3 oz.) ounce premeasured dry formulation packet, such as Mycor Tree Saver Transplant®, as manufactured by Plant Health Care, Inc., Pittsburgh, PA; Rhizanova Tree Transplant, as manufactured by Becker Underwood, Inc., Ames, IA; or approved equal. Packets shall contain, as a minimum: one thousand (1000) live spores of Vesicular-Arbuscular fungi, including: Entrophosphora columbiana, Glomus clarum, Glomus etunicatum, and Glomus sp.; seventeen million five hundred thousand (17,500,000) live spores of Ectomycorrhizal fungi (Pisolithus tinctorius); Biostimulant ingrediants including Yucca schidigera extract; soluble sea kelp extract derived from Ascophylum nodosum; humic acids; and acrylamide copolymer gel as a water absorbent medium. Mycorrhizal fungi inoculant shall be added to the top six to eight inches (6-8") of backfill soil in each planting pit and thoroughly mixed to distribute the inoculant. The material shall be applied according to the following chart:

<u>Size of rootball or container</u>	<u>Ounces per plant</u>
20" B&B	6
24" B&B	9
30" B&B	9
36" B&B	12
42" B&B	12
48" B&B	15
60" B&B	18
72" B&B	21
96" B&B	27

**Stakes:** Stakes shall be of white cedar with bark attached and have a maximum allowable deflection of ten percent (10%).

**Wire:** Shall be #12 gauge, annealed, galvanized, steel wire.

**Hose:** Shall be new reinforced one-half (1/2") inch dia. rubber hose.

**Shredded Bark Mulch:** Shall consist of shredded bark, pieces not exceeding three (3") inches in length and one (1") inch in width. Mulch contaminated with leaves, twigs, and/or debris shall not be acceptable. Only mulch derived from tree material, not from wood waste products like sawdust, shall be acceptable.

**EXECUTION:**

**Note:** The Engineer's representative must be present during all transplanting work. Plants shall be installed where shown on the plans and as the directed by the Engineer.

**Preparation of Plants:** All precautions customary in good trade practice shall be taken in preparing plants for moving, and workmanship that fails to meet the highest standards will be rejected. All plants shall be dug immediately before moving unless otherwise directed. All plants shall be dug to retain as many fibrous roots as possible. Balled and burlapped plants shall have a solid ball of earth of minimum specified size according to the American Standard for Nursery Stock securely held in place by burlap and sisal twine. Loose, broken, and wire caged balls will be rejected. All rejected material shall be immediately removed from the site and replaced with acceptable material at no additional cost to the Agency.

Bare root plants, where recommended by the Engineer, shall conform to the same standards for balled and burlapped plant material and shall be adequately protected from drying out and immediately heeled in moist soil until planting.

Time of Planting and Transplanting: Unless otherwise directed by the Engineer, evergreen material shall be transplanted from April 1st to May 1st and from September 1st to October 15th. Deciduous material shall be transplanted from March 1st to May 1st and from October 15th to December 1st.

Excavation of Planting Pits: Tree pit shall be dug a minimum of one (1') foot wider than root ball in all directions, and depth of pit shall be thirty-six (36") inches, or as directed by the Engineer.

No plant pits shall be dug until the proposed locations have been staked on the ground by the Contractor and approved by the Engineer. No plant pits shall be backfilled until approved by the Engineer and all pits shall have vertical sides unless otherwise directed. Where, in the opinion of the Engineer, the existing soil is unsuitable, it shall be replaced with Topsoil for New Planting Pits and Beds.

Where excavation is done by backhoe (or any comparable machine) Contractor shall exercise extreme care not to excavate too deeply. This will ensure the least amount of settling, which is important to achieve a proper planting grade. If planting pits are dug before plant material is on site, the pits shall only be excavated to two-thirds (2/3) the depth of a standard pit, the final depth to be adjusted at the time of planting. If any backfilling is required, the soil under the root ball is to be compacted sufficiently to ensure no further settling or sinking.

While awaiting planting, the Contractor shall protect plant roots from drying out and the means employed shall be satisfactory to the Engineer. In general, all plants shall stand, after settlement, at the same level at which they have grown. Care shall be exercised in setting the plants plumb with the "good face" to the outside. All ropes, stones, etc., shall be removed from the pit before backfilling. Soil for backfilling shall be loose and friable. Fertilizer tablets and Mycorrhizal inoculant shall be added to backfill material in quantities described above.

Balled and burlapped plants shall be handled so that the ball will not be loosened or broken. After the soil has been thoroughly firmed under and around the lower half of the ball, the burlap shall be cut away from upper half of the ball and the remaining burlap adjusted to prevent the formation of air pockets. Soil shall be firmed at six (6") to eight inch (8") intervals and thoroughly settled with water the same day of planting.

Bare root plants shall be placed in the proper position in the center of the pit after the soil in the bottom of the pit has been firmed. Roots shall be arranged in their natural position and loose friable topsoil worked in among them, firmed at intervals and thoroughly settled with water. Care shall be taken to avoid bruising or breaking the roots when tamping the soil. All large and fleshy roots which are bruised or broken shall be pruned with a clean cut before planting.

Finishing Surface After Backfilling: The Contractor shall cultivate and rake over finished planting areas and shall leave them in an orderly condition. On level ground or slight slopes a shallow saucer or basin a little larger than the diameter of the plant pit shall be left around each plant as shown on the plans or as directed by the Engineer. On steep slopes the soil on the lower side of the plant shall be graded in such a manner that it will catch and hold water, as shown on the plans or as directed by the Engineer. The transplanted plants shall be watered with a minimum of twenty (20) gallons each.

After the shallow tree saucers or basins have been prepared, they shall be mulched, three to four inches (3-4") in depth, inside, and along the outside edge of the saucers or basins.

Pruning: Dead, injured or diseased wood shall be removed in accordance with good horticultural practice. Crossed branches shall be pruned with a sharp tool in such a manner as to preserve and encourage the plant's natural growth form. Do not cut leaders or use wound paint or dressing to treat cut areas. Additional pruning may be required as determined by the Transplanting

Contractor to preserve aesthetic balance. Any pruning shall preserve the natural character of each plant and shall be done in a manner appropriate to its particular requirements. In general, no more than one-fourth (1/4) of the wood of deciduous plants shall be removed by thinning or shortening branches. Double leaders and multiple branched crotches shall be corrected. Any crown pruning shall be done during the transplanting season and may be performed either before or after transplanting, at the Contractor's discretion. If done before transplanting, additional pruning may be required to correct any damage incurred during the transplanting operation. In no case shall leader branches be removed or harmed. The crowns of young trees should not be cut back to compensate for root loss. All pruning shall be done with sharp tools in accordance with the instructions, and in the presence of, the Engineer.

AT NO TIME SHALL MORE THAN 20% OF A TREE'S LIVE CANOPY BE REMOVED.

Debris: If directed by the Engineer, pruned material shall be chipped and spread as mulch to supplement "Protect existing tree roots with wood chips" item. All other pruned material and debris shall be removed from the site of the contract within twenty four (24) hours and disposed of as directed by the Engineer, and per the Quarantine provisions.

Staking: All staking shall be done immediately after planting and all stakes, wire and guying material maintained. Plants shall stand plumb after staking. Stakes shall be placed outside of the root ball and shall be driven thirty-six inches (36") into the ground for all trees under three and one-half (3-1/2") inches in caliper and shall be driven forty-eight inches (48") into the ground for all larger trees. Stakes shall be fastened to the tree with a doubled strand of #12 gauge, annealed, galvanized, steel wire run through a suitable length of new reinforced one-half inch (1/2") rubber hose, or approved equal, as directed by the Engineer. Stakes shall be set parallel to the contours, curbs, or walks unless otherwise directed by the Engineer. Staking shall be as follows:

Minor trees over three (3') feet and less than ten (10') feet in height shall be supported by two (2) stakes five feet (5') long in accordance with the plans and specifications or as directed by the Engineer.

Major trees less than three and one-half (3 1/2") inches in caliper shall have two (2) stakes eight feet (8') long with a minimum stake diameter of three inches (3").

Major trees four (4") inches in caliper shall have three (3) stakes ten feet (10') long with a minimum stake diameter of three inches (3").

Major trees between four (4") inches and six (6") inches in caliper shall be staked as directed by the Engineer.

Stakes, wires, hoses and guying shall be removed at the end of the guarantee period unless otherwise directed by the Engineer.

Spraying with Anti-Desiccant: When directed by the Engineer, the Contractor shall spray all Plant Material with an anti-desiccant, using an approved power sprayer to apply an adequate film over trunks, branches, twigs, and/or foliage, as directed by the Engineer. The anti-desiccant shall be an emulsion which will provide a protective film over plant surfaces, permeable enough to permit transpiration. The anti-desiccant shall be Hydrotec100, by Botanical Security Products Co., New York, NY; ArborGuard as manufactured by SavATree, Bedford Hills, NY; or Wilt Pruf, NCF, as manufactured by Nursery Specialties Products, Greenwich, CT; or approved equal. Anti-desiccants shall be delivered in containers of the manufacturer, shall be mixed according to directions, and applied to plant material within forty-eight (48) hours of each day's planting that is completed.

Edging of Planting Areas: The Contractor shall establish a neat edge where planting areas meet grass areas as shown on the plan or as directed by the Engineer. Edging shall be done by

competent mechanics in a professional manner with a spade or edging tool immediately after all planting is completed. Particular care shall be exercised in edging to establish good flowing curves as shown on the plans or as directed by the Engineer. Edging shall be maintained by the Contractor.

**MAINTENANCE:** The Contractor shall maintain areas within the drip line of all transplanted plant material within the limits of this contract in accordance with the plans and specifications and directions of the Engineer through the Guarantee period specified in Schedule A.

The Contractor shall submit for approval a proposed maintenance schedule specifying workers, materials, and equipment required to comply with maintenance provisions. The proposed schedule shall commence three (3) weeks from the date of Substantial Completion.

Maintenance shall be defined as watering, weeding, cultivating; pruning; spraying with anti-desiccant (where directed by the Engineer), adjustments and replacement of stakes, anchors and wires; repair of minor washouts and gullies up to twelve (12") inches in depth; and other horticultural operations necessary for the proper growth of all plants and for keeping the entire area within the contract limits neat in appearance.

The maintenance period shall extend from May 1st to October 15th and maintenance shall be repeated at least every three (3) weeks. Dead, dying, or undesirable plants shall be removed during this period at the direction of the Engineer. Under no conditions shall weeds be allowed to grow more than six (6") inches in height. The cost of maintenance shall be included in the prices bid.

**REPLACEMENT:** The Contractor shall replace, in accordance with the contract plans and specifications, any transplanted plant material that is dead or, in the opinion of the Engineer, in an unhealthy or unsightly condition, and/or have lost their natural shape due to dead branches, excessive pruning, inadequate or improper maintenance, in the next planting season. There shall be a guarantee on plant material commencing after the Substantial Completion and the completion of the whole work of this contract. The duration of the guarantee period is set in Schedule A. When instructed by the Engineer, plant material that has died after final acceptance shall be replaced in the next appropriate planting season, even when the next planting season falls outside the one year period.

Names for Replaced Material: Plant names, size, and grading standards shall conform to those prepared by the American Association of Nurserymen Horticultural Standards, 2004 Edition, unless otherwise specified. No substitution shall be permitted, except with the written permission of the Engineer. Replacement trees shall be between two and one half (2 1/2") inches and three and one half (3 1/2") inches caliper (regardless of transplanted tree size), and be the same species as the transplanted tree unless otherwise directed. The Engineer must be consulted to select a replacement species where transplanted tree is an ALB host species within quarantine zone.

Where vandalism or related causes are agreed by the Engineer as the cause for transplanted plant material death, the Contractor shall not be responsible for replacement during the guarantee period after final acceptance.

Where dead plant material has been identified, whether due to natural causes or vandalism, the Contractor shall remove the dead material, including stakes, and wire (if applicable) within three (3) weeks of notification.

At the expiration of the guarantee period, unless specifically directed by the Engineer, the Contractor shall leave the entire area cultivated and weed free and shall remove all stakes and wires. All saucers in seeded or sodded areas shall be leveled and seeded with the appropriate mix under the direction of the Engineer.

**FINAL ACCEPTANCE:** The Contractor shall be liable for any damages to property by transplanting operations and all areas and construction disturbed shall be restored to their original condition, to the satisfaction of the Engineer.

**SUBMITTALS:** All submittals shall be as per the S-Pages. The Contractor shall submit the following for review and approval prior to performing work:

State Certification (in quarantine zone only) where applicable: The Contractor must submit a copy of a valid Compliance Agreement issued by the State of New York Department of Agriculture and Markets, Division of Plant Industry.

**MEASUREMENT AND PAYMENT:** The quantity of **TRANSPLANT TREE UP TO 4" CALIPER** and **TRANSPLANT TREE OVER 4" TO 6" CALIPER** to be paid for under these items shall be the number of trees transplanted and maintained in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be a unit price for **EACH TRANSPLANT TREE UP TO 4" CALIPER** and each **TRANSPLANT TREE OVER 4" TO 6" CALIPER** and shall include the cost of unclassified and/or hand excavation of plant pits, ball and burlap operation, transplanting, pruning, slow-release fertilizer tablets mycorrhizal inoculant, anti-desiccant, shredded bark mulch, staking, watering, replacing, and maintaining all transplanted trees, and all other work incidental thereto in accordance with the plans and specifications, to the satisfaction of the Engineer.

Topsoil For New Planting Pits and Beds and Tree Growth Regulator, where required and as directed by the Engineer, shall be paid for separately under their respective contract items.

**END OF SECTION**

## SECTION PK-ESCR 148 – GEOTEXTILE - DRAINAGE

**PK-ESCR 148.1 WORK:** Under this Item, the Contractor shall furnish and install GEOTEXTILE - DRAINAGE in accordance with the plans and specifications, as directed by the Engineer.

**PK-ESCR 148.2 MATERIALS:**

**GEOTEXTILE - DRAINAGE:** Drainage application is defined as a soil to geotextile system that allows for long-term, adequate liquid flow normal to the geotextile with limited soil loss across the plane of the geotextile.

Fibers used in the manufacture of drainage geotextiles, and the threads used in joining geotextiles by sewing, shall consist of long-chain, synthetic polymers, composed of at least 95 percent by weight polyolefins, polyesters, or polyamides. They shall be formed into a stable network such that the filaments or yarns retain their dimensional stability relative to each other, including selvages. The geotextile shall have no tears or defects which adversely alter its physical properties. Geotextiles used in drainage applications shall be Class 2 and shall conform to the following AASHTO-M-288 properties for drainage geotextiles:

		Insitu Soil requirements-% passing through a Standard No. 200 US sieve					
Property	ASTM Test	Less than 15%		15% to 50%		Greater than 50%	
Structure		Woven	Non-Woven	Woven	Non-Woven	Woven	Non-Woven
Elongation	ASTM D4632	<50%	>=50%	<50%	>=50%	<50%	>=50%
Grab Strength (Min.)	ASTM D4632	1100N (247 LBF)	700N (157 LBF)	1100N (247 LBF)	700N (157 LBF)	1100N (247 LBF)	700N (157 LBF)

Apparent Opening Size (Max.)	ASTM D4751	0.43 mm (0.01645 inch) Std No. 40 sieve	0.25 mm (0.0098 inch) Std. No. 60 sieve	0.22 mm (0.0083 inch) Std. No. 70 sieve
------------------------------	------------	---	---	---

Geotextiles shall be FX-60HS (nonwoven) as manufactured by Carthage Mills, Cincinnati, OH, or 160N (nonwoven) by Mirafi, Inc., Pendergrass, GA, or TerraTex N06 (nonwoven) by Hanes Geo Components, Winston Salem, NC, approved equal. Contractor shall submit product data showing that the proposed geotextile is suitable for the soil condition on site.

**DELIVERY AND STORAGE:** Each geotextile roll shall be wrapped with a material that will protect the geotextile, including the ends of the roll, from damage due to shipment, water, sunlight, and contaminants. The protective wrapping shall be maintained during periods of shipment and storage. During storage, geotextile rolls shall be elevated off the ground and adequately covered to protect them from the following: site construction damage, precipitation, extended ultraviolet radiation including sunlight, chemicals that are strong acids or strong bases, and any environmental condition that may damage the physical property values of the geotextile.

**PK-ESCR 148.3 INSTALLATION:** The geotextile shall be installed on ground free of objects which may tear or damage the fabric. Install geotextile at elevations and alignments as indicated on the drawings or as directed by the Engineer. The drainage geotextile shall be placed loosely with no wrinkles or folds. Care will be taken to place the geotextile in intimate contact with the soil so that no void spaces occur between the geotextile and trench or ground. Where the geotextile is to be installed in a trench, the geotextile shall be overlapped at the top of the trench, twelve (12") inches or the full width of the trench, whichever is less.

If the geotextile is damaged during installation, the rupture shall be removed and the damaged area shall be covered with a patch of new fabric which will overlap the undamaged fabric approximately six (6") inches in all directions. All repaired fabric surface costs will be deemed part of the price bid.

**PK-ESCR 148.4 SUBMITTALS:**

Manufacturer's Data: The Contractor shall submit manufacturer's data with sufficient detail to demonstrate compliance with the requirements of this specification. Contractor must examine soil condition on site and select the appropriate geotextile to submit and to use for the site.

Samples: The Contractor shall furnish two (2) labeled samples, six inch by six inch (6" x 6") minimum, of the geotextiles intended for use in the work for approval and the Engineer's use. The label shall include the manufacturer's product name, the type of fabric, and the weight of grade of the material. Geotextiles used in the work shall conform to the approved samples.

Soil Testing for Large Quantities: Where quantity of Geotextile - Drainage exceeds four hundred and fifty (450) square yards and as directed by the Engineer, the Contractor shall pay for soil testing of existing soil prior to the selection and submittal of the specific geotextile. The Contractor shall furnish a certified report by an approved Materials Testing Laboratory showing the in-situ soil condition. Contractor shall submit to the Engineer the result of the sieve analysis indicating percent passing through a standard No. 200 US Sieve along with the Geotextile sample. The grain size analysis of insitu soil shall be in accordance with AASHTO T88. Contractor shall obtain

a minimum of one soil sample per one hundred and fifty (150) square yard of area covered. The Contractor shall bear responsibility for all costs associated with soil laboratory testing.

**PK-ESCR 148.5 MEASUREMENT AND PAYMENT:** The quantity of **GEOTEXTILE - DRAINAGE** to be paid for shall be the number of **SQUARE YARDS** required, measured in its final position, furnished and installed in accordance with the plans and specifications and the directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of **GEOTEXTILE - DRAINAGE** installed and shall include the cost of furnishing all labor, material, equipment, submittals, soil testing (where directed by the Engineer), and incidental expenses necessary to complete the work in accordance with the plans and specifications and to the satisfaction of the Engineer.

Excavation, topsoil, or borrowed fill shall be paid for separately under their respective contract items.

*Payment will be made under:*

<b>PK-ESCR 148</b>	<b>GEOTEXTILE - DRAINAGE</b>	<b>S.Y.</b>

**END OF SECTION**

## SECTION PK-ESCR 149 – GEOTEXTILES – SEPARATION, STABILIZATION

**WORK:** Under these Items, the Contractor shall furnish and install **GEOTEXTILE - SEPARATION** and/or **GEOTEXTILE - STABILIZATION** in accordance with the plans and specifications, as directed by the Engineer.

**MATERIALS:**

Fibers used in the manufacture of geotextiles, and the threads used in joining geotextiles by sewing, shall consist of long-chain, synthetic polymers, composed of at least 95 percent by weight polyolefins, polyesters, or polyamides. The geotextile and the threads used in sewing geotextiles, shall be resistant to chemical attack, rot, and mildew. The geotextile shall have no tears or defects which adversely alter its physical properties. They shall be formed into a stable network such that the filaments or yarns retain their dimensional stability relative to each other, including selvages. The geotextile shall have no tears or defects which adversely alter its physical properties. The separation and stabilization applications shall be as specified below:

**GEOTEXTILE - SEPARATION APPLICATION:** Separation application is defined as the placement of a flexible porous geotextile between dissimilar materials so that the integrity and functioning of both materials can be maintained or improved, but where water seepage through used in separation applications shall conform to the following AASHTO-M-288 properties for separation geotextiles:

Structure	ASTM Test	Woven	Non-Woven
Elongation	D4632	< 50%	≥ 50%
Grab Strength (Minimum)	D4632	1100 N (247 LBF)	700 N (157 LBF)
Tear Strength (Minimum)	D4533	400 N (90 LBF)	250N (56 LBF)
CBR Puncture (Minimum)	D4833	4000 N (900 LBF)	1820 N (410 LBF)
Permitivity (Minimum)	D4491	0.02 / sec.	0.02 / sec.
Apparent Opening Size (Maximum)	D4751	0.6 mm (0.023 inch) Std. No. 30 sieve	0.6 mm (0.023 inch) Std. No. 30 sieve

Geotextile used in separation applications shall be FX-66 (woven) or FX-60HS (nonwoven) manufactured by Carthage Mills, Cincinnati, OH, or 600X (woven) or 160N (nonwoven) as manufactured by Mirafi, Inc., Pendergrass, GA, or TerraTex HD (woven) or TerraTex N06 (nonwoven) as manufactured by Hanes Geo Components, Winston Salem, NC or approved equal.

**GEOTEXTILE - STABILIZATION APPLICATION:** Stabilization application is utilized in wet, saturated conditions to provide the coincident functions of separation and filtration. In some installations, the geotextile can also provide the function of reinforcement. The stabilization application is appropriate for subgrade soils that are saturated due to a high groundwater table or due to prolonged periods of wet weather. Geotextiles used in stabilization applications shall conform to the following AASHTO M-288 properties for stabilization geotextiles:

Structure	ASTM Test	Woven	Non-Woven
Elongation	D4595	< 50%	≥ 50%
Grab Strength (Minimum)	D4632	1400 N (315 LBF)	900 N (205 LBF)
Tear Strength (Minimum)	D4533	500 N (112 LBF)	360 N (80 LBF)
CBR Puncture (Minimum)	D6241	4000 N (900 LBF)	1820 N (410 LBF)
Permitivity (Minimum)	D4491	0.05 / sec.	0.05 / sec.
Apparent Opening Size (Maximum)	D4751	0.43 mm (0.0165 inch) Std. No. 40 sieve	0.43 mm (0.0165 inch) Std. No. 40 sieve

Geotextile used in stabilization applications shall be FX66 (woven) or FX80-HS (nonwoven) manufactured by Carthage Mills, or 600X(woven) manufactured by Mirafi, Inc. or TerraTex HD (woven) manufactured by Hanes Geo Components, or approved equal.

**INSTALLATION:** For separation and stabilization applications the ground shall be prepared by removing stumps and other organic material, along with any large boulders and sharp objects which may tear or damage the fabric. After the ground has been prepared, the fabric shall be rolled directly on the ground. All seams shall be overlapped approximately six (6") inches. No equipment, materials or machinery shall be placed on or be transported over exposed fabric. Topsoil backfill or other clean fill shall then be carefully placed to prevent dislocation of the fabric.

If the fabric is damaged during installation, the rupture shall be removed and the damaged area shall be covered with a patch of new fabric which will overlap the undamaged fabric approximately six (6") inches in all directions. All repaired fabric surface costs will be deemed part of the price bid.

**SUBMITTALS:** All submittals shall be submitted prior to purchase and in accordance with the requirements of the S-Pages.

**Manufacturer's Data:** The Contractor shall submit manufacturer's data with sufficient detail to demonstrate compliance with the requirements of this specification.

**Samples:** The Contractor shall furnish two labeled (2) samples, six inch by six inch (6" x 6") minimum, of the geotextiles intended for use in the work for approval and the Engineer's use. The label shall include the manufacturer's product name, the type of fabric, and the weight of grade of the material. Geotextiles used in the work shall conform to the approved samples.

**MEASUREMENT AND PAYMENT:** The quantity of Geotextiles to be paid for shall be the number of **SQUARE YARDS** of **GEOTEXTILE - SEPARATION** and **GEOTEXTILE - STABILIZATION** required, measured in its final position, furnished and installed in accordance with the plans and specifications and the directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of each type of Geotextile installed and shall include the cost of furnishing all labor, material, equipment, submittals, and incidental expenses necessary to complete the work in accordance with the plans, specifications, and to the satisfaction of the Engineer.

Excavation, topsoil, or borrowed fill shall be paid for separately under their respective contract items.

PARKS-124

## SECTION PK-ESCR 152 – BENCH, 1964 WF RPL SLATS

**WORK:** Under this Item, the Contractor shall furnish and install **BENCH, 1964 WORLD'S FAIR W/ RPL SLATS** in accordance with the plans, specifications, and directions of the Engineer.

**BENCH DESIGN:** In general, 1964 World's Fair Bench standard detail (originally designed for wood slats) shall be followed except that recycled plastic lumber (RPL) slats shall have an unsupported span no greater than two feet six inches (2'-6"). Overhang shall not exceed three (3") inches. Steel supports shall be installed to adequately support the plastic slats. All standards shall have arms, unless otherwise shown on contract plans. The 1964 World's Fair bench shall be manufactured by Kenneth Lynch and Sons, Oxford, CT, Kevin G. Lindelow Quality Site Furnishings, Frenchtown, NJ, All City Play Equipment, Inc., Metuchen, NJ, or approved equal.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

**STANDARDS:** Bench standards shall be of cast ductile iron. The tensile strength shall meet a minimum of 65,000 psi, in accordance with ASTM designation A536, Grade 65-45-12.

**Standards shall be hot dipped galvanized in accordance with ASTM A153.** Any resulting dimples or sharp points shall be ground smooth.

**Steel Supports:** Steel supports for recycled plastic lumber shall be hot-rolled carbon steel flat bars and channels of the sizes indicated on the drawings and secure to the plastic slats with vandal resistant screws. All steel supports shall be hot dipped galvanized or stainless steel as per this specification.

**Touch-up and Repair:** For minor damage caused by grinding, installation or transportation, touchup galvanized finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of six (6') feet.

**BENCH SLATS – RECYCLED PLASTIC LUMBER:** All slats for benches shall be fabricated from at least ninety percent (90%) post-consumer recycled plastic, dimensions as indicated on the plans. Recycled plastic lumber shall be Selectforce as manufactured by Bedford Technology, LLC Worthington, MN, PolyTuf™ as manufactured Tangent Technologies, LLC, Aurora, IL, or approved equal. Color to be Cedar, Brown or Weathered Wood unless otherwise indicated on the plans.

Recycled plastic lumber shall comply with or be tested in accordance with the following.

ASTM D6108 Standard Test Method for Compressive Properties of Plastic Lumber and Shapes

ASTM D6109 Standard Test Method for Flexural Properties of Unreinforced and Reinforced Plastic Lumber

ASTM D6111 Standard Test Method for Bulk Density and Specific Gravity of Plastic Lumber and Shapes by Displacement

ASTM D6112 Standard Test Methods for Compressive and Flexural Creep and Creep Rupture of Plastic Lumber and Shapes

ASTM D6117 Standard Test Methods for Mechanical Fasteners in Plastic Lumber and Shapes

ASTM D1248 Standard Specifications for Polyethylene Plastics Extrusion Materials for Wire and Cable

Recycled Plastic Lumber shall be fabricated primarily from recycled High Density Polyethylene (HDPE) and recycled Low Density Polyethylene (LDPE). HDPE resins shall meet the requirements of ASTM D1248 for Type III or IV (high density), Grade G7. Lumber shall contain no toxic materials, but shall contain UV-inhibited pigments. Composition and mechanical properties shall be as follows: Minimum Recycled Content 90%

Minimum High Density Polyethylene 70%  
Maximum Percentage of Materials other than Polyolefins 5%  
Minimum Specific Gravity (ASTM D6111) 0.02 lbs-in<sup>3</sup>  
Minimum Flexural Modulus (ASTM D6109) 85,000 psi  
Minimum Screw Pull-out Strength (ASTM D6117) 700 lbs

Flame Spread, Class C or better, tested in accordance with ASTM E84.

Coefficient of Thermal Expansion (ASTM D6341), in the range of -10 degrees C to 30 degrees C, shall not exceed  $70 \times 10^{-6}$  degrees F.

Recycled Plastic Lumber shall not absorb moisture, corrode, rot, warp, splinter, or crack and shall not contain fiberglass or any material that will be irritating in contact with skin.

Fabrication Tolerances: Ends shall be smooth with clean cuts. Cross-sections shall not have voids greater than 1/2" dia. Voids of 1/2" dia. Or less shall be filled as per manufacturer's specifications. All edges shall have 1/4" radius. Maximum variation from flat surface across section shall be 1/8".

Delivery and Storage: Keep recycled plastic lumber protected at all times against exposure to extreme heat or impact. All material shall be bundled and fully supported during shipping and storage to prevent creep. Any lumber that is damaged or excessively scratched will be rejected and replaced with new. All material must be straight and true when placed in the construction.

Hardware: Bolts, locknuts, and washers used to secure slats to standards shall be stainless steel or hot dipped galvanized. Bolt or wood screw used for mid section steel support strap (RPL only) shall be a vandal resistant type, either stainless steel or hot-dipped galvanized. Type and dimensions of all bolts, nuts, and washers shall be as indicated on the plans. Anchor bolts used to secure the benches to pavements may be either stainless steel or hot-dipped galvanized steel. Bolts for securing slats shall be provided with nylon lock nuts so as to render the connection vandal resistant.

Concrete: Concrete for slabs or footings shall be " , " class B-32 per the NYCDOT Standard Highway Specifications *Section ESCR-4.06* and shall be of the dimensions indicated on the plans.

**ASSEMBLY AND INSTALLATION:** Benches shall be pre-assembled before being installed in their final location and properly secured in place by anchor bolts drilled into concrete footings or slab, as indicated on the plans.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

Shop Drawings: The Contractor shall submit Shop Drawings showing adequate number of supports and armrests required specifically for recycled plastic lumber design.

Foundry Certificates: Certifying Ductile Iron used in bench standards shall be submitted. The certificate shall be on foundry letterhead, dated and signed by the manufacturer with the Contract No., Contractor name, and Class of Ductile Iron provided.

Sample: The Contractor shall submit a twelve inch (12") sample of the recycled plastic lumber slat for surface and color approval. Required test results shall be submitted if an approved equal manufacturer is proposed.

**MEASUREMENT AND PAYMENT:** The quantity of **BENCH, 1964 WORLD'S FAIR W/ RPL SLATS** to be paid for under this item shall be the number of **LINEAR FEET** of bench measured in place along the top slat, installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT of BENCH, 1964 WORLD'S FAIR W/ RPL SLATS** furnished and installed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary, including hardware, anchors, recycled plastic lumber (R.P.L.), galvanized ductile iron standards, certificates, and submittals, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation and Concrete for slabs or piers shall be paid for separately under their respective contract items.

<b>PK-ESCR 722</b>	<b>BENCH, 1964 WORLD'S FAIR W/ RPL SLATS W / ARMS, 8' LENGTH</b>	<b>L.F.</b>

**END OF SECTION**

## SECTION PK-ESCR 155 – BENCH, TYPE C (SPORTS)

**WORK:** Under these Items, the Contractor shall furnish and install **BENCH, TYPE 'C' (SPORTS) W/ RPL SLATS – BACKLESS** as shown on the plans, herein specified, or as directed by the Engineer. Unless otherwise noted, benches shall conform to DPR Standard Details.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of shall meet the requirements of the NYCDOT Standard Highway Specifications.

Benches shall be manufactured by All City Play Equipment, Metuchen, NJ or approved equal.

**BENCH STANDARDS:** The bench standards shall be made up of galvanized and powder coated steel tubular supports and channel seat frames. Where the standards are to be set in concrete slabs, the tubular supports shall be provided with base angles. The steel tubular supports shall be continuously welded to the seat channel and the base angle as indicated on the Standard Detail. The standards shall be hot dipped galvanized in accordance with ASTM A123 or receive an approved equal corrosion resistant treatment.

**Corrosion Resistant Treatment:** All fabrication and welding shall be completed prior to application of the corrosion resistant coating, metal pieces shall be cleaned of all weld spatter, mill scale, varnish, rust, grease, and the like and the surface mechanically or chemically prepared to receive the coating. This corrosion resistant coating shall be either hot-dip galvanizing or a thermal spray zinc coating with a minimum thickness of 3 mils or a multi-step iron phosphate bath coating process.

**Powdercoating:** The steel tubular supports shall be powdercoated with a polyester thermosetting powdercoating. Color shall be Black, unless otherwise indicated on contract plans. Powdercoating shall be applied to the metal in such a manner that the coating will not peel off. Ensure that surfaces to be coated are clean and dry and free of grease, dust, rust, etc.

Powdercoating shall be applied at a film thickness of 3 to 4 mils by electrostatic spray process and bake finished per the manufacturer's directions. It shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point. All visible nuts, washers, and ends of all bolts shall be painted with touchup paint as described below.

**Touchup and Repair:** For minor damage caused by installation or transportation, touchup finish in conformance with manufacturer's recommendations. Provide touchup such that repair is not visible from a distance of six (6') feet.

**Laboratory Test For TGIC-Polyester Powdercoat:** At the discretion of the Engineer, a sample TGIC-Polyester powdercoated bench standard may be laboratory tested for bonding of the powdercoating to the metal. Test shall be the Cross Hatch test per ASTM D3359, Method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**BENCH SLATS:** All slats shall be recycled plastic lumber (RPL) and not absorb moisture, corrode, rot, warp, splinter, or crack and shall not contain fiberglass or any material that will cause irritation when in contact with skin. Warped or deflected slats shall not be accepted.

Recycled Plastic Lumber: All slats for benches shall be fabricated from at least ninety percent (90%) post-consumer recycled plastic, dimensions as indicated on the plans. Recycled plastic lumber shall be as Ecoboard manufactured by Trelleborg Marine Systems, Clearbrook, VA, or PolyTuf™ manufactured Tangent Technologies LLC, Aurora, IL or

approved equal. Color to be Cedar unless otherwise indicated on the plans.

Recycled plastic lumber shall comply with or be tested in accordance with the following.

- ASTM D6108 Standard Test Method for Compressive Products of Plastic and Shapes
- ASTM D6109 Standard Test Method for Flexural Properties of Unreinforced and Reinforced Plastic Lumber
- ASTM D6111 Standard Test Method for Bulk Density and Specific Gravity of Plastic Lumber and Shapes by Displacement
- ASTM D6112 Standard Test Methods for Compressive and Flexural Creep and Creep Rupture of Plastic Lumber and Shapes
- ASTM D6117 Standard Test Methods for Mechanical Fasteners in Plastic Lumber and Shapes
- ASTM D1248 Standard Specifications for Polyethylene Plastics

Recycled Plastic Lumber shall be fabricated primarily from recycled High Density Polyethylene (HDPE) and recycled Low Density Polyethylene (LDPE). HDPE resins shall meet the requirements of ASTM D1248 for Type III or IV (high density), Grade G7. Lumber shall contain no toxic materials, but shall contain UV-inhibited pigments. Composition and mechanical properties shall be as follows:

Minimum Recycled Content	90%
Minimum High Density Polyethylene	70%
Maximum Percentage of Materials other than Polyolefins	5%
Minimum Specific Gravity (ASTM D6111)	0.02 lbs-in <sup>3</sup>
Minimum Flexural Modulus (ASTM D6109)	85,000 psi
Minimum Nail Pull-out Strength (ASTM D6117)	700 lbs

Flame Spread, Class C or better, tested in accordance with ASTM E84.

Coefficient of Thermal Expansion (ASTM D6341), in the range of -10C to 30C, shall not exceed  $70 \times 10^{-6}/F$ .

Recycled Plastic Lumber shall not absorb moisture, corrode, rot, warp, splinter, or crack and shall not contain fiberglass or any material that will be irritating in contact with skin.

Fabrication Tolerances: Ends shall be smooth with clean cuts, cross-sections shall not have voids greater than 1/2" dia. Voids of 1/2" dia. or less shall be filled with a matching color of silicone caulk, as per manufacturer's specifications. All edges shall be eased. Maximum variation from flat surface across section shall be 1/8".

Delivery and Storage: Keep materials protected at all times against exposure to extreme heat or impact. All material shall be bundled and fully supported during shipping and storage to prevent creep. Any lumber that is damaged or excessively scratched will be rejected and replaced with new. All slat material must be straight and true when bolted to the standards.

HARDWARE: All hardware shall be stainless steel. Slats shall be attached to bench standards with 3/8" diameter carriage bolts with a 3/8" lock washer and a 3/8" nut.

CONCRETE: Concrete for slabs or footings shall be Concrete for park structures class B-32 per the NYCDOT Standard Highway Specifications, *Section ESCR-4.06* and shall be of the dimensions indicated on the plans.

**INSTALLATION:** The bench standards shall be set in concrete slabs or footings with supports vertical and true to line and position, as shown on the plans or as directed by the Engineer.

The slats shall be secured to the channel frames with vandal-resistant bolts of 18-8 Stainless Steel as indicated on the Standard Detail. Ends of all bolts shall be peened and filed smooth after tightening.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture and in accordance with the requirements of the S-Pages.

**Shop Drawings:** Shop Drawings shall be submitted for approval by the Engineer. Shop Drawings will not be required if benches are fabricated in strict accordance with the details indicated on the Contract Drawings.

**Recycled Plastic Lumber:** The following tests shall be provided if the Contractor proposes an approved equal slat material.

1. ASTM D6108 - Compression Properties
2. ASTM D6109 - Flexural Properties
3. ASTM D6111 - Density tests
4. ASTM D6112 - Creep tests
5. ASTM D6117 - Mechanical Fasteners
6. ASTM D1248 - Standard Specifications for Polyethylene Plastics
7. ASTM E84 - Flame Spread

**Sample:** The Contractor shall submit a twelve inch (12") sample of the reinforced recycled plastic lumber slat for surface and color approval.

**MEASUREMENT AND PAYMENTS:** The quantity of **BENCH, TYPE 'C' (SPORTS) W/ RPL SLATS - BACKLESS** to be paid for under these Items shall be the number of **LINEAR FEET**, of each type, measured along the top slat, installed in accordance with the plans, specifications, and directions of the Engineer.

The prices bid shall be a unit price per **LINEAR FOOT of BENCH, TYPE 'C' (SPORTS) W/ RPL SLATS – BACKLESS** installed, and shall include the cost of all labor, materials, equipment and all incidental expenses necessary to complete the work, including steel standards, slats, hardware and powder coating, all in accordance with the plans, specifications, and directions of the Engineer.

Excavation, Concrete Pavement or concrete for park structures for piers will be paid for separately under their respective contract Items.

**END OF SECTION**

## SECTION PK-ESCR 156 – BICYCLE RACK – HOOP

**WORK:** Under this Item, the Contractor shall furnish and erect BICYCLE RACK - “HOOP” in accordance with the plans, specifications, and directions of the Engineer.

**INTENT:** This specification is intended for bicycle rack installation within NYC Parks property as well as the Public Right of Way under the jurisdiction of NYCDOT, but ordering procedure varies as described below.

**MATERIALS:** Unless otherwise specified herein, all materials and methods of construction shall conform to applicable portions of the NYCDOT Standard Highway Specifications.

**Bicycle Rack – “Hoop”:** The bicycle rack shall be the NYCDOT – NYCityRack, a trademarked design of the City of New York. The bicycle rack is constructed of cast ductile iron ASTM grade A536.

NYCDOT owns the intellectual property rights to the CityRack design. The NYCDOT contractually authorized manufacturer is Campbell Foundry Company, Harrison, NJ or the latest authorized manufacturer/supplier, as applicable.

No order can take place without authorization from the Engineer, in consultation with NYCDOT Director of CityRacks. The Director of the CityRacks Unit will issue an authorization letter so the Contractor may purchase CityRacks. Contractors will place orders with NYCDOT’s authorized manufacturer/supplier only.

**ORDERING PROCEDURE:** Contractor shall contact the Director of City Racks for bid prices and to receive a purchase authorization letter. The Contractor shall supply the following information to the Director of City Racks a minimum of two months but no earlier than six months prior to desired delivery date:

### FOR INSTALLATIONS ON PARK PROPERTY:

1. Contractor shall e-mail the number of CityRack units to be purchased for installation on Parks Property (verify that none will be installed on Public Right of Way), and
2. Provide the name of the Contractor, name of the Park, Park location and Parks contract number, and
3. Copy the Engineer in such e-mail.

### FOR INSTALLATIONS ON PUBLIC RIGHT OF WAY:

1. Contractor shall e-mail the number of CityRack units to be purchased for installation on the Public Right of Way sidewalk (verify that none will be installed on Parks Property), and
2. Submit layout plan, marking exact location on sidewalk where bike rack(s) are shown using a thick pencil or marker and
3. Provide the name of the Contractor, name of the Park, Park location and Parks contract number, and
4. Copy the Engineer in such e-mail.

NYC-Department of Transportation  
Director of City Racks, Bike Parking / Public Space Unit  
Transportation Planning & Management  
55 Water Street, 6th Floor | New York, New York 10041  
**Kenneth Lewis**, Director Klewis@dot.nyc.gov (212) 839.7241 Office phone

Hardware: Mushroom head spikes for surface mount shall be either stainless steel, of the sizes shown on the Detail. Spikes will be provided by the manufacturer.

Concrete: Concrete pavement or piers shall be installed as shown on contract drawings.

**EXECUTION:** All Bicycle Racks shall be installed in locations as shown on the contract plans. Bicycle rack layout and details shall be as shown on the contract drawings.

Surface Mount: Bicycle rack shall be installed in their final location and properly secured in place. Holes shall be drilled into the concrete, in accordance with the detail. Base plate shall be secured with four (4) mushroom head spikes driven into the pre-drilled hole.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

Contractor shall submit authorization letter from NYCDOT.

**MEASUREMENT AND PAYMENT:** For furnishing and installing **BICYCLE RACK - "HOOP"** complete in accordance with the plans and specifications and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Bicycle Rack - "Hoop" and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work including obtaining purchase authorization letter, hardware, all in accordance with the plans and specifications to the Satisfaction of the Engineer.

Excavation and concrete shall be paid for separately under their respective contract items.

**END OF SECTION**

## SECTION PK-ESCR 158 – PICNIC TABLE FIXED

**WORK:** Under these items, the Contractor shall furnish and install **PICNIC TABLE -FIXED** and **PICNIC TABLE -FIXED/ACCESSIBLE** with bench sets in accordance with the plans, specifications and directions of the Engineer.

**MATERIALS:** Unless otherwise specified herein, all materials and methods of construction shall conform to applicable portions of the NYCDOT Standard Highway Specifications. The Picnic Table shall be manufactured by All City Play Equipment, Metuchen, NJ, or approved equal.

**CONCRETE:** Concrete piers or pavement shall be 3,200 psi average class B-32 concrete per the NYCDOT Standard Highway Specifications as shown on the plans and as directed by the Engineer.

**STANDARDS:** The picnic table and bench standards shall consist of steel tubular supports and channel seat and table frames. The tubular supports shall be provided with base angles. The steel tubular supports shall be continuously welded to the channels and the base angle as indicated on the plans. The standards shall be galvanized and powder coated after fabrication.

**Galvanizing:** All steel components shall be hot-dipped galvanized or receive an approved equal corrosion resistant coating prior to powdercoating. An approved equal corrosion resistant coating shall be either a thermal spray zinc coating with a minimum thickness of 3 mils, or a multi-step iron phosphate bath coating process.

**Powder Coating:** The galvanized picnic table and bench set standards shall be powder coated with a polyester thermosetting powder coating such as manufactured by Tiger Drylac USA, Reading, PA, or approved equal. Color to be gloss black, RAL 8022, unless otherwise indicated on the plans.

Galvanizing of standards shall provide an acceptable substrate for applied powder coatings. No lacquer, urethane or other coatings which would prevent proper adhesion of powder coating shall be applied to the steel.

The powder coating shall be applied to the galvanized standards in such a manner that the coating will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. All coated parts shall first receive phosphating and chromating treatments to improve the adhesion of the surface coating.

The TGIC-Polyester shall be applied at a film thickness of 3 to 4 mils by electrostatic spray process and bake finished per manufacturer's directions. The TGIC-Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

**Touch-up & Repair:** For minor damages caused by installation or transportation, clean damaged area, then:

1. On damaged galvanized surfaces, apply organic zinc repair paint complying with ASTM A780, then repair powder coating per number 2 below. Galvanizing repair paint shall have 65 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of six feet (6').

**RECYCLED PLASTIC LUMBER:** All slats for table and benches shall be recycled plastic lumber that shall not absorb moisture, corrode, rot, warp, splinter, or crack and shall not contain fiberglass or any material that will be irritating when in contact to the skin.

Recycled plastic lumber shall be manufactured from high and low density plastic with at least ninety (90%) percent of the material to be post-consumer recycled plastic. HDPE resins shall meet requirements of ASTM D1248 for Type III or IV (high density), Grade G7. Recycled plastic lumber shall be manufactured by Bedford Technology LLC, Washington, MN, or approved equal. Color to be DARK GRAY or CEDAR unless otherwise indicated on the plans. Material shall contain no toxic materials. Recycled Plastic Lumber shall contain UV-inhibited pigment.

Composition and mechanical properties shall be as follows:

Minimum Recycled Content		90%
Minimum High Density Polyethylene		70%
Maximum percentage of materials other than polyolefins		5% Minimum
Specific Gravity (ASTM D6111)	0.86	
Minimum Flexural Strength (ASTM D6109)		1,300 psi
Minimum Flexural Modulus (ASTM D6109)		95,000 psi
Minimum Compression Strength (ASTM D6108)		1,400 psi
Minimum Nail Pull-out Strength (ASTM D6117)		500 lbs

Flame Spread, Class C or better, tested in accordance with ASTM E84.

Coefficient of Thermal Expansion (ASTM D6341), in the range of -10C to 30C, shall not exceed 60 x 10<sup>-6</sup>/F.

Creep performance data (time dependent stress/strain characteristics) shall be submitted in accordance with ASTM D6112, if required.

**Fabrication Tolerances:** Ends shall be smooth with clean cuts, cross-sections shall not have voids greater than 1/2" dia. Voids of 1/2" dia. or less shall be filled as per manufacturer's specifications. All edges shall be eased. Maximum variation from flat surface across section shall be 1/8".

**Delivery and Storage:** Keep materials protected at all times against exposure to extreme heat or impact. All material shall be bundled and fully supported during shipping and storage to prevent creep. Any lumber that is damaged or excessively scratched will be rejected and replaced with new. All material must be straight and true when placed in the construction.

**HARDWARE:** All hardware shall be either stainless steel or hot-dipped galvanized. Slats shall be attached to bench standards with 3/8" dia. carriage bolts with 3/8" lock washer and 3/8" nut. Ends of bolts shall be peened.

**INSTALLATION:** The standards shall be set in concrete with supports vertical and true to line and position as shown on the plans or as directed by the Engineer. Concrete footings shall be installed below pavement so it is not visible at finished grade.

The slats shall be secured to the channel frames with vandal proof bolts as indicated on the plans or approved equal. Ends of all bolts shall be peened and filed smooth after tightening.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture and in accordance with the requirements of the S-Pages.

Recycled Plastic Lumber: The following tests shall be provided if the Contractor proposes an approved equal manufacturer for recycled plastic lumber:

1. ASTM D6108 - Compression Properties
2. ASTM D6109 - Flexural Properties
3. ASTM D6111 - Density tests
4. ASTM D6112 - Creep tests
5. ASTM D6117 - Mechanical Fasteners
6. ASTM D1248 - Standard Specifications for Polyethylene Plastics
7. ASTM E84 - Flame Spread

Laboratory Test For TGIC-Polyester Powder Coat: At the discretion of the Engineer, a sample TGIC Polyester powder coated standard shall be laboratory tested for bonding of the powder coating to the metal. Test shall be the Cross Hatch test per ASTM D3359, Method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**MEASUREMENT AND PAYMENT:** The quantity of **PICNIC TABLE -FIXED** and **PICNIC TABLE -FIXED/ACCESSIBLE** to be paid for under these items shall be the number of units furnished and installed in accordance with the plans, specifications and directions of the Engineer

The price bid shall be a unit price for **EACH** Picnic Table -Fixed and for **EACH** Picnic Table Fixed/Accessible and shall include the cost of all labor, materials and equipment including table, benches, steel standards and frames, plastic lumber, hardware, and powder coating and all incidental expenses necessary to complete the work in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation, concrete for slab or piers shall be paid for separately under their respective contract items. Foundation Material, where required, shall be paid for under the item "Foundation Material For Concrete".

**END OF SECTION**

**SECTION PK-ESCR 161 – PUBLIC SPACE RECEPTACLE BINS**

**WORK:** Under this Item, the Contractor shall furnish and install PUBLIC SPACE RECEPTACLE BINS in accordance with the plans, specifications and directions of the Engineer.

**MATERIALS:** Public Space Receptacles shall be 32 gallon size, and be similar to receptacles available through DCAS Requirements Contract RC/OMPA #3487003 (20141200601) "Public Space Receptacle Bins" as manufactured by Landscape Forms, Inc., Kalamazoo, MI or similar as manufactured by Maglin Site Furniture, Inc, Woodstock, ON or approved equal.

**PURCHASING:** There are three coordinated receptacles available through the DCAS contract. The **Public Space Trash Receptacle**, **Public Space MGP** (commingle Metal, Glass, Plastic) **Receptacle** and **Public Space Paper Receptacle** are contractually all identical in price.

Required quantities of each receptacle type are shown on the drawings. The Engineer reserves the right to revise the quantity of each type of receptacle as shown in the chart below, provided that changes are requested in writing by the Engineer prior to the order date. Receptacles must be ordered directly from the manufacturer a minimum of 120 days in advance of expected installation date.

<b>Public Space Trash Receptacle</b>	Landscape Forms, Inc Or approved equal	Maglin Site Furniture, Inc Or approved equal
Model No.	SF 1288-005	CMLWR90740-32-HST
Bin color (Unless otherwise shown on drawing)	Grey RAL #9023	Gunmetal Grey or Graphite
Lid Color	Black	Black

Lid Color	Green RAL #6018	Green RAL #6018
Graphics-Logo	Graphics for Mixed Paper Recycling	Graphics for Mixed Paper Recycling

**INSTALLATION:** Contractor shall install receptacles in locations as shown on the drawing into pavement with three (3) 3/8" x 4" minimum length, non-corrosive, concrete expansion anchors. Location of trash receptacle shall be as shown on the plans or as determined by the Engineer.

<b>Public Space Receptacle Bins (All)</b>	
Capacity	32 gallons
Lids	Hinged Top Opening
Plastic Liner	Required and Slotted for drainage
Optional lock	Not required
Optional extra key	Not required

**SUBMITTALS:** shall be submitted in accordance with the requirements of the S-Pages a minimum of 120 days in advance of receptacle installation.

Catalog cut of receptacle(s) with manufacturer name and features included. Submit final quantity of each type of receptacle to be ordered under this Contract. Submit color samples upon request.

**MEASUREMENT AND PAYMENT:** The quantity of **PUBLIC SPACE RECEPTACLE BINS** to be paid for under this Item shall be the number of receptacles (in any combination) furnished and installed, in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be a Unit Price for **EACH** Public Space Receptacle Bin installed complete, and shall include the cost of furnishing all labor, materials and equipment to complete the work including anchoring receptacle to pavement and providing liner, all in accordance with the Plans and Specifications to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 161</b>	<b>PUBLIC SPACE RECEPTACLE BINS</b>	<b>EA</b>

**END OF SECTION**

## SECTION PK-ESCR 170 – STEEL FENCE AND GATES

**WORK:** Under these Items, the Contractor shall furnish and erect **STEEL FENCES** and **GATES** of the types and sizes shown on the plans, in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise specified, the materials shall meet the requirements of the NYCDOT Standard Highway Specifications

**FENCES AND GATES** shall be constructed of solid bars, posts, and rails of the sizes shown on the plans unless specifically noted as lightweight. All material shall conform to Specification ASTM A36.

**FABRICATION- LIGHTWEIGHT GATE** (where specified only): Shall be as manufactured by Shannon Gates and Railings, Deer Park, NY, or approved equal and shall be fabricated from 16G square tubing and 1/2" channels.

**FABRICATION-STEEL FENCES AND GATES:** Fences and Gates shall be fabricated in strict accordance with the plans and approved Shop Drawings. Posts and rails shall be formed into panels of the shapes on the plans and joints completely welded with welds of proper size and shape; all welds ground smooth to a neat finish. Connection shall be provided as indicated on the plans. Welding shall conform to the requirements given in the NYCDOT Standard Highway Specifications.

Posts and pickets shall, in all cases, be truly vertical. Rails and bars shall be parallel to grade as shown on the plans. Panels shall be curved as required by the work. Braces shall be required at two-thirds (2/3) of the way up each post when fence is ten feet (10') high or over.

**HINGES:** shall be Stanley #BB855, Heavy Duty Steel Ball Bearing Hinge, 5" x 6", as manufactured by Stanley Hardware, New Britain, CT, Shannon Gates and Railings, Deer Park NY or approved equal.

**LOCK BOLT- Double Gates:** Shall be a drop rod bar arranged to engage the gate stop. Locking device shall be constructed so that the drop rod cannot be raised when the gate is locked. The locking bolt and bolt catch hardware shall be constructed as shown on the standard detail drawings. The locking device shall have provisions for a padlock. All necessary fittings and gate holders to lock gates in both open and closed positions shall be furnished. The locking device shall be as manufactured by Shannon Gates and Railings, Deer Park NY, or an approved equal locking device.

**GATE LATCH – Single Gates:** Shall be a lockable stirrup type. Latch shall be constructed of steel bars and blocks with a stainless steel pin, as shown on the drawings. The ends of stirrups shall be treated with a heavy-duty flexible, rubberized coating such as Plastidip as manufactured by P.D.I. Inc., Circle Pines, MN, or approved equal.

**PADLOCK:** The Contractor shall furnish one padlock for each single gate and each leaf of double gates. The padlocks shall be American No. 5571 as manufactured by American Lock Co., Crete, IL., or approved equal. All padlocks for the same park facility shall be keyed alike, with two inch (2") wide by three-quarter inch (3/4") thick brass body, maximum security, five (5) pin tumblers with hardened alloy steel chrome plated shackle no less than three-eighth inch (3/8") diameter and two inch (2") clearance (elongated shackle). A galvanized steel chain, nine inches (9") long shall be fastened to the gate and body of the lock. The chain shall be five-sixteenths inch (5/16") by one and three-eighths inch (1 3/8"). The Contractor shall furnish two (2) keys for each padlock.

**CAST IRON PARKS LEAF – Double Gates:** The Park Leaf casting shall be as manufactured by Wemco Castings, Bohemia, N.Y, or approved equal. The City, through NYCDPR, retains  
PARKS-138

exclusive right to the use of the pattern. Leaf castings are to be fabricated from Ductile Iron 65-45-12. The small 9 1/2" leaf shall weigh approximately six pounds (6 lbs.) each. The back of the leaf casting is to be flat and the front face shall be contoured with the veins of the leaf shown in relief. See Contract Drawings for structural details.

Park leaves shall be welded to each leaf of the steel gate in the shop. Field welding will not be permitted.

**GROUT:** Grout for fence posts shall be non-shrink, cement based grout such as SonogROUT 10K as manufactured by BASF Building Systems, Shakopee, MN or SikaGrout 212, as manufactured by Sika Corporation, Lyndhurst, NJ, or approved equal.

**SEALANT:** Sealant around fence post shall be one part polyurethane, elastomeric adhesive such as MasterSeal CR 195, as manufactured by BASF Building Systems, Shakopee, MN or Sikaflex1a, as manufactured by Sika Corporation, Lyndhurst, NJ, or approved equal.

**PAINTING:** The fences and gates shall receive three (3) coats of paint. The first coat shall be shop applied; the second and third coat shall be field applied. Immediately prior to painting, all surfaces of fences and gates shall be thoroughly free of debris. All surfaces that are rust free shall be treated in accordance with SP-1, Solvent Cleaning. Treatment shall be performed with a solvent such as mineral spirits, xylol, or turpentine to remove all dirt, grease, and foreign matter. Surfaces that show evidence of scale and rust shall be cleaned in accordance with SP-2, Hand Tool Cleaning, a method generally confined to wire-brushing, sandpaper, hand scrapers, or hand impact tools or SP-3, Power Tool Cleaning, a method generally confined to power wire brushes, impact tools, power sanders, and grinders in order to achieve a sound substrate. After the fence and gates have been cleaned and prepared, they shall be painted as follows:

**First Coat (Shop Applied):** D.T.M.(Direct to Metal) Alkyd semi-gloss P24, as manufactured by Benjamin Moore & Co., Montvale, NJ, or Kem Bond® HS Metal Primer, B50NZ3, red oxide, as manufactured by Sherwin Williams Company, Woodside, NY, or approved equal. Primer shall be a fast drying, 53 to 61% weight solids, low VOC, rust inhibiting, modified alkyd metal primer with a dry film thickness of 1.7 - 5 mils. Paint requires up to two (2) to two and a half (2 ½) hours drying time before recoating (with alkyds).

**Second Coat and Third Coats (Field Applied):** D.T.M.( Direct to Metal) Alkyd semi-gloss P24, Safety Black, as manufactured by Benjamin Moore & Co., Montvale, NJ, or Steel Master 9500 Silicone Alkyd, as manufactured by Sherwin Williams Company, Woodside, NY, or approved equal. Color to be Black unless otherwise shown on the contract drawings. Topcoat shall be a silicon alkyd, semi or high gloss coating having a dry film thickness of 1.7 - 3 mils. Paint requires up to thirty (30) hours drying time @ 50° F; up to sixteen (16) to eighteen (18) hours drying time @ 77° F. Paint adhesion shall be 100% retention in accordance with ASTM D3359, classification 5B.

All paints shall be applied when ambient air temperature is 50 °F minimum and rising. No painting will be allowed below the minimum ambient air temperature. Surfaces to be painted shall be moisture free. In addition, no painting will be allowed below the temperature at which moisture will condense on surfaces; the ambient temperature must be at least 5 degrees F above the dew point.

**INSTALLATION:** The fences shall be erected in holes that have been formed in the concrete or stone to receive them. After the posts have been set in place and properly supported to hold them in line and grade, the annular space shall be filled with the specified non-shrink, cementitious grout. The grout shall be flush with the concrete curb. After the grout has cured, the Contractor is to install polyurethane sealant around the fence post. Sealant shall be gunned in between the base of the fence post and the concrete curb. Sealant shall be applied in strict accordance with

the manufacturer's instructions, and shall be tooled in as required. **Note: All gypsum (Calcium Sulfate, CaSO4) based grout will be rejected.**

Any fences and gates not set plumb and true to line and grade shall be removed and replaced at the Contractor's expense. The Contractor shall maintain the fences and gates during the life of the contract and shall repair replace all members that are disturbed, damaged, or destroyed.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Shop Drawings:** shall be submitted prior to fabrication. Include plans, elevations, for entire length including all radial panels, sections, details, attachments to existing and stepped conditions, connectors, anchoring and connecting hardware, fence height, post spacing, gate locking device, gate construction, dimensions and unit weights of framework, and lightning protection for all fences. Include schedule for fence uprights and fabrications methods. Indicate all field and shop welds. Detail custom conditions at non-90° angles.

**SAMPLES:** The Contractor shall submit for the approval finished samples of parts of the fences. The workmanship and finish of the final product shall be equal to the approved samples. Only if proposed manufacturer is other than as specified, a full size sample must be submitted for approval for the following: Gate latch for single gate, padlock, cast iron parks leaf.

**FOUNDRY CERTIFICATE:** A certificate verifying the quality of ductile iron for the Parks Leaf shall be submitted. Certificate shall be on Manufacturers' letterhead, dated and signed by the company President with Contract Number, Contract Title, Contractor Name, and Class of Ductile Iron provided.

**PAINT SUBSTITUTION:** A written request for paint substitution must be submitted to the Engineer. The Contractor shall submit this request, along with manufacturer's data sheets for approval, a minimum of two (2) weeks prior to the intended date of paint application. All paint substitutions must be approved in writing prior to use.

**MEASUREMENT AND PAYMENT:** The quantity of **STEEL FENCE** to be paid for shall be the number of **LINEAR FEET** of each type of fence furnished and erected complete, regardless of height and material, in accordance with the plans, specifications, and directions of the Engineer.

The quantity of **GATES** to be paid for shall be the number of **EACH** size (including both leaves of double gates and gate posts) furnished and erected complete in accordance with the plans, specifications, and directions of the Engineer, including Park leaf castings where double gates are specified, locking devices, gate stops, and padlocks.

The prices bid shall be unit prices per **LINEAR FOOT** of Steel Fence of each type and a unit price for EACH gate and shall include the cost of all labor, materials, and equipment required to furnish and erect fences and gates, including painting, grout, sealant, and all incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Concrete and excavation shall be paid for separately under their respective Items.

Item No.	Item	Pay Unit
PK-ESCR 170	STEEL FENCE 4'-0" HIGH	L.F.
PK-ESCR 170 B	STEEL FENCE 2'-6" HIGH	L.F.
PK-ESCR 171	SINGLE GATE FOR STEEL FENCE 4'-0" HIGH	EA

**END OF SECTION**

**SECTION PK-ESCR 178 – BASEBALL ACCESSORIES SET**

**WORK:** Under this Item, the Contractor shall furnish **BASEBALL ACCESSORIES SETS** in accordance with the plans, specifications, and directions of the Engineer. Each set of baseball accessories shall consist of three (3) Bases, one (1) Home Plate and one (1) Pitcher's Box Plate, all provided with accompanying spikes.

Bases shall be 15" x 15" x 3" white vinyl-coated nylon shell with nylon straps over firm foam filler with two (2) heavy steel spikes, as manufactured by "Beam Clay Bolco Bases" Great Meadows, NJ, Model No. 120-PRO, or approved equal. Home plate shall be a regulation size white rubber with black beveled edge equipped with five (5) four (4") inch zinc-plated metal spikes as manufactured by "Beam Clay Bolco Bases" Great Meadows, NJ, Model No. 380-HP, or approved equal. Pitcher's plate shall be 6" x 24" x 3/4" white rubber equipped with three (3) metal spikes as manufactured by "Beam Clay Bolco Bases" Great Meadows, NJ, Model No. 490-cc, or approved equal.

**MEASUREMENT AND PAYMENT:** The quantity of **BASEBALL ACCESSORIES SETS** to be paid for under this Item shall be the number of sets furnished in accordance with the plans, specifications, and directions of the Engineer

The price bid shall be a unit price for each **SET** of Baseball Accessories Set and shall include the cost of all labor, materials, equipment, and incidentals expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

<b>PK-ESCR 178</b>	<b>BASEBALL ACCESSORIES SET</b>	<b>SET</b>

**END OF SECTION**

## SECTION PK-ESCR 180 – BASKETBALL BACKSTOP-SINGLE POST

**WORK:** Under this Item, the Contractor shall furnish and erect a complete cantilevered **BASKETBALL BACKSTOP - SINGLE POST** with clear polycarbonate (PC) BACKBOARD, in accordance with the plans, DPR standard details, specifications, and directions of the Engineer. The backstop shall be freestanding only.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

**Post:** Post shall be galvanized steel, powdercoated per this specification. All fittings for the backboard shall be as indicated on the standard details and shall be powdercoated. Post and fittings shall be as manufactured by All City Play Equipment, Metuchen, NJ, or approved equal.

The cantilevered basketball backstop shall be attached to one six inch (6") square, three-sixteenth inch (3/16") thick powder coated square galvanized steel tube.

Posts shall be reinforced with two (2) three-eighths (3/8") inch reinforcing bars and filled with concrete for park structures as indicated on the plans and standard details.

**Post Cap:** The post caps shall be cast of class 65-45-12 ductile iron, powdercoated and secured as shown on the plans.

**Fastenings:** All fastenings shall be as indicated on the plans and the Contractor shall furnish and install all required bolts, drive and machine screws, pins, rivets, welds, and other fastenings necessary to complete the work, whether specifically indicated on the plans or not. Bolts and nuts shall be galvanized after threading. The drive screws shall be of stainless steel. All fastenings shall be neatly sprayed with powder coat touch-up spray after installation. All fastenings shall be coated with high locking adhesive immediately prior to tightening. The locking adhesive shall be Loctite® 271 manufactured by Henkel Corporation, Westlake, OH, or approved equal.

**Backboard - Polycarbonate:** Polycarbonate backboard shall be as manufactured TrueBounce Backboards, New Bedford, MA, model number XL7048, or approved equal. Dimension of backboard shall be as shown on the standard details or contract drawings. Backboard shall be made of half (1/2") inch unbreakable clear polycarbonate material, secured to frame with stainless steel bolts, sizes as shown in the plans. The frame for the backboard shall be made of aluminum, lap jointed at corners and bolted together, all as recommended by the manufacturer.

**Goal:** Goal shall be "Endurance Fixed Goal", Model No. 8550 as manufactured by Gared Sports, St. Louis, MO or "Heavy Duty Playground Goal" No. 00251-H00 as manufactured by Porter, Broadview, IL, or approved equal. Any equal submitted must match complete backplate hole layout as shown on standard details. Goal shall be unconditionally warranted for a minimum of 10 years. The goal shall be made of steel rod welded to steel brackets bolted to backboard, all as shown on the plans. All metal parts shall be hot-dipped galvanized and powder coated as heretofore specified, after fabrication. Powdercoating shall be color orange. Net is not required.

**Concrete Footing:** Shall be 3,200 psi Class B-32 concrete per the NYCDOT Standard Highway Specifications Section ESCR-4.06.

**Steel Bar Reinforcement:** Reinforcement shall meet the requirements of the NYCDOT Standard Highway Specifications, the N.Y.C. Building Code and the latest ASTM specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement", Designation A-615. Reinforcement shall be of the sizes and dimensions shown on the plans.

**ERECTION:** Posts shall be set in holes formed in new reinforced concrete footings; dimensions indicated on the Standard Detail. Posts shall then be set in holes and shall be grouted firmly in

place with a grout composed of one part Portland Cement and two parts sand, or approved equal. Posts shall be erected truly vertical.

**POWDERCOATING:** All new backstop parts (except for steel or polycarbonate backboards) shall be powdercoated with TGIC-Polyester; nuts, bolts and threaded ends of tie rods shall be neatly sprayed with powdercoat touch-up after installation. No lacquer, urethane, or other coatings which would prevent proper adhesion of powder coating shall be applied to the parts. The powdercoating shall be applied in such a manner that the coating will not peel off. Ensure surfaces to be coated are clean, dry, and free of grease, dust, rust, etc. All coated parts shall first receive phosphating and chromating treatments to improve the adhesion of the surface coating. Color to be black unless otherwise indicated on the plans.

The TGIC-Polyester shall be applied at a film thickness of 3 to 4 mils by electrostatic spray process and bake finished per manufacturer's directions. The TGIC-Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

**Laboratory Test For TGIC-Polyester Powdercoat:** At the discretion of the Engineer, a sample TGIC-Polyester powdercoated part shall be laboratory tested for bonding of the powdercoating to the metal. The test shall be the Cross Hatch test, as per ASTM D3359, Method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**TOUCH-UP & REPAIR:** For minor damaged caused by installation or transportation, clean damaged area, then:

1. On damaged galvanized surfaces, apply organic zinc repair paint complying with ASTM A780, then repair powder coating per number 2 below. Galvanizing repair paint shall have 65 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of 6 (six) feet.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Shop Drawings:** The Contractor shall submit Shop Drawings showing complete details of construction and installation.

**Warranty for Goal:** A ten (10) year warranty shall be submitted, and in turn handed over to the Engineer.

**MEASUREMENT AND PAYMENT:** For furnishing and installing **BASKETBALL BACKSTOP - SINGLE POST (PC BACKBOARD)** in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Basketball Backstop–Single Post (PC Backboard) furnished and installed, and shall include the cost of all labor, materials, and equipment, including posts, concrete for park structures for footings, posts filled with concrete, steel reinforcement, unclassified excavation, sawcutting, core drilling (where required), outrigger, tie rods, polycarbonate backboard, goal, powder coating, locking adhesive and any other incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Hand and/or Pneumatic Excavation, if required, shall be paid for separately under its own contract item.

Item No.	Item	Pay Unit
PK-ESCR 180	BASKETBALL BACKSTOP-SINGLE POST (PC BACKBOARD) END OF SECTION	EA

## SECTION PK-ESCR 181 – HOODED BASEBALL BACKSTOP

**WORK:** Under this item, the Contractor shall furnish and erect galvanized and powdercoated **HOODED BASEBALL BACKSTOP ON CURB** or **ON PIERS** (see plans), with vinyl-clad steel fabric, in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

All posts, rails, sleeves, and bracing shall be galvanized and powdercoated steel pipe of the sizes shown on the plans in accordance with ASTM Specifications A-120, except the pipe shall be unthreaded and untested for water pressure, except as otherwise herein specified or shown on the plans. Fittings shall be of the best quality malleable iron castings or pressed steel and provided with pin connections, and shall be galvanized in accordance with appropriate ASTM A-123 and powdercoated per this specification. Malleable iron fittings shall be galvanized in accordance with ASTM A-338 and powder coated per this specification.

**Surface Coatings:** All posts, rails, and fittings shall be powdercoated with either polyvinyl chloride (PVC) or TGIC-Polyester, with the exception of nuts and bolts which shall be sprayed with powder coat touch-up after installation.

Galvanizing of all components shall provide an acceptable substrate for applied powdercoatings. No lacquer, urethane, or other coatings which would prevent proper adhesion of powdercoating shall be applied to the pipe. The powdercoating shall be applied to the galvanized surfaces in such a manner that the coating will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. All coated parts shall first receive phosphating and chromating treatments to improve the adhesion of the surface coating. Color to be black unless otherwise indicated on the plans.

The entire installation shall be coated with one of the two following types of powdercoating, with the exception of fabric which shall always be PVC coated. All Fence components shall be coated on all surfaces, in a color to match the framework. All coated surfaces shall comply with the adhesion specifications listed in ASTM F1043.

**TYPE A - Polyvinyl Chloride Powder Coating:** PVC powdercoating shall be applied to the galvanized steel or iron by the fluid bed method to a preheated base which has been cleaned and primed prior to submersion in vinyl, resulting in a firm bond between the PVC and the metal. PVC shall be applied to a film thickness of 10 to 15 mils on framework, and fittings and 7 to 12 mils on fabric without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

**TYPE B - TGIC-Polyester Powdercoating:** TGIC-Polyester Powder shall be applied to the galvanized steel or iron in such a manner that the coating will not peel off. The TGIC-Polyester shall be applied at a film thickness of 3 to 6 mils by electrostatic spray process and bake finished per manufacturer's directions. The TGIC-Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

### **TESTS:**

**Field Test For PVC Powdercoating:** As per ASTM F668, three (3) sample sections of the PVC powder- coated framework shall be tested for bonding of the powder coat to the metal. Each test will consist of making two(2) cuts parallel to the axis of the pipe or fitting, through the coating, approx. One-sixteenth inch (1/16" or 1.6 mm) apart, at least one-half inch (1/2" or 12.7 mm) long. With a knife peel back a section of the coating between one-eighth inch (1/8" or 3.2 mm) and

onequarter inch (1/4" or 6.4 mm) long to produce a tab. Attempt to remove the one-sixteenth inch(1/16") strip of coating by pulling the tab. The fence shall be deemed acceptable if the coating breaks rather than separates from the metal on all three(3) samples.

**Laboratory Test For TGIC-Polyester Powdercoat:** At the discretion of the Engineer, a sample of the TGIC-Polyester powdercoated fence shall be laboratory tested for bonding of the powdercoating to the metal. Test shall be the Cross Hatch test per ASTM D3359, method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**Touch-up and Repair:** For minor damaged caused by installation or transportation and field welded metal powder coated surfaces, clean welds, bolted connections, and abraded areas, then;

1. On damaged galvanized surfaces, apply organic zinc repair paint complying with ASTM A780, then repair powder coating per number 2 below. Galvanizing repair paint shall have 65 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up paint such that repair is not visible from a distance of (6') six feet.

**FABRIC:** Fabric shall be hot dip galvanized steel wire mesh as per ASTM - 641, with a thermally fused polyvinyl chloride powder coating of 7 to 12 mils thick as per ASTM F668 class 2b. Color to match framework. Fabric shall be produced by methods recognized as good commercial practices. Core wire tensile strength shall be 78,000 psi.

Wire used for the manufacture of fabric shall meet the requirements of ASTM F668 and shall be capable of being woven into fabric without the PVC coating cracking or peeling. PVC coating shall be a dense impervious covering free of voids. Excessive roughness, bubbles, blisters, bruises and flaking will be a basis for rejection. PVC shall be thermally fused. Bonded or extruded and glued surface coating will not be permitted. Fabric shall be stretched to provide a smooth, taut, uniform appearance free from sag.

**Field Test:** PVC coating on fabric shall be field tested for adherence to the metal as outlined elsewhere in this specification. Tensile strength shall have a test minimum of 3300 psi in accordance with ASTM D-412.

**Mesh Sizes:** Fabric shall be woven diamond mesh openings determined by taking the mean of two dimensions at right angles to each other. Size shall be 2 inches.

**Fabric Thickness:** Wire for side and ends shall have an uncoated wire dimension of .192 inches in diameter. Zinc coating shall be .40 ounces per square foot of wire surfaces. Vinyl coating shall be not less than .022 inches. Total diameter of wire to be not less than .236 inches.

Wire for top shall be .148 in. in diameter. Zinc coating shall be .40 ounces per square foot of wire surfaces. Vinyl coating shall not be less than .022 inches. Total diameter of wire to be not less than .192 inches.

**Tension Bands:** Tension bands shall be 1/8" x 1" pressed steel.

**Tension Bars:** Tension bars shall be 1/4" x 3/4" galvanized steel.

**TIES:** Tie-wire core thickness shall be 9 gauge (.148") wrought aluminum alloy 1100-H16 wire with an extruded vinyl coating in accordance with ASTM A641 Class 3. PVC shall be applied to a film thickness of 20 to 22 mils. Ties shall be spaced fifteen (15) inches apart on rails and twelve (12) inches apart on posts. The ends of ties shall be wound in a telegraph twist two and one half turns. Color to match mesh. Contractor shall touch-up PVC coating on ties damaged as result of installation.

**Fittings:** Single steel clamps shall be one-quarter inch(1/4") by one-half inch(1/2") galvanized steel with one-half inch(1/2") pins. Double steel clamps shall be one-quarter inch(1/4") by one-half inch( 1-1/2") galvanized steel with one-half inch(1/2") pins.

**Elbows:** Welded galvanized pipe elbows consist of standard weight three inch(3") .D. galvanized steel pipe, with ends cut and welded in such a manner as to properly receive the two and one-half inch(2 1/2") pipe hood framework rails, as indicated on the plans. For the two side elbows, a plug consisting of two inch(2") O.D. galvanized pipe and approximately seven inches(7") in length, is slipped into the elbow and has a flat steel cap welded to its end. A three-eighth inch(3/8") thick lug with drilled hole is then welded to the cap, allowing a malleable iron pipe end to be attached to the elbow. The elbows and plugs are attached to the pipe rails by means of pin connections. For the center elbow, the plug-cap-lug welded piece is to be omitted. All welds shall be ground smooth, and shall be galvanized after fabrication.

**Malleable Iron Pipe Ends:** Malleable iron pipe end shall be three-eighth inch(3/8") thick malleable iron.

**Post Caps:** Shall be malleable iron with 3/16" wall thickness throughout. Cap shall fit tightly over post and shall be fixed in place with two #14 stainless steel drive or set screws.

**FASTENINGS:** All fastenings shall be as indicated on the plans and the Contractor shall furnish and install all required bolts, drive and machine screws, pins, rivets and other fastenings necessary to complete the work, whether specifically indicated on the plans, or not. All pins shall be one-half inch (1/2") diameter with counter-sunk heads and upset ends. All hex heads bolts are to be one-half inch (1/2") diameter, carriage bolts are to be three-eighth inch (3/8") diameter. All bolts are to be supplied with appropriate lock washers and nuts. Bolts, nuts, and pins shall be hot-dipped galvanized steel; drive and set screws shall be stainless steel 18-8.

**BOLT AND HARDWARE INSTALLATION:** Nuts and bolts shall be galvanized but not powder coated. Cans of TGIC-Polyester or PVC touch-up powder coating shall be used to paint the nuts and bolts per manufacturer's recommendations. The ends of all bolts shall be peened after tightening. Bolts which are installed six feet (6') or less above grade shall not protrude more than one-quarter inch (1/4") beyond the nut after tightening. All rough edges resulting from the cutting of bolts to achieve this requirement shall be filed smooth to the satisfaction of the Engineer.

**BACKSTOP:** The backstop shall consist of a frame constructed of standard weight galvanized and powder coated pipe and rails, except for the four inch (4") O.D. posts, which shall be double extra strong.

The side and back of the baseball backstop consists of a framework of vertical galvanized and powder coated steel posts set in a concrete pier, and horizontal galvanized and powder coated steel pipe rails, of varying sizes and outer diameters as specified in the Standard Detail Sheets. The rails are connected to the posts with either single steel clamps or double steel clamps, and malleable iron pipe ends with appropriate fastenings. Chain link fabric, consisting of two inch (2") vinylclad galvanized steel wire mesh, tension bars, tension bands, tie wires, and attendant fastenings, is stretched tightly over each frame section and attached to the frame.

The backstop hood consists of a series of galvanized and powder coated steel pipe rails, of varying lengths and O.D.'s as specified in the Standard Detail Sheets, and placed either vertically, horizontally, or on angles. The rails form the main food frame, hood modification, and hood bracing, as shown in the Standard Detail Sheets, and are fastened together with either single steel clamps or double steel clamps, together with malleable iron pipe ends, or welded pipe elbows. The fastenings connect fittings and steel clamps to the rails and to each other. Once the hood framework, modification and bracing is constructed, two inch(2") chain link fabric, consisting of vinyl-coated galvanized steel wire, is cut to fit each hood section and fastened to the frame by

means of tension bands, tension bars, tie wires, and attendant fastenings.

**Concrete:** Concrete for piers or curbs shall be placed as shown. Concrete shall conform to N.Y.C. Dept. Of Transportation class B-32, Type II A, air entrained, moderate sulphate resistant. The batch shall contain a minimum of six (6) bags of cement per cubic yard of concrete, maximum of 6¼ gallons of water per bag, a maximum of three (3") inch slump, and a minimum compressive strength of 3,200 psi. Large aggregate shall be limited to one (1") inch.

**METHOD:** All methods of construction shall conform to applicable portions of the NYCDOT Standard Highway Specifications.

**Installation on Piers:** The piers shall be constructed of concrete as described in Section ESCR-4.06 as shown on the Standard Detail Sheets. The piers shall have holes formed in it, each being two inches (2") larger in diameter than the pipe post which shall be set in them. Steel bar reinforcement shall be set in the concrete in accordance with the Standard Detail Sheets and the plans.

**Installation on Curb:** The curb shall be constructed of Concrete for park structures as described in Section ESCR-4.06 and steel bar reinforcement as described in Section ESCR-4.14 and as shown on the Standard Detail Sheets. The curb shall have holes formed in it, each being two inches (2") larger in diameter than the pipe post which shall be set in them.

**Installation of Posts:** The backstop frame posts shall be set in holes, which shall have been formed in the concrete piers to receive them and shall be firmly grouted in place using a mortar or grout composed of one (1) part Portland cement and two(2) parts sand or approved equal. The posts shall be erected vertical.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture and in accordance with the requirements of the S-Pages.

**Shop Drawings:** Before the work in the shop is started, the Contractor shall submit Shop Drawings for approval, including complete details of installation and construction.

**Samples:** The Contractor shall submit the following for approval:

**Fence Framework:** One piece of each pipe size, twelve inches (12") long.

**Fence Fabric:** One piece twelve inches (12") square.

**Design Mix report:** The Contractor shall submit a design mix report prior to the production and delivery of concrete for review and approval. Design Mix Report dated more than one (1) year of the submittal date will be rejected. The Contractor shall submit the design mix report including but not limited to the following information: date of design mix report, name and address of concrete mixing company, name and address of laboratory, name of project, water/cement (w/c) ratio, type and sieve analysis of aggregates, type of cement, type and amount of fly ash or slag used, percentage of portland cement replacement by fly ash or slag, types of admixture used, amount of water used, air content and slump of design mix, three (3) day curing strength, seven (7) day curing strength, and twenty-eight (28) day curing strength.

**MEASUREMENT AND PAYMENT:** For each **HOODED BASEBALL BACKSTOP ON CURB OR ON PIERS** with vinyl-clad steel fabric furnished and installed in accordance with the plans and specifications and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Hooded Baseball Backstop with vinyl-clad steel fabric furnished and installed, and shall include the furnishing of all labor, materials, equipment, including unclassified excavation, concrete for curb/piers (as shown on details) per Section PK-ESCR-4.06, steel bar reinforcement, galvanizing, powder coating, and any other incidental

expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 181</b>	<b>HOODED BASEBALL BACKSTOP</b>	<b>EA</b>

END OF SECTION

## SECTION PK-ESCR 182 – PREPARE SKINNED AREA

**WORK:** Under this Item, the Contractor shall PREPARE SKINNED AREAS and surfaces on the baseball diamonds, in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise specified herein, all materials shall conform to the requirements of Section "B", Materials and Methods of Construction.

**Skinned Infield Mix:** Infield Mix shall be taken from an approved source(s) and shall contain a combined total of not more than five percent (5%) of mica, feldspar, and organic matter. The percentage of organic matter shall be determined by loss through ignition of moisture free samples dried at one hundred (100) degrees centigrade. No gravel or hard pan will be allowed in the clay mixture. The soil shall be free from gravel and hardpan, as well as sticks, roots, sod, and trash of every description. No material shall be delivered in a pasty, muddy, or lumpy condition. Material shall not be dark or odorous. The particle size analysis of the mixture shall be as follows:

1. U.S. Std. Sieve No. % Passing No. 10 90%-100%
2. U.S. Std. Sieve % Passing 1/4" 100%
3. The portion of the mixture passing the No.10 U.S. Standard Sieve when tested in accordance with the American Society of Agronomy's Methods of Soil Analysis, Part 1, Chapter 43, Sec. 43-5, "Particle Fractionation and Particle Size Analysis", shall be according to the American Society of Agronomy Particle size and in accordance with ASTM D422 "Standard Test Method for Particle-Size Analysis of Soils", and as follows:

CLAY/SILT 23+4% (Minimum Clay Content shall be 12%)

SAND: 77+4%

TOTAL: 100.0%

Clay is defined as particles < 0.002 mm in diameter, silt are particles >0.002mm and < 0.05mm, and sand are particles >0.05mm and < 2.00mm. Any clay mixture that has less than 12% of clay content shall be rejected.

For information only, this custom clay, silt, and sand mix is available at Recreational Sand, LLC, Williamstown, NJ, Greenpro materials, Bound Brook, NJ, Custom Clay and Soil Co., Syosset, NY, or approved equal. If the sand, silt, and clay do not comply with the above ranges, the Skinned Infield Mixture will not be accepted.

**Plasticity Index:** Plasticity index and limits shall be in accordance with ASTM D4318 "Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils." The plasticity index of the material shall be less than five (5) and the plastic limit and the liquid limit shall be determinable.

**Color:** The color of the soil must be between one of the following ranges in accordance to the Munsell Soil Color Chart: (A) 10 YR 5/6 (yellowish brown) or 10 YR 5/8 (yellowish brown) or 10YR 6/6 (yellowish brown) or 10YR 6/8 (yellowish brown) 7.5YR 5/8 (strong brown) or 7.5YR 6/6 (strong brown) (B) 7.5YR 6/8 (reddish yellow) or 7.5YR 5/6 (strong brown) or (C) 5YR 5/6 (yellowish red) or 5YR 5/8 (yellowish red)

**Methods of Test:** The mixture shall be tested in accordance with the American Society of Agronomy's Methods of Soil Analysis, Part 1, Chapter 43, Sec. 43-5, and ASTM Designation D421 and D4318, latest revisions. However, any applicable method of test or examination may be used, provided that it is satisfactory to the laboratory designated by the Department of Parks & Recreation.

The Engineer reserves the right to reject any or all samples submitted for approval which in their opinion is unsatisfactory in this respect. The clay shall be well dried before application to finished surface, and broken up fine with a steel rake.

Sand: The sand shall be clean and sharp and free from lumps and foreign matter. Sand shall conform to grading requirements as follows:

<u>Sieve Size</u>	<u>Percentage</u>
¼" sq. screen	100%
No. 100 sq. screen	not more than 15%

**LAYING:** The Skinned Infield Mix shall be prepared and constructed in accordance with the latest revision of ASTM Designation F2107. The clay/sand mixture shall be spread over the surface in one layer approximately six inches (6") thick, thoroughly raked to break up the clay and to mix in the sand so as to make a homogeneous mixture of sand and clay and each layer handrolled to a thickness of approximately four inches (4"). The roller shall not exceed two (200) hundred pounds.

**SUBMITTAL:** All submittals shall be in accordance with the requirements of the S-Pages.

Samples: The Contractor shall submit a two pound (2 lb.) sample of the clay/sand mixture taken from the source of supply they propose to use, together with a report from an independent soil testing laboratory giving a physical analysis of the proportions of sand, clay and silt contained therein. Sample shall be labeled with Contract Number and Name, Contract Item No., and name of supplier. All clay/sand mixture used in the work shall conform to the approved sample.

**MEASUREMENT AND PAYMENT:** The quantity of **PREPARE SKINNED AREA** to be paid for under this item shall be the number of **SQUARE YARDS** furnished and prepared, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** and shall include the cost of all labor, materials, equipment and all other incidentals necessary to complete the work, including clay, sand, and laboratory testing, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation, if necessary, shall be paid for under its own item.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 182</b>	<b>PREPARE SKINNED AREA</b>	<b>S.Y.</b>

**END OF SECTION**

## SECTION PK-ESCR 183 – SOCCER GOAL, PORTABLE

**WORK:** Under this Item, the Contractor shall furnish and install **SOCCER GOALS- PORTABLE AND SOCCER GOALS JUNIOR - PORTABLE** set in accordance with the plans and specifications and directions of the Engineer. Each set shall consist of two (2) goals as shown on the plans.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

**Portable Soccer Goals:** SOCCER GOALS-PORTABLE shall be regulation size (8'h X 24'w X 8'd). SOCCER GOALS JUNIOR-PORTABLE shall be 6'h X 12'w X 6'd or similar. Goal shall meet ASTM F295014 "Standard Safety and Performance Specification for Soccer Goals" and ASTM F1938-98 "Standard Guide for Safer Use of Movable Soccer Goals". Goal posts and the crossbar shall be 4 inch by 2 inch 11 gauge tubular steel with (2) 28 lb. anchor weights permanently installed, and a special cable for net attachment. Goal shall be similar to model M88W-824, equipped with permanent solid rubber wheels and ACW-28 optional anchor weights as manufactured by Keeper Goals, Wauwatosa, WI or approved equal. Anchor weights shall be factory installed so they will not come off. Soccer goals shall be polyester powder coated, finish color shall be WHITE. Soccer net is not required.

**Safety Warning Labels:** The crossbar and both vertical posts of each portable soccer goal shall be provided with safety warning labels in accordance with ASTM F2950-14 "Standard Safety and Performance Specification for Soccer Goals", similar to those provided by Keeper Goals, or approved equal. The labels shall be placed by the manufacturer so they are clearly visible to the public. Label, type 1. "WARNING----NEVER CLIMB ON GOAL, Goal can fall over causing serious injury or death", Label, type 2. "WARNING-ALWAYS ANCHOR GOAL, Unsecured goal can fall over causing serious injury or death" and Label, type 3. "WARNING- This goal should be securely anchored at all times- This goal is not to be stored or used on a slope or hill area- Check that all fastenings are fully tightened before using this product- Check fastenings periodically after using goal- Goal shall be secured against overturning at all times- Do not climb on net or framework- This goal is designed to be used for soccer only". The following labels are required:

1. Two (2) of type 1 on each goal post (four in total)
2. Two (2) of type 2 on each goal post (four in total)
3. One (1) of type 3 on each crossbar (two in total)

**Goal Markings:** Specification labels, as provided by the Manufacturer and as described in ASTM F2950-14 "Standard Safety and Performance Specification for Soccer Goals", shall be placed on one or both vertical posts. Label, type 4 shall contain the name of the manufacturer, and at least one of the following: address, phone number, and/or website. Label, type 5 shall include "Meets Safety and Performance Specification ASTM F2950-14 when assembled according to manufacturer's instructions". The following labels are required:

1. One (1) of type 4 on each goal (two in total)
2. One (1) of type 5 on each goal (two in total)

**INSTALLATION:** Contractor shall be responsible for setting up the goals for inspection by the Engineer to demonstrate completeness and acceptability of the system. Goal shall be placed either in final position, or against the fence, as directed by the Engineer. Contractor shall install goals in accordance with the 2014 NY Senate-Assembly Bill S6811, A5308C, effective May 25,

2015, and “Guidelines for Movable soccer goal safety” issued January 1995 by U.S. Consumer Product Safety Commission. It is imperative that ALL movable soccer goals be anchored firmly in place. Manufacturer provided anchors shall NOT be removed under any circumstances.

**SUBMITTALS:** The Contractor shall submit shop drawings (when proposing a substituted item) or catalog cuts (when proposing a specified item) showing all components and assembly details. Also submit maintenance data and manufacturer’s warranty in accordance with the requirements of S-Pages.

**SUBSTITUTIONS:** A written request for substitution of manufactured products must be submitted as per S-Pages. The Contractor shall submit this request, along with a detailed shop drawing for approval, a minimum of two weeks prior to the intended date of construction. All substitutes must be approved in writing prior to ordering.

**MEASUREMENT AND PAYMENT:** The quantity of **SOCCER GOALS- PORTABLE** to be paid for under this Item shall be a unit price for each **SET** of two (2) Goals furnished and erected in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price for each SET of two (2) Goals and shall include the cost of furnishing all labor, materials, and equipment and all incidental expenses necessary to furnish and erect the goals including submittals, delivery, set-up, anchor weights, safety warning labels, and goal markings, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

## SECTION PK-ESCR 184 – TENNIS COURT ACCESSORIES SET

**WORK:** Under this Item, the Contractor shall furnish and install **TENNIS COURT ACCESSORIES SET**, in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise specified herein, all materials and methods of construction shall conform to applicable portions of the NYCDOT Standard Highway Specifications, and DPR Standard Detail Sheet 'Tennis Court Layout & Details'.

**Post:** Each set of Tennis Court Accessories shall consist of one (1) net with center strap anchor supported by two (2) posts. Posts shall be extra heavy weight Schedule 80 hot-dipped galvanized steel pipe of the sizes shown on the plans.

**Fittings:** The reducing collars, deck plates, covers at top, and tapered rings or sockets at bottom of setting sleeves shall be made of the best quality ductile cast iron, galvanized after threading and other necessary machining, secured as shown on the plans. All cleats and clamps for cables shall be made of best quality malleable cast iron, galvanized and secured with stainless steel machine screws.

**Pulley Top:** The pulley tops shall be of the best quality galvanized malleable cast iron, with pulley axles and fastening pins of stainless steel. Castings shall be perfectly sound and smooth and free from all flaws.

**Net Tightener (Winch):** The net tightener shall be powdercoated steel, as manufactured by Shelby, Model No, 5403, nine hundred pound (900 lb.) capacity, or approved equal.

**Nets:** Net size shall be forty-two feet (42') by three and one-quarter feet (3 1/4'). Mesh opening of nets shall not exceed one and three-quarter inch (1 3/4"). Mesh shall be fabricated of three strand twisted nylon cord with the top nine (9) rows double mesh. The headband, side and bottom bindings shall be extra heavy nylon reinforced vinyl or polyester fabric. The top hood shall be white, minimum two and one-half inches (2 1/2") wide and attached to the net with four (4) rows of heavy, polyester lock stitching. The side and bottom bindings shall be a minimum of one inch (1") wide and have a double row of heavy polyester lock stitching. The top cable supporting the net shall be a five (5) mm vinyl-coated galvanized or stainless steel cable.

The center strap shall be a two-inch (2") wide adjustable nylon strap with rustproof snap hook. The net shall be similar to Model #20103 Hercules Tennis Net as manufactured by Carron Net Co., Inc., Two Rivers, Wisconsin, or approved equal.

**Anchor Box:** The center strap anchor box shall conform to the standard details, as shown on the plans, and shall consist of a 1 5/8" by 10" galvanized pipe with 1/4" pin set in concrete. The anchor box shall be similar to Catalogue VB24, as manufactured by Bison Recreational Products, Lincoln, NE, or approved equal.

**ERECTION:** Posts shall be set in standard weight galvanized steel pipe sleeves of the sizes shown on the plans. Each sleeve shall be equipped with a deck plate of the size shown, for which an approved operating key shall be furnished by the Contractor. Posts shall be erected truly vertical.

**Footings:** Sleeves shall be set in concrete footings of the size and construction shown on the plans. The footings shall be erected on a crushed stone bed.

**SHOP DRAWINGS:** The Contractor shall submit shop drawings where required, in accordance with the requirements of the S-Pages.

**MEASUREMENT AND PAYMENT:** The quantity of **TENNIS COURT ACCESSORIES SET** to be paid for under this Item shall be the number of sets furnished and erected complete, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price for each **SET** of Tennis Court Accessories furnished and installed and shall include the cost of furnishing all labor, materials, tools, equipment and other expenses necessary, including concrete footings, setting sleeves, unclassified excavation, crushed stone bed, net, posts, center strap and anchor box all in accordance with the plans and specifications to the satisfaction of the Engineer.

The price bid shall include all delivery charges.

<b>PK-ESCR 184</b>	<b>TENNIS COURT ACCESSORIES SET</b>	<b>EA</b>

**END OF SECTION**

**SECTION PK-ESCR 185 – PAINT LINES 4 INCH – SYNTHETIC TURF**

**WORK:** Under this item, the Contractor shall PAINT LINES 4” WIDTH – SYNTHETIC TURF in accordance with the Plans, Specifications, and the directions of the Engineer.

**INTENT:** This item is intended to provide initial painted lines on synthetic turf fields which will be maintained and repainted by leagues or organizations who utilize the fields. Leagues shall furnish the equipment and material to repaint the playing lines.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

**Line Marking Paint:** (where shown on the drawings): Paint shall be applied according to the substrate upon which it is being applied.

**Polyethylene Fibers:** Paint suitable for satisfactory application on polyethylene synthetic fibers shall be durable, 100% acrylic emulsion water-base paint, designed to last a minimum of six (6) months from the time of application. Paint shall be similar to ExtremeLine™ synthetic turf marking paint as manufactured by Pioneer Manufacturing, Cleveland, OH, or approved equal. Drying time shall be 48 to 72 hours. Coverage (undiluted) shall be a minimum of 250 linear feet of four (4”) inch wide line per gallon. Color shall be white unless otherwise shown on the drawings.

**Nylon Fibers:** Paint suitable for satisfactory application on nylon synthetic fibers shall be a durable, 100% acrylic emulsion water-base paint, designed to last a minimum of six (6) months from the time of application. Paint shall be similar to Titan™ Synthetic Turf Marking Paint as manufactured by Pioneer Manufacturing, Cleveland, OH, or approved equal. Drying time shall be 48 to 72 hours. Coverage (undiluted) shall be a minimum 250 linear feet of four (4”) inch wide line per gallon. Color shall be white unless otherwise shown on the drawings.

**EXECUTION:** Prior to painting, areas to receive paint shall be cleaned of debris and groomed so fibers stand up straight. Line paint application temperature shall be between 60 °F and 90 °F. Turf shall be clean and dry at the time of paint application. Lines shall be placed using an airless, high pressure field marking machine such as FieldLazer S100 airless field marker as manufactured by Graco, Inc., Minneapolis, MN, or the Brite Striper 3000 as manufactured by Pioneer Athletics, Cleveland, Ohio, or approved equal. All lines shall be clear and distinct with sharply defined edges. Painting shall be applied to fibers. Every effort shall be made to avoid paint leaking on to adjacent infill material.

All lines shall be placed with a four (4”) inch width unless otherwise shown on the drawings.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Paint Substitution:** A written request for paint substitution, along with manufacturer’s data sheets shall be submitted for approval a minimum of two (2) weeks prior to the intended date of paint application. All paint substitutions must be approved in writing.

**MEASUREMENT AND PAYMENT:** The quantity for **PAINT LINES 4” WIDTH – SYNTHETIC TURF** to be paid for under this Item shall be the number of **LINEAR FEET** painted in accordance with the Plans and Specifications to the satisfaction of the Engineer.

The Price bid shall be a unit price per **LINEAR FOOT** of Painted Lines provided and shall include the cost of all labor, materials, equipment and incidentals necessary to complete the Work all in accordance with the Plans, Specifications and directions of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 185</b>	<b>PAINT LINES 4 INCH – SYNTHETIC TURF</b>	<b>L.F.</b>
	<b>END OF SECTION</b>	
	<b>PARKS-156</b>	

## SECTION PK-ESCR 188 – POLYETHYLENE PIPE, PERFORATED NON PERF

**WORK:** Under this item, the Contractor shall furnish and lay **POLYETHYLENE CORRUGATED PIPE** or **PERFORATED POLYETHYLENE CORRUGATED PIPE** of the required size, in accordance with the plans, specifications, and directions of the Engineer. All work of connecting and joining to other pipes or drainage structure shall be included under this item.

**MATERIALS:** Pipe and fittings shall be manufactured by Advanced Drainage Systems, Inc. (ADS) Staybrook Industrial Area, Ludlow, MA, or approved equal. Sizes 4 – 36 inch (N-12) shall have a full circular cross-section, with an outer corrugated pipe wall and an essentially smooth inner wall (waterway). Corrugations for these sizes may be either annular or spiral. All sizes shall conform to the AASHTO classification "Type S" (smooth waterway) or "Type SP" (smooth waterway and Class 2 perforations) as specified.

Pipe manufactured for this specification shall comply with the requirements for test methods, dimensions, and markings found in AASHTO Designations M252 and M294. Pipe and fittings shall be made from Virgin PE compounds which conform with the requirements of cell Class 424420C for 4" through 10" diameters and Class 435400C for 12" through 60" diameters as defined and described in ASTM D3350.

The minimum parallel plate stiffness values when tested in accordance with ASTM D2412 shall be as follows:

<u>Diameter</u>	<u>Pipe Stiffness</u>
4" (100 mm)	50 psi (340 kPa)
6" (150mm)	50 psi (340 kPa)
8" (200mm)	50 psi (340 kPa)
10" (250mm)	50 psi (340 kPa)
12" (300mm)	50 psi (340 kPa)
18" (450 mm)	40 psi (280 kPa)
24" (600 mm)	34 psi (235 kPa)
36" (900 mm)	22 psi (150 kPa)

The fittings shall not reduce or impair the overall integrity or function of the pipe line. Common corrugated fittings may be either molded or fabricated. Common corrugated fittings include inline joint fittings, such as couplers and reducers, and branch or complimentary assembly fittings such as tees, wyes, and end caps. These fittings may be installed by various methods, such as snap-on, screw-on, bell and spigot, and wrap around. Couplings shall provide sufficient longitudinal strength to preserve pipe alignment and prevent separation at the joints.

Only fittings supplied or recommended by the pipe manufacturer shall be used. Where designated on the plans, a neoprene or rubber gasket shall be supplied.

**SOCK:** The perforated pipe shall have a "DC Sock" - a polyester machine knitted envelope factory applied and ready for installation.

**INSTALLATION:** All pipe shall be laid in reasonably close conformity to line and grade and shall have a full, firm and even bearing at each joint and along the entire length of pipe. Joint misalignment shall not result in offsets, in the interior smooth liner, greater than one-quarter (1/4") inch. Pipe laying shall begin at the downstream end and progress upstream. Any single run of pipe, excluding end sections, shall consist wholly of the same type material unless otherwise directed by the engineer. No section of pipe used shall be less than three feet (3') in length. Installation of the pipe shall be in accordance with ASTM Recommended Practice D2321.

**Installation Requirements:**

1. Crushed stone, gravel or compacted soil backfill material should be used as the bedding and envelope material around the culvert. The aggregate size should not exceed one-sixth (1/6) of the pipe diameter or four inch (4") diameter, whichever is smaller.
2. The corrugated pipe should be laid on grade, on a layer of bedding material. If native soil is used as the bedding and backfill material, it should be well compacted in six inch (6") layers under the haunches, around the sides, and above the pipe to the recommended minimum height of cover.
3. Either flexible (asphalt) or rigid (concrete) pavements may be laid as part of the minimum cover requirements.
4. Site conditions and availability of bedding materials often dictate the type of installation method used. See plans.
5. The load bearing capability of flexible conduits is dependent on the type of backfill material used and the degree of compaction achieved. Crushed stone and gravel backfill materials typically reach a compaction level of ninety to ninety five percent (90-95%) AASHTO standard density without compaction. When native soils are used as backfill material, a compaction level of eighty five percent (85%) is required. This is the same minimum compaction that is recommended by all culvert pipe manufacturers and can be achieved by either hand or mechanical tamping.

Two types of installations are recommended for H-20 live loads - the heaviest legal highway loads. These are the trench and open ditch installations. The minimum height of cover recommendations are the same for both conditions.

**MINIMUM DIMENSIONS TRENCH OR OPEN DITCH INSTALLATIONS**

Nominal Diameter	Min. Thickness Of Bedding	Minimum Cover	Minimum Trench Width
4"	3"	12"	21"
6"	3"	12"	23"
8"	3"	12"	26"
10"	4"	12"	28"
12"	5"	12"	30"
18"	6"	12"	39"
24"	6"	12"	48"
36"	6"	12"	64"

Coupling of the pipes shall be performed using Standard ADC (Advanced Drainage Systems) N12 split coupler PRO LINK ST, or PRO LINK 10.8, or PRO LINK 5, or approved equal.

**MEASUREMENT AND PAYMENT:** The quantity of **POLYETHYLENE CORRUGATED PIPE** to be paid for under this Item shall be the number of linear feet (laying length) of each size pipe, including fittings, measured in its final position, furnished, and placed in accordance with the plans, specifications, and the directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length Polyethylene Corrugated Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer. Excavation and broken stone shall be paid for under their respective Items.

**MEASUREMENT AND PAYMENT:** The quantity of **PERFORATED POLYETHYLENE CORRUGATED PIPE** to be paid for under this Item shall be the number of linear feet (laying length) of each size pipe, including fittings, measured in its final position, furnished, and placed in accordance with the plans, specifications, and the directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length Polyethylene Corrugated Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary to complete the work in accordance with the plans and specifications including the sock, to the satisfaction of the Engineer.

Excavation and broken stone shall be paid for under their respective contract Items.

**END OF SECTION**

## SECTION PK-ESCR 191 – ASPHALT BLOCK ON CONCRETE BASE

**WORK:** Under this item the Contractor shall furnish and place **ASPHALT BLOCK ON CONCRETE BASE**, in accordance with the plans, specifications, and directions of the Engineer.

**Pattern:** The layout of the pavers shall be subject to approval by the Engineer. Layout patterns and paver designs are as indicated on the plans. All edges, borders, and corners of the paved area shall be finished to true and neat lines. Special cutting, soldier courses, color patterns, various shapes, and variations in size and finish are all to be included in the square yard price bid.

**MATERIALS:** Unless otherwise specified, the materials shall meet the requirements of the NYCDOT Standard Highway Specifications.

**Bituminous Setting Bed:** Asphalt cement to be used in the bituminous setting bed shall conform to PGA 64-22, ASTM D6373 for Performance Graded Asphalt.

The fine aggregate to be used in the bituminous setting bed shall be clean, hard sand with durable particles and free from adherent coatings, lumps of clay, alkali salts and organic matter. It shall be uniformly graded from "coarse" to "fine" and all passing the No. 4 sieve and meet the gradation requirements when tested in accordance with the standard method of test for sieve or screen analysis of fine and course aggregates ASTM C136.

The dried fine aggregate shall be combined with hot asphalt cement, and the mix shall be heated to approximately 3000 F. at an asphalt plant. The approximate proportion of materials shall be six (6%) percent cement asphalt and ninety-four (94%) percent fine aggregate. Each ton shall be apportioned by weight in the approximate ratio of 120 lbs. asphalt to 1,880 lbs. sand. The Contractor shall determine the exact proportions to produce the best possible mixture for construction of the bituminous setting bed to meet construction requirements.

**Tack Coat:** Tack coat shall be # 237 2% Neo-Asphalt, Brush Grade as manufactured by Hanover Architectural Products, Hanover, PA, or approved equal. Tack coat shall be an asbestos free, cold applied, rubberized asphalt cement, and shall consist of two percent (2%) neoprene rubberized asphalt with 1500 softening point and 6.5 percent (6.5%) inorganic material.

**Asphalt Block:** Unless otherwise noted on the plans, all pavers shall be hexagonally shaped asphaltic concrete blocks, eight inches (8") between parallel sides and two inches (2") in thickness, with a permissible plus or minus tolerance of one-sixteenth inch (1/16") in any dimension.

The blocks shall be composed of approximately 6.5%+/- (plus or minus) .5% high melting point oxidized asphalt conforming to ASTM Designation D-312 for Type 3 asphalt and ninety four percent (94%) graded crushed rock aggregate and mineral filler; at the temperature of 300 degrees °F the mix is compressed 4,000 lbs. per square inch by high speed hydraulic presses.

The blocks shall be as manufactured by Hanover Architectural Products Inc. of Hanover, Pa., or approved equal. Top exposed surface of blocks shall have a ground finish, exposing a small aggregate, similar in appearance to Hanover's Matrix #10, unless otherwise noted in the Contract Drawings. The total post-industrial recycled content of the blocks shall be 23.6 %, or approved equal.

**Concrete Base:** Concrete shall be as described in Section ESCR-4.06 and shall be of the dimensions indicated on the plans.

**Foundation:** Material for Foundation shall be a straight run of single size aggregate and shall consist of either all one and one-half (1 1/2") inch stone or all three-quarter (3/4") inch stone in

accordance with ASTM C33, free from organic or other deleterious material. In addition, Foundation Material may contain no more than five (5%) percent of fines, defined as aggregates passing a No.4 sieve or smaller. The Magnesium Sulfate Soundness loss after ten (10) cycles shall be eighteen (18%) percent or less, as per ASTM C88. Coarse aggregate may be one of the following:

- A. Broken Stone or gravel of approved quality and conforming to the requirements of the NYCDOT Standard Highway Specifications
- B. Recycled Material consisting of at least ninety five (95%) percent by weight of the following:
  - 1. Recycled Portland Cement Concrete Aggregate or
  - 2. Recycled Portland Cement Concrete Aggregate mixed with Stone Gravel.

**Laboratory Testing:** The Contractor shall, at the direction of the Engineer furnish a certified report by an approved Materials Testing Laboratory showing the materials composition, sieve analysis, plasticity index, and soundness of the representative samples of recycled material which they propose to use.

The Engineer will deliver the samples to an independent testing laboratory. The Contractor shall bear responsibility for all costs associated with laboratory testing. No recycled material shall be delivered to the site until positive test results have been obtained. The Engineer reserves the right to reject on or after delivery any material which does not, in their opinion, meet these specifications.

#### **EXECUTION:**

**Preparation of Fine Grade:** Before any pavement is placed upon the fine grade, the fine grade shall be prepared to line and grade and compacted where practicable with an approved self propelling roller weighing not less than ten (10) tons. All hollows and depressions which develop under rolling shall be filled with acceptable material and shall again be rolled. This process of shaping, filling and rolling shall be repeated until no depressions develop.

The Contractor shall remove from the subgrade all debris, foreign material, and all other undesirable material designated by the Engineer. The fine grade shall not be muddy or otherwise unsatisfactory when the pavement is placed upon it. If the fine grade becomes rutted or displaced, due to any cause whatsoever, the Contractor shall regrade same without additional payment.

**Spreading:** Material for foundation shall be evenly spread on a prepared sub-grade in the position shown on the plans or directed by the Engineer, in four inch (4") layers, each layer to be rolled while wet with a seven (7) to twelve (12) ton tandem roller (or other approved method satisfactory to the Engineer) to the thickness shown on the plans or directed by the Engineer.

**Forms:** Forms shall be made of substantial material (preferably steel), with suitable metal dividing plates and of sufficient strength to satisfactorily resist distortion when fastened together and secured in place. Forms and dividing plates shall be of depth not less than that of the thickness of the concrete slab, properly located with tops set to the designated sidewalk surface, and left in place until the concrete is set.

**Construction:** Foundation course shall be wetted immediately before concrete is placed. The concrete shall be placed within the forms and thoroughly tamped until the surface is at the finished grade. The top surfaces shall be finished to true smooth planes by troweling.

When base is constructed in independent slabs, they shall be separated by expansion joints approximately one-quarter (1/4) inch wide. Adjacent to structures, (manholes, hydrants, etc.) expansion joints and sealant shall be installed as directed

Expansion Joint: The Contractor shall furnish and place expansion joint every 400 square feet or as shown on the plans. The expansion joint material shall be one of the following.

A premoulded bituminous fiber joint filler as specified in Section "B" (requires a bond breaker and sealant) or,

A premoulded closed cell expanded polyethylene form joint filler such as MasterSeal 920 by BASF, Inc., Shakopee, MN (requires only sealant) or, an approved equal of any of the above.

If bituminous fiber material is used, a bond breaker such as one-half inch (1/2") width polyurethane tape or five-eighths inch (5/8") diameter expanded polyethylene foam backer rod shall be installed as recommended by manufacturer prior to pouring sealant. A bond breaker will not be required for a premoulded foam joint, but sealant is always required.

Sealant: After the concrete is placed, finished, and set, and the bond breaker, if necessary installed, the space as shown in the drawings shall be filled with a poured joint sealer. Joint sealer shall be a 2-component polyurethane base elastomeric sealant such as Sikaflex 2C-SL manufactured by Sika Corporation, Lyndhurst, NJ, or a 1-component polyurethane base elastomeric sealant, such as MasterSeal SL1 manufactured by BASF, Inc., Shakopee, MN, or approved equal. Asphalt cement will not be approved as a sealant. Install sealant in accordance with manufacturer's instructions including allowable minimum temperature of 40 degrees Fahrenheit.

Clean all surfaces of joint. Surfaces must be sound, clean dry and free from oil or grease. Mask sides of joint with masking tape to prevent spillage onto adjacent pavement.

Pour sealant in joints and tool to produce a smooth surface. If bubbles form, wait 5-10 minutes before tooling to break the bubbles. Remove excess sealant promptly as the work progresses and clean the adjacent surfaces. Remove masking tape.

Protection and Curing Concrete: Concrete base shall be carefully protected from the drying effects of the sun and wind, traffic, or other causes by means of suitable guards and coverings, and shall be kept moist for period of three days. Before laying asphalt pavers Engineer shall inspect and approve the concrete base.

Bituminous Setting Bed: To install the setting bed over the surface of the base, place three-quarter inch (3/4") deep control bars directly over the base course. If grades must be adjusted, set wood chocks under depth control bars to proper grade. Set two bars parallel to each other approximately 11 feet long (2" x 6" board). The depth of control bars must be set carefully to bring the paver, when laid, to the proper grade.

Place some bituminous material between the parallel depth control bars. Pull this bed with the striking board over these bars several times. After each passage, low porous spots must be showered with fresh bituminous materials to produce smooth, firm and even setting bed. As soon as this initial panel is completed, advance the first bar to the next position in readiness for striking the next panel. Carefully fill up any depressions that remain after removing the depth control bars and wood chocks.

Bed shall be spread in a continuous professional manner. Installation of base in spotted, different and isolated areas will not be accepted. Bed depth greater than 1-1/8" will not be acceptable. After setting bed has cooled, it shall be rolled by hand with a 100 lb. roller to eliminate sponginess and to prepare the surface for the installation of the tack coat. The setting bed shall be protected against all pedestrian traffic and construction equipment to ensure a level surface for setting pavers.

Tack Coat: The neoprene-modified asphalt adhesive tack coat shall be applied by mopping, squeegeeing or troweling over the top of the bituminous setting bed so as to provide a bond between the bituminous setting bed and the paver.

Setting Pavers: When modified asphalt adhesive is dry to touch, carefully place the pavers by hand, ground finish side up unless otherwise specified, in straight course, with hand tight joints and uniform top surfaces, keeping full alignment according to the patterns shown on the plans. Joints between blocks shall have a maximum width of one-eighth inch (1/8").

Pavers may vary slightly in shade and tonality. Installer shall work from at least four (4) pallets at a time in order to create a uniform blend of paver shades.

All blocks shall be cleaned when placed on the pavement. In no case shall the bituminous setting bed in front of the pavement be disturbed or walked on during the laying of the blocks.

Joint Filler: Upon the completion of the work of laying the blocks in each section to the satisfaction of the Engineer, the surface of the blocks shall be swept clean, and the joints filled with fine sand. All joints shall be filled the same day as the blocks are laid. Filler shall not be applied if the blocks are wet or if the air conditions are such that the fill does not readily enter the joints. Filler shall be well worked into the joints by means of squeegees or other approved devices operating slowly backward and forward. Squeegeeing shall continue until the joints are flush with top surface. Immediately after the joints are filled, the pavement shall be lightly sprayed and cleaned.

**DEFECTS:** Where defects in material or installation appear in the completed work, such areas shall be removed to the full depth of the course and the defective material replaced with new for the required thickness of pavement at the expense of the Contractor for such removing and replacing.

**SUBMITTALS:** All submittals shall be in accordance with S-Pages.

Samples: The Contractor shall submit samples of each type of paver they propose to use for approval by the Engineer. The samples shall be clearly labeled with Contract No., manufacturer, and finish. All pavers used on the work shall conform to the approved samples. A three (3) pound bag of stone screenings shall be submitted to the Engineer for approval, with a sieve analysis and the name of supplier attached.

**MEASUREMENT AND PAYMENT:** The quantity of **ASPHALT BLOCK ON CONCRETE BASE** to be paid for under this item shall be the number of **SQUARE YARDS** of pavement constructed as shown on the plans and in accordance with the specifications and directions of the Engineer. The price bid shall be a unit price per **SQUARE YARD** of Asphalt Block on Concrete Base and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including asphalt pavers setting bed and expansion joints, concrete base, foundation material, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation shall be paid for separately under its own contract item.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 191</b>	<b>Asphalt Block on Concrete Base</b>	<b>S.Y</b>

**END OF SECTION**

**SECTION PK-ESCR 210 – PAINT LINES 4 INCH – LAWN CLAY AREA**

**WORK:** Under this item, the Contractor shall apply **PAINT LINES 4” WIDTH - LAWN & CLAY AREAS** in accordance with the Plans, Specifications, and the directions of the Engineer.

**MATERIALS:** Paint shall be a vinyl-acrylic latex line marking paint similar to Sapolin PPX Deluxe Athletic Field Marking Paint, as manufactured by Mercury Paint Corp., Brooklyn, NY; or Brite Stripe as manufactured by Pioneer Manufacturing, Cleveland, OH; or approved equal. Dry times shall be as listed by manufacturer.

Color shall be white unless otherwise shown on the drawings.

**EXECUTION:** Lines shall be placed using a field marking machine. All lines shall be clear and distinct with sharply defined edges. All lines shall be placed with 4” width unless otherwise shown on the drawings.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Paint Substitution:** A written request for paint substitution, along with manufacturer’s data sheets shall be submitted for approval a minimum of two (2) weeks prior to the intended date of paint application. All paint substitutions must be approved in writing.

**MEASUREMENT AND PAYMENT:** The quantity for **PAINT LINES 4” WIDTH - IN LAWN AND CLAY AREAS** to be paid for under this Item shall be the number of **LINEAR FEET** painted in accordance with the Plans and Specifications to the satisfaction of the Engineer.

The Price bid shall be a unit price per **LINEAR FOOT** of Painted Lines provided and shall include the cost of all labor, materials, equipment and incidentals necessary to complete the Work all in accordance with the Plans, Specifications and directions of the Engineer

## SECTION PK-ESCR 214 – CUSTOM 1964 WORLD'S FAIR SITE FURNISHINGS

### PK-ESCR 214.1 INTENT

This section describes the products and installation of Site Furnishings in accordance with the plans, specifications and directions of the Engineer.

### PK-ESCR 214.2. DESCRIPTION

1. Under this Section, the Contractor shall furnish and install the followings Site Furnishings, in accordance with the Contract Drawings, specifications and directions of the Engineer:
  - a. 1964 Worlds Fair Chaise Lounge
  - b. 1964 Worlds Fair Bar Stool
  - c. 1964 Worlds Fair Chair

### PK-ESCR 214.3. MATERIALS

1. Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

Steel Supports: Steel supports for recycled plastic lumber shall be hot-rolled carbon steel flat bars and channels of the sizes indicated on the drawings and secure to the plastic slats with vandal resistant screws. All steel supports shall be hot dipped galvanized or stainless steel as per this specification.

Touch-up and Repair: For minor damage caused by grinding, installation or transportation, touchup galvanized finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of six (6') feet.

BENCH SLATS – RECYCLED PLASTIC LUMBER: All slats for benches shall be fabricated from at least ninety percent (90%) post-consumer recycled plastic, dimensions as indicated on the plans. Recycled plastic lumber shall be Selectforce as manufactured by Bedford Technology, LLC Worthington, MN, PolyTuf™ as manufactured Tangent Technologies, LLC, Aurora, IL, or approved equal. Color to be Cedar, Brown or Weathered Wood unless otherwise indicated on the plans.

Recycled plastic lumber shall comply with or be tested in accordance with the following.

ASTM D6108 Standard Test Method for Compressive Properties of Plastic Lumber and Shapes

ASTM D6109 Standard Test Method for Flexural Properties of Unreinforced and Reinforced Plastic Lumber

ASTM D6111 Standard Test Method for Bulk Density and Specific Gravity of Plastic Lumber and Shapes by Displacement

ASTM D6112 Standard Test Methods for Compressive and Flexural Creep and Creep Rupture of Plastic Lumber and Shapes

ASTM D6117 Standard Test Methods for Mechanical Fasteners in Plastic Lumber and Shapes

ASTM D1248 Standard Specifications for Polyethylene Plastics Extrusion Materials for Wire and Cable

Recycled Plastic Lumber shall be fabricated primarily from recycled High Density Polyethylene (HDPE) and recycled Low Density Polyethylene (LDPE). HDPE resins shall meet the requirements of ASTM D1248 for Type III or IV (high density), Grade G7. Lumber shall contain no toxic materials, but shall contain UV-inhibited pigments. Composition and mechanical properties shall be as follows:

- Minimum Recycled Content 90%
- Minimum High Density Polyethylene 70%
- Maximum Percentage of Materials other than Polyolefins 5%
- Minimum Specific Gravity (ASTM D6111) 0.02 lbs-in<sup>3</sup>
- Minimum Flexural Modulus (ASTM D6109) 85,000 psi
- Minimum Screw Pull-out Strength (ASTM D6117) 700 lbs

Flame Spread, Class C or better, tested in accordance with ASTM E84.

Coefficient of Thermal Expansion (ASTM D6341), in the range of -10°C to 30°C, shall not exceed  $70 \times 10^{-6}/^{\circ}\text{F}$ .

Recycled Plastic Lumber shall not absorb moisture, corrode, rot, warp, splinter, or crack and shall not contain fiberglass or any material that will be irritating in contact with skin.

Fabrication Tolerances: Ends shall be smooth with clean cuts. Cross-sections shall not have voids greater than 1/2" dia. Voids of 1/2" dia. or less shall be filled as per manufacturer's specifications. All edges shall have 1/4" radius. Maximum variation from flat surface across section shall be 1/8".

Delivery and Storage: Keep recycled plastic lumber protected at all times against exposure to extreme heat or impact. All material shall be bundled and fully supported during shipping and storage to prevent creep. Any lumber that is damaged or excessively scratched will be rejected and replaced with new. All material must be straight and true when placed in the construction.

Hardware: Bolts, locknuts, and washers used to secure slats to standards shall be stainless steel or hot dipped galvanized. Bolt or wood screw used for mid section steel support strap (RPL only) shall be a vandal resistant type, either stainless steel or hot-dipped galvanized. Type and dimensions of all bolts, nuts, and washers shall be as indicated on the plans. Anchor bolts used to secure the benches to pavements may be either stainless steel or hot-dipped galvanized steel. Bolts for securing slats shall be provided with nylon lock nuts so as to render the connection vandal resistant.

Concrete: Concrete for slabs or footings shall be as described in Section ESCR-4.06 and shall be of the dimensions indicated on the plans.

### **PK-ESCR 214.3.1. REFERENCES**

ASTM Designation A536: Bench standards shall be of cast ductile iron. The tensile strength shall meet a minimum of 65,000 psi, in accordance with ASTM designation A536, Grade 65-45-12.

ASTM A153: Standards shall be hot dipped galvanized in accordance with ASTM A153. Any resulting dimples or sharp points shall be ground smooth.

### **PK-ESCR 214.3.2. SUBMITTALS**

- A) Product Data: Submit manufacturer's product data, storage and handling requirements and recommendations, installation methods and available colors, styles, patterns and textures.
- B) Shop Drawings: Show fabrication and installation details. Include plans, elevations, sections, and details of RPL slat and metal fabrications and their connections. Show anchorage and accessory items.
- C) Sample: The Contractor shall submit a twelve inch (12") sample of the recycled plastic lumber slat for surface and color approval. Required test results shall be submitted if an approved equal manufacturer is proposed.

### **PK-ESCR 214.3.3. QUALITY CONTROL**

- A) Foundry Certificates: Certifying Ductile Iron used in bench standards shall be submitted. The certificate shall be on foundry letterhead, dated and signed by the manufacturer with the Contract No., Contractor name, and Class of Ductile Iron provided.

### **PK-ESCR 214.3.4. DELIVERY, STORAGE, AND HANDLING**

- A) Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.
- B) Storage: Store materials in clean, dry area in accordance with manufacturer's instructions. Keep materials in manufacturer's original, unopened containers and packaging until installation.
- C) Handling: Protect materials and finish during handling and installation to prevent damage.

### **PK-ESCR 214.3.5. WARRANTY**

- A) Warranty Information:
  - a. Products will be free from defects in material and/or workmanship for a period of three years from the date of substantial completion.
  - b. The warranty may exclude damage resulting from accident, misuse, tampering, negligence, or abuse.
  - c. Products shall be repaired or replaced to the satisfaction of the Engineer any items found defective upon inspection by an authorized manufacturer service representative and Engineer.

### **PK-ESCR 214.4. METHODS**

The following methods of installation shall be used.

- A. Examination:
  - 1. Examine areas to receive the Site Furnishings.
  - 2. Notify Engineer of conditions that would adversely affect installation or subsequent use.
  - 3. Do not begin installation until unacceptable conditions are corrected and

acceptance verified in writing by Engineer.

**B. Installation:**

1. Benches shall be pre-assembled before being installed in their final location and properly secured in place by anchor bolts drilled into concrete footings or slab, as indicated on the plans.

**C. Adjusting:**

1. Finish Damage: Repair minor damages to finish in accordance with manufacturer's instructions and as approved by Engineer.
2. Component Damage: Remove and replace damaged components that cannot be successfully repaired as determined by Engineer.

**D. Cleaning:** Clean Site Furnishings promptly after installation in accordance with manufacturer's instructions. Do not use harsh cleaning materials or methods that could damage finish.

**E. Protection:** Protect installed Site Furnishings to ensure they will be without damage or deterioration at time of Substantial Completion.

**PK-ESCR 214.5. MEASUREMENT**

The quantities of Site Furnishings to be measured for payment shall be the quantity of each type Site Furnishing installed at the site to the satisfaction of the Engineer.

**PK-ESCR 214.6. PRICES TO COVER**

The prices bid shall be the unit price per EACH type site furnishing Item covered under this Section and shall include the cost of furnishing all labor, materials, equipment, insurance, and incidentals necessary to furnish, assemble and install the Site Furnishings including, but not limited to, chair arm rests and glides, and hardware, all in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

*Payment will be made under:*

**END OF SECTION**

## **SECTION PK-ESCR 221 – STAINLESS STEEL HAND RAIL**

**WORK:** Under this Item, the Contractor shall furnish and erect STAINLESS STEEL HAND RAIL for steps and/or ramps where shown on the plans or directed by the Engineer, in accordance with the plans, specifications, and directions of the Engineer. All handrail, including extensions, shall comply with Americans with Disabilities Act (ADA) provisions as described in ANSI A117.1-1998 (or most recent edition).

**MATERIALS:** All posts and rails shall be 316L in accordance with ASTM Designation

Tubing: ASTM A 554, Grade MT 316L. All materials as delivered shall be in condition for erection without field fitting or cutting. Stainless steel handrail shall be as manufactured by

1. Architectural Metal Works.
2. Blum, Julius & Co., Inc.
3. Blumcraft of Pittsburgh. or approved equal.

**WELDING:** Welding shall be done by competent mechanics as specified under Section “B” and all welds shall be ground smooth.

**ERECTION:** The posts shall be set in holes which shall have been formed in the steps or footings, as shown on the plans or directed by the Engineer. After the posts have been set in place and properly supported to hold them to line and grade, the remaining space shall be neatly filled with a grout consisting of one (1) part cement and two (2) parts sand. Color of grout shall match surrounding pavement or stone.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Sample:** Submit one twelve (12”) inch section of stainless steel pipe for approval.

**Shop Drawings:** The Contractor shall submit shop drawings including complete details of handrail construction, height, post spacing layout, dimensions and concrete footing detail. Stainless steel handrail shall be fabricated in strict accordance with the plans and shop drawings.

**Certification:** Submit certification that the materials used comply with this specification.

**MEASUREMENT AND PAYMENT:** The quantity of STAINLESS STEEL HANDRAIL to be paid for shall be the number of LINEAR FEET of stainless steel handrail, including handrail extensions furnished and erected complete in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be unit prices per LINEAR FOOT of handrail and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation, concrete for piers, and core drilling, if required, shall be paid for separately under their respective contract items.

<b>PK-ESCR 221</b>	<b>STAINLESS STEEL HANDRAIL</b>	<b>LF</b>

**END OF SECTION**

## SECTION PK-ESCR 400 RECONSTRUCT DRAINAGE STRUCTURE

**PK-ESCR 400.1 WORK:** Under this Item, the Contractor shall reconstruct drainage structure including removing the frame and grates (and curb piece if applicable) and reconstructing the existing structure, including providing new frame and grate and setting the new frame to grade as shown on the plans, all in accordance with the plans, specifications, and directions of the Engineer.

**PK-ESCR 400.2 MATERIALS:**

Concrete: Concrete shall be mixed in the proportions of one (1) part Portland Cement, two (2) parts fine aggregate and four (4) parts coarse aggregate, with the maximum size of stone to be one inch (1").

Mortar: Mortar shall be composed of one (1) part Portland Cement and a maximum of two (2) parts sand, with not more than five percent (5%) of the cement content containing hydrated lime.

Reinforcement: Reinforcement and dowels where required shall be deformed steel bars.

Brick Masonry: Shall meet those requirements as shown on the details located in Appendix A of the Contract Drawings.

Ladder rungs: Ladder rungs shall be constructed of wrought iron and be hot-dipped galvanized after bending.

Hoods: Hoods shall be of the type existing and shall be installed with wall plates.

Frames, Grate & Covers: Shall be according to the appropriate Standard Detail in Appendix A of the Contract Drawings.

Incidental Work: The Contractor shall furnish materials for and do all incidental work to complete the reconstruction of drainage structures, including setting and adjusting frames and plastering.

**PK-ESCR 400.3 METHOD:** The Contractor shall debride and expurgate all existing drainage structures of all rubbish, dirt, debris, and any other materials to the original depth of the basin, prior to reconstructing the drainage structures.

All excess materials, dirt, and debris generated by the Contractor's operations shall be removed from the site and disposed of at the Contractor's expense. The existing frame, grate, and curb piece shall also be discarded or become the property of the Contractor.

The existing drainage structure shall then be reconstructed in strict accordance with the Standard Details in Appendix A of the Contract Drawings. After the drainage structures have been reconstructed, they shall be maintained in satisfactory operating condition, until Substantial Completion. Prior to, or as part of the final inspection, the Contractor, in the presence of the Engineer, shall conduct such inspections and tests as are necessary to determine that the drainage facilities are in clear and functional condition. Such condition being defined as equal to that achieved upon completion of the initial clearing and it shall be the Contractor's responsibility to perform such additional clearing as is necessary to achieve such conditions, at their own expense and at no additional cost.

The Contractor is responsible for any damage caused to existing structures by their operations and shall make repairs with no additional cost.

**PK-ESCR 400.4 MEASUREMENT AND PAYMENT:** For reconstruct drainage structure in complete accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Drainage Structure Reconstructed, regardless of size, and shall include the cost of all labor, materials, and equipment, including new frame and grate, brick masonry, concrete and any other incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 400</b>	<b>RECONSTRUCT DRAINAGE STRUCTURE</b>	<b>EA</b>

**END OF SECTION**

**SECTION PK-ESCR 401 – ADJUST TOP OF UTILITY STRUCTURE TO GRADE**

**PK-ESCR 401.1.**     **WORK:** Under this item, the Contractor shall remove existing frames and covers of utility structures (i.e. existing catch basins, manholes, drain inlets and electric covers) and reset them to grades shown on the plans or as directed by the Engineer. Work under this item includes excavation.

**PK-ESCR 401.2.**     **MATERIAL:** All changes shall be made with acceptable brick laid in Portland cement mortar of one (1) part cement and two (2) parts of fine aggregate.

**PK-ESCR 401.3.**     **METHOD:** All work should be done in a professional manner by competent masons, but if the frames or covers are broken through carelessness of the Contractor, the Contractor shall replace them with new ones equal to those broken, at the Contractor's own expense.

**PK-ESCR 401.4.**     **MEASUREMENT AND PAYMENT:** The quantity of **ADJUST TOP OF UTILITY STRUCTURE TO GRADE,** to be paid for under this item shall be the number adjusted in accordance with the plans and specifications and the directions of the Engineer.

The price bid shall be a unit price for **EACH** head adjusted and shall include the cost of all labor, materials, equipment and incidental expenses including unclassified excavation, necessary to complete the work in accordance with the plans and specifications to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 401</b>	<b>ADJUST TOP OF UTILITY STRUCTURE TO GRADE</b>	<b>S.F.</b>

**END OF SECTION**

## SECTION PK-ESCR 402 CATCH BASIN COVER AND FRAME WITH BALLAST SCREEN

**PK-ESCR 402.1 WORK:** Under this Item, the Contractor shall furnish and install catch basin cover and frame with ballast screen, including vandal resistant bolts, in accordance with the plans, specifications, and as directed by the Engineer.

The purpose of this item is to construct a catch basin with ballast screen in areas where safety surfacing is installed to ensure drainage above and below the safety surfacing. Work shall include all materials required to ensure drainage and shall include, but are not limited to, rectangular catch basin cover (grate), frame with ballast screen, concrete, steel reinforcement, and broken stone.

### **PK-ESCR 402.2 MATERIALS:**

Catch Basin Cover and Frame With Ballast Screen: Catch Basin cover, frame, and ballast screen shall be cast gray iron per ASTM A48, latest revision, Class 35B. Catch basin assembly shall be provided with bolting option. Catch Basin cover (grate) shall be pattern number 7516-0600, ballast screen shall be 7516-0601, and the frame shall be 7516-0602.

Vandal Resistant Bolt: Each cover shall be furnished with two (2) Stainless Steel Penta-Head bolts. Typical plastic end caps are to be supplied with hardware and installed on Penta-Head bolts.

Broken Stone: Broken Stone shall consist solely of crushed ledge rock. Stone shall be No. 3A size and shall be of approved size and quality as directed by the Engineer. Material substitutions will not be approved under any circumstances. All recycled materials will be rejected.

### **PK-ESCR 402.3 INSTALLATION:**

Concrete: Steel bar reinforcement shall be placed as shown prior to installation of concrete. Class B-32 concrete shall be installed on two to four sides of the frame as shown on contract drawing. The Contractor shall furnish and place forms as required and shall remove them as directed by the Engineer. All finished concrete shall be protected and cured as directed by the Engineer.

Broken Stone: Broken stone shall be placed as shown on the Standard Details in Appendix A of the Contract Drawings.

Cover and Frame with Ballast Screen: Precast Concrete for Drain Structure shall be installed and paid for separately. The cover (grate) and ballast screen shall be installed on the frame as shown on the Standard Details in Appendix A of the Contract Drawings. Immediately prior to the final inspection the Contractor shall clean cover surfaces that show evidence of loose mill scale, non-adherent rust, peeling paint and other deleterious matter in accordance with SP-2, Hand Tool Cleaning, a method generally confined to wire brushing, sandpaper, hand scrapers or hand impact tools. Unless otherwise directed by the Engineer, covers shall be painted with two coats of black silicone alkyd paint.

**PK-ESCR 402.5 SUBMITTALS:** All submittals shall be as directed by the Engineer.

Foundry Certificates: Foundry Certificates shall be submitted on pattern holder's letterhead certifying the cover, frame, and ballast screen is manufactured of materials that meet this specification.

**PK-ESCR 402.6 MEASUREMENT AND PAYMENT:** For furnishing and installing catch basin cover and frame with ballast screen in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Catch Basin Cover & Frame With Ballast Screen, furnished and installed, and shall include the cost for all labor, material, equipment, and incidental

expenses necessary to complete the work, including frame, cover, ballast screen, concrete, steel reinforcement, broken stone, vandal resistant bolts, and painting all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation, Precast Concrete for Drain Structure, and Safety Surfacing shall be paid for separately under their respective contract items.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 402</b>	<b>CATCH BASIN COVER AND FRAME WITH BALLAST SCREEN</b>	<b>EA</b>

**END OF SECTION**

**SECTION PK-ESCR 403 – DUCTILE IRON SEWER PIPE – 18” DIA.**

**PK-ESCR 403.1.      WORK:** Under this item, the Contractor shall furnish and lay **DUCTILE IRON SEWER PIPE** of the inside diameter sizes called for and shown on the plans or as directed by the Engineer.

**PK-ESCR 403.2.      MATERIALS:** Ductile Iron Sewer Pipe shall consist of bell and spigot type Ductile Iron Pipe sections with Mechanical Joints (MJ fittings), and shall conform to the American National Standards Institute C151 and American Water Works Association A21.51, Thickness Class 56. Pipe shall be laid true to line and grade when bells upstream.

**PK-ESCR 403.3.      LAYING:** If the the Engineer determines the foundation is good, firm earth the earth shall be pared or molded to give a full support to the lower third of each pipe. If the Engineer determines the foundation is unstable, or other conditions prevent a proper bearing for the pipe, a bedding of broken stone shall be installed as shown on the details located in Appendix A of the contract drawings “Standard Detail Sheet ‘Drainage Details-No. 2”. If the excavation has been made deeper than necessary, a bedding of broken stone shall be installed at the Contractor’s expense.

When the pipe is to be installed under a roadway a concrete cradle shall be laid to provide a full, firm and even bearing as directed by the Engineer.

Trenches shall be promptly backfilled after the installation of pipe or completion of structures but no backfilling shall be done until the work has been inspected and approved by the Engineer.

Trenches shall be backfilled with clean fill, hand placed and tamped with six (6) inch layers to completely fill all spaces adjacent to the pipe.

**PK-ESCR 403.4.      CONNECTIONS:** The Contractor shall do all the work necessary to join the Ductile Iron Sewer Pipe to the existing sewer as shown on the plans. The cost for doing this shall be included in the unit price bid for this item.

**PK-ESCR 403.5.      MEASUREMENT AND PAYMENT:** The quantity of **DUCTILE IRON SEWER PIPE** to be paid for under this item shall be the number of **LINEAR FEET** (laying length) of each size pipe, including fittings, furnished, placed and measured in its final position, in accordance with the plans and specifications and the directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length of Ductile Iron Sewer Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary to complete the work, including delivering, handling and laying of pipe, connection and fittings, backfilling with clean fill, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation, Concrete and Broken Stone shall be paid separate for under their respective items.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 403</b>	<b>DUCTILE IRON SEWER PIPE – 18” DIA.</b>	<b>L.F.</b>

**END OF SECTION**

**SECTION PK-ESCR 404 – DUCTILE IRON SEWER PIPE – 24” DIA.**

**PK-ESCR 404.1.** **WORK:** Under this item, the Contractor shall furnish and lay **DUCTILE IRON SEWER PIPE** of the inside diameter sizes called for and shown on the plans or as directed by the Engineer.

**PK-ESCR 404.2.** **MATERIALS:** Ductile Iron Sewer Pipe shall consist of bell and spigot type Ductile Iron Pipe sections with Mechanical Joint Gasket Joints and shall conform to the American National Standards Institute C151 and American Water Works Association A21.51, Thickness Class 56. Pipe shall be laid true to line and grade when bells upstream.

**PK-ESCR 404.3.** **LAYING:** If the foundation is good, as determined by the Engineer, firm earth the earth shall be pared or molded to give a full support to the lower third of each pipe. If the foundation is unstable as determined by the Engineer, or other conditions prevent a proper bearing for the pipe, a bedding of broken stone shall be installed as shown on the details located in Appendix A of the contract drawings “Standard Detail Sheet ‘Drainage Details-No. 2”. If the excavation has been made deeper than necessary, a bedding of broken stone shall be installed at the Contractor’s expense.

When the pipe is to be installed under a roadway a concrete cradle shall be laid to provide a full, firm and even bearing as directed by the Engineer.

Trenches shall be promptly backfilled after the installation of pipe or completion of structures but no backfilling shall be done until the work has been inspected and approved by the Engineer.

Trenches shall be backfilled with clean fill, hand placed and tamped with six (6) inch layers to completely fill all spaces adjacent to the pipe.

**PK-ESCR 404.4.** **CONNECTIONS:** The Contractor shall do all the work necessary to join the Ductile Iron Sewer Pipe to the existing sewer as shown on the plans. The cost for doing this shall be included in the unit price bid for this item.

**PK-ESCR 404.5.** **MEASUREMENT AND PAYMENT:** The quantity of **DUCTILE IRON SEWER PIPE** to be paid for under this item shall be the number of **LINEAR FEET** (laying length) of each size pipe, including fittings, furnished, placed and measured in its final position, in accordance with the plans and specifications and the directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length of Ductile Iron Sewer Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary to complete the work, including delivering, handling and laying of pipe, connection and fittings, backfilling with clean fill, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation, Concrete and Broken Stone shall be paid separate for under their respective items.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 404</b>	<b>DUCTILE IRON SEWER PIPE – 24” DIA.</b>	<b>L.F.</b>

**END OF SECTION**

## SECTION PK-ESCR 405 - PRECAST CONCRETE DRYWELL

**PK-ESCR 405.1**     **WORK:** Under this Item, the Contractor shall furnish and install precast concrete drywell of the sizes and at the locations shown, in accordance with the plans, or as directed by the Engineer.

**PK-ESCR 405.2**     **MATERIALS:** Precast Concrete Drywell shall be in accordance with ASTM C913 — "Standard Specification for Precast Concrete Water and Wastewater Structures".

Covers: Concrete cover shall be 2' - 6" diameter with a min. of P earth cover.

Broken Stone No. 3 or No. 4: Broken stone shall consist solely of crushed ledge rock. Stone shall be No. 3 or No. 4 size.

Geotextile-Drainage: Geotextiles used in drainage applications shall be Class 2 and shall conform to AASHTO-M-288 properties for drainage geotextiles.

PVC Pipe: The PVC piping is to be twenty four inches (24") in diameter, and shall meet the requirements of ASTM D1785 "Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120", with one inch (1") holes drilled four inches (4") on center.

**PK-ESCR 405.3**     **INSTALLATION:** The Precast Concrete Drywell shall be installed as shown on the details located in Appendix A of the contract drawings "Standard Detail Sheet Stormwater Management Details No. 8."

**PK-ESCR 405.4**     **INCIDENTAL WORK:** The Contractor shall furnish materials for all incidental work to complete the structures, including the work of providing openings for connecting piping, drilling, and setting the twenty four inch (24") PVC pipe, installation of the No.3 or No.4 Broken Stone. No additional payment will be allowed for any incidental work.

**PK-ESCR 405.5**     **SUBMITTALS:** The Contractor shall submit the following for review and approval prior to manufacture:

SHOP DRAWINGS: The Contractor shall submit Shop Drawings showing layout and construction details for top slab, frames & covers, circular footings, stormwater drainage ring, and joints. No work or ordering of materials shall commence until receipt of approval by the Engineer.

**PK-ESCR 405.6**     **MEASUREMENT AND PAYMENT:** For each precast concrete drywell furnished and installed in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Precast Concrete Dry Well and shall include the cost of all labor, materials, and equipment, including concrete, PVC pipe, No.3 or No.4 broken stone, concrete cover, shipping charges, dewatering, and incidentals, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Item No.	Item	Pay Unit
PK-ESCR 405	PRECAST CONCRETE DRYWELL	EA

END OF SECTION

## **SECTION PK-ESCR 450 – IP PTZ HDTV DOME CAMERA AND MOUNTING ASSEMBLY**

### **GENERAL:**

Under this item, the contractor must furnish and install new IP PTZ HDTV Dome cameras with matching IP Camera Dome mounts, in accordance with the Contract Documents and the requirements of New York City Department of Transportation (NYCDOT) Signals.

The work must include, but is not limited to furnishing, installation and acceptance testing of active equipment, mounting bases, arms, cables, terminations and final connections on line and load sides of existing ITS installations.

Install all newly supplied equipment, as specified under this contract and coordination with any incidental equipment as supplied by others.

All work must be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

### **DESCRIPTION:**

This work must consist of furnishing and installing IP PTZ HDTV Dome Camera Assemblies and mounts of the type described in this specification, in accordance with the contract documents and as directed by the Engineer.

### **MATERIALS:**

To ensure compatibility and interchangeability with equipment furnished under previous projects, the IP Camera assembly must support the NTCIP 1205 protocol from the manufacturer with no additional software development or external translation devices.

The IP Camera manufacturer must provide documentation verifying NTCIP 1205 compliance for at least 1 year in their product line. The IP Camera Assembly must be compliant with the latest version of the NTCIP Standards, as defined by AASHTO, ITE, and NEMA.

General requirements for material, construction, installation, testing, and documentation are presented in this specification. Where material or construction requirements presented in this specification conflict with the proposed model, the manufacturer and installer must provide written documentation describing the conflict and the manufacturer's plan for meeting the requirements of this specification. All materials furnished, assembled, fabricated or installed must be new, corrosion resistant and in strict accordance with the details shown in the contract documents and this specification. Each IP PTZ HDTV Dome Camera Assembly must deliver high quality full-motion video during day or night operation with the video and control/status data transmitted over the NYC DOT communications network (specified elsewhere).

Each IP PTZ HDTV Camera Assembly must consist of a solid-state color/monochrome IP camera with infra-red cut filter, motorized zoom lens, pressurized enclosure, pan/tilt/zoom unit, integral camera control receiver, and all cabling required to interface the IP PTZ HDTV Dome Camera Assembly with associated equipment in the ITS field cabinet.

The IP PTZ HDTV Camera Assembly must be designed for mounting on poles or pendant attached to Overhead structures as shown in the plans. Connections between the equipment must be through water proof connectors.

Repair, replacement, and parts service for the IP Camera Assembly must be available within the contiguous United States or Canada.

Each IP PTZ HDTV Camera Assembly Outdoor Dome mount camera must meet the following minimum requirements:

CAMERA HOUSING:

Weight	10.5 Lbs.
Dimensions	8.2 x 10.6 inches
Operating Temperature	-58 F to +122 F Absolute Limit +165 F per NEMA TS2 60 watts
Humidity	10 – 100% RH (condensing)
Wind Survivability	Meet all performance criteria when subjected to a 90 mph Wind, Able to withstand a 125 mph wind gust
Electrical Supply	(a.) 120 VAC ± 10% at 60 Hz. For VoIP units operating at 24 VAC, a 115/24, VAC mid span transformer must be located within the ITS equipment cabinet which is provided under other pay items in this contract.
Electrical POE++	24 VAC / 48 VAC (4 wire).
Electrical Requirements	115 VAC., 66 Watts max. typical 14 W to 51 Watts
Electrical Rating Dome Casing	NEMA 4x IP67
Electrical Interfaces	(a.) Power and control cables between the IP Camera Assembly and the associated field cabinet must be in accordance with the manufacturer's technical support recommendations.  Shop drawings showing the configuration of the harness along with the manufacturer's recommendations must be submitted to the Engineer for approval prior to fabrication.  (b.) Weatherproof Cat 6 Ethernet cable must be used to connect the camera to the field IP communications interface.  (c.) Control signals between the camera assembly and a TMC controlling device must be via the NTCIP 1205 protocol  (d.) Electrical connections between the positioning device and camera/lens must be through a pre-wired feed rather than through a wiring harness.
Electrical Connectors	RJ-45 10Base T/ 100Base-TX PoE Weather Proof Push-Pull connector (IP67) included
Enclosure Casing	Enclosure Material Main body must be painted, or powder coated anodized aluminum
Enclosure Dome	PC (polycarbonate) ¼ inch thick optically clear dome

	Smoked dome enclosure (optional)
Hardware	304/316 Stainless Hardware only on exposed surfaces
Camera Model	Q6075-E
Camera Mount Pole Box & Bracket	T91B57 T91B61
Camera Mount Vert. Pendant	T91B63

CAMERAS:

Image Sensor	CMOS ½.8" Progressive scan
Lens	4.25 – 170 mm Aperture: F 1.6-4.95 FOV: 65.1° - 2.00° Horizontal FOV: 39.1° - 1.18° Vertical Auto Focus Auto Iris
Minimum Illumination	Color: 0.1 lux @ 30 IRE, F1.6 B/W: 0.002 lux @ 30 IRE, F1.6 Color: 0.15 lux @ 50 IRE, F1.6 B/W: 0.003 lux @ 50 IRE, F1.6
Resolution	HDTV 1080p 1920 x 1080 To 320 x 120
Format Day/Night	Automatic, removable Infrared cut filter
Pan Tilt Zoom (PTZ)	Pan: 360° Endless, 0.005° - 450° /s Tilt: 220°, 0.05° - 450° /s Zoom: 40x Optical, 12x Digital, 480x Total Zoom E Flip 256 Zoom Presets On Screen Direction indication Adjustable zoom speed Focus recall
Imager Settings	Manual Shutter time Compression Brightness Sharpness White Balance Compensation Backlight Compensation Automatic defog Wide Dynamic Range
Video	Multiple, individually configurable streams H.264 H.265 JPEG – Motion

	Controllable Frame Rate & bandwidth Max Frame Rate: 60 fps @ 60 Hz in HDTV (1080p)
Digital Storage	Support for: SD/SDHC/SDXC cards Support for record to NAS Storage

**IP VIDEO:**

IP Format	802.3u, 100 Base-T, MDI-X auto-sensing, full duplex.
Network Protocol	TCP, UDP, IPv4, IGMP, ICMP, DNS, DHCP, RTP, RTSP, SNMP, RTCP, NTP, HTTP, SOAP, HTTPS, ARP,
	FTP, SMTP, Telnet, ONVIF, Profile S, NTCIP 1205.
Media Players	VLC, Quick Time, or any media player compliant with RFC 2326, 3984, 3550, 2435. ISO/IEC 13818-1.
Security - 4 Levels:	Admin, Open User, Anonymous [User Name + Password], Digest Authentication
Updates	File upload over network using camera web server interface
Video Streams	Dependent on processing budget – 5 or more.
Video Codec	H.264 Base, Main and High Profiles, MJPEG.
Video Protocols	RTSP/RTP, RTSP Interleave, HTTP Tunneling, RTP Multicast
Video Resolution	1080p, 720p, D1, CIF, OCIF
Video Data Rate	256 KBps to 8 Mbs
Video Rate Control	Variable or Constant Bit Rate.
Video GOV	1 to 600, 30 default.
Video Latency	Four frames (0.133 sec).
Video Transmission	99.999% error free.

**NTCIP:**

To ensure compatibility and interchangeability with equipment furnished in previous and future contracts, the IP Camera Assemblies must be compliant with the latest version of the NTCIP Standards, as defined by AASHTO, ITE, and NEMA.

**Surge Protection:**

Surge protection devices (SPD) must be provided, installed within the ITS equipment cabinet for each IP PTZ HDTV Dome camera.

Provide 35 mm DIN SST Rail mount

SPD Model: BSPD48RJ45, UL 497B listed, IP10, Cat 6, RJ-45  
as Manufactured by: Cooper Bussmann Corp.

SPD must be CAT 6 PoE+, RJ-45 jack connected.

Surge Ratings: C2 Nominal discharge current (8/20µs) line PG (I<sub>n</sub>) = 2.5 kA

**IP PTZ DOME CAMERA MANUFACTURERS:**

The IP PTZ HDTV Dome Camera equipment must be completely integrated with and compatible with the existing NYS / NYC Department of Transportation Regional Traffic Monitoring Center (RTMC) equipment including the DOT existing ITS communications and infrastructure.

NYC DOT RTMC & DOT-Signals approved IP PTZ HDTV Dome Camera equipment system manufacturer / integrators must be:

AXIS Communications, Inc.

Mid-Atlantic Regional Office and Axis Experience Center  
1001 19th Street N. Suite 1400.  
Arlington, VA, 22209  
1-800-444-2947

No alternates will be approved.

**CONSTRUCTION DETAILS:**

The Contractor must install and program the specified IP Camera field equipment at locations shown on the plans. Each camera assembly must be installed such that the line of sight of the camera is in the center line of the desired field of view (FOV), when the camera is in the midpoint of the desired motion, between the limit stops.

Each IP PTZ Dome Camera assembly must be installed such that the home position for each camera must be set to true North.

The Engineer will provide the field of view of each camera, the limit settings of its vertical and horizontal movements and the programmable parameters for the Contractor's placement on a drawn to scale site plan of each IP PTZ Dome camera site location. The Contractor's intended FOV, Camera mounting and 2D aiming plans must be reviewed and confirmed with the Engineer and the NYCDOT, prior to installation.

The Contractor must furnish and install the mounting hardware, including brackets, mounting plates, bolts, safety lanyards, connectors, cabling between the camera housing and ITS equipment cabinet(s), and weather heads required for the installation of the camera, cable, mount assembly.

The Contractor must connect and test the control, power and video cables between the camera assembly and the ITS equipment cabinet in accordance with the manufacturer's recommendations.

The Contractor must electrically bond the camera assembly and the pole mounted adapter to the pole or sign structure. The camera assembly must be connected to the pole mounting adapter through a No. 6 AWG braided grounding conductor.

The SPD (surge protectors) must be individually grounded in accordance with the manufacturer's recommendations using 35 mm SST DIN rail bonded to an identified copper ground bus bar supplied in the ITS cabinet.

The Ethernet data output from the IP PTZ HDTV Dome Cameras must be each connected to the Ethernet Switch, furnished as part of the ITS Signal cabinet item.

**WARRANTIES AND GUARANTEES:**

The Contractor must provide warranties and guarantees in accordance with the Standard Specifications for the project. The IP PTZ HDTV Dome cameras must be furnished with a separate Manufacturer's Three (3) year warranty, effective the date of Acceptance of the Camera installation by the Engineer. The Contractor must provide information on the Manufacturer's Warranty coverage for each IP Dome Camera at the project closeout.

**Cable Tags:**

Furnish and install approved 2" wide, 304 stainless steel, engraved cable tags with the conductor/cable identification data permanently engraved thereon, so that all cables may be traced from enclosure to enclosure. Install a tag on each cable end within 12 inches on all sides

of every enclosure. Tags must machine engraved, equal to Panduit Type PLM markers.

304 SST engraved permanent tags must be attached to each camera cable end using (2) SST cable ties to fasten the tags to the cable. The Contractor must submit a label nameplate (NP) sample, proposed engraving text and cable identification schedule with identification procedure, to the Engineer for approval prior to installation of any camera cables. Each cable tag must be uniquely identified as to NYCDOT Video / Camera channel ID and unique cable identification.

**SUBMITTAL REQUIREMENTS:**

The Contractor must prepare and submit for review, within 120 working days after the Notice to Proceed, the following submittals, including, but not limited to:

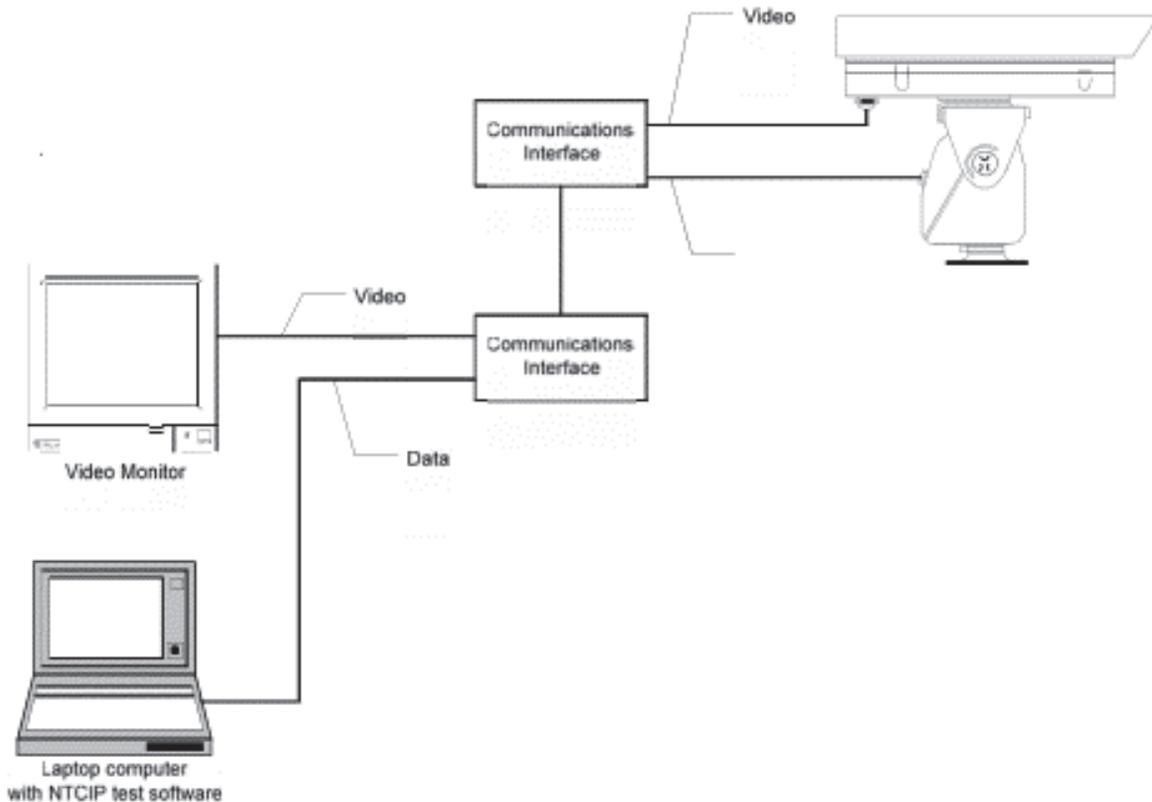

1. Provide complete Bill of Material (BOM) including technical data-catalog information, Manufacturers and part number information for all equipment and components is to be supplied under this contract.
2. Provide a schedule of all hardware, control and communications devices which must list each device by its designation tag, as shown on the schematic wiring diagrams and schedule must state for each device; its function, ratings, catalog number, and installation locations. Show intended and As Built IP addresses for each Static IP device. IP addresses required must match and integrate with the NYCDOT TMC IP Schema.
3. Provide a complete block diagram showing all high-level network and communication components and their interconnections.
4. Provide IP PTZ Camera System-Input / Output (I/O) wiring diagrams and schematics.
5. Provide complete schematics and Inter-Connection Wiring Diagrams (IWD) for all hardware, control & communications equipment and other related devices, furnished under this contract.
6. Detailed drawings showing the construction of ITS cabinets, panel equipment locations, active equipment, patch panels, wiring diagrams, conduit entries, brackets, racks, fans, thermostat, ground equipment, rack mounts, power devices, etc.
7. Provide Point to point wiring diagrams showing all wiring and conduits entering and exiting all contract equipment. Include wiring and inter-connections to other field devices supplied by the contractor or by others. Wiring diagrams must include wire sizes (AWG), insulation systems and type.
8. All layout and shop drawings must be drawn in AutoCAD format, in accordance with the General Requirements of the project. Drawings must be drawn to scale, shown on both plan and section views (2D). Plans and shop drawings must include details, where required to show the intended installation information.
9. Detailed commissioning and test plan submissions must be provided; FOV, Camera Mount and Aiming angles, functional performance tests, site pre-functional acceptance tests (PFAT) and Site Acceptance Tests, include test plans for: NTCIP, Standalone SAT, Group SAT, IST, sub-system and integrated interoperability testing (IST).

**QUALITY CONTROL / QUALITY ASSURANCE (QA/QC):**

Testing Requirements:  
On Site Compliance Testing (NTCIP)

The purpose of these tests is to verify the operation of each IP PTZ HDTV Dome Camera Assembly, using the NTCIP specific communications protocols.

- (a.) The contractor must prepare a test script that must be provided to the Engineer for review, as part of the above project submittal requirements. The NTCIP tests must demonstrate all required functionality of the IP PTZ Dome camera assembly and demonstrate that the appropriate requests and responses are transmitted and received by the IP Camera Assemblies and the NYCDOT's camera control software.
- (b.) Where a range of acceptable values is specified in the NTCIP conformance tables annexed to the project documents, the Contractor must submit the actual values for each test criteria for review, as part of the test plan submittal requirements.
- (c.) Failure to satisfactorily complete these compliance tests, configured for the actual cameras, feature sets and this project must be cause for immediate rejection of the proposed IP PTZ Camera equipment.

**Figure 1-1 Test Environment for ip Camera Assembly**

### On Site Testing – IP PTZ HDTV Dome Camera Operations Tests - Stand Alone

The purpose of this test is to verify the operation of all installed equipment between the ITS equipment cabinet and the end Camera devices, including all electrical, grounds, and IP data connections.

(a.) Pre-requisites for the IP PTZ HDTV Dome Camera Stand Alone Operations test are as follows:

- Satisfactory completion of NTCIP compliance testing;
- Satisfactory completion of sub-system specific staging tests, with complete resolution of any issues documented during these tests;
- Permanent installation of all IP PTZ Dome Camera equipment into the ITS cabinet for each site under test.
- Permanent connection of electrical power to the local ITS equipment cabinet for each site under test. Portable generator supplied electric power must not be acceptable.

(b.) This test must demonstrate the following:

Local control of all camera and pan-tilt-zoom unit functions;

IP Video output from the IP Camera

Operation of the local camera using manufacturer's control software or hand held PZ camera controller

The Contractor must test each IP PTZ Dome Camera and all interconnections to ensure that the Cameras and data cables have not been damaged during installation.

### On Site Testing – IP Dome Camera Operation - Group Site Acceptance Tests (SAT):

The purpose of this test is to verify the operation of all installed equipment from an aggregation point, e.g. an ITS hub cabinet, to each end device, including related equipment installed in local ITS equipment cabinets.

(a.) Pre-requisites for the IP PTZ Dome Camera Operation Group Tests are as follows:

- Satisfactory completion of the operational stand-alone test for each end device connected to the aggregation point, with complete resolution of any issues documented during these tests;
- Permanent installation of all equipment into the ITS equipment cabinets, ready on all aspects for the aggregation of each site under test;
- Permanent connection to the DOT ITS communications network at each end device and at the aggregation locations, including all test documentation required for acceptance of the installed IP Camera network;
- Permanent connection of electrical power to the ITS equipment cabinets for the aggregation site under test.

(b.) The Camera Operation Group Acceptance Tests must demonstrate the following:

- Operation of the IP communications network and any required modems, protocol converters, multiplexers, switches or any other communications interface between end devices and the aggregation point(s);
- Remote control of each IP camera and pan-tilt-zoom unit functions at each IP Camera, operated over the installed IP communications network;
- Satisfactory video output from each IP Camera operating over the installed ITS communications network;

- Operation of each IP camera using camera manufacturer's control software or a compatible video / PTZ controller, operated over the installed IP communications network.

#### IP PTZ HDTV Dome Camera Sub-System - Integration Tests (IST):

The purpose of these tests are to verify the operation of all installed IP Video equipment between the Joint Traffic Management Center (JTMC) facility and IP PTZ HDTV Dome Camera systems deployed in the field, including all existing & operational DOT equipment installed in intermediate locations and in local ITS equipment cabinets.

(a.) Pre-requisites for this test are as follows:

- Satisfactory completion of the group site acceptance test for each aggregation point, with complete resolution of any issues identified or documented during these tests;
- Permanent installation and programming of all IP PTZ Dome Camera sub-system equipment, furnished by the NYCDOT into the JTMC facility under test;
- Permanent connection to the ITS communications network at the JTMC facility, any aggregation points, and each ITS end device;
- All test documentation required for acceptance of the installed network;
- Permanent connections of electrical power to the equipment under test;

#### IP PTZ HDTV Dome Camera Integration (IST) tests must demonstrate the following:

- Operation of the ITS communications network and any required modems, protocol converters, multiplexers, switches or any other communications interfaces between IP Dome Camera end devices and the JTMC facility.
- Remote control of all camera and pan-tilt unit functions at each
- IP Cameras, operated and controlled over the installed ITS communications network;
- Video output from the IP PTZ Dome Cameras, over the installed ITS communications network;
- RTMC End to End Operation of the IP Camera control software or controller over the installed NYCDOT fiber communications network.

#### System Acceptance Tests – Final:

The purpose of this test is to ensure interoperability of all sub-systems from central to the end device, including all parts in between; detailed requirements for the system acceptance test may be provided in the Special Notes.

At the completion and acceptance of these tests, the NYC Department of Transportation must have beneficial use of the IP PTZ Dome Camera equipment, the IP PTZ Dome Camera system will begin the operational use, acceptance and warranty periods.

#### **MEASUREMENT & PAYMENT:**

##### METHOD OF MEASUREMENT:

This work will be measured as the number of IP PTZ HDTV Dome Camera Assemblies satisfactorily furnished, installed, tested, and made fully operational in accordance with the plans, specifications and directions of the Engineer and the NYCDOT.

The unit price bid must include the cost of furnishing all labor, materials, testing and equipment necessary to satisfactorily complete the work.

##### BASIS OF PAYMENT

The Unit price bid must also include the cost of all required labor, materials, equipment, commissioning and testing and incidental expenses required to furnish, install, integrate, align and demonstrate each IP PTZ HDTV Dome Camera System.

Payment for the ITS Signal cabinets, conduit, data and power wiring must be included under separate contract items.

Payment will be as follows for each IP PTZ HDTV Dome Camera System:

1. Twenty – Five percent (25%) of the bid price for each IP PTZ HDTV Dome Camera System will be paid when the Contractor certifies the equipment is ready for delivery and installation at the Project. (After Submissions, Shop Drawings, Test Plans, Equipment Delivery)
2. Twenty – Five percent (25%) of the bid price for each IP PTZ HDTV Dome Camera System will be paid when the IP Dome Camera equipment has been installed and approved at the Project site. (After equipment installation and wiring within the ITS signal cabinets and on the sign/pole structures, including NTCIP and Camera Operations- Stand Alone tests).
3. Twenty – Five percent (25%) of the bid price for each IP PTZ HDTV Dome Camera System will be paid when the IP PTZ Dome Camera equipment has been approved at the completion of Group Camera Acceptance Testing (SAT) And the IP PTZ HDTV Dome Camera Integrated Systems Testing (IST) are accepted by the NYCDOT. Fifteen percent (15%) of the bid price for each IP PTZ HDTV Dome Camera System will be paid when the IP PTZ HDTV Dome Camera equipment has been approved at the completion of Final System Acceptance testing
4. Ten percent (10%) of the bid price for will be paid when the contractor submits Record Drawings, Maintenance & Operations Manuals, Provides training on the IP PTZ Dome Camera operations to the NYCDOT and once the NYCDOT has beneficial use of the IP PTZ Dome Camera equipment (each system begins the operational use, acceptance, guarantee and warranty period).

**SECTION PK-ESCR 456 – VEHICLE TRANSMIT TAG ANTENNA OSS-8S FDR SOUTH**

**GENERAL:**

Under this item, the contractor shall furnish and install new RFID based TRANSMIT Tag Readers and TRANSMIT RFID Antennas in accordance with these Contract Documents and the requirements of the NYCDOT Traffic Management Center (TMC).

The work shall include, but is not limited to furnishing, installation and acceptance testing of active equipment, antennas, cables, conduit and boxes including cleaning of the conduits, splices, terminations and final connections on line and load sides of existing ITS installations,

Install all newly supplied equipment, as specified under this contract and coordination with incidental equipment as supplied by others.

All work shall be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

**MATERIALS:**

**TRANSMIT TAG READER SYSTEM**

Under this item the Contractor shall furnish TRANSMIT Tag Readers (Multiprotocol RFID field processors) and TRANSMIT Antennas with associated power supplies, software, mounts, miscellaneous coaxial RF cables, Surge Protectors along with mounting antenna mounting hardware and incidentals required at each RFID location, as indicated in the Contract drawings.

Equipment cabinets, mounting pads for the TRANSMIT Tag Reader enclosures, ITS communications equipment, and data communications cables will be furnished and installed under other related ITS contract payment items for this contract.

NYC DOT RTMC TRANSMIT RFID Central Traffic Management and Server Equipment will be provided by the City.

To assure compatibility with the existing TRANSMIT RFID system; the equipment shall be as follows:

## TRANSMIT Tag Readers

The RFID TRANSMIT Tag Readers shall meet the following requirements:

Protocol:	For interrogation of RFID tags - Interagency Group (IAG). The Engineer will furnish FHWA standards-based protocols for communication between the RTMC Operations Center and the TRANSMIT tag readers.
Reading Speed:	Up to eight (8) lanes of traffic with vehicles traveling at 100 mph.
Data Interface:	Ethernet (TCP/IP)
FCC Licensing:	Contractor (integrator) shall be responsible for obtaining and paying for all licenses required to test and operate the TRANSMIT system, license by the Federal Communications Commission (FCC)., The FCC license shall be in the name of: New York State Department of Transportation or the New York City Department of Transportation (DOT). FCC Part 15 Class A License holder is required to test. Use FCC Form 601 to apply. FCC License application takes 4-6 months to process, coordinate submission with existing NYS/NYC FCC applications. System operates @ 902-928 MHz band, RF Output is > 3 milliwatt Refer to FCC Section 90.351 for permitted uses.
Distance from Antenna:	RFID Reader System shall operate reliably up to 300 ft. from the TRANSMIT Antenna
Electrical Requirements:	115 VAC, 265 Watt
RF Modules:	Provide One (1) RF transceiver module for each TRANSMIT antenna panel specified in the Contract Documents. The Modules shall be compatible with the TRANSMIT Antennas, as installed. Provide SMA x N(F) whip RF cables for connection to protected side of each SPD. Provide One (1) spare RF module, ship loose for NYC DOT Spare use.
Mechanical Requirements:	<ul style="list-style-type: none"> <li>• Configured for mounting within NEMA 3R ITS Cabinet with EIA-19" rack chassis, See ITS Cabinet specification.</li> <li>• Maximum dimensions: 21 in (H) x 19 in (W) x 13 in (D)</li> <li>• Blank plates shall cover unused RF module slots</li> <li>• Rack Mount Power Supply</li> </ul>
Environmental Requirements:	<ul style="list-style-type: none"> <li>• Operating Temperature: -30°F to +165°F</li> <li>• Humidity: 5% to 95%, non-condensing</li> <li>• Meets NEMA TS-1 with enclosure cooling fan</li> </ul>
Multi-Protocol Compatibility	<ul style="list-style-type: none"> <li>• TDM – EZ-Pass Consortium</li> <li>• ISO 18000-62 (6B)</li> <li>• ISO 18000-63 (6C)</li> <li>• ATA ISO 10374</li> </ul>
Reader Model	JANUS® Multiprotocol Reader II (MPR 2.3)

TRANSMIT Tag Antenna

The TRANSMIT Tag Antenna shall adjustable and suitable for overhead structural mounting and shall meet the following requirements:

Electrical - RF	<ul style="list-style-type: none"> <li>• Frequency Range: 902 MHz to 930 Mhz.</li> <li>• Gain: 9.5 ±1 dB.</li> <li>• VSWR: 1.3:1 maximum from 902-928 MHz.</li> <li>• Impedance: 50 ohms.</li> <li>• Beam width - horizontal: 60±5degrees.</li> <li>• Beam width - vertical: 40±5 degrees.</li> <li>• Polarization: horizontal.</li> <li>• Cross polarization: less than 15 dB.</li> <li>• Side Lobe Suppression: less than 17 dB</li> </ul>
Mechanical	<ul style="list-style-type: none"> <li>• Dimensions: 17.25" (H) x 11" (W) x 2" (D) maximum.</li> <li>• Weight: 6 lbs. maximum.</li> <li>• Rated Wind Velocity: 125 mph.</li> <li>• Moment at 100 mph: 3.5 lbf (compliance depends on mounting structure).</li> <li>• Reflector Material: Aluminum.</li> </ul>
Antenna Connector:	Type N (F) coaxial connectors shall be used to attach the RF coaxial cable to the antenna
Antenna Mounts:	Astro-Brac Articulated SST Band Mount # AS-3029-29-SS-PNC
Antenna Type	Parabolic Directional, 2 Patch, Vertical Orientation
Antenna Coverage	60° Horizontal 40° Vertical 05° Tilt Angle
Gain	10 dB
Antenna Model	Kapsch EZ-Pass 800260-010 Adjustable mount

TRANSMIT Tag Antenna - coaxial cable

TRANSMIT Tag Antenna item appropriate coaxial cables shall be furnished and installed to connect each RFID lane antenna to the TRANSIT Tag Reader RF modules, located in the ITS signal enclosure. The coax cable shall meet the following general requirements:

RF Coax Connector TRANSIT Antenna End	RG-8 Type N (M) Connector. Matched to Antenna Connector
RF Coax Connector TRANSIT RF Module End	Type N (M) Connector, silver plated body, plated pin, Matched to SPD connector type
Coax Cable Characteristic impedance:	50 ohms
Coaxial Cable Type	Outdoor, Watertight, Flexible Low Loss Communications Coax, RG-8 Type: LMR-400-DB Times Microwave Systems or Engineer approved equivalent

**Surge Protectors:**

Surge protection devices (SPD) shall be provided in the TRANSMIT equipment cabinet for each TRANSMIT antenna.

SPD Model: Provide Waterproof (IP 67 rated), bulkhead mount, SPD, model DSXL-NS with model BFN ground angle mount, as manufactured by PolyPhaser Corp, or approved equal.

The surge protectors shall be in accordance with the TRANSMIT Tag Reader RF Module manufacturer's recommendations.

SPD shall be coaxial connected, N/SMA on protected side, N(F) connected on antenna side.

Ratings: 700 MHz to 2.7 GHz, 300-Watt RMS, 18 kA rated.

**Manufacturers:**

The RFID TRANSMIT reader equipment must be completely integrated with and compatible with the existing NYS / NYC Department of Transportation Regional Traffic Monitoring Center equipment, ITS communications and infrastructure.

Approved Transit Tag system manufacturer/ integrators must be:

Kapsch TrafficCom North America  
8201 Greensboro Drive  
McLean VA 22101  
1-845-220-7802

Or

Transcore.Com  
150 4th Avenue North, Suite 1200  
Nashville, TN 37219,  
1-615-988-8960

No alternates will be approved.

**CONSTRUCTION DETAILS:**

The Contractor shall install the TRANSMIT Tag Reader rack into the ITS cabinet and as designated in the Contract Documents. ITS Equipment Cabinet mounting shall be as shown in the Contract Documents.

The Contractor shall connect the TRANSMIT Tag Reader RF modules to the TRANSMIT antenna lead-in coaxial cables via the individual surge protector devices (SPDs) and connect the TRANSMIT Tag Reader rack Power Supply to the 120 VAC power bus in the ITS cabinet. The surge protectors shall be individually grounded in accordance with the manufacturer's recommendations to an identified copper ground bus bar supplied in the ITS cabinet.

The Ethernet output from the TRANSMIT Tag Readers shall be connected to the ethernet switch, furnished as part of the ITS Signal cabinet item.

The TRANSMIT RF Antenna coaxial cables shall be continuous from TRANSMIT antenna up to the surge protectors (SPD), located in the ITS Cabinet, without any intermediate splices or connectors.

RF coaxial cable slack of 12" shall be left at the TRANSIT antenna location and slack of 12" shall also be left at the ITS cabinet, for each coaxial cable.

### **CABLE TAGS:**

Furnish and install approved 2" wide, 304 stainless steel, engraved cable tags with the conductor/cable identification data permanently engraved thereon, so that all cables may be traced from enclosure to enclosure. Install a tag on each end within 12 inches on all sides of every enclosure. Tags shall be machine engraved, equal to Panduit type PLM markers.

304 SST engraved permanent tags shall be attached to each coaxial cable end using (2) SST cable ties to fasten the tags to the cable. The Contractor must submit a label nameplate (NP) sample, proposed engraving text and cable identification schedule with identification procedure, to the Engineer for approval prior to installation of any coaxial cables, TRANSMIT Antenna or TRANSMIT RF reader modules. Each cable tag shall be uniquely identified as to antenna / RF channel and unique cable identification.

### **SUBMITTAL REQUIREMENTS:**

The Contractor shall prepare and submit for review, within 120 working days after the Notice to Proceed, the following submittals, including, but not limited to:

1. Provide complete Bill of Material (BOM) including technical data-catalog information, Manufacturers and part number information for all equipment and components is to be supplied under this contract.
2. Provide a schedule of all hardware, radio, control and communications devices which must list each device by its designation tag, as shown on the schematic wiring diagrams and schedule must state for each device; its function, ratings, catalog number, and installation locations.
3. A complete block diagram showing all high-level network and communication components and their interconnections.
4. Reader System-Input / Output (I/O) wiring diagrams and schematics.
5. Complete schematics and Inter Connection Wiring Diagrams (IWD) for all hardware, control & communications equipment and other related devices, furnished under this contract.
6. Detailed drawings showing the construction of ITS cabinets, panel equipment locations, wiring diagrams, conduit entries, brackets, racks, fans, thermostat, etc.
7. Point to point wiring diagrams showing all wiring and conduits entering and exiting all contract equipment. Include wiring and inter-connections to other field devices supplied by the contractor or by others. Wiring diagrams shall include wire sizes (AWG), insulation systems and type.
8. Provide complete descriptions, frequencies, output and operational data for all RF and communications equipment.
9. Provide submissions for FAT and SAT testing plans.
10. Provide a sample of the FCC Radio operating license application for review.

### **QUALITY CONTROL / QUALITY ASSURANCE (QA/QC):**

All apparatus, components and equipment comprising the RFID TRANSMIT vehicle reader system, including, but not limited to, NEMA 3R traffic enclosure-pole mount, TRANSMIT reader rack mount chassis, TRANSMIT reader RF modules, TRANSMIT reader rack backplane with power supplies, RF coax cables, connectors, surge protective devices, TRANSMIT parabolic

antennas, antenna adjustable mounts, etc. must be manufactured, configured, assembled and acceptance tested by a single, NYC DOT qualified system integrator.

The vehicle reader system integrator must assume complete system responsibility for the pre-fabrication layout, programming, assembly, acceptance testing and integrated system functioning of all components. The assembled systems must provide satisfactory performance in local operation and must then be carefully integrated into the existing Regional Traffic Monitoring Center (RTMC) operations.

The vehicle reader system integrator must be responsible to survey the intended antenna placements, aiming angles and provide detailed layout and coverage schematics for the TRANSMIT RF readers and TRANSMIT antenna mounting systems.

The system manufacturer shall submit an acceptable plan for source/fabrication quality control, along with a written plan of software, programming, testing and acceptances.

### **Testing Requirements:**

#### **Factory Acceptance Tests (FAT)**

The vehicle tag reader system integrator must submit a plan of Factory Acceptance Testing (FAT) to be conducted at the manufacturer's facility, located within the contiguous United States. Qualified representatives of the manufacturer of the TRANSMIT RF equipment shall conduct full acceptance tests and operational demonstrations of each system, before the system is shipped to the site.

FAT tests shall demonstrate, to the satisfaction of the Engineer, that the reader equipment and transponder configuration is tested, acceptable and ready in all aspects. All components, interconnected devices, communication and control devices, etc. must be installed, programmed, connected and operate in accordance with the approved plans, specifications, layout shop drawings and approved schematics as part of the FAT acceptance of each system.

The FAT test shall be attended by the Manufacturer, the System Integrator and the installing Contractor. The Engineer may witness the FAT tests.

#### **Site Acceptance Tests (SAT)**

##### **Reader / Antenna**

The Contractor must test each reader / antenna and all interconnections to ensure that the readers, antenna and coaxial cables have not been damaged during installation.

Prior to connecting the readers antenna and coaxial cables, installed at each site, the Contractor shall conduct a Pre-Functional Acceptance Test (PFT) of each item separately.

The Contractor, in coordination with the reader antenna system integrator, must submit a detailed plan of Site Acceptance Testing (SAT) for approval.

The following on-site tests must be performed:

**Coaxial Cable – On Arrival.** each reel of RF coaxial cable must be carefully handled and inspected by the Contractor, on arrival to the site to ensure coax cable RF integrity and no physical damage.

- A DC resistance, a 500 vdc megger test and a TDR "sweep" test shall be performed, on each reel at arrival to the site.
- SWEEP TESTS: Each RF coaxial cable (on reel) must be frequency swept, from 850 to 950 Mhz.

- Submit a written record of each cable's on reel inspection and test results to the Engineer.

#### Prior To Install - TRANSMIT Antenna

- The Contractor must physically inspect each antenna for no physical damage.
- Perform a VSWR test on the antenna units, prior to mounting and measure the antenna's impedance.

#### After installation - TRANSMIT antenna and coaxial cables

The Contractor must perform a physical inspection of each item to verify that it has not been damaged during installation.

- Perform a TDR coax acceptance test, a DC resistance (ohm) test and DC megger test on each installed coaxial cable assembly and other tests as recommended by the cable / antenna manufacturer.
- Perform an impedance measurement on each antenna once installed in the field.
- Sweep tests - After connection of the RF coaxial cable to the TRANSMIT antenna and all connectors, the Contractor must conduct a calibrated frequency sweep (850 to 950 MHz performance) and TDR cable performance baseline tests from the ITS cabinet to each antenna location.
- Submit a written record of each coaxial cable and antenna in place test results to the Engineer. The RFID reader manufacturer must review and approve of all site testing and validations of the field work. Test records must be submitted at least (30) days prior to the date of first low power energization of the radio transponders.

#### Site Operational Tests (SOT)

The Contractor must perform complete Site Operational Tests – local, for each TRANSMIT site, after the antenna(s) have been connected and are acceptance tested back to the tag reader RF modules.

The Contractor must verify that vehicles with RFID tags are correctly interrogated by the tag readers.

Ninety-five percent (95%) of all tagged vehicles passing within each antenna's field must be correctly interrogated.

This Site Operational Test of each individual lane and the aggregated data output for each site, must be performed locally from the ITS reader cabinet.

After satisfactory testing of the Site Operational Tests - local, the Contractor must also remotely conduct a comprehensive end-to-end Site Acceptance and Connectivity Test (SAT) in cooperation with the RTMC operations center and the NYC DOT Signals Department.

All support personnel, test instruments and equipment necessary to perform the testing and site acceptances must be provided by the Contractor.

The integration of each TRANSMIT site into the RTMC TRANSMIT system software will be performed under other contract items or by others, as directed by the Regional TMC Director. The Contractor and the Equipment Manufacturer must provide on-site technical and operational support during the Site Acceptance Tests, including the Site Operational Tests – Remote. The TRANSMIT Tag reader manufacturer's service representative must directly supervise and attend the onsite testing and commissioning of each reader antenna system, in order to support the Contractor's start-up and to validate the operational readiness of the system.

The manufacturer shall provide the on-site supervision of each of the RF antenna and transmitter installations, using an FCC licensed radio operator to conduct pre-energization testing, antenna pattern alignments and full RF power testing, required for FCC license approval.

### **MEASUREMENT & PAYMENT:**

The Vehicle TRANSMIT Reader System work is to be paid for under each of the below listed payment items, which must be installed in accordance with the plans, specifications and directions of the Engineer.

### **BASIS OF PAYMENT**

The Lump Sum price bid shall include the cost of all required labor, materials, equipment, commissioning and testing and incidental expenses required to furnish, install, integrate, RF test, align and demonstrate the TRANSMIT Reader System.

Payment for the ITS Signal cabinets, conduit and power wiring shall be included under separate contract items.

Payment for the RF coaxial cables, antenna mounts and components used to connect the TRANSMIT antennas to the TRANSMIT RF tag readers will be included under TRANSMIT antenna item.

Payment will be as follows for the TRANSMIT Tag Readers

1. Twenty percent (20%) of the bid price for the TRANSMIT Tag Readers will be paid when the Manufacturer certifies the equipment is ready for delivery to the Project. (After Submissions, Fabrication, Programming and FAT Acceptances by the Engineer.)
2. Twenty percent (20%) of the bid price for the TRANSMIT Tag Readers will be paid when the equipment is installed and wired within the ITS signal cabinets on the sign structures.
3. Twenty percent (20%) of the bid price for the TRANSMIT Tag Readers will be paid when the equipment is energized and has been approved, after the Site Acceptance-Local operation test.
4. Twenty percent (20%) of the bid price for the TRANSMIT Tag Readers will be paid when the equipment is has been approved, after the Remote (end-to-end) Operations test.
5. Ten percent (10%) of the bid price for the TRANSMIT Tag Readers will be paid when the contractor submits Record Drawings, Maintenance & Operations Manuals and FCC Radio licenses.
6. Ten percent (10%) of the bid price for the TRANSMIT Tag Readers will be paid when the Engineer has accepted each site for Final System Acceptances.

Payment will be as follows for the TRANSMIT Antenna Systems:

1. Twenty percent (20%) of the bid price for the TRANSMIT Antenna will be paid when the Manufacturer certifies the Contractor's installation, Sweep and integrity testing of the RF Coaxial cables and Antennas.
2. Twenty percent (20%) of the bid price for the TRANSMIT Antenna will be paid when the Antenna Surge Protection and coax systems are installed within the ITS signal cabinets.
3. Twenty percent (20%) of the bid price for the TRANSMIT Antenna will be paid when the equipment is energized and has been approved, after the Site Acceptance-Local operation test. This includes the in-place Antenna alignment & Sweep tests.

4. Twenty percent (20%) of the bid price for the TRANSMIT Antenna will be paid when the equipment is energized and has been approved, after the Remote (end-to-end) Operations test.
5. Twenty percent (20%) of the bid price for the TRANSMIT Antenna will be paid when the Engineer has accepted each site for Final System Acceptances.

**END OF SECTION**

**SECTION PK-ESCR 461 – NEMA 3R ITS SIGNAL CABINETS, TYPE P44**  
**SECTION PK-ESCR 462 – NEMA 3R ITS SIGNAL CABINETS, TYPE 344**  
**SECTION PK-ESCR 463 – NEMA 3R ITS SIGNAL CABINETS, TYPE ATSC-12**  
**SECTION PK-ESCR 464 – NEMA 3R ITS SIGNAL CABINETS, TYPE ATSC-8**

**GENERAL:**

Under this item, the contractor must furnish and install new NEMA 3R SIGNAL CABINETS, in accordance with these Contract Documents, as shown in the plans, per the requirements of NYC DOT – Signals and as directed by the Engineer.

The signal cabinets must be NEMA 3R rated enclosures, which must house the ITS signal control equipment necessary to operate VMS sign controllers, TRANSMIT (RFID) Readers, CCTV, RTMS and ITS fiber equipment. The ITS signal control equipment must be provided under these contract items and other sections items in this specification.

The work must include, but is not limited to; furnishing, installation and acceptance testing of active equipment, mounting bases, rack mount Fiber Patch panels, rack mount CAT 6 Patch panels, wire management, labels, wire identification, nameplates, rack mounting hardware and all final connections on line and load sides of ITS cabinet installations.

Install all supplied equipment, as specified under this contract and coordination with any incidental equipment, as supplied by others.

All work must be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

**DESCRIPTION:**

This work must consist of furnishing, installing, testing and commissioning of NEMA 3R ITS SIGNAL CABINETS and cabinet mounts of the types described in this specification, in accordance with the contract documents and as directed by the Engineer.

**MATERIALS:**

All materials furnished, assembled, fabricated or installed must be new, corrosion resistant and in strict accordance with NY State, NEMA 3R and Underwriters Laboratories (U.L.) specifications. Each of the four (4) cabinet configurations covered by this specification, must be provided complete in all aspects with all the internal components and mounting hardware necessary to provide for the installation and operation of ITS signal's equipment, as noted in the plans and specifications.

General requirements for material, construction, installation, testing, and documentation are presented in this specification. Where material or construction requirements presented in this specification conflict with the proposed model, the manufacturer and installer must provide written documentation describing the conflict and the manufacturer's plan for meeting the requirements of this specification.

All materials furnished, assembled, fabricated or installed must be new, corrosion resistant and in strict accordance with the details shown in the contract documents and this specification. The exterior ITS signal cabinet housings must be fabricated from 1/8 inch minimum thickness, aluminum alloy sheet meeting the requirements in ASTM Specification No. 5052-H32. Each of the ITS signal cabinet tops must be provided with a 1-inch slope to prevent the accumulation of water on its top surface.

The exterior surfaces of each ITS signal cabinet must be factory powder coated, Color to match NYC DOT standard Federal Color Spec. 595B Color: 14062 Medium Green

### **Mechanical Requirements:**

#### **Door and Door Hardware:**

Each ITS signal cabinet must have a hinged main door which permits access to all equipment within the cabinet and visual inspection of all indications and controls. The main cabinet door must be double flanged on all four edges to increase strength around the openings and to keep dirt and liquids from entering the enclosure when the doors are open.

The cabinet doors must be constructed of 1/8 inch thick type 5052-H32 aluminum alloy to provide a strong rigid construction. All welds must be neatly formed and free of cracks, blowholes and other irregularities, and all inside and outside edges of the cabinet must be free of burrs.

The door hinges must be a one-piece, continuous piano hinge, with a stainless-steel hinge pin. The hinge must be located on the right side of the door when viewed from the front, unless otherwise indicated. The door hinge and pin must run the entire length of the door. The hinge pin must be capped at the top and bottom by a weld to render it tamper proof.

The doors must be furnished with a gasket that satisfies the physical properties as found in UL 508 table 21.1, including a weather tight seals between the cabinet and doors.

Each door must be equipped with a prop/catch mechanism to automatically hold the door open at least 125 degrees. Each ITS cabinet door must be furnished with Stainless Steel door handles, 3-point latch and fitted with padlock hasp feature.

All doors must be provided with a main cylinder door lock, Corbin No. 15481RS, or equivalent, constructed of stainless steel which must operate with a NYC DOT Signals industry conventional No. 2 key. A stainless-steel lock protector plate must be fitted over the rear of the main door lock cylinder.

The cylinder lock must engage a three-point, roller positive, locking system. The lock cylinder must be located so as not to interfere with movement of the door handle. Two No. 2 keys must be provided with each cabinet for use by NYC DOT Signals personnel.

#### **Gasketing:**

The housing must have a door, securely gasketed, which must include substantially the full area of the front of the cabinet. Gasketing must be provided on all door openings and must be of dust-tight permanent type that will not peel off or deteriorate. Door gaskets must be 1/4 inch minimum thickness, closed cell neoprene and must be installed with compatible contact cement for a permanent bond. The gasket mating surface must be sprayed or otherwise coated with a silicon lubricant to prevent sticking to the mating metal surface.

The gasket material must not be damaged by normal cabinet cleaning agents and solvents normally used to remove graffiti from the exterior of the cabinet.

#### **Gasket material must be UV resistant:**

The design of the door and gasket must be such that the integrity of the gasket material must not be required to ensure that the internal cabinet assemblies are protected from water damage under adverse environmental conditions. Cabinet door assemblies must be designed in such a way that damaged gaskets do not allow water to enter the Signal cabinet. Gasket material must be continuous along the entire top of the cabinet door with no seams or joints in this section.

The Contractor must submit interior layout and factory fabrication shop drawings for each type of ITS cabinet specified for review and approval by NYC DOT Signals personnel and the Engineer.

### Shelves:

All NEMA 3R ITS signal cabinets must be supplied with two removable shelves

One shelf of the ITS cabinet must have a rigid pull-out drawer with a lift open top. The pull-out drawer must be capable of supporting a complete set of cabinet wiring drawings, Fiber distribution diagrams, Interconnecting wiring diagrams (IWD), equipment manuals, and a portable laptop computer (laptop not provided as part of contract).

Signals cabinet 19-inch rack mount drawers must have roller drawer glides to allow for easy pulling out and returning to the closed position.

### Cabinet Mounting:

The NEMA 3R ITS cabinets will be oriented and mounted as shown in the submitted layout plans or as directed by the Engineer.

For pole-mounted cabinets, all the hardware and labor necessary to mount the ITS cabinet to the pole or sign structures must be provided under this contract item.

For base-mounted cabinets, all the hardware and labor necessary to mount the ITS cabinet base to the concrete footings, including matching frangible anchor bolts, must be provided under this contract item.

### Ventilation:

The NEMA 3R ITS cabinets must be equipped with suitable top and bottom Vent fans. The lower section of the cabinet door must be provided with a louvered air entrance, protected by washable, inlet air filters. Louvers must satisfy the NEMA rod entry test for 3R ventilated closures. Removable, inlet air filters must all be supplied with each cabinet for each of the louvered air entrances. The inlet filters must be securely attached to the louvered air inlet openings with Stainless Steel, adjustable slide retainers.

The cabinet exhaust area must be screened with a durable material having a maximum hole diameter of  $\frac{1}{8}$  inch. Each ITS cabinet will have an active ventilation system that is thermostatically controlled by fans. Cabinets must contain a 200 cubic feet per minute long life exhaust fan, with adjustable thermostatic control.

The lower portion of the front door must have a louver area of sufficient size to permit the free flow of air corresponding to the rated capacity of the associated cabinet fan. The louvers must be sized to satisfy the filtered air inlets and must be provided on all louvers, inlet filter guide angles must be securely bracketed to the door inlets.

The fan(s) and cabinet ventilation louvers must be located with respect to each other to direct the bulk of the air flow throughout the entire cabinet and in particular over the field equipment units as approved by the Engineer. The Fan thermostat must be adjustable to turn on between 90 degrees and 110 degrees Fahrenheit.

### Heating:

All ITS cabinets must be provided with a fan forces electric cabinet heater located near the bottom of the cabinet. An adjustable thermostat must be provided to turn the heater on and off and must be set to turn on at  $36 \pm 5$  degrees F and turn off at  $52 \pm 5$  degrees F. The cabinet heater must be rated at 250 Watts, 120 VAC.

### Lighting:

A 19" LED rack mount lamp must be provided at each door section for the front and back of each ITS cabinet. The lights must be configured to turn on upon each door opening.

### Assembly:

The ITS cabinet must have a standard EIA 19-inch adjustable, self-standing rack assembly. The racks must be capable of housing all equipment specified.

### Fiber Optic Distribution Panels:

Fiber Optic distribution panels (FOPP) must be provided in each cabinet as specified for the termination and optical continuation of the ITS fiber optic cables, as required. The FOPP rack mount unit must act as an interface between the fiber optic drop cables and the fiber optic patch cables located within the cabinet.

In addition, the FOPP distribution panel must facilitate the reassignment of the FO fibers within and the local testing of the ITS optical fiber cable plant. The FOPP must be configured in connector fields consisting of rack mounted, bulkhead, Single Mode FOC connectors. The FOPP patch fields must contain a sufficient quantity of connectors to accommodate the maximum number of fibers entering the equipment cabinet. Each connector field must consist of up to 12 type ST single mode connectors, paired per row, with the connector fields clearly identified, by engraved markers, sorted by function group (Trunk, Drop, etc.).

The Fiber distribution panel (FOPP) must be designed for mounting in the standard 19-inch rack assembly of the ITS signals cabinet. The FOPP distribution panels must have sufficient room for slack fiber storage and must have multiple rear entrances.

All connections to active Fiber optic transmission and end device equipment within the cabinet must be via this FOPP panel.

### Fiber Optic Cable Slack:

ITS Signal cabinets are required to store slack trunk fiber cable per the Contract documents and must be laid out and furnished with sufficient room to neatly coil the FOC trunk thru and drop cables in the base / rear of the cabinet. Cable rack hardware and storage trays must be furnished and installed to hold the FO cables up and off of the concrete ITS Cabinet base.

### Fiber Optic Patch Cables:

The ITS cabinets must be equipped with low loss, duplex type, SM fiber optic patch cables to provide internal distribution to all opto-electronic equipment provided and as shown on the approved layout plans. The FOC patch cables must be factory terminated with matching SM connectors, compatible with the specified equipment complement.

The optical characteristics must be compatible with the fiber optic drop cable specified under a separate contract item. Each FOC patch cable must conform to industry published connector and cable specifications. The Contractor must submit a record of certified test performances, from the factory, for each individual patch and drop FOC cable assembly installed.

### Cabinet Wiring:

ITS Cabinet wiring must be provided for the equipment complement as specified on the plans. All cabinet wiring where connected to terminal strips, relays, active equipment switches, SPD, Receptacles, work lights, fans, power supplies, etc., must be identified by the use of insulated, heat shrink, machine pre-printed sleeving slipped over each wire before attachment of lugs, connectors or making the connections. The wire markers must carry the legend in plain words with sufficient details and unique conductor identifications so that a translating sheet will not be required.

All field wires must be cut to the proper length before assembly. No wires must be doubled back to or folded over to take up slack. Individual wires must be identified and neatly laced into cables with nylon lacing. Cables must be secured with UV resistant nylon cable clamps.

The grounding conductors for the utility electric service must be carried throughout the cabinet without a break.

All electrical connections in the cabinet must have enough clearance between each terminal and the ITS cabinet enclosure to provide an adequate distance to prevent a leakage path or physical contact under stress. Where these clearance distances cannot be maintained, suitable dielectric barriers must be provided.

All equipment grounding conductors must run directly and independently to the identified enclosure ground bus bar.

The lay of the interconnecting cables between components must be such that when any enclosure door or drawer is closed, it does not press against the cables or force the cables against the various components inside the cabinets.

All wiring containing line voltage (AC) must be routed and bundled separately and/or shielded from all low voltage, i.e. signal, data, RF and control circuits.

All conductors and live terminals or energized parts, which could be hazardous to maintenance personnel, must be covered with suitable finger safe insulating material.

#### Power Line Surge Protection Device (SPD):

A power line surge protection device must be installed in each cabinet between the load side of the input power circuit breaker and ground. The protector must have a minimum continuous current rating that is adequate for the protected equipment load (and any associated start up current surges) in each cabinet.

The Power Line surge protector must have the following characteristics:

#### (a) Working Voltage

The unit must be rated for operation on Single Phase AC power lines with a voltage rating of 120/240 volts 3-wire (Isolated Ground)

#### (b) Surge Voltage

The unit must protect against a surge current of 50 kA per phase. The rated SSCR must be: 25 kA.

Surge protection devices (SPD) must be provided, installed within the ITS equipment cabinet, one SPD for each panelboard. Provide ½" spud type direct mount.

UL 1449 listed, Type 1

#### Hardware:

All external screws, nuts, and locking washers must be stainless steel; no self-tapping or Tek screws must be used unless specifically approved by the Engineer. All screws, nuts, and locking washers used internally must be of corrosion resistant material, or Stainless Steel to resist corrosion. All material furnished must be new, first quality, and used in accordance with the highest industry practices.

#### Material:

All parts must be made of corrosion resistant material, such as stainless steel, aluminum, or brass; or must be treated with corrosion resistance such as cadmium plating or Hot Dip galvanizing. All

materials used in construction must be resistant to fungus growth and moisture deterioration. Dissimilar metals apt to corrode through electrolysis under the environmental operating conditions specified must be separated by an inert material.

#### Panelboard:

Each ITS Signal cabinet shall have a UL Listed surface mounted panelboard, installed by the enclosure fabricator to provide the necessary power to the Signal cabinet components, heater, fans, AC & DC cabinet mounted power supply, work light, service equipment, PDUs and branch circuits as shown on the project documents to power other related ITS auxiliary equipment.

All components of the panelboard shall be front accessible for ease of replacement without removing any other components or equipment. The circuit breaker panelboard must be Factory Installed Main Circuit breaker type.

Adequate space shall be provided for the tightening of all terminals.

The Signal Cabinet panelboards shall be rated as follows:

120/ 240 Volts AC

Single Phase

3 Wire, Plus ground

Main Circuit Breaker: 100 A Frame Type QOM1

Copper Phase, Neutral and Ground bus

22,000 AIC

20 Circuit

UL Listed Service Equipment

Surface Mount

#### Circuit Breaker(s):

Panelboard, breakers and components must be approved and listed by Underwriter's Laboratories. The breaker operating mechanism must be enclosed, trip free from operating handle on overload, and trip indicating.

Properly rated equipment circuit breaker(s) must be provided for the equipment complement / schedule shown on the plans.

Circuit breakers must be: unaffected by ambient temperature range, relative humidity, applied power, shock, and vibration range as specified in NEMA TS-1.

Circuit Breakers must have a minimum interrupt capacity of: 22,000 amperes.

Branch Circuits, 1 Pole2 Pole, Vms Sub-Panel Feed And Auxiliary Signal Cabinet Feed.

#### Signals Cabinet - Grounding Bar:

A solid copper ground bus bar kit must be permanently affixed to the inside surface of the ITS Signal cabinet wall.

The point of contact between the ground bus and ITS cabinet wall must be solidly bonded to have less than 1 ohm resistance. The copper ground bus bar must have a minimum of 20 factory punched connector points, each capable of securing at least one #10 conductor.

Equipment branch circuit ground wiring must return to the panelboard ground bar. Secondary, SPD and conduit/raceway bonds and grounding electrode conductors must be grounded to the identified cabinet enclosure ground bus bar.

The cabinet ground bus bar must be bonded to the panelboard (service) or service disconnect ground using # 4 AWG, green insulated, copper conductor.

The utility service disconnect must be grounded to the Panelboard ground.

The Neutral conductor must be equipped with an identified, removable neutral bonding jumper.

Where multiple grounding bus bars are used, they must be bonded to each other with

Insulated, stranded, #6 AWG copper wire, color: Green.

Furnish and install (1) copper Ground bus bar kit, 4 x 20 "

Drill pattern 'CC', in each ITS enclosure.

#### Duplex Receptacle:

Each ITS Signal Cabinet shall be supplied with an enclosed raintight NEMA Type 5-15R duplex receptacle with integral ground fault interrupting (GFCI) circuit as required by the National Electrical Code. The GFCI receptacle shall be protected by a dedicated 120V 20 Amp branch circuit breaker and located so that no electrical hazard exists when used by service personnel.

### **CONSTRUCTION DETAILS:**

#### Cabinet Mountings:

All ITS cabinets must be either ground mounted on a specified concrete pad base or must be pole (OSS support) mounted at each location, as shown on the project plans.

ITS Cabinets for pole mounting must be furnished with two (2) stainless steel exterior pole mounting brackets and a solid aluminum plate to cover the opening on the bottom of the ITS Signal cabinet base. The cabinet manufacturer must reinforce the cabinet sidewalls/bracket mounting holes with metal plates of adequate size and strength, welded longitudinally across the inside depth of the cabinet.

The pole mounted ITS signal cabinets must provide enough resistance to flexing and must withstand pole type mounting without warping the cabinet, whenever the cabinet doors are opened or closed.

Pole mounted ITS signal cabinet installations must include the drilling and welding of posts or poles, provisions for a 3" or 4" galvanized nipple threaded inlet into the pole / support leg, below each cabinet and provide for the fastening of structural supports, to match the cabinet size provided.

The Contractor must supply all bolts, nuts, straps, malleable Hot Dipped Galvanized steel condulets with screw on covers and gaskets, nipples, lock washers, mounting plates, bushings and other material required to secure the cabinet properly to the pole in accordance with the details shown on the plans.

The ITS signal cabinet base mount conduit for pole mounted cabinets must be 3" or 4" in trade diameter, as required, as shown in the layout shop drawings and as directed by the Engineer.

Prior to each ITS signal cabinet installation, the Contractor must submit an approved cabinet wiring schematic and cabinet interior layout, detailed for each cabinet specified to the Engineer for approval. The cabinet schematic must depict all of the wiring required for each equipment, to complement of each specific cabinet.

ITS signal cabinets must not be installed without an Engineer approved schematic and interior layout.

#### Labeling:

The ITS signal cabinets must be furnished with a metal plate embossed with the following two (2) lines of text:

<p><b>TRAFFIC CONTROL</b></p> <p><b>NEW YORK CITY</b></p>
---

the information noted above may be permanently etched or embossed into the cabinet door, in an approved manner as to be clearly visible on the exterior of the cabinet.

If a nameplate is used, it must be 11 inches in length and 5 inches tall and welded to the outside of the front door, with the center of the nameplate located at the vertical centerline and midway between the top and the middle of the door. This plate must be painted with the same green paint as the exterior of the signal cabinet.

The nameplate text must have letters that are 0.875 inch in height; the information noted above must be embossed in a manner which allows this information to be read even after several coats of paint have been added to the cabinet. The welding for this plate must be neat in appearance.

The ITS controller cabinet must also be identified by model number, a serial number, on a metal nameplate visible on the inside of the cabinet. Consecutive serial numbers must also be stamped on the metal nameplate and fastened to the inside of the cabinet by stainless steel rivets, which must not protrude or otherwise be visible on the exterior of the cabinet.

NYC DOT requires that each separate procurement contract or construction contract have equipment serial numbers which are unique and identifiable. The Contractor must work with the NYC DOT, as directed by the Engineer, to establish a numbering scheme that allows the NYC DOT and its maintenance contractors to quickly identify the specific contract number which provided the ITS control cabinets.

This requirement must be followed for all subassemblies as well, so that the City NYCDOT can identify the origin of the part and determine which contractor is responsible for its maintenance.

**ITS NEMA 3R ENCLOSURE TYPES**

<b>ITS ENCLOSURE TYPE</b>	<b>EXTERIOR DIMENSIONS</b>	<b>PAY ITEM</b>
P44 2 bay Ground Pad Mount	55.62" H x 44" W x 25.27" D	PK-ESCR-461
344 (P38) Pole Mount	66.82" H x 24.25" W x 30.5" D	PK-ESCR-462
ASTC-12 Pole Mount	49" H x 21" W x 15" D	PK-ESCR-463
ASTC-8 Pole Mount	43" H x 21" W x 16" D	PK-ESCR-464

**METHOD OF MEASUREMENT:**

Each NEMA 3R ITS Signal Cabinet will be measured based on the number of complete units furnished and installed in accordance with the Contract Documents or as directed by the Engineer.

**BASIS OF PAYMENT:**

The unit price bid for each NEMA 3R ITS Signal Cabinet must include the cost of furnishing all labor, materials, mounting, concrete bases and equipment necessary to complete the work.

Payment for ITS cabinet grounding, interconnect cables, wires, fiber optic & Cat 6 patch cables, fiber optic distribution panels, surge protectors, rack mounted fiber optic patch field, rack mounted Cat 6 patch field, wire management, LED work lighting, heater and fan vents, active network equipment, hardware, electrical panelboards, circuit breakers, GFCI receptacle, ITS electronic peripherals, interface equipment, submittals, documentation, service energization, warranty, and the testing items referenced herein must be included under the unit price bid for these items.

The VMS sign controller and power supply will be paid for under the related VMS payment item.

**END OF SECTION**

## **SECTION PK-ESCR 465 – RADAR BASED TRAFFIC MEASURING SENSOR (RTMS)**

### **GENERAL:**

Under this item, the contractor must furnish and install multi-channel ranging radar traffic sensor unit at locations shown on the plans and in accordance with the Contract Documents, per the requirements of NYC DOT – Signals and as directed by the Engineer.

Each unit must be a self-contained sensor which detects and monitors roadway traffic. The sensor must be a true presence traffic detector which provides volume, per lane occupancy, speed and vehicle classification information on up to twelve (12) user defined discreet detection zones from a single side-fire mounting location.

The sensor information must be available via a built-in TCP/IP communication option.

The work must include, but is not limited to furnishing, installation and acceptance testing of active equipment, mounting brackets, 24 v AC power supply. etc. Work must include on site programming, pattern alignment and site acceptance tests including all final connections on line and load sides of ITS installation.

Install all supplied equipment, as specified under this contract and coordination with any incidental equipment as supplied by others.

All work must be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

### **DESCRIPTION:**

This work must consist of furnishing and installing NYC DOT Radar Traffic Sensor and mounts of the type described in this specification, in accordance with the contract documents and as directed by the Engineer.

### **MATERIALS:**

All materials furnished, assembled, fabricated or installed must be new, corrosion resistant and in strict accordance with NY State/ NY City DOT, NEMA 4X, IP67, watertight construction, designed for single pole bracket mount. Mount must feature the ability to aim and tilt on three axis, locking adjustment for elevation angle, pitch and azimuth.

The radar traffic sensor must operate on the K-band with high vehicle resolution, in the 2.4 GHz band assignment. Radar sensor must be NEMA TS-02 and FCC compliant.

General requirements for material, construction, installation, testing, and documentation are presented in this specification. Where material or construction requirements presented in this specification conflict with the proposed model, the manufacturer and installer must provide written documentation describing the conflict and the manufacturer's plan for meeting the requirements of this specification.

All materials furnished, assembled, fabricated or installed must be new, corrosion resistant and in strict accordance with the details shown in the contract documents and this specification. Each radar traffic detector must be factory encased in a rugged, watertight, gasketed enclosure.

### **Guarantee and Warranty:**

The Radar Traffic Sensor unit shall be provided with a 3 year Manufacturer's Warranty, which shall name the NYC Department of Transportation as the owner. The Radar Traffic Sensor warranty shall include the costs to remove, ship and replace any Radar Traffic Sensor unit which fails to provide reliable performance during the entire warranty period.

The Manufacturer's warranty is in addition to the Contractor's project guarantee, which is described elsewhere in the contract provisions.

The Radar detector warranty begins on the date of formal acceptance of the installed Radar Traffic Sensor unit, by the Engineer.

#### Mechanical Requirements:

#### Functional:

The radar traffic sensor must be pole or sign structure mountable from a side-fire location and must comply with the following functional specifications:

- Must comply with the limits of a Class A digital device pursuant to Part 15 of the FCC rules
- The radar traffic unit must not interfere with any known equipment
- The radar traffic unit must support at least eight lanes of traffic within the range of 0 feet to 250 feet from the sensor when the sensor is mounted at least 17 feet higher than the roadway profile
- The width and location of the detection zones must be fully programmable via communications interface. The unit must retain its programming in non-volatile memory.
- Basic resolution of the unit must be 3 milliseconds or less
- The data reporting interval must be set within the range of 10 to 600 seconds in increments of ten seconds.

The radar traffic sensor unit must support both contention and polled protocols. In contention mode, the unit must report volume, average occupancy, and average speed over the reporting interval at the end of the interval.

In polled mode, a communication address must be assigned to the unit via its setup program. Upon receiving a command from the Radar Based Traffic Monitoring (RTM) center with the appropriate unit address, the radar traffic unit must respond with the accumulated traffic volume, average occupancy, and average speed in the period since the last poll request was issued.

- Complete communication protocol descriptions must be supplied with the submittals for the radar traffic sensor unit. These protocol descriptions must be complete and adequate for the purpose of developing software to retrieve the information from the sensor.
- The radar traffic sensor unit must not exceed: 2.5 lbs. in weight, plus mount.
- Nominal dimensions for the unit must be: 9.0 inches X 7.25 inches X 6.75 inches.
- The radar traffic sensor unit must operate in all prevalent traffic conditions, from 0 to 70 mph. Over this range, the unit must be accurate to:
  - Volume - 0% of Actual Count
  - Occupancy - The unit must be able to measure and output occupancy
  - Speed - Within  $\pm 10$  mph of true speed as measured by radar gun. For instance, if true speed averages 50 mph, reported speed must be 40 mph to 60 mph
  - Classification - The unit must be able to differentiate long from short vehicles within 20% of actual count

#### Radar Traffic Coverage:

- Up to 12 discrete lanes of traffic.
- Elevation Angle: 50 degrees
- Zero Setback feature for near side pole mounting
- Azimuth: 12 degrees
- Range: 0 to 250 feet

- Detection Zones: programmable, up to 12
- Detection Zone width: 7-20 feet
- Detection Range increment: 1.2 feet
- Detection speed: 0-70 mph
- Event times: 1.3 msec.
- Data Interface: Base configuration, plus TCP/IP

Data sets:

- Volume
- Occupancy
- Speed
- Gap or headway
- Vehicle classes (up to six)
- 85<sup>th</sup> Percentile
- Data Storage: 8 MB, built in

Interfaces:

A single MS type bulkhead connector provides data communications, power and output signals. An optional matching MS male convertor cable must be ordered to provide IP-67 RJ-45 industrial cable connection at the device end.

Bluetooth® communications is also built in, to facilitate ground based local sensor status, configuration, setup, calibrations and traffic data access.

Environmental Conditions

The radar traffic equipment must meet all its specified requirements during and after being subjected to any combination of the following conditions:

- The ambient temperature range must be between: -40°F to +165°F.
- Relative humidity: up to 95 %, non-condensing.
- Rain or snow: up to 2 inches per hour.
- Vibration: 2 g up to 200 Hz sinusoidal.
- Shock: 5 g 10 millisecond half sine wave.

The design must be inherently temperature compensated to prevent abnormal operation. The circuit design must include such compensation as is necessary to overcome adverse effects due to temperature in the specified environmental range. The radar traffic unit must not require programming changes to compensate for different environmental conditions encountered from season to season.

Mounting Bracket:

The radar traffic detector must be supplied with a mounting bracket. The mounting bracket must be supplied with stainless steel bands which will allow the unit to be attached to traffic or overhead sign support poles or sign structure, ranging from 1 to 20-inch diameter. The appropriate size stainless steel bands must be supplied for the pole / structure supports designated in the plans to which the unit will be mounted.

Interface Cable:

A single composite custom interface cable must be provided which will provide AC power to the radar traffic unit as well as weatherproof Cat 6 TCP/IP data lines, required to interface with an Ethernet managed switch unit, installed in the ITS signal equipment cabinet. The composite cable

must terminate in a metal weatherproof MS connector, rated for outdoor usage, on the sensor side.

The ITS signal side of the composite Cat 6 TCP/IP cable must be terminated with an industrial weatherproof RJ-45 jack suitable for connection to a local Cat 6 Ethernet Patch field to be installed within the ITS Signal cabinet.

The 24 VAC power for the Radar Traffic Sensor must be labeled and terminated with suitable connection to a standard AC connector matched to weather resistant, 300 V rated cord, as may be required for installation at the pole mounted traffic sensor's MC composite cable connector and at the pole or sign structure mounted ITS Traffic equipment cabinet's, DIN mounted 24 VAC power supply. The radar traffic detector assembly composite interface cable must be designed for outside use, must utilize stranded wire and must be of sufficient length to connect to the electronic equipment with no additional splices.

The Contractor must submit layout and pole or sign structure mounting shop drawings for each Radar Traffic sensor specified, submit for review and approval by the NYC DOT and the Engineer.

#### ITS Signal Cabinet Wiring:

ITS Signal Cabinet wiring must be provided for the equipment complement as specified on the plans. All cabinet wiring where connected to terminal strips, active equipment switches, SPD, Receptacles, work lights, power supplies, etc., must be identified by the use of insulated, heat shrink, machine pre-printed sleeving slipped over each wire before attachment of lugs, connectors or making the connections. The wire markers must carry the legend in plain words with enough details and unique conductor identifications so that a translating sheet will not be required.

All field wires must be cut to the proper length before assembly. No wires must be doubled back to or folded over to take up slack. Wires must be neatly laced into cables with nylon lacing. Cables must be secured with nylon cable clamps.

The ITS Signal Cabinet enclosure is to be paid for under a separate pay item for NYC DOT NEMA 3R ITS Signal Cabinets, Item PK-ESCR-461/462/463/464.

#### RJ-45 Data Surge Protector:

An Ethernet Surge Protection Device (SPD) must be installed in each ITS Signal cabinet between the load side of the TCP/IP Cat 6 cable, to the pole mounted radar traffic unit and the ground bar. The surge protector must have a minimum continuous current rating that is adequate for the protected equipment load (and any associated start up current surges) in each cabinet.

The Ethernet SPD must have the following characteristics:

#### (a) Working Voltage

The SPD unit must be rated for operation on a single Cat 6 Ethernet cable, with a nominal working voltage rating of: 48 volts. SPD is suitable for POE+ to IEEE 802.3at, up 57 V.

#### (b) C2 Nominal Discharge Current

The SPD unit must protect against a nominal (8/20  $\mu$ s) Line to PG, surge current of: 2.5 kA. Rated Total nominal discharge current of: 10 kA

Surge protection devices (SPD) must be provided, installed within the ITS Signal equipment cabinet, one SPD for each Cat 6 Ethernet cable. Provide 35 mm DIN rail mount.

SPD Model: BSPD48RJ45, UL 497B listed, Type 1 as Manufactured by: Cooper Bussmann or Engineer Approved equivalent

Hardware:

All external screws, nuts, and locking washers must be stainless steel; no self-tapping or Tek screws must be used, unless specifically approved by the Engineer. All screws, nuts, and locking washers used internally must be of corrosion resistant material, or Stainless Steel to resist corrosion. All material furnished must be new, first quality, and used in accordance with the highest industry practices.

**MATERIAL:**

All parts must be made of corrosion resistant material, such as stainless steel, aluminum, or brass; or must be treated with corrosion resistance such as cadmium plating or Hot Dip Galvanizing. All materials used in construction must be resistant to fungus growth and moisture deterioration. Dissimilar metals apt to corrode through electrolysis under the environmental operating conditions specified must be separated by an inert material.

Manufacturer:

The Radar Traffic Sensor must be completely integrated with and compatible with the existing NYS / NYC Department of Transportation Regional Traffic Monitoring Center (RTMC) equipment, including DOT existing ITS communications and infrastructure.

NYC DOT RTMC and NYC DOT Signals approved Radar Traffic Sensor equipment manufacturer must be:

Model: RTMS Sx-300 Option 2 TCP/IP as manufactured by:

Image Sensing Systems  
500 Spruce Tree Centre  
1600 University Av. West  
St. Paul MN 55104  
1-651-603-7700  
[www.imagesensing.com](http://www.imagesensing.com)

No alternates will be approved.

**CONSTRUCTION DETAILS:**

Submittal Drawings:

The contractor must prepare Radar Traffic Sensor layout and electrical shop drawings which must detail the complete radar traffic unit assembly, layout and wiring of all components to be supplied including the Radar Traffic sensor mounting hardware.

These shop drawings must detail the exact placement of each radar traffic sensor unit showing the height the unit is mounted at, the proposed detection zone, aiming patterns and radar sensor hardware mounting methods. Drawings must be in AutoCAD format (2D), drawn to scale, showing both plan and section views.

Shop drawings must also include details of the installation of a composite communications cable from the radar traffic unit, and separate 24 VAC power and Cat 6 ethernet data cables to the pole / sign support mounted ITS signals equipment cabinet.

Site Demonstration and Start up:

The contractor must perform a field demonstration of the traffic sensor assembly at the identified OSS-1 site. The demonstration is intended for confirming the site specific conditions under which the radar sensor unit will be mounted and aligned, in order to operate reliably for the project.

The contractor must utilize factory technical personnel to validate the radar traffic unit's site specific installation, radar coverage, aiming adjustment and data accuracy, The factory technical

personnel must validate and confirm the radar traffic sensor is mounted at the optimum height and lane coverage, on the assigned OSS-1 structure.

Via the use of a bucket truck, the radar traffic mounting assembly must be physically aimed and calibrated to provide optimum coverage for the travel lanes, indicated on the shop drawing and layout plans for the zones to be covered.

Once mechanically aimed and secured, the radar traffic sensor's diagnostic software application must be utilized by the contractor and the factory technical personnel to pin-point optimum detector width settings. In addition, the communication address assigned to the new traffic sensor unit must be programmed, in coordination with the Director of the NYC DOT RTMC.

A calibrated radar traffic gun must be used for the purpose of confirming vehicle speeds on the traffic lanes at the time that the assembly is mounted and aimed. The calibrated vehicle speeds must be provided to the diagnostic program for the purpose of calibrating speed measurements obtained for the new radar traffic sensor assembly.

Once the radar traffic unit is programmed, a System Acceptance Test with traffic validation test must be conducted to verify the entire sensor installation, end to end connectivity from the new radar traffic sensor to the RTMC. The System Acceptance Test must include traffic and lane volume measurements against manual counts and speed measurements validated against calibrated radar gun readings.

The new unit must operate within the tolerances included in the Functional Requirements specifications for volume, occupancy, and speed.

At the completion and acceptance of the installation and all testing specified, the Department shall have beneficial use of the Radar Traffic Sensor unit. The Radar Traffic sensor unit will begin the operational use, acceptance and warranty periods.

**METHOD OF MEASUREMENT:**

Each Radar Based Traffic Measuring Sensor (RTMS) unit will be measured based on EACH complete sensor units furnished, installed, activated, calibrated, tested and accepted, each in accordance with the Contract Documents or as directed by the Engineer.

**BASIS OF PAYMENT:**

The unit price bid for each RADAR BASED TRAFFIC MEASURING SENSOR must include the cost of furnishing all labor, materials, incidentals, SPD, mounting, calibration, testing and equipment necessary to complete the work.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR-465	RADAR BASED TRAFFIC MEASURING SENSOR (RTMS)	EACH

**END OF SECTION**

## **SECTION PK-ESCR 466 – ITS CAT 6 OUTDOOR ETHERNET CABLE-GEL FILLED**

### **GENERAL:**

Under this item, the contractor must furnish and install ITS Cat 6 Outdoor Ethernet Cable, at locations shown on the plans and in accordance with these Contract Documents, per the requirements of NYCDOT – Signals and as directed by the Engineer.

All work must be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

### **DESCRIPTION:**

This work must consist of furnishing and installing ITS CAT 6 OUTDOOR ETHERNET CABLE-GEL FILLED of the type described in this specification, in accordance with the contract documents and as directed by the Engineer.

### **MATERIALS:**

All materials furnished, assembled and installed must be new, ANSI/TIA 568-C.2 compliant which meets or exceeds ISO 11801 Category 6 performance for TCP/IP data at speeds of 10/100 BASE-T (IEEE 802.3) and 1000 BASE-T (GIGABIT ETHERNET).

The cable must be of Gel filled construction to prevent moisture migration for use in underground and outdoor wet applications. The cable must be of the Outside Plant (OSP) type.

The cable must be suitable for wide temperature extremes: (-49° F to + 176° F).

General requirements for material, construction, installation, testing, and documentation are presented in this specification. Where material or construction requirements presented in this specification conflict with the proposed model or products, the manufacturer and installer must provide written documentation describing the conflict and the manufacturer's plan for meeting the requirements of this specification. All materials furnished, assembled, fabricated or installed must be new, corrosion resistant first quality and in strict accordance with the details shown in the contract documents and this specification.

### **Mechanical Requirements:**

#### Cable Construction

The OSP Cat 6 cable must be suitable for above and below ground installation in conduit and duct bank installations. Direct burial methods are not approved. Nominal specifications for the OSP Cat 6 cable must be:

- 23 AWG, solid, bare annealed copper conductors
- Polyolefin conductor insulation
- UV & Abrasion resistant Polyethylene outer jacket
- Cable Diameter: 0.25" OD
- Bend Radius: 1.0" minimum
- Pulling force: 32 lbs. maximum
- Pairs (UTP); 4
- Jacket color: Black
- Standard Put up: 1,000 ft. reel.
- Jacket Print legend: contains footage markings from 1,000 to 0 feet
- Made in U.S.A.

### **Manufacturers:**

The Category 6 Outdoor Ethernet Cable must be:

PARKS-218

- GenSPEED® Item: 7136100 as manufactured by General Cable
- BBD6 Item: 04-001-68 as manufactured by Superior/Essex Wire
- C6CMX-2043BK as manufactured by CRN/Primus Cable
- Or Approved Equal

**CONSTRUCTION DETAILS:**

The Category 6 Outdoor Ethernet Cable must be field terminated with ezEX38 RJ-45 cable connectors which feature a unique Hi-Lo conductor stagger load bar. The connectors must be designed to allow conductors to pass through the front end of the connector making it easy to verify the wiring sequence before terminating.

The ezEX38 connector is typically used with Cat 6 cabling and is recommended for PoE/PoE+ and Data applications. The termination tool for these connectors is: EXO Crimp Frame and EXO-EX Die (100061C).

RJ-45 ezEX38 connector specifications:

- Insulation Diameter (Conductor) Size range: .033” – .038” (ezEX38)
- Max. conductor Outer Diameter: .290”
- 50 micron - Gold plated contacts
- Category 5e/6/6A compliant
- Solid or Stranded 24-22 AWG conductors
- TIA, TAA, RoHS, UL & FCC compliant
- Made in the U.S.A.

The contractor must perform a field certification of each segment of Category 6 OSP cable to demonstrate the field terminated cables are tested to meet the data throughput requirements of the EIA/TIA 568A/B. The Ethernet network cables must be tested to a speed of 1 GBS, in accordance with IEEE standard 802.3

Cat 6 Outdoor Ethernet Cables must be tested for mis-wires, noise, faults and to assure the network cables are able to support the speed capabilities of the active equipment. Test results must be documented for each cable segment. Cable segments must match the cable identification (tags) on each test report document

**METHOD OF MEASUREMENT:**

ITS CAT 6 OUTDOOR ETHERNET CABLE-GEL FILLED will be measured based on the number of linear feet of connected cables furnished, installed, terminated, tested and accepted, each in accordance with the Contract Documents or as directed by the Engineer.

**BASIS OF PAYMENT:**

The unit price bid for each linear foot of ITS CAT 6 OUTDOOR ETHERNET CABLE-GEL FILLED installed must include the cost of furnishing all labor, materials, incidentals, identification, and related cable equipment necessary to complete the work.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR-466	ITS CAT 6 OUTDOOR ETHERNET CABLE-GEL FILLED	LF

**END OF SECTION**

## SECTION PK-ESCR 467 – ITS REMOVALS

### **GENERAL:**

Under this item, the contractor must remove ITS related equipment, at locations shown on the plans and in accordance with these Contract Documents, per the requirements of NYC DOT – Signals and as directed by the Engineer.

All work must be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

### **DESCRIPTION:**

This work must consist of removal of ITS equipment, enclosures, power supplies, active components, antenna, coax cables, cameras VMS, radar vehicle sensors cabinet, junction boxes, conduit, wiring and similar signals equipment, as described in this specification and in accordance with the contract documents.

### **MATERIALS:**

All equipment, cabinets and equipment to be removed must be turned over to the NYCDOT, unless otherwise directed by the Engineer.

### **CONSTRUCTION DETAILS:**

The contractor must inventory and test each piece of ITS equipment in the presence of the engineer and a representative of NYCDOT-Signals, to assure the ITS equipment to be removed and salvaged was fully operational, before removal process is started.

The contractor must identify each cable and conductor associated with the ITS equipment to be removed, with linen strung tags, prior to the equipment being declared out of service.

The Engineer, coordinating with a representative of NYCDOT-Signals, must coordinate the identification and removals of active ITS data and communications wiring to each ITS equipment and declare each system and component out of service, prior to its disconnection.

A written record of each piece of ITS equipment to be removed must be made, including model and serial numbers and location of the equipment subject to removal. All removed ITS equipment must be cleaned, bubble wrapped, boxed, labeled and turned over to the Engineer for salvage as directed by the Engineer.

Ancillary ITS equipment such as poles, mounts, enclosures, extensions, structural supports, cables, harnesses, clamps and associated ITS materials are to be presented to the Engineer for review of suitability for salvage.

All equipment, materials, removed conduits and cables not identified for salvage must be properly disposed of by the contractor.

### **METHOD OF MEASUREMENT:**

**ITS REMOVALS** will be measured for payment based on a lump sum basis for the complete services furnished in accordance with the Contract Documents or as directed by the Engineer.

### **BASIS OF PAYMENT:**

The lump sum price bid for ITS REMOVALS must include the cost of furnishing all labor, equipment, materials, incidentals, identification, packaging, transportation and the disposal of any materials, conduit, cables or incidental work necessary to complete this bid item.

**END OF SECTION**

**PK-ESCR-468 LED FULL COLOR VARIABLE MESSAGE SIGN (VMS) - OSS-1**  
**PK-ESCR-469 LED FULL COLOR VARIABLE MESSAGE SIGN (VMS) - OSS-8S**

**GENERAL:**

The Variable Message Sign (VMS) must be LED FULL COLOR system. Unless specifically indicated, these specifications apply to all types of VMS', inclusive of the sign case and mounting hardware.

The VMS must be compatible with existing NYCDOT Regional Traffic Monitoring Center (RTMC) and Signals infrastructure, using like technology. To ensure compatibility and interchangeability with equipment furnished under previous projects, the VMS must be compatible with Daktronics VX-2428, 20 mm LED pixel, RGB Color products presently used in the NYCDOT. Refer to Technical Criteria section for each VMS sign identification and sign specific technical data.

Each sign must be provided with the mounting hardware necessary to attach the sign assembly to the VMS support structure. All the structural and support components of the VMS signs, attachments and support structure attachment hardware must be designed, checked, signed, and sealed by a Professional Engineer, holding a valid license to practice engineering in the State of New York.

The VMS communications protocol must be the National Transportation Communication for ITS Protocol (NTCIP) Version 02.35 (1203 v02.35).

The VMS must be designed to comply with NEMA TS-4.

Internal VMS access for all maintenance must provide unobstructed viewing, removal and replacement of any non-structural component within the sign case and ground/pole mount equipment cabinets. Access must be via a non-walk in, hinged, swing-up front access.

The VMS front face must not distort in a manner that adversely affects LED message legibility when subjected to adverse weather conditions including those involving wind, rain and snow.

The removal of any combination of one or more VMS modules must not alter the structural strength of the sign display assembly or the sign case.

The removal or failure of any combination of display modules must not affect the operation of the remaining functional modules in any way.

All serviceable components (except the Uninterruptible Power Source) must weigh 50 pounds or less.

**MATERIALS:**

Each VMS must consist of the following minimum components and general requirements:

Light Emitting Diode (LED), Full Matrix Display technology.

Structural supports to VMS sign case mounting brackets, I-beams, Z bars, bolts, nuts, washers and other hardware required for the installation to the VMS OSS Sign support structure.

VMS Controller Unit, VMS Controller Unit Software, VMS maintenance Software and documentation, Fiber Optic Cable (or approved manufacturers' cable) for connection between the sign case control and the Roadside Signal Cabinet Controls.

All hardware and fasteners must be stainless steel except for the VMS sign case lifting eyes which must be hot dipped galvanized, high strength steel. Lifting eyes must be attached to the VMS sign case with nylon locking hex nuts and flat washers. Washers must be placed on each side of the

sign case (interior/exterior) and be fabricated of stainless steel or other metal that is chemically nonreactive with the aluminum sign case material. Lifting eyes must be left in place. VMS sign case intrusions for lifting eyes must be sealed to prevent liquid or vapor infiltration. Alternative VMS lifting configurations must not be used unless preapproved by the Engineer.

All electronic components must be rated for NEMA TS-4 environmental conditions. Electrical/electronic component power, signal, data, board to board, board to connector and grounding connections must be noncorrosive low loss, vibration resistant points that pass the minimum and maximum current levels without loss levels that reduce the performance of the inter-mating assemblies when subjected to NEMA TS-4 environmental conditions.

All VMS equipment and controller must operate at -31 degrees F to 165 degrees F

The VMS Manufacturer must have a minimum of 10 years manufacturing LED DMS for ITS application, must be certified for the latest ISO 9001 standards and must have a minimum of 100 outdoor LED DMS. VMS installations currently in operation by similar Transportation agencies in the U.S.

The display unit must be designed to provide at least 10 years useable life.

LED VIEW ANGLE: 30°

LED TYPE: FULL MATRIX RGB COLOR

SIGN DIMENSIONS: 13'-5" W  
5'-8" H  
1'-4" D

SIGN ACTIVE AREA: 13'-0" W  
4'-3" H

SIGN CHARACTERS: 6" HEIGHT 6 LINES OF 32 CHARACTERS 300 FEET

VIEW DISTANCE: 9" HEIGHT 3 LINES OF 19 CHARACTERS

**MANUFACTURER:**

VMS SIGN AND CONTROLLERS MUST BE FULLY COMPATIBLE WITH AND MATCH THE EXISTING NYCDOT TRAFFIC & SIGNALS STANDARDS FOR:

FULL COLOR LED VARIABLE MESSAGE SIGNS (VMS), AS MANUFACTURED BY:

DAKTRONICS  
117 PRINCE DRIVE  
BROOKINGS, SD 57006  
(605) 692-0200

No alternates will be approved.

**1. Sign Housings, Faces, Framing and Mounting Members**

The VMS signs must utilize vertical, multiple door construction with hinged and gasketed door panels which allows a single maintainer to achieve access to a section of the sign housing from the front of the assembly while working from a standard bucket or lift truck. The doors must have retaining latches to hold the door open at 90 degrees and captive latches to secure it.

The VMS sign housing top must be crowned to prevent standing water and must be constructed so that it is weather resistant under all conditions. Maintenance and repair of VMS must be from the outside through front access doors. Front doors and other panels required to be moved out of their normal closed position for maintenance or repair of the VMS must not impede access of a maintenance person to the internal components of the VMS from a bucket truck or boom lift.

Sign housings must be constructed of aluminum, alloy 5052 H32 or H34, and with a minimum thickness of 0.125 inch. Seams must be continuously welded (chemically bonded only as approved by the Engineer) and smooth except for the KYNAR 500 polyvinylidene fluoride (PVDF) or approved equal, coated sign face. All welds must be neatly formed and free of cracks, blow holes and other irregularities. All exterior cabinet welds must be made using the gas tungsten arc (TIG) welding method. All internal cabinet welds must be made using the gas metal arc (MIG) or TIG process.

Other welding methods may be used only if approved by the Engineer, in advance of fabrication. All inside and outside edges of the cabinet must be free of burrs or sharp edges. All edges must be filed to a radius of 0.03125 inch minimum. ER5356 aluminum alloy bare welding electrodes must be used and conform to American Welding Society standard AWS A5.10 requirements for welding on aluminum. Procedures, welders and welding operators must conform to AWS requirements as contained in AWS B3.0 and C5.6 for aluminum. Framing structural shapes must be constructed of aluminum, alloy 6061T6.

Non-corrosive materials must be used, throughout each sign. Corrosion protection must be provided between dissimilar metals. Sign cases must be cleaned and de-oxidized after welding. The sign cases must have a smooth, uniform finish without rivet holes, visible scratches or gouges on the outer surfaces. The front of the cases must be finished matte black. The remaining exterior

surfaces must be natural aluminum finish. Other sign finishes may be acceptable if preapproved by the Engineer. The sign case interiors must be unpainted.

Signs must have polycarbonate sign face coverings. Coverings must be weather tight, ultraviolet protected, non-diffusing, polycarbonate (non-matte finish) nominally 1/4-inch thick unless otherwise approved by the Engineer.

Polycarbonate sign faces must be covered with a .090-inch minimum thickness aluminum mask for Type I and II VMS LEDs. The aluminum mask must provide openings directly in front of each pixel unless surface mount technologies are utilized. Alternately, the front of each LED display module must be black and contain louver-type openings for the LED pixels.

When louvers are used, the LED pixels in the module must be protected by a black contrast-enhancing silicone elastomer or approved equal that surrounds the base of the LEDs and seals the entire front face of the module to prevent penetration by the elements and corrosion, while not obstructing the viewing angles of the LEDs. Pixel openings must be of sufficient size as to not interfere with LED light output from the road viewing angles stipulated for the display. The sign face must be designed to minimize deflection.

Sign housing, face coverings, framing and mounting members must be designed to conform to the requirements of the current edition of the AASHTO's Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals and the following clarifications:

Basic wind speed must be used in the designs. Alternate method for wind pressures must not be used.

When the installation location of the sign structures being designed lie between isotachs, the basic wind speed must be determined by using the higher adjacent isotach. Any optional design parameters indicated in the AASHTO specification that are allowed when acceptable to the owner must not be used for the designs.

Signs must be constructed to present a clean, neat appearance; and the equipment located within must be protected from moisture, dust, dirt and corrosion. Sign enclosures must contain small weep holes for draining moisture that accumulates in the signs from condensation. Weep holes must be designed to prevent the entrance of insects or roadway debris.

Signs must be attached to the vertical truss of the butterfly and overhead sign structure with I-beams. VMS signs must be furnished with all required attachments and hardware for attachment to the I-beams on overhead and butterfly sign structures. The number of I-beams needed and the method of attaching the I-beams to the sign housing and the vertical truss of the overhead sign structure must conform to the requirements of the current edition of the AASHTO's Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals.

Any optional design parameters indicated in the AASHTO specification that are allowed when acceptable to the owner must not be used for the designs.

Lifting eyes or the equivalent must be provided for moving and mounting signs. Sign housings must be designed so that the sign(s) can be shipped and temporarily stored without damage or subjection to undue stresses prior to installation on the support structure.

Each sign must be shipped with a temporary wood support frame that permits the shipping/storage of the sign in an above ground vertical position without damage to the sign housing.

The exterior of sign housing must not have any manufacturer decals or identification plates of any kind attached to the housing. The interior of the sign housing must have a permanent stainless-steel nameplate with the Project Contract number, date of manufacture, the model number, the

serial number and the sign manufacturer identified. The label data must match the documentation package provided with each VMS.

Factory site acceptance date must also be recorded for each sign.

## 2. Power Supplies:

VMS sign power supplies must operate from 120 VAC power. The LED displays must be operated at low internal DC voltage not exceeding 24 VDC. Power supplies must be solid state electronic regulated output comprised of Ferro-resonant components, or a Department approved equivalent.

Power supplies must provide N+1 redundancy, or approved equivalent method. Power supplies must be rated so that if one supply fails, the other(s) can operate the entire LED section under nominal load conditions. A minimum of one LED driver per display module must be provided unless otherwise approved by the Engineer. A failure of one display module driver must not cause a failure of the others. A single failure of one power supply must not cause a failure of the other(s).

Power supplies must meet NEMA TS-4 temperature requirements operating from -31°F to +165°F (-35°C to +74°C). Power supplies must have over-voltage protection devices that supplement the VMS assembly's over voltage, surge and transient voltage protection devices.

Power supplies must be short circuit protected by turning the DC power off and must reset automatically after 5 seconds of AC power off. Power supplies must also be protected by a minimum overload allowance of 125 percent and have an efficiency rating of at least 80 percent.

Power supplies must be UL listed and RoHS compliant for the appropriate application.

Power supplies must be installed with the terminals/connectors unobstructed by hardware or mounting brackets. The operator must be able to read the terminal designations and measure voltages without removing the power supply or obstructions.

Power supplies must have a visible means of determining power status of individual supplies via the VMS controller and the supplies themselves. Indicators must identify whether the supplies are functioning properly and outputting power at the correct/calibrated levels.

The VMS controller must indicate that any power supply has failed and power supply must have an identifier tag that indicates the specific power supply that has failed.

The regulated DC power supplies must conform to the following specifications, and must be compatible with the DC voltage requirements set forth by the VMS equipment manufacturer:

Nominal maximum output power rating of 1000 watts

Operating input voltage range must be a minimum of 90 to 264 VAC

Operating temperature range must be a minimum of -30°F to +165°F (-34° C to +74° C)

Maximum output power rating must be maintained over a minimum temperature range of -30°F to +140°F (-34° C to +60° C)

Power supply efficiency must be a minimum of 80%

Power factor rating must be a minimum of 0.95

Power supply input circuit must be fused

Automatic output shut down and restart if the power supply overheats or one of the following output faults occurs: over-voltage, short circuit, or over-current

Power supplies must be UL listed

Printed circuit boards must be protected by an acrylic conformal coating

### 3. Electrical Panelboard

The VMS sign controller Signal enclosure must include a UL listed electrical panelboard with, copper busses, bolt on circuit breakers, factory installed, inside the VMS sign controller enclosure. 120/240 V, Single Phase, 3 wire, grounded AC power is required for equipment in the sign case and is fed from the VMS sign ITS Signal controller enclosure.

Refer to pay item 461 for the ITS Signal controller enclosure for OSS-1 VMS-01.

Refer to pay item 462 for the ITS Signal controller enclosure for OSS-8S VMS-02

The sign case's electrical (sub) panelboard must be rated for a minimum 60 amperes. Provide six (6) 20 amp single pole circuit breakers. Circuit breakers and wiring must be rated and in accordance with the NEC and the anticipated loads that will be experienced by traffic equipment, interior lighting and power receptacles located within the VMS sign cases. Circuit breakers of the appropriate AIC rating must be provided with each panelboard.

VMS wiring must be rated and in accordance with the NEC and the anticipated loads that will be experienced by equipment, interior lighting, and power receptacles within the VMS housing and the 2 pole branch/feeder circuit to the sign case. The power wiring and circuit breaker ratings must be sized to accept a short circuit current up to: 22,000 AIC. The VMS sign conductors must not sustain any damage or reduction in current capacity at the maximum short circuit current level.

The VMS and associated equipment and enclosures must be listed by the Underwriter's Laboratories (UL) or another acceptable Nationally Recognized Testing Laboratory (NRTL).

VMS Control equipment and enclosures must also be listed to UL 1422 Standard for Control Centers for Changing Message Type Signs.

Failure to provide acceptable product listing or code conformances will be cause for product rejection.

### 4. Temperature Sensor

VMS Sign cases must be fitted with programmable temperature sensor(s) to monitor the interior temperature of the sign. The temperature sensor(s) must be placed near the top of the display face to monitor the nominal high temperature of the LED area.

Temperature sensor(s) must monitor temperature within the range of -220° F to +1,850° F (-30° C to +85° C) and must be calibrated to accurately report temperatures within +/- 3 Degrees C. Temperature sensor data must be monitored by the sign controller in order to respond to temperatures fluctuations affecting the equipment installed in the sign case and the LED pixels in the display of the sign face. -30° F to +165° F (-34° C to +74° C)

### 5. Interior VMS Environmental Control

The VMS must contain systems for cabinet ventilation and safe over-temperature shutdown as required to comply with NEMA TS-4 environmental requirements.

### 6. Housing Ventilation System

The ventilation system must be a positive-pressure, filtered, forced-air, fully ducted system which cools both the display modules and the sign housing interior. Negative pressure systems that use exhaust fans are not acceptable.

The VMS must contain an electronically controlled ventilation system and a failsafe thermostat designed to keep the internal VMS air temperature lower than +140°F (+60°C), when the outdoor ambient temperature is +115°F (+46°C) or less.

The ventilation system must consist of two or more air intake ports. Intake ports must be located near the bottom of the VMS rear wall. Each intake port must be covered with a filter that removes airborne particles measuring 500 microns in diameter and larger. One or more fans must be mounted at each intake port. The fans must have ball or roller bearings, must be permanently lubricated and must require no periodic maintenance. These ventilation fans must positively pressure the VMS cabinet.

Fans and air filters must be easily removable and replaceable from inside the VMS housing without the use of tools. Both inlet and exhaust must use environment-friendly, washable, reusable electrostatic filters.

Each ventilation fan must contain a sensor to monitor its rotational speed, measured in revolutions per minute. The fan speeds must be reported via a CAN (controller area network) communication network to the sign controller upon command.

The ventilation system must move air across the rear of the LED modules in a manner such that heat is dissipated from the LED's. The airflow must move from the bottom of the cabinet towards the top to work with natural convection to move heat away from the modules.

Each exhaust port must be located near the top of the rear VMS wall. One exhaust port must be provided for each air intake port. All exhaust port openings must be screened to prevent the entrance of insects and small animals.

An aluminum hood attached to the rear wall of the VMS must cover each air intake and exhaust port. All intakes and exhaust hoods must be thoroughly sealed to prevent water from entering the VMS.

#### 7. Over Temperature Safety Shutdown

The VMS must automatically shut down the LED modules to prevent damaging the LEDs if the measured internal cabinet air temperature exceeds a maximum threshold temperature.

All electronic setup and adjustments for the display must be enabled from the ground mounted equipment cabinet.

#### 8. Communication between Sign Controller Cabinet and VMS Sign Case

VMS Communications Cable - Communication between the VMS sign case located equipment and the VMS sign controller, installed in the ITS controller cabinet, must be by fiber optic interfaces. Electrical conductor data/control cable circuits must be used as an interface or transmission media for interconnection between the ground control cabinet and the sign case equipment. Support must be provided for other standard communication media including Fiber and Category 6, IEEE 802, Ethernet copper cables.

The Contractor must install fiber optic cable including termination facilities and system compatible transceivers as incidental to the VMS equipment. The VMS manufacturer must pre-terminate and test the fiber optic cable which runs between the VMS sign and the VMS sign controller.

Electrical Transient Protection - All electrical connections internal to the VMS sign case where an electrical conductor of any type is terminated, must be provided with one or more transient noise suppression devices. The devices must be of the multiple strike type and must not require resetting/replacement when exposed to 100 times the electrical current capacity of the electrical conductor/terminator which it is fitted to as a protection device.

A bonding conductor, connected to earth ground must be the common voltage drain point for each of the transient protection devices. The device and grounding must suppress the transient to a level of no more than the normal operating voltage / current of the connected circuit. No transient

protection device may be bonded to any Direct Current connection point or to the ITS Electrical Service neutral.

The metal case of each sign must also be electrically bonded to the sign support structure at all mounting bolt locations using non-corrosive tin-plated copper compression connections to form an effectively terminated ground path to the electrical grounding conductors. The bonding system must consist of an electrical bond wire or properly prepared electrical contact plate. The sign structure, in turn, must also be electrically bonded to earth ground through a grounding electrode array which provides a measured minimum of 5 ohms to true ground conductivity. The VMS manufacturer must provide a VMS system compatible with the OSS structure and the utility grounding requirements.

Other items that are required to form and install complete and fully functional VMS assemblies that are not described in this document and that may be Manufacturer specific, they must be identified as to function and supplied with the VMS assemblies. These items must be included in the products provided for in the contract and must be considered incidental to the work. The VMS sign must be furnished and installed as a complete, fully functional system and must include all accessories and incidentals required to operate in coordination with the existing NYCDOT RTMC based VMS network systems.

## 9. Displays

Displays must be full matrix. Signs must be designed to provide proper spacing between the lines of text for the characters and lines of text as indicated herein. Sign displays must have sufficient borders on all four sides for display clarity and background contrast. Characters and/or shapes must be formed on a matrix comprised of rows and columns forming a continuous line.

Pixel columns and rows must be perpendicular. Individual characters must be formed by pixels within a character matrix defined by the character font. All upper-case characters must be displayed over the entire height of each character matrix. Character to character spacing must be determined by the font selected by the user. Lower case letters that extend below the bottom of the line base must be proportional in location and style per line. Both fixed and proportional spaced fonts must be supported.

Legibility distance must be defined as the legibility of displays from a specified distance and must include daylight hours with direct sunlight on the face and behind the VMS and must meet Federal MUTCD section 2L.03 message legibility requirements: 18" character message must be legible from a minimum distance of 800 feet in normal daylight conditions

Each sign must be able to display a message composed of any combination of the following characters and shapes:

- All upper-case letters A through Z
- All lower-case letters a through z
- All decimal digits 0 through 9
- A blank or space
- Punctuation marks shown in the brackets [ . , ! ? - ' " / ( ) ]
- Special characters shown in brackets [ # \$ % & \* + < > ]
- 32 or more special graphics shapes editable by the user.

The sign displays must support text and graphic displays in accordance with the requirements of the NTCIP communication protocol specified and must be downward compatible with the Department's implemented NTCIP V1 protocol. All fonts must be editable through the vendor's maintenance laptop and from the RTMC's ATMS software. Ensure VMS fonts have character dimensions that meet the MUTCD, Section 2L.04, paragraph 08.

Ensure that full-color signs can display the colors prescribed in the MUTCD, Section 1A.12. The display must allow for multiple fonts, 3 line or more display formats. Support Static, Flashing and multiple page messages (minimum 3-Page messages). On/Off flashing times and message times are adjustable in 0.1 seconds increment.

The VMS must meet NEMA TS-4 standards for inter-line and inter-character spacing.

The time required to clear any display and post any new display must not exceed 500 milliseconds.

The VMS must conform to the following display characteristics requirements unless otherwise approved by the Engineer

Messages must be configured with priorities and durations. Messages must be activated by the controller keypad, by an internal time-based schedule, or by events (e.g., power or communication loss can trigger a message) Light Emitting Diodes (LEDs)

All full color LED's provided for the manufacture of VMS must conform to the following requirements in addition to those above:

Red LEDs must utilize AlInGaP semiconductor technology and must emit red light that has a peak wavelength of 618-630nm.

Green LEDs must utilize InGaN semiconductor technology and must emit green light that has a peak wavelength of 519-539nm.

Blue LEDs must utilize InGaN semiconductor technology and must emit blue light that has a peak wavelength of 460-480nm.

Each color LED module must contain a minimum of 256 surface mount LED pixels, configured in a two-dimensional array. The pixel array must be a minimum of nine (9) pixels high by ten (10) pixels wide.

The distance from the center of one pixel to the center of all adjacent pixels, both horizontally and vertically, must be as directed by the Engineer.

The LED manufacturer must perform color sorting of the bins. Each color of LEDs must be obtained from no more than two (2) consecutive color "bins" as defined by the LED manufacturer.

The LED manufacturer will perform intensity sorting of the bins. LEDs must be obtained from no more than two (2) consecutive luminous intensity "bins" as defined by the LED manufacturer.

The various LED color and intensity bins must be distributed evenly throughout the sign and must be consistent from pixel to pixel. Random distribution of the LED bins will not be accepted.

The LED manufacturer must assure color uniformity and consistency on the LED display face within the 30 degree cone of vision. Inconsistent color shifts or intensity will be cause for rejection.

The sign board must automatically adjust the LEDs' intensity to be dimmer or brighter for optimum viewing as natural ambient light conditions change. And must include a manual override function in the control system.

#### 10. Pixels

Each light emitting pixel of an LED display must consist of a cluster of closely spaced LEDs. LED pixels must conform to the following requirements:

Pixels must be constructed with strings of LEDs. Each amber pixel must consist of the minimum number of LEDs per pixel determined by the VMS manufacturer to meet the minimum optical requirements and redundancy requirements of the NEMA

TS4 standard. LED power supply redundancy requirements must comply with Section "Power Supplies" herein.

Each color pixel must consist of a minimum of one LED for each color (Red, Green, Blue) LED power supply redundancy requirements must comply with Section "Power Supplies" herein.

Each pixel must illuminate a minimum of 33 candelas (for Type I) or 40 candelas (for Type II) with no more than 50% reduction in intensity at 15 degrees from center viewing angles. The average illumination of the display must be determined by measuring the display intensity within a square meter of display area. The intensity must be a minimum of 7,000 candelas per square meter for amber signs, measured through the polycarbonate display face sheeting and determined from three measurements taken for the furnished display/sign.

Where multiple strings are employed, the failure of an LED within one string of a pixel must not affect the LED(s) in any other string or pixel.

Drive current must be within the manufacturer's specifications to provide the overall sign intensity as specified herein.

All LEDs used in a sign must be from one luminous intensity bin from which the dimmest LED does not emit less than 70% of the luminous intensity of the brightest LED when driven with identical currents.

Pixels must be driven with direct-drive pulse width modulation. Maximum pulse amplitude must not exceed 30 mA, and must be adjustable in 1mA increments.

Materials used in the fabrication of LED clusters must contain UV light inhibitor and must be designed for direct exposure to sunlight.

Each LED pixel must be operated over the environmental range defined herein.

LED pixels must be mounted perpendicular to the display panel.

All full color LED pixels provided for the manufacture of VMS must conform to the following requirements in addition to those above:

Each pixel must contain the quantity of discrete LEDs needed to output white colored light at a minimum luminous intensity of 12,000 candelas per square meter when measured using a photometric meter through the VMS front face panel assembly.

Each pixel must also be capable of displaying amber colored light with a minimum luminous intensity of 7,000 candelas per square meter when measured using a photometric meter through the VMS front face panel assembly.

Pixel modules must be replaceable from outside of the enclosures for non-walk-in sign enclosures without the use of tools. Display modules must be interchangeable between signs employing the same display technology and pixel pitch furnished by a VMS manufacturer.

The number of pixels making up the character width must vary by character and must be in accordance with the characters described herein but the number of characters per line must be based on the default font sizes.

## 11. Serviceable Parts

LED driver boards must be quickly replaceable and hot swappable within the sign housings for all signs. Plug-in locking connectors must be provided on each pixel driver board for all connections.

Connectors must be held in place with positive retaining latches. Spring clips, screws or any connector requiring tools to engage/disengage must not be used. Driver boards must be easily removable for service/replacement with simple hand tools.

Driver boards and all electronic circuit boards installed in the sign housing must be thoroughly coated with an acrylic or urethane conformal coating for enhanced moisture resistance.

## 12. Multiple Sign Control Maintenance Positions

The VMS controller operation must be accessible from both the ground (or pole) mounted VMS Signal controller and also from inside the VMS sign case, through a remote control panel / local communication port, mounted within in the VMS sign case, for maintenance. If a separate remote control panel is not deployed, a laptop computer interface, provided by others, must be Ethernet RJ-45 or Fiber Optic based. The activation and use of the remote sign control facilities must not require disconnection of the normal communication service between the ground (or pole) mounted VMS sign controller and the VMS sign case connections or removal of any equipment.

The VMS must be provided with the necessary hardware and software to support the ITS Network and Local Network interfaces to the ground (or pole mounted) VMS Signal cabinet, and the in-sign case interface/remote. The VMS sign control panel (ITS Signal ground cabinet mounted) or an Ethernet interface (located in the VMS sign case) must have the same capabilities as a maintenance laptop computer connected to the local port of the ground or pole mount VMS controller and must be used for field maintenance.

## 13. VMS Controller

### General

Each sign must include a VMS sign controller which must be installed in a ground mounted ITS controller cabinet (or pole mounted cabinet) FURNISHED as part of another pay item.

Provide One (1) Licensed copy of the VMS Software compatible with the Department's laptop computer, the laptop to VMS controller cables and any other material equipment needed to program the VMS controllers.

Provide a maintenance technician interface to the VMS controller installed in the ground mounted ITS Signal cabinet. A sign case remote connection must also be provided by the VMS manufacturer and must be retained by the Department.

VMS Sign Controllers must be installed to operate over the single mode, ITS fiber-based communication system between the Central Control (e.g. NYCDOT RTMC) facility and the VMS sign locations.

Provide communications ability to operate with alternate communication media, include at minimum:

- 10/100 Ethernet over SM ITS fiber and/or Cat 6 copper through an industrial duty managed ethernet switch supporting secure layer 2 and layer 3 network communications (NYCDOT ITS SM FIBER IS THE PREFERRED MEDIA)
- Dedicated DSL or dial-up telephone lines include a RS-232 interface modem
- Wireless or Cellular modems
- Short haul microwave

Communications interfaces must be configured per the Department's local / regional office IP and serial addressing requirements.

Contractor must coordinate with the Design Engineer, the Department's Signals technical staff and the Department's existing ITS System Integrator to obtain site-specific parameters and assure point to point communications are integrated and tested.

VMS Controllers must be a microprocessor based intelligent unit, capable of controlling and monitoring all of the variable message signs and associated functions described in the Contract.

Controllers must be integral units with their own power supplies. Controllers must be housed in durably fabricated aluminum enclosures. The controller's volume and power supplies must not exceed two cubic feet and must be shelf type.

VMS Sign Controllers must be 19-inch EIA rack mountable.

Memory – VMS Controllers must have both permanent and changeable memory. Permanent memory must be in the form of plug-in EEPROM integrated circuits, or an approved equivalent flash memory technology, and must contain the operating system/application software/firmware.

Changeable controller memory must be in the form of NVRAM integrated circuits (or other approved backup) that retains the data in memory for a minimum of one year following a power failure. Changeable memory must contain all of the changeable operating parameters including the set-able data defined by the NTCIP V01 and V02.35 requirements.

#### 14. Data Transmission Requirements

Data Ports - Each VMS controller must have a minimum of: one 10/100 Ethernet technician local support port, one 10/100 Ethernet Central Control, one EIA-232 serial communication control port, one TIA/EIA-232E communication technician support port and one 10/100 Ethernet (fiber) or dedicated data over RS-485 to the sign case interface port.

Each of these ports must be permanently labeled: Local Ethernet, Central Ethernet, Local RS-232 and Sign Data.

The maintenance technician local ports must be located on the front of the controller easily accessible and quickly identifiable for the maintenance technician's use.

The RS-232 port must be capable of operation at all industry standard speeds up to 115Kbps and must support all of the Subnet Profiles defined in NTCIP Requirements herein.

A maintenance technician must be able to directly connect a laptop computer to the identified LOCAL ports via a direct Ethernet or serial cable and carry out all central computer "CENTRAL" port operations.

The controller must meet all other communication requirements, such as checksum and parity, specified by NTCIP standards.

All data ports must be permanently labeled.

VMS Controller Addressing - A configurable IP Network Address must be assigned to each controller. The Contractor and the Sign Manufacturer's technicians must in coordination with the Design Engineer, the Department's Signal technical staff and a VMS communications representative in the Regional Traffic Management Center assure the VMS controllers are addressed per the approved project IP network schema.

Clock - The VMS controller must contain a computer-readable time-of-year clock with a lithium battery or other equivalent backup. Back up must keep the clock operating properly for at least 10 years without external power. The clock must automatically adjust for daylight saving time and leap year through upgradeable software. The clock must be set by the sign controller's microprocessor and must be accurate to within 1 minute per month.

Local Interface Functions - The controller must support a local user interface that allows the maintenance technician to perform VMS configuration, maintenance/diagnostics and repair activities as well as compose, display, and blank messages through a laptop connected to one of two local ground/pole mount controller ports, or the interface panel internal to the sign case or sign case local port that will accommodate a laptop computer. The local user interface must allow display of the available display test patterns on the sign, blank the current message and perform

available canned tests (pixel, power supply, etc.). The display of other messages or VMS configuration changes must require an optional password. The default password must be coordinated/selected by the Department. The password must not be echoed on the operator interface when entered by the user. Controllers must be initially shipped with the default password selected by the Department. The sign controller must store a minimum of three (3) user configurable passwords.

Controller Software - The VMS controller software must support NTCIP V02.35 and must be backward compatible with the Department's current Version 1 of the NTCIP communication protocol and the functions and features contained within the Department's existing RTMC central control software. Local controllers must be configurable by the user to define the number of LED display elements (pixels) to fail either in an "Off" or "On" state before the controller blanks the sign.

Display Presentation - The VMS sign controller must control the driver modules to create the desired displays on the sign. At a minimum, the signs must be able to display the characters as described in the respective NTCIP supported protocols. Space allocated to each character must be proportional to the character's true width and a non-proportional spacing as commanded by the supported character fonts.

Display Selection - The controller must implement the display, per the logic defined in the VMS Messages – VMS messages must be programmable by users from a local user interface device as well as from remote locations by a computer running vendor-furnished VMS application software such as Vanguard®.

#### 15. Dimming System

Each VMS must be provided with a VMS display intensity control system. The system must contain a minimum of three VMS sign case installed photo-electric sensors to measure light levels striking the sensor and report the levels within 255 increments to the display control system. The sensors must be positioned so that one sensor must monitor the light levels on the front of the VMS, a second sensor must monitor the light striking the back of the VMS and a third sensor must monitor the light striking the top of the VMS (Ambient light).

The intensity levels reported to the VMS control system must be processed so that the highest light level sensed must be considered the controlling level and must be compared against a table containing a minimum of 160 configurable intensity levels.

The intensity levels must be configurable from the local or the central control points.

Each intensity level must consist of an entry and exit value that allows the overlapping of levels to prevent display fluctuation with minor ambient light changes and flickering of the display during intensity level changes.

The dimming system must conform to the following requirements:

The photocells must be enclosed within the sign case with transparent covered windows that allow light to pass from the exterior of the sign case to the surface of the photocell. The photocell must be vibration and temperature extreme hardened to withstand NEMA TS-4 Environmental conditions for the life of the VMS. The sensors must be capable of being continually exposed to direct sunlight without impairment of performance.

The sensors must be immune to transient voltages and vibration. The connections to the sensor must be through solder connection plugs and sockets with interlocking latches. The wiring must be tinned, stranded copper conductors in shielded cables with electrical noise protection.

Dimming Levels - Manual and automatic dimming modes must be provided enabling the user to select the desired mode of operation. The dimming system must be capable of selecting a minimum of 160 levels from the sensed ambient light table containing values from 0 to 255 light levels in increments of 10. The set points for each of the ambient light levels must be set by user adjustable software.

Interference - The dimming circuit and sign power system must have electrical devices installed to minimize RFI noise generated by the sign both on the power line and radiated by sign circuitry.

Temperature Limit - A configuration table must be provided that allows the definition of internal VMS sign case temperatures and a corresponding reduction in display intensity in concert with the fan forced ventilation to prevent an over temperature from damaging the LED display. It must be assumed that the primary fans are operating, and the temperature is rising to or above the first high temp threshold. A high temperature table must be configurable and logic provided to reduce the power applied to the pixels upon meeting pre-configured temperatures. The table must match a power level to a threshold temperature and reduce the power to the pixels to the next power level or a percentage of the power level commanded.

Upon reduction of the temperature below the current reduction level the logic must increase the power to the LEDs consistent with the pre-configured threshold. In cases where the thermal calculation indicates that a primary and secondary fan system is warranted, the primary fans must start as the initial reaction to reaching the threshold temperature. If temperatures rise to the next threshold, the secondary fans must start.

Whenever internal VMS sign temperature continues to increase beyond the programmed safety limit, the sign controller must issue reduction in power applied to the pixels. This power reduction process must be repeated until the temperature fails to increase beyond the threshold established for the power applied or the display is turned off completely. The configuration table must provide limits that are constrained within those operable limits defined by the sign manufacturer's specifications.

In conformance with the NTCIP communication protocols, over temperature alarms/alerts and display status reports must be provided to the RTMC and/or the local connection.

## 16. Diagnostics and System Failures

Failure Reports - The sign controller must detect VMS status reports and have them available from a poll from central RTMC or the Local Connection. Sensors must be provided in the VMS controller hardware and firmware that must detect abnormal or current status data. Data acquired by the VMS controller must be provided to the central system.

Diagnostic Tests - Upon command from a remote computer, the controller must test the electrical operation of all drivers and the over current, under current and normal current of the pixels. The field controller must analyze the pixel current and determine whether the pixel is operating with "normal", "under", or "over" current and must communicate the results using standard NTCIP data objects.

Power Interruptions - The contents of the controller's memory must be preserved by backup power during power interruptions and the controller must resume operation automatically when power is restored. Upon recovering from a power interruption, the controller must report to the central computer that it has recovered from a power-interruption.

## 17. VMS Software Rights

The VMS Manufacturer must provide a non-assignable software use license in support of the VMS on an exclusive perpetual basis.

The Contractor must provide documentation to the Engineer of any incompatibility identified between the central control software and the VMS firmware/software to the level that a resolution plan may be formulated.

It is anticipated that there may be minor incompatibilities between the VMS manufacturers' NTCIP V02.35 implementation and that of the City's NTCIP V02.35 central implementation.

The Manufacturer's VMS software must be made compatible with the City's NTCIP V02.35 or higher version central RTMC control implementation, at no additional cost to the City.

The VMS controller manufacturer must provide (1) licensed copy of the controller software (Vanguard or engineer approved equivalent) with each VMS sign controller furnished for this project. The software must be the latest published edition and must be backwards compatible with other software V02.35 or higher instances in use at the RTMC Server location.

#### 18. Communication Requirements

The interfaces between the ITS controller cabinet and the VMS sign case must support fiber connection media (or other media types as approved by the Engineer), other existing media types and media as defined in the VMS hardware requirements herein.

The communication requirements must be in conformance with the City's most recent implemented NTCIP V01 (or higher) communication protocol and the NTCIP V02.35 communications protocol. The NTCIP V02.35 must be downward compatible with the Department's NTCIP V01 communication protocol.

Communications Protocol - Each NTCIP Component covered by these project specifications must implement the most recent version of the standard that is at the stage of Recommended (or higher) as of the date of the Contract Notice to Proceed, (NTP) including any and all Approved or Recommended Amendments to these standards as of the NTP date. It is the ultimate responsibility of the sign manufacturer to monitor NTCIP activities to discover and confirm any more recent NTCIP national standard documents.

NTCIP – Each Variable Message Sign assembly and communications controller must be compliant with the latest version of the NTCIP Standards, as defined by AASHTO, ITE, and NEMA.

#### 19. Subnetwork Profiles

Each serial or modem port on each NTCIP device must be configurable to support both NTCIP 2101 and NTCIP 2103. Only one of these profiles must be active at any given time. Serial ports must support external dial-up, leased line, radio, cellular and fiber optic modems.

Each Ethernet port on the NTCIP device must comply with NTCIP 2104 protocol.

The NTCIP device(s) may support additional Subnet Profiles at the manufacturer's option. At any one time, only one subnet profile must be active on a given port of the NTCIP device. All response datagram packets must use the same transport profile used in the request. The NTCIP device must be configurable to allow a field technician to activate the desired subnet profile and must provide a visual indication of the currently selected subnet profile.

#### 20. Transport Profiles

Each serial or modem port, on each NTCIP device, must be configurable to support both NTCIP 2201 and NTCIP 2202.

Each Ethernet port on the NTCIP device must comply with NTCIP 2202.

The NTCIP device(s) may support additional transport profiles at the manufacturer's option. Response datagrams must use the same transport profile used in the request. Each NTCIP device must support the receipt of datagrams conforming to any of the supported transport profiles at any time.

21. Application Profiles

Each NTCIP device must comply with NTCIP 2301 and must meet the requirements for Conformance Level.

An NTCIP device may support additional application profiles at the manufacturer's option. Responses must use the same application profile used by the request. Each NTCIP device must support the receipt of application data packets at any time allowed by the subject standards.

The following conformance groups within the NTCIP 1203:1997 and Amendment 1 standard must be supported with the values defined in these tables. For the purposes of this specification NTCIP 1203 Conformance Statements must be considered mandatory, except where noted.

Each NTCIP device must support all mandatory objects in all optional conformance groups that are required herein. All optional objects listed in these specifications as mandatory, must be supported.

VMS CONFORMANCE STATEMENTS

Conformance Group	Reference	Conformance Requirement
Configuration	NTCIP 1201:1996	Mandatory

2.11.2.1.1.7	lampTestActivation	NTCIP 1203:1997	-	1..3

MULTI Tags - Each NTCIP device must support the following message formatting MULTI tags. The manufacturer may choose to support additional standard or manufacturer-specific MULTI tags.

MULTI Tag	Description
f1	Field 1-time (12 hr)
f2	Field 1-time (24 hr)
f8	Field 8- day of month

MULTI Tag	Description
f9	Field 9-month
f10	Field 10-2 digit year
f11	Field 11-4 digit year
fl (and /fl)	Flashing text on a line-by-line basis with flash rates controllable in 0.1-second increments.
Fo	Font
jl2	Justification- line-left
jl3	Justification- line-center
jl4	Justification- line- right
jp2	Justification- page- top
jp3	Justification- page- middle
jp4	Justification- page- bottom
mv	Moving text
nl	New line
np	New page up to 5 instances in a message (i.e. up to 6 pages/frame in a message counting first page)
pt	Page times controllable in 0.1-second increments

## 22. Documentation

NTCIP documentation must be provided on a CD-RW OR DVD-R ROM media and must contain ASCII versions of the following Management Information Base (MIB) files in Abstract Syntax Notation 1 (ASN.1) format:

The relevant version of each official standard MIB modules referenced by the device functionality.

If the device does not support the full range of any given object within a standard MIB Module, a manufacturer specific version of the official standard MIB Module with the supported range indicated in ASN.1 format in the SYNTAX and/or DESCRIPTION fields of the associated OBJECT TYPE macro. The filename of this file must be identical to the standard MIB Module except that it will have the extension “.man”.

A MIB module in ASN.1 format containing any and all manufacturer specific objects supported by the device with accurate and meaningful DESCRIPTION fields and supported ranges indicated in the SYNTAX field of the OBJECT-TYPE macros.

A MIB containing any other objects supported by the device.

Manuals – INSTALLATION, Operation and Maintenance Manuals (IOM) that detail the operation of the system must be furnished as part of the VMS System.

User Manuals must be provided for each system component - The User Manuals must fully identify the system's, or the component's, features and functions and give detailed step-by-step instructions on how to operate and adjust the system or component and how to respond to system or component failures.

Operations Manuals must be provided and must, as a minimum, include:

Detailed description of normal system operation.

Detailed description of VMS sign control software operation and procedures. The manuals must clearly describe all functions supported by the sign control software. The software operations manual must be written for beginner personal computer users who are not familiar with detailed computer operations and terms. It must contain step-by-step procedures with examples containing pictures of the computer screens.

Error and alarm handling procedures, including recovery from communications failures.

System start-up and shutdown procedures.

Detailed procedures on how to create, save, transmit and display messages, including all graphic features, back-up and restore message libraries, sign configurations, error and event logs.

The sections covering system administration features such as password management, setting access levels, installing, backing-up and restoring the sign control software must be contained in a separate "System Administration Operations Manual."

Detailed Maintenance Manuals must be provided and must, as a minimum, include:

Maintenance Manuals must provide diagnostic routines for trouble shooting the system from the system computer and from each sign location. The manuals must contain theory of operation, specifications, installation instructions, mechanical details, detailed alignment procedures, schematic drawings, photographs or drawings detailing component layouts, parts lists, including manufacturer's part numbers, and troubleshooting procedures for repair/replacement of all component parts, including printed circuit board replacement.

The Maintenance Manuals must include, but not be limited to:

All the requirements for the User and Operations manuals.

Detailed description of procedures for modifying the LED VMS, sign controller and sign control software configuration settings.

Description of operating procedures and troubleshooting procedures for each subsystem. This must include step-by-step field and bench troubleshooting procedures to isolate and repair faults, as well as normal waveforms and test voltages.

System message and configuration editing back-up and restore procedures, including procedures for changing any messages stored in non-volatile memory. Hard copy listing for all non-volatile or similar memory devices used in the equipment. The Contractor must also supply complete instructions for the hardware and software equipment that must enable NYCDOT to change, add and delete messages stored in non-volatile memory.

The Contractor must provide "As Installed" color-coded interconnection wiring diagrams (IWD), for both "factory" and "field." VMS Equipment wiring and all circuit board schematic diagrams indicating "factory" and "field" wiring. This must include drawings showing the physical location of each component, as well as logic diagrams and stage-by-stage explanation of the circuit theory for each circuit board.

Provide complete nomenclature and commercial manufacturer and part numbers of all replacement parts, including current prices, listing of spare parts initially provided, and a second source of supply where applicable, cross-referenced as to component designation.

Each manufacturer's product data sheet must be annotated to clearly identify product or part.

Each product manufacturer's printed operating and maintenance instructions.

Provide list(s) of recommended cleaning agents, maintenance procedures and schedules.

Provide list(s) of recommended test and service equipment, including manufacturer's name, address, and model number.

Three (3) copies of each IOM manual must be furnished with each VMS. The IOM manuals are in addition to the system training manuals required to be provided during formal orientation courses for City staff. All manuals of each type must be identical and must be printed bound originals, not reproduced photo copies.

Options and components identified in any manual, which are not furnished with the VMS System supplied, must be redacted or marked "NOT USED".

The IOM manuals must consist of sturdy, white hard cover, 3 ring binder with clear removable title sheet and spline covers. The IOM must include a printed table of contents, reinforced, printed tabbed dividers and an index section.

The IOM manuals must be provided with a table of contents clearly itemizing the catalog.

Software Documentation - For all custom application software necessary to operate the VMS, the Contractor must provide NYCDOT with the software source code, and compiler necessary to compile it. The Contractor must also demonstrate the compiling, linking, and loading of the source code as part of this test.

### 23. Acceptance Testing – Factory Acceptance (FAT)

The factory acceptance test will use the NTCIP Exerciser, Trevilon's N-Tester, Intelligent Devices' Device Tester for NTCIP, or other testing tools, approved by the Engineer. If the manufacturer implements any vendor-specific Multi tags, the VMS system must provide meaningful error messages formatted within the NTCIP Standard DMS MIB 2.7.1.1.1.20 DMS MULTI OTHER ERROR DESCRIPTION whenever one of these tags generates an error.

The VMS manufacturer must prepare and submit a detailed, NTCIP based, factory acceptance test plan (FAT) to the Engineer for approval, a minimum of Ninety (90) days prior to scheduling NTCIP acceptance testing.

NTCIP acceptance testing will be performed at one of the VMS manufacture factory test locations, under this contract. Testing will be performed at the VMS manufacturer's or an Engineer approved test agency's facility. There must be no additional cost to the City, should the Engineer elect to have the Engineer and/or Engineer's staff, witness the sign manufacturer's FAT testing.

Specification or Standards Interpretation Resolution - If the Engineer or VMS manufacturer discovers an ambiguous statement in these specifications or in the standards referenced by this procurement specification, the issue must be submitted to the Engineer, the VMS manufacturer or the NTCIP DMS Working Group for resolution. If the DMS Working Group fails to respond

within 90 days, the Engineer must provide an interpretation of the specification for use on the project.

#### 24. Commissioning & Testing

Factory Design Approval Tests (FAT) - The Factory Design Approval Test must be performed on complete VMS sign assemblies. While performing these tests, a test set must be used to issue commands to the VMS sign controller, to verify that each sign remains operational throughout the test.

The following tests must be performed as part of the design approval test, in addition to those specified in the General Requirements:

**Power variation:** Test the sign with the line voltage at the maximum, minimum and nominal specified values. Using a power interruption meter, at each of these voltages interrupt the power for 0.1 sec five times. Repeat test for a 0.5 second interruption and for a single 1 second interruption.

**Transient immunity:** Using a calibrated transient generator, set to the following conditions:

**Amplitude:** 300 volts +5 percent, positive and negative polarity

**Peak power:** 5000 watts

**Repetition:** One pulse every other cycle moving uniformly over the full wave in order to sweep once every 3 seconds across 360 degrees of line cycle.

**Pulse rise time:** 500 ns.

**Power line surge:** Discharge a 25 uF capacitor charged to plus and minus 2000 volts applied directly across the incoming AC line at a rate of once every 10 seconds. Perform the test 10 times for each polarity. The unit must be operated at  $120 \pm 12$  VAC.

**Temperature:** All functional operations of the VMS equipment must be successfully performed under the following conditions and in the order specified below:

The equipment must be stabilized at 0 degrees Celsius. After stabilization at this temperature, the equipment must be operated without degradation for two (2) hours.

The equipment must be stabilized at 62 degrees Celsius. After stabilization, the equipment must be operated without degradation for two (2) hours.

The equipment must be subjected to temperature shock of 17 degrees Celsius per hour, during which time the relative humidity must not exceed 95%. The equipment must be operated without failure during and after the temperature shock.

**Relative Humidity:** All equipment must meet its performance requirements when subjected to temperature and relative humidity of 43 degrees Celsius and 95%, respectively. The equipment must be maintained at this condition for 48 hours. At the conclusion of the soak, within 30 minutes, the equipment must meet all of its operational requirements.

**Vibration:** The VMS equipment must show no degradation of mechanical structure, soldered components, plug-in components or satisfactory operations in accordance with the manufacturer's specification after being subjected to the following vibration test:

The equipment must be secured to the head of suitable electro-mechanical shaker in the vertical, lateral, and longitudinal planes, respectively.

The object of the test is to vibrate the equipment in each of the three (3) mutually perpendicular axes, in accordance with the following parameters:

Amplitude:	2.0 mm "Double Amplitude" (peak to peak)
Linear Acceleration (g's):	5 maximum
Linear Velocity;	Approx. 190 mm/s
Frequency:	40 Hz
Duration:	Five (5) minute dwell in each axis

If the VMS equipment fails any design approval test, the design fault must be corrected and the entire design approval test must be repeated.

All deliverable equipment must be modified, without additional cost to the NY City Department of Transportation, to include all design changes required to pass the design approval tests.

### Factory Demonstration Tests

Immediately following Design Acceptance Testing and prior to shipping of any project VMS signs, the manufacturer must perform a factory demonstration test on each sign. Factory Demonstration Tests must test the full functionality of a matched set consisting of sign, sign controller, central control, VMS software, maintenance software and selected media communications between each component

Using a notebook computer, loaded with test software provided by the sign manufacturer, demonstrate the following connected to the input (remote) port of the VMS controller:

Exercising of all sign functions, as defined in this document.

Simulation common error and fault conditions to demonstrate the detection and reporting of the status conditions defined in this document. Including, but not limited to, open cabinet door(s), bad pixels, bad drivers, illegal message, and illegal character.

With the fiber optic communications interface installed, remotely operate the VMS sign, via a simulated IP communications network.

Demonstrate VMS operation through the local port of the sign controller.

Test Demonstrate compliance with the NTCIP specific standards to be implemented, applicable conformance groups, applicable data objects and their associated range values that are pertinent to the implementation of this specification.

Two (2) required VMS Test cases are included within this specification, the manufacturer must provide in writing a complete set test criteria and test scripts, to be submitted as part of the required test and commissioning plan submission for this section. The Factory Test cases must be submitted for approval with 120 days after the NTP.

Water Test - A water spray test must be performed to demonstrate that the enclosure meets the requirements of the NEMA 3R rating for the VMS housing. At the completion of the test, the Contractor and the Department must verify that the inside of the housing is dry. The water spray test is conducted at the manufacturer's facility, it must also be repeated, once each sign is rigged in place and the Contractor has completed the rough in of all conduits, supports and other sign case penetrations.

If any VMS fails any factory demonstration test, the fault(s) must be corrected and the entire factory demonstration test must be repeated. All deliverable equipment must be modified, without additional cost to the NYSDOT, to include any changes required to complete the factory demonstration tests to the satisfaction of the Design Engineer and/or the Department.

Pre-Installation Tests – VMS Prior to the rigging and erection of each VMS sign, the Contractor must also conduct a pre-installation VMS and operational test, at its facility or at a local indoor storage facility, approved by the Department. The Pre-Installation tests must be scheduled &

conducted by the Contractor, no more than Thirty (30) days prior to the date of each VMS sign being rigged into place.

The Contractor must include the on-site services of the VMS manufacturer's factory technical representative, who must conduct each of the field inspection and test programs.

On-Site tests must include a visual inspection of each sign to verify that the sign has not been damaged in shipment or storage. Conduct an inspection and a VMS pre-functional demonstration of the operation of each sign, using the manufacturer's sign test software.

Pre-Installation tests must be witnessed by the Resident Engineer and the Department.

### Stand Alone Tests

Conductor Insulation, continuity and ground tests must be performed:

Continuity Test - each electrical circuit must be tested for continuity

Ground Resistance Test - all circuit grounding systems when completed in place must be measured to document a resistance to ground of not more than shown in the table below as determined in the following manner:

Temporary connect a 10 Amp load between the AC+ side of the equipment cabinet fuse and the ground system. It should be assured that the power company applied voltage is 120 VAC at the time of the test.

Disconnect the power company AC neutral from the ground system.

Connect the voltmeter between the power company AC neutral and the ground system

Controller Type	Voltmeter Reading (V)	Equivalent Resistance (Ohms)
2 Phase	20	2.0
Model 170	20	2.0
All others	20	2.0

If the voltmeter reading is higher than the appropriate voltage shown in the above table under 10 Amp load, the grounding system has an unacceptable resistance to ground. Additional grounding, including electrical bonding of underground metallic conduit, may be necessary in order to meet the requirements of this test.

Insulation Resistance Tests - insulation resistance tests, at 500 VDC for 1-minute durations must be made on each circuit, between each of the circuit conductors and ground. The insulation resistance must not be less than 10 mΩ on each circuit. The Contractor must take extra care to assure each conductor under test is lifted and not connected to any active components.

Site Acceptance Tests (SAT) - After installation and prior to integration of the VMS into the Department's ITS / RTMC system, the Contractor must perform an operational stand-alone SAT test on-site for each VMS sign & controller.

The SAT test, as a minimum, must demonstrate operation of each VMS sign using the test software running on a notebook computer (provided under a separate bid item). The VMS manufacturer's factory service technician must conduct the SAT tests, at each project location and must certify to the Department, all of the VMS equipment has been correctly installed,

wired, is fully commissioned and is ready for use in all aspects, based on the VMS performance tests

Using a notebook computer, loaded with test software provided by the sign manufacturer, the Contractor, with the manufacturer's technician on site, must demonstrate the following functions, while connected to the input (remote) port of the VMS ITS controller:

Exercising of all sign functions as defined by the approved Contract and a formal Testing – Commissioning plan, to be prepared and conducted by the VMS manufacturer.

Simulation of error and fault conditions to demonstrate the detection and reporting of the status conditions defined in this document and the approved test plan documents. Error tests must include, but are not limited to, open cabinet door, bad pixels, bad drivers, bad power supply, illegal message, loss of (remote) communications and illegal character.

With the notebook computer, loaded with the test software provided by the sign manufacturer, demonstrate operation through the local port of the sign controller.

Do not display any VMS test messages to traffic without prior written approval of the Department's RTMC regional traffic controller.

Continuous Operation Test (COT) - Each new VMS sign must be operated for thirty (30) consecutive days in an automated display test mode, that must continuously exercise the entire VMS display system. At the end of the thirty (30) day test period, operation of each sign, using the test software, must again be demonstrated to the City's RTMC operator(s). If any failure occurs during the COT period, the sign must be repaired or replaced by the manufacturer and another thirty (30) day COT test repeated. A scripted test pattern, must be submitted to and approved by the Design Engineer. Only NYCDOT approved sign messages and patterns must be displayed during the COT tests. COT test patterns must exercise all pixels in each display.

Remote Site Verification Test (RSAT) - The Contractor and the sign manufacturer's factory service technician(s) must conduct an end-to-end communications and performance test, for each VMS system. The tests must be scripted and designed to verify and demonstrate the remote operations of each VMS sign, by operating each from the Regional Traffic Monitoring Center (RTMC) The RSAT test must demonstrate Remote operations and status using the City's ITS Fiber communications network. Tests must operate each sign via their respective Fiber Managed switches and each VMS controller's Remote communication port. The Remote Site Verification Test (RSAT) must be scheduled to be conducted immediately following the successful test and acceptance of the COT tests, for each sign system.

Integrated System Acceptance Tests (IST) - Following the satisfactory completion of the Site Verification Tests (TMC), a complete system functional acceptance test must be performed. Testing must meet the requirements of the Contract documents and the sign manufacturer's field acceptance inspection and onsite testing requirements. At the successful completion of each sign's IST test, to the satisfaction of the Department, the system will be accepted, and the Manufacturer's warranty and the contractor's guaranty period must commence.

## 25. Test Software

Test software that will run on a notebook computer under the Windows 10 operating system designed to emulate the central software must be provided. This software must permit downloading and uploading of the commands and responses through the Ethernet, or the RS-232 port of the VMS controller. Three copies of the most recent released test software on CD-ROM or DVD-R media must be delivered to the Design Engineer.

## 26. Orientation

Upon completion of the work and at a scheduled time to be submitted to and approved by the Engineer, a program of formal orientation must be provided by a qualified instructor to City personnel.

A formal, written orientation plan must be submitted for approval along with a printed workbook type employee orientation manual, which must also be submitted for review and comment by the Engineer.

The orientation program must be designed to orientate City craft workers and supervisors in the proper operation and maintenance of the VMS equipment. City personnel must receive orientation comparable to the equipment manufacturer's factory training, provided orientation for each type of VMS equipment and software.

The minimum orientation must be: two (2) Eight (8) hour days of formal in classroom delivered orientation sessions on VMS software, configuration, VMS device remote (RTMC) and local operations.

Provide two additional (2) days of on-site (field) delivered sessions. Include the sign manufacturer's hand on instruction on VMS equipment failure modes, site sign operation, configuration troubleshooting, VMS sign controller functions, common failure and service issues and VMS sign – control device maintenance and repairs.

#### 27. Guarantees and Warranties

The VMS manufacturer must guarantee that all equipment including all parts thereof are of the first quality throughout and equipment provided complies in all respects or is fully equal to standards called for in the specification, and provide a guarantee certificate.

The Contractor must provide a warranty that all equipment, workmanship and all parts thereof, against any defects of workmanship, construction and materials, for a duration of Eighteen (18) months, beginning after the date of the Engineer's acceptance of each sign's RIST test.

A warranty certificate must be supplied for each component from the designated manufacturer's field service director indicating the acceptance for warranty start and end dates of the major component warranties.

The guarantee certificate must name NYC DOT as the owner and the recipient of the services. NYC DOT must have the right to transfer this product and service to other private parties or governmental agencies who may be contracted to perform overall VMS systems oversight or maintenance.

#### **METHOD OF MEASUREMENT:**

This work will be measured as the number of LED FULL COLOR VARIABLE MESSAGE SIGN assembly satisfactorily furnished, installed, tested, and made fully operational in accordance with the plans, specifications and directions of the Engineer and the NYCDOT.

The unit price bid must include the cost of furnishing all labor, materials, orientation, commissioning, configurations and equipment necessary to satisfactorily complete the work.

#### **BASIS OF PAYMENT:**

The Unit price bid must also include the cost of all required labor, materials, equipment, commissioning and testing and incidental expenses required to furnish, install, integrate, align and demonstrate each LED FULL COLOR VARIABLE MESSAGE SIGN system.

Payment for the ITS Signal cabinets, conduit, data and power wiring must be included under separate contract items.

Payment will be as follows for each LED FULL COLOR VARIABLE MESSAGE SIGN System:

Twenty – Five percent (25%) of the bid price for each LED FULL COLOR VARIABLE MESSAGE SIGN System will be paid when the Contractor certifies the equipment is ready for delivery and installation at the Project site. (After Submissions, Shop Drawings, Test Plans, Factory Acceptance Tests, Equipment Delivery)

Twenty – Five percent (25%) of the bid price for each LED FULL COLOR VARIABLE MESSAGE SIGN System will be paid when the VMS Sign equipment has been rigged in, installed and approved at the Project site. (After VMS equipment installation, and wiring to the ITS signal cabinet, including Water Tests, Stand Alone and SAT Tests).

Twenty – Five percent (25%) of the bid price for each LED FULL COLOR VARIABLE MESSAGE SIGN System will be paid when the VMS Sign equipment has been approved at the completion of the COT and RSAT tests is accepted by the Engineer.

Fifteen percent (15%) of the bid price for each LED FULL COLOR VARIABLE MESSAGE SIGN System will be paid when the LED FULL COLOR VARIABLE MESSAGE SIGN equipment has been approved, at the completion of the Integrated Systems Testing (IST), once approved by the Engineer and the NYCDOT.

Ten percent (10%) of the bid price for will be paid when the contractor submits Record Drawings, Maintenance & Operations Manuals, provides orientation plan, orientation documents and conducts formal orientation on the LED FULL COLOR VARIABLE MESSAGE SIGN operations to the City employees. The City must have beneficial use, acceptances, guarantee and warranty documentation for approval of this payment.

**END OF SECTION**

## SECTION PK-ESCR 691 – BRICK MASONRY/PRECAST CONCRETE FOR DRAINAGE STRUCTURE

**PK-ESCR 691.1. WORK:** Under this item, the Contractor shall build or provide **BRICK MASONRY/PRECAST CONCRETE FOR DRAINAGE STRUCTURE** in accordance with the plans, specifications, and directions of the Engineer.

### **PK-ESCR 691.2. MATERIALS:**

Brick: Brick Masonry drainage structures shall not be permitted for this contract. All structures shall be precast concrete. Brick shall be only utilized for manhole cover and catch basin grate adjustments, as directed by the Engineer.

Mortar: The mortar shall be composed of one (1) part of Portland cement and a maximum of two (2) parts fine aggregate, with not more than five percent (5%) of the cement content of hydrated lime putty.

Precast Concrete: All new park drainage and sanitary structures shall be precast concrete. The Contractor and the Contractor's precaster shall be responsible for the structural design, to meet H-20 loading, of any new structures to meet the rim and invert elevations indicated on the details located in Appendix A of the contract drawings. Payment shall be made on a cubic yard basis of precast concrete at the same price bid for brick masonry. No additional payment shall be made for structural design of precast structures.

Ladder Rungs for Precast Concrete Drainage Structures: Ladder rungs for precast drainage structures shall be constructed of copolymer polypropylene plastic, as manufactured by M.A. Industries Peachtree City, GA, or approved equal. The cost for these ladder rungs shall be included in the cubic yard unit cast for precast structure.

### **PK-ESCR 691.3 INSTALLATION:**

Laying Bricks: Bricks shall be satisfactorily wet when being laid, and each brick shall be laid in cement mortar so as to form full bed, end and side joints at one operation. The joints shall not be wider than three eighth inch (3/8"), except when the bricks are laid radially, in which case the narrowest part of the joint shall not exceed one quarter inch (1/4"). The bricks shall be laid in a professional manner true to line and wherever practicable, the joint shall be carefully struck and pointed on the inside. Brick work shall be laid with a satisfactory bond and as it progresses, shall be racked back in course, unless otherwise permitted.

Cold Weather: In freezing weather, bricks shall be heated sufficiently to remove all ice and frost. No brickwork shall be laid or relaid when the temperature is below 25° Fahrenheit..

**PK-ESCR 691.4. PROTECTION:** All fresh brickwork shall be carefully protected from freezing and from drying effects of the sun and wind and, if required, shall be sprinkled with water at such intervals and for such time as may be directed. Brickwork shall be protected from injuries of all sorts, and all portions which may become damaged or may be found defective shall be repaired, or if directed, to be removed and rebuilt to the satisfaction of the Engineer.

**PK-ESCR 691.5. LIABILITY:** When using precast concrete drainage structures, the Contractor accepts full and complete responsibility for the location of knock-out holes that allow for the entrance of drainage pipes. All pipe invert dimensions shall be verified in the field by the

contractor prior to ordering precast drainage structures. No additional compensation shall be paid by the city of any discrepancies that may occur.

**PK-ESCR 691.6.      SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

Shop Drawings showing all invert elevations must be submitted for approval, prior to use of the precast drainage structures.

**PK-ESCR 691.7.      MEASUREMENT AND PAYMENT:** The quantity of **BRICK MASONRY/PRECAST CONCRETE FOR DRAINAGE STRUCTURE** to be paid for under this item shall be the number of **CUBIC YARDS** furnished and laid complete in the work, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **CUBIC YARD** of Brick Masonry/Precast concrete furnished and incorporated in the work complete, and shall include the cost of furnishing all labor, material, equipment, including ladder rungs as necessary, and incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

No deductions will be made for spaces occupied by pipes entering drainage structure.

Any frames, covers, etc. if necessary shall be paid for separately under their respective contract item.

Excavation shall be paid for separately under its own contract item.

**END OF SECTION**

**SECTION PK-ESCR 600 – SAND BASE FOR UTILITY LINE**

**WORK:** Under this item, the Contractor shall furnish and install **SAND BASE FOR UTILITY LINE** as a cushion for utility piping/conduit beds or to fill abandoned and/or discontinued manholes, catch basins, and other structures etc., all in accordance with the plans, specifications, and directions of the Engineer.

**MATERIAL:** Sand shall meet the requirements of select granular fill as described in the NYCDEP Standard Sewer and Water Specifications.

Sand shall consist of clean, hard, durable, uncoated stone particles, free from lumps of clay and all deleterious substances.

Sand shall be so graded that when dry, one-hundred percent (100%) shall pass through a one-quarter inch (1/4") square opening sieve; not more than thirty-five percent (35%) by weight shall pass a No.50 sieve and not more than ten percent (10%) by weight shall pass a No.100 sieve.

Sand may be rejected for this class if it contains more than ten percent (10%) by weight of loam and/or silt.

**MEASUREMENT AND PAYMENT:** The quantity of **SAND BASE FOR UTILITY LINES**

to be paid for shall be the number of **CUBIC YARDS** placed in accordance with the plans, specifications and to the satisfaction of the Engineer.

The price bid shall be a unit price per **CUBIC YARD** of sand furnished and installed in place and shall include all labor, materials, and equipment necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

**END OF SECTION**

**SECTION PK-ESCR 601 – WET CONNECTION – 6" DIA.**

**SECTION PK-ESCR 602 – WET CONNECTION – 8" DIA.**

**SECTION PK-ESCR 609 – WET CONNECTION – 4" DIA.**

**WORK:** Under these Items, the Contractor shall make a **WATER TAP** or **WET CONNECTION** of the size shown on the plans, to the existing water main in accordance with the plans, specifications, and directions of the Engineer. The Contractor shall obtain a permit from D.E.P, saw cut pavement, prepare opening, abandon, disconnect, cap, or plug any existing water service from the existing water main in accordance with the Rules of the Bureau of Water Supply, arrange D.E.P. installation, arrange inspection (where required) prior to backfilling and restore street pavement.

**PERMITS:** The Contractor shall employ a licensed Certified Master Plumber to obtain a permit from the New York City Department of Environmental Protection, Bureau of Water Supply and Wastewater Collection, Tapping Division, hereinafter referred to as D.E.P. All permits for work requiring opening or obstructing a street and/or sidewalk shall be contingent on approval by the Department of Transportation (DOT) or the agency having jurisdiction to authorize such opening. All permits shall be displayed at the work site.

**MATERIALS & EXECUTION:** The Contractor shall notify the Engineer three (3) days prior to intended date of work. Water taps and wet connections to a City Main shall be inserted or installed only by D.E.P employees, unless waived by D.E.P. The Contractor shall set up appointment with D.E.P and pay all D.E.P. fees under this item. The Contractor shall erect proper barricades and all other protective devices in strict compliance with City ordinances governing the protection of the public. All materials, excavation, saw cutting, and restoration of street pavement (where applicable) shall be performed in accordance with D.E.P. and New York City Department of Transportation requirements. Size of excavation for water tap or wet connection shall be in accordance with the requirements of NYC Department of Environmental Protection "Rules governing and Restricting the Use and Supply of Water" Appendix Table #4 and Detail Figure No.1. If subsurface conditions prevent a plumber from making an excavation of the dimensions indicated therein, the plumber shall immediately notify the Engineer. The Engineer, in turn shall notify D.E.P., who has the discretion to determine whether the dimensions should be changed, and what the new dimensions for the excavation shall be. Where excavations are required to be larger than Appendix Table #4, such excavation shall be paid separately under the item "Unclassified Excavation". All excavations shall be made safe by sheeting and bracing, where depth of excavation exceeds five (5) feet. Hand excavate as necessary to protect underground utilities. Arrange for inspection by D.E.P. (where necessary) prior to compacting backfill in six (6") inch lifts and street pavement restoration.

**INSPECTION:** Where required by D.E.P., the connection shall be inspected prior to backfilling.

**MEASUREMENT AND PAYMENT:** For each **WATER TAP** or **WET CONNECTION** made in accordance with the plans, specifications, directions of the Engineer and provisions of the D.E.P. permit, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Water Tap or Wet Connection made and shall include

furnishing all labor, material, equipment, and incidental expenses including obtaining permits, saw cutting, gooseneck connection for copper water tubing, unclassified excavation and/or hand excavation as required, all fees to D.E.P., backfilling and compaction to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation beyond what is required by D.E.P. Appendix Table #4, Cap water line, Maintenance and protection of traffic, Restoration of Street Pavement, water line beyond the gooseneck connection, and Temporary Sheeting (where applicable) shall be paid under separate contract items.

**END OF SECTION**

## **SECTION PK-ESCR 603 – RPZ AND WATER METER W/REMOTE AND HEATED ENCLOSURE**

**WORK:** Under these Items, the Contractor shall provide all labor, materials and equipment necessary or required to furnish and install **RPZ and WATER METER W/ REMOTE and HEATED STRUCTURE** of the size indicated, including all piping, fittings, valves, test tee, and test tee valve, if required and other incidentals necessary to complete plumbing work and connection to water service and water feed lines in accordance with the plans, specifications, and directions of the Engineer. RPZ (Reduced Pressure Zone Valve) device is also known as a Backflow Preventer. Water Meter W/ Remote Reader shall include Water Meter, Strainer and Automatic Reading & Billing System (also known as Remote Reading Device). All factory plumbing work is to be done by a Licensed Plumber. All on-site plumbing work is to be done by a New York City Master Licensed Plumber. The Contractor shall comply with all rules, regulations, and requirements of all regulatory agencies having jurisdiction. In addition, the Contractor shall furnish extra material to D.P.R. Maintenance and Operations Borough Shop as specified under the heading INCIDENTAL MATERIALS.

**MATERIALS:** Unless otherwise provided for herein, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

**Concrete:** Concrete shall conform to the provision of the Standard DPR Item for “Controlled Concrete”. All concrete shall have a honed finish. The precast concrete shall be well cured, shall be dense and shall have good edges.

**Reinforcement:** Steel reinforcement shall conform to the provisions of the D.P.R. standard items for “Steel Bar Reinforcement” and “Steel Fabric Reinforcement”. Reinforcement shall be placed as shown on the drawings.

**Below Grade Water Piping:** Cement lined ductile iron pipe and fittings shall conform to the provisions for Ductile Iron Pipe contained in these Specifications.

**Above Grade Water Piping:** Flanged Ductile Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges shall conform to the requirements of AWWA C115-05. 12-in. and smaller flanged joints with ductile-iron flanges shall be rated for a maximum working pressure of 350 psi.

RPZ: The RPZ (Reduced Pressure Principle Backflow Prevention device) shall be Febco Model #825YD OSY, or approved equal. Size shall be as indicated above and on the Contract Drawings. The RPZ shall meet the requirements of American Society of Sanitary Engineers (ASSE) Standard 1013 & the American Water Works Association (AWWA) Standard Code 506-78.

The RPZ shall consist of two independently operating center guided, spring loaded, "Y" pattern check valves and one hydraulically dependent differential relief valve. Mainline valve body and caps including relief valve body and cover shall be bronze. Check valve and relief valve components shall be constructed so they may be serviced without removing the valve body from the line. Shut-off valves and test cocks shall be full ported resilient seated ball valves.

EFFECTIVE JAN. 4TH, 2014, ALL PROPOSED INSTALLATIONS/ REPAIR OF BACK FLOW PREVENTER (BFP) DEVICES AND ALL ASSOCIATED VALVES TO BE UTILIZED ON ALL DOMESTIC DRINKING WATER SERVICES FOR HUMAN CONSUMPTION, MUST BE LEAD-FREE IN COMPLIANCE WITH THE AMENDED FEDERAL LAW, SAFE DRINKING WATER ACT (SDWA).

**OS&Y Gate Valve:** Outside Stem and Yoke valves shall be mechanical joint, iron body, resilient seated gate valves conforming to AWWA C509-01.

## Heated Insulated Enclosure:

### A. Materials of Fabrication

1. Enclosure Construction
  - a. Mill finish aluminum, ASTM B209.
  - b. Gel coated fiberglass.
  - c. Polyethylene
2. Insulation shall be polyisocyanurate foam: spray applied, frothed in place or board stock laminated between two (2) layers of fiberglass mat. The insulation shall have the following properties.
  - a. Dimensional stability – less than 2% linear change.
  - b. Comprehensive strength – 20 P.S.I.
  - c. Water absorption – less than 1 % by volume.
  - d. Density – nominal 2.0 lbs. per cubic foot.
  - e. Flame spread – 25
  - f. Service temperature minus (-) 100 degrees F. to +250 degrees F.
  - g. Insulation thickness shall be 1” for enclosures up to 2” I.P.S. and 1.5” for enclosures 2.5” I.P.S. and above with a minimum “R” factor of eight (8).
  - h. Adhesive applied board stock or insulation materials secured by mechanical fasteners shall be cause for rejection.
3. Structural members shall be aluminum or fiberglass.
  - a. No wood or “particle board” shall be allowed in assembly.

### B. Components

1. The roof, walls and access panels shall be constructed of the specified materials in the specified thicknesses.
2. Multi-sectional enclosures shall fit together with the overlapping “tongue and groove” joints and be secured internally with mechanical fasteners.
3. The enclosure shall be securely attached to a concrete base or fiberglass pad with anchor brackets installed on the interior of the enclosure, through the flange base of the enclosure itself or through a stainless steel anchor hinge.
4. Access panels shall be provided to allow easy access for operations and maintenance without removal of the enclosure.
5. Access panels shall be secured using a four (4) pronged interior latch with a padlock through the handle, on the multi-sectional aluminum enclosures. Fiberglass enclosures shall be secured by using a padlock in conjunction with a stainless steel hasp and staple that has been attached to the enclosure during manufacturing.
6. Drain openings shall be designed to remain closed except when the device is discharging water. Openings shall be designed to accommodate the maximum discharge of the backflow prevention device and shall protect against the intrusion of the wind, debris and animals.

### C. Heating Equipment

1. Heating equipment shall be furnished and designed, by the manufacturer of the enclosure, to maintain an interior temperature of +40 degrees F with an exterior/outside temperature of minus (-) 30 degrees F and a velocity of 15 mph.

- a. The factory assembled heating equipment shall be ETL, UL or CSA certified.
- b. Field assembled heater parts shall be cause for rejection.
- c. Heating equipment shall be installed above the level of Double Check Valve discharge, when possible.
- d. Electric power source for heat and accessories shall be G.F.I. protected, with 18" minimum clearance from receptacle base to top of slab.

D. Mounting Hardware

- 1. Mounting hardware shall be corrosion resistant and provided with the enclosure by the manufacturer.
- 2. Assembly fasteners shall be corrosion resistant.
- 3. Anchor hardware shall be adjustable up to 2" vertical to accommodate uneven concrete slabs.

E. Manufacturer

- 1. The enclosure manufacturer shall be a company specializing in the manufacturing of such enclosures with at least fifteen (15) years of successful field experience and be A.S.S.E. 1060 Seal Certified.
- 2. The heated insulated enclosure shall be as manufactured by Hot Box® or approved equal.

Water Meter:

A. General

- 1. The meter shall be a fire service compound meter type as manufactured by Neptune.
- 2. All meters furnished shall be manufactured by a registered ISO 9001 quality standard facility. Acceptable meters shall have a minimum of five years of successful field use. All specifications meet or exceed the latest revision of AWWA C703.

B. Type

- 1. Meters shall consist of a combination of an AWWA class II in-line horizontal axis turbine for measuring high rates of flow and a positive displacement bypass meter conforming to AWWA C700 for measuring low rates of flow. An automatic valve shall direct the flow from the bypass meter to the mainline meter as flow rates increase and back to the bypass meter as flow rates decrease. All components of the meter assembly shall be both UL (Underwriter's Laboratory) listed and Fm (Factory Mutual) approved for fire service use.

C. Capacity

- 1. The capacity of the meters in terms of normal operating range, maximum rate for continuous use, maximum loss of head, and extended low flow capability is as follows:

Size	Normal operating range (gpm)	Maximum rate for continuous use (gpm)	Maximum loss of head @ max rate (psi)	Extended low flow (gpm)
8"	2 - 4000	4000	10.5	1

D. Size

1. The size of meters shall be determined by the nominal size (in inches) of the opening in the inlet and outlet flanges. Overall lengths of the meters shall be as follows:

Meter size	Laying length
8"	53"

E. Case and cover

1. The meter body, strainer body, and valve body shall be fabricated steel with a coating of fusion-bonded epoxy both internally and externally.
2. The meter body shall be welded to the valve body effecting a uni-body construction with the valve. The strainer outlet and meter inlet shall be connected by a Style 77 Victaulic or other UL listed/fm approved grooved coupling. The meter assembly shall have a rated working pressure of 175 psi.
3. The meter cover shall be cast of a no-lead high copper alloy containing a minimum of 85% copper. An arrow indicating direction of flow shall be cast in raised characters on the cover. The cover shall have a rated working pressure of 175 psi. The cover shall contain a calibration vane for the purpose of calibrating the turbine measuring element while in-line and under pressure. The calibration vane shall be mounted under the register that is attached in a tamper-resistant manner.

F. Strainer

1. Meters shall be supplied with a strainer designed and approved for the fire service use by UL and FM, and shall have a rated working pressure of 175 psig. The strainer shall be constructed of steel and coated with fusion-bonded epoxy. The strainer basket shall be constructed of AISI Type 18-8 stainless steel. The strainer shall contain a flushing port located near its bottom to facilitate easy cleaning.

G. External bolts

1. Meter cover bolts shall be made of AISI Type 316 stainless steel. All other bolts shall be zinc-plated steel or stainless steel.

H. Connections

1. Inlet and outlet flanges shall be round flanged per AWWA C207, Class D.

I. Registers

1. Registers shall be permanently roll-sealed, straight reading in gallons and cubic feet. Registers shall include a center-sweep test hand and low flow indicator. Registers shall be removable for replacement without interruption of the service line.

J. Register boxes

1. Register boxes and covers shall be of bronze composition. The name of the manufacturer and the meter serial number shall be clearly identifiable and located on the register box covers.

K. Register box sealing

1. The register box shall be affixed to the top cover by means of a plastic tamperproof seal pin that must be destroyed in order to remove the register.

L. Meter serial number

1. The meter serial number shall be on the meter flange or cover and on register box covers.

M. Unitized measuring element

1. A UME is a complete assembly, factory calibrated to AWWA standards that includes the cover, registers, and a turbine measuring element. It shall be easily field removable from the meter body without the requirement of unbolting flanges.

N. Intermediate gear train

1. The intermediate gear train shall be directly coupled to the turbine rotor and magnetically coupled to the register through the meter cover. The gear train shall be housed within the turbine measuring chamber. All moving parts of the gear train shall be made of a self-lubricating polymer or AISI Type 316 stainless steel for operation in water.

O. Bypass meter

1. The bypass meter shall be of a positive displacement, nutating disc type. The bypass meter may be piped on the left or right side of the assembly. The bypass meter shall conform to AWWA C700 standards in the following sizes:

Mainline size	Meter size
8" & 10" mainline	2" bypass meter

P. Automatic valve

1. The automatic valve shall be of the spring-loaded, knuckle-joint type. All internal linkage parts shall be stainless steel. A vulcanized rubber disc on a stainless steel clapper plate shall seal against a bronze seat. The springs shall be AISI Type 18-8 stainless steel.
2. The disc meter shall include a self-actuated valve that directs flow through the disc meter at low flow rates, and through the turbine meter at high flow rates. At high flow rates, the self-actuated throttle valve shall restrict the flow through the disc meter to minimize wear.

Q. Registration accuracy

1. Registration accuracy over the normal operating range shall be 98.5% to 101.5%.

R. Remote capability options

1. Type A — all meters shall be equipped with encoder remote registers per AWWA C707, and meet all AWWA C703 performance standards.
2. Type B — all meters shall be equipped with generator remotes per AWWA C706, shall meet all AWWA C703 performance standards, and shall include all hardware. Two-wire cable is not to be included in quoted meter prices.

S. Acceptable meters shall be Neptune HP Protectus® III or approved equal.

Remote Reader:

- A. The Remote Reader shall be Neptune Proread ARB System ® as manufactured by Schlumberger Industries Water Division or Remote Meter Read (RMR) System® as manufactured by ABB, or approved equal. The Remote Reader shall be a self-contained encoder register metering system designed to obtain remote simultaneous water meter registration directly from the register odometer. The metering information shall be obtained

through a remotely located receptacle using a compatible data capture system. The system shall consist of the Encoder Meter Register and Remotely Mounted Receptacle.

1. Encoder Meter Register: Shall be direct mounted with encoded odometer wheels and digital data stream. Batteries or pulses are not allowed.
2. Registration: The register shall provide a six digit visual registration at the meter. The unit shall, in a digital format, simultaneously encode the four or six most significant digits of the meter reading for transmission through the remotely located receptacle. (The most significant meter registration digits are defined as those digits on the register number wheels that denote the highest recorded values of water consumption.) A quick indexing mechanism shall be employed which shall prevent ambiguous reading. The register shall have a full test sweep hand or dial divided into gradients of down to 1/100th of the units of registration. Register test rings shall be available for shop testing. The units of registration shall be in U.S. gallons. These units shall be clearly designated on the face of the register. The month and year of manufacture and other identification information shall appear on the face of the register. The register shall employ a leak detection indicator on the dial face. Registers using pulse generation or conversion of pulses to digital output is not permitted. Batteries shall not be required.
3. Mechanical Construction: Materials used in the construction of the register shall be compatible with the normal water meter environment and with each other. The unit shall possess a copper bottom and incorporate a rubber O-ring seal. Where indicated, pit set registers must be provided with moisture protection for all internal components when operating under flooded pit conditions. The register and mounting base shall be integral components and should not allow for disassembly. The register shall be attached to the meter case by a bayonet attachment. Fastening screws or nuts shall not be required. A tamperproof plastic seal pin shall be used to secure the register to the main case. No special tools shall be required to remove the register. The register head must swivel 360 degrees without removing the seal pin to facilitate visual reading and ease of wiring. The register shall be removable from the meter without disassembling the meter body and shall permit field installation and/or removal without taking the meter out of service. Provision shall be made in the register for the use of seal wires to further secure the register. Terminal screws must be accessible on the register for transmission wire connection to the remote receptacle or future connections to a telephone system.
4. Electrical Construction: The materials employed for contacts and connectors shall inhibit corrosion and shall suffer minimal effect from environmental conditions to which they are exposed. The number wheels used in the register assembly shall be provided with spring-type bifurcated metal contacts to ensure a high probability of information transmission.  
  
Connection shall be made to the register by three screw-type terminals, sonically inserted into the register top. Access to the terminals shall be available to all models of register. A port cover shall be provided to cover the terminals after they have been wired. Digitally formatted data transmitted from the register shall incorporate a check sum character to verify correct information transmission and integrity. Data errors shall be indicated by the reading equipment.
5. Meter Reading Information: The encoder register shall provide up to six digits of information to the reading equipment. A ten digit identification number shall also

be provided with each reading. The utility shall have the option to reprogram the internal register identification number an unlimited number of times. The encoder register must have the capability to provide additional custom information to the reader. This information shall be programmed (and reprogrammed at any time) by the utility. Information on programming the register, equipment needed, and encoder meter reading output shall be provided with each proposal.

6. Remote Mounted Receptacle: Remote receptacle shall provide a communication link for the transmission of information from the register.
  - a. Mechanical Construction: Where indicated, a remote receptacle must be provided for attachment to a pressure treated wood post. The materials employed shall be corrosion resistant, resist ultraviolet degradation, unaffected by rain or condensation, and compatible with rugged service and long life.
  - b. Electrical Construction: The receptacle construction shall incorporate the function of a cable clamp or strain relief. Design of the unit shall be such that it provides for mechanical and electrical connection between the receptacle and interrogation equipment.
  - c. Cable: The connecting cable shall be of the two-wire conductor type in a sheath which shall be abrasion and moisture resistant. Each conductor shall be color coded.
7. PVC Conduit for Remote Mounted Receptacle: PVC conduit for all buried installations shall be heavy-wall Type 40 polyvinyl chloride conduit and shall conform to NEMA and ASTM Standards (NEMA TC-6 & TC-9, ASTM D2244 & 2412) and be UL listed in conformance with the National Electric Code for the use intended. Conduit, fittings and cement shall be produced by the same manufacturer. Material must have a minimum tensile strength of 8,600 psi. Conduit shall be Carlon Type DB or approved equal.

Electrical Work: Contractor to provide four specification grade GFI receptacles with weatherproof in use covers in cast iron FD junction boxes for the heaters. Heaters and junction box to be mounted 18 inch minimum above slab evenly spaced throughout the enclosure. Conduit and wire size shall be as shown on the site plan, all wire within the enclosure shall be USE-2 with EPR insulation and conduit shall be PVC coated rigid galvanized steel.

#### **INSTALLATION:**

The Contractor shall install supports for the water meter at the height shown on the Contract Drawings. The meter shall be set so that the dial faces upward and is horizontal. The dial shall not be more than three (3) feet above the floor. The encoder register shall be installed on meter as per manufacturer's instructions.

The remote reader receptacle shall be installed cover as per the manufacturer's directions and recommendations on a 4"X4" pressure treated post set in a concrete footing. The Contractor shall allow sufficient Water Meter Remote Reader cable slack for possible relocation of the remote reader.

The DCV shall be installed as shown on the Contract Drawings and per manufacturer's instructions.

Heated Enclosure: Enclosure shall be assembled and mounted on a concrete pad according to the manufacturer's instructions and Contract Drawings. The Enclosure shall be installed plumb, level and square.

**Connections:** The Contractor shall connect the water piping as shown on the Contract Drawings for complete and satisfactory operating unit to the satisfaction of the Engineer. Connections shall be made to The Water Meter by coupling union or flange union on both inlet and outlet ends of the meter and bored for sealing with holes not less than one-eighth (1/8) of an inch in diameter - solder connections are not permitted. Connections to the DCV shall be as shown on the Contract Drawings and per manufacturer's instructions.

**SUBMITTALS:** Provide Product Data including Manufacturer's catalog sheets and specifications for each item.

**Shop Drawings:** The Contractor shall submit Shop Drawings when required, in accordance with the requirements of the S-Pages. A shop drawing is required showing installation of the complete DCV assembly, water meter, piping, pipe supports, and the precast concrete structures.

**Catalog Cuts:** The Contractor shall submit Catalog Cuts of the DCV, water meter, meter reading system, strainer, valves, and all connected piping for approval prior to installation.

**Certifications:** The Contractor shall be responsible for obtaining all certifications necessary to comply with the NYC Bureau of Water Supply & Wastewater Collection, Cross Connection Control Unit & the NYS Dept. of Health regulations for Double Check Valves (after installation), including Certification by Backflow Prevention Device Tester; Certification of Master Plumber responsible for the Double Check Valve installation, and a Professional Engineer's or Registered Architect's Certification that the installation is in accordance with the approved Plans.

The Contractor shall prepare and submit copies of N.Y.S.D.O.H. Form Gen. 215B to the NYS Dept. of Health & NYC Cross Connection Control Unit of the Bureau of Water Supply & Wastewater Collection. NYCDPR shall receive copies in triplicate of all such submittals. The Engineer. In summation, the Contractor shall be held completely responsible to ensure that all Work is in compliance with N.Y.S. D.O.H., Form Gen. 215B.

**MEASUREMENT AND PAYMENT:** For the furnishing and installation of **EACH** size of the **RPZ and WATER METER W/ REMOTE AND HEATED ENCLOSURE** indicated complete and in place, including installation of all plumbing work, certifications, etc., in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** size RPZ, Water Meter w/ Remote and Heated Enclosure and shall include the cost of all labor, materials, equipment, and any incidental expenses necessary, including certifications, all plumbing work within the structure, connection to the water service at the structure; piping, valves, RPZ device, Water Meter, heated enclosure, heaters, electrical receptacles, etc. all in accordance with the plans and specifications, to the satisfaction of the Engineer.

In addition, the Contractor shall deliver INCIDENTAL MATERIALS as outlined above to D.P.R. Maintenance and Operations Borough Shop No additional payment shall be made for incidental materials. The Contractor shall include cost in the bid price.

**SECTION PK-ESCR 605 – 4” DIA. DUCTILE IRON CEMENT WATER PIPE LINE**  
**SECTION PK-ESCR 606 – 6” DIA. DUCTILE IRON CEMENT WATER PIPE LINE**  
**SECTION PK-ESCR 607 – 8” DIA. DUCTILE IRON CEMENT WATER PIPE LINE**  
**SECTION PK-ESCR 608 – 10” DIA. DUCTILE IRON CEMENT WATER PIPE LINE**

**WORK:** Under this Item, the Contractor shall furnish and install CEMENT LINED DUCTILE IRON WATER PIPE, of the size shown, in accordance with the plans, specifications and the directions of the Engineer.

**MATERIAL:** Pipe shall be Ductile Iron Pipe meeting requirements of A.N.S.I. Specifications A-

21.51 and A.W.W.A. Specifications C-151. Water pipe shall be Class 52 for 3" and 4" diameter and Class 56 for all pipes greater than 4" diameter.

All pipe shall be cement-mortar lined in conformance with A.N.S.I. 21.4. The exterior surface of pipe shall receive a standard foundry coal tar dip coating. Cement Lined Ductile Iron Water Pipe shall consist of bell and spigot type Ductile Iron Pipe Tyton Joint sections with Field Lock Gasket Joints, similar or equal to that manufactured by the U.S. Pipe & Foundry Co., Birmingham, AL, and shall conform to the American National Standards Institute C151 and American Water Works Assoc. A21.51., Thickness Class 52 and better. Pipe shall be laid true to line and grade with bells upstream and shall have a full, firm and even bearing on a bed of broken stone, as shown in the details.

Dielectric fittings/flanges shall be used where there is connection between dissimilar metals. All elbows shall be rodded in accordance with the specifications of the Dept. of Environmental Protection, Bureau of Water Supply.

**CONNECTIONS:** The Contractor shall do all the work necessary to join the Ductile Iron Pipe to the existing water lines as shown on the plans. The cost for doing this shall be included in the unit price bid for this item.

**TESTS:** The Contractor shall not backfill over any pipe until ordered by the Engineer. The pipe system shall be tight and show no leaks when filled with water, sealed and subjected to an internal hydrostatic pressure of one-hundred twenty-five (125) pounds per square inch. Temporary caps shall be placed where required to permit making the tests where valves are not available. The tests shall be made in the presence of the Engineer.

**MEASUREMENT & PAYMENT:** The quantity of **CEMENT LINED DUCTILE IRON WATER PIPE** to be paid for under this item shall be the number of **LINEAR FEET** (laying length) of each size pipe, including fittings, furnished and incorporated, in accordance with the plans, specifications, and the directions of the Engineer.

The price bid shall be a Unit Price per **LINEAR FOOT** of laying length of Cement Lined Ductile Iron Water Pipe of each size shown, and shall include the cost of all labor, materials, and equipment necessary to complete the Work, including fittings, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Where fittings connect different sizes of pipe, the fittings shall be included in quantity measured for larger size.

Excavation and broken stone shall be paid for separately under their respective contract items.

**SECTION PK-ESCR 612 – GATE VALVE – MECHANICAL JOINTS – 8" DIA.**

**SECTION PK-ESCR 613 – GATE VALVE – MECHANICAL JOINTS – 10" DIA.**

**WORK:** Under these Items, the Contractor shall furnish and install **GATE VALVES - MECHANICAL JOINTS** of the sizes shown on the Plans, in accordance with the plans, specifications, and directions of the Engineer.

**GATE VALVES:** Shall be U.S Pipe Model # USP1-20 Mechanical joint ends (with accessories unassembled), or approved equal, with Non-rising stem (NRS), Meets or exceeds all applicable requirements of ANSI/AWWA C515 Standard, UL 262 Listed, FM 1120/1130 Approved, and certified to ANSI/NSF 61 & 372, Standard mechanical joint ends comply with ANSI/AWWA C111, Nominal 10 mils Pro-Gard® Fusion Bonded Epoxy coated interior and exterior surfaces. Epoxy coating meets or exceeds all applicable requirements of ANSI/AWWA C550 Standard,

Iron wedge, symmetrical & fully encapsulated with molded rubber; no exposed iron, Triple O-ring seal stuffing box (2 above the thrust collar and 1 below), 2" square wrench nut—open left or open right, 350 psig (2400 kPa/24 barg) maximum working pressure, 700 psig (4800 kPa/48 barg) static test pressure, UL Listed, FM Approved: 350 psig (2400 kPa/24 barg), Designed for potable water applications

EFFECTIVE JAN. 4TH, 2014, ALL PROPOSED INSTALLATIONS/ REPAIR OF VALVES TO BE UTILIZED ON ALL DOMESTIC DRINKING WATER SERVICES FOR HUMAN CONSUMPTION, MUST BE LEAD-FREE IN COMPLIANCE WITH THE AMENDED FEDERAL LAW, SAFE DRINKING WATER ACT (SDWA).

**OPERATING KEY:** An approved operating key of proper size for each valve shall be furnished by the Contractor except that the Contractor need not furnish more than two (2) keys for each size or kind of valve regardless of the quantity of valves called for in the Contract.

**SUBMITTALS:** Provide Product Data including Manufacturer's catalog sheets and specifications for each valve type. List type of valves, manufacturer's model number, and size for each service application.

**MEASUREMENT & PAYMENT:** The quantity of **GATE VALVES - MECHANICAL**

**JOINTS** to be paid for under these Items shall be the number of valves of each size, furnished and installed in accordance with the Plans and Specifications and directions of the Engineer.

The price bid shall be a unit price for **EACH** valve of each size, and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work in accordance with the plans, specifications, and to the satisfaction of the Engineer.

Excavation shall be paid for separately under its own item.

PARKS-267

## **SECTION PK-ESCR 614 – QUICK COUPLING VALVE AND VACUUM BREAKER WITH CHAMBER**

**WORK:** Under this item, the Contractor shall furnish all labor, materials, and equipment necessary or required to install a **QUICK COUPLING VALVE AND VACUUM BREAKER WITH CHAMBER**, including all incidentals, all plumbing work, connection to water service, and irrigation accessories in accordance with the plans, specifications, and directions of the Engineer.

### **MATERIALS:**

**CAST STONE CHAMBER:** The vacuum breaker chamber shall be constructed of reinforced cast stone and set in place on a concrete base, or as shown on the plans. The cast stone shall be manufactured by an approved manufacturer, having facilities for furnishing the quality of cast stone required.

The three-eighth inch (3/8") dia. reinforcing bars shall protrude three inches (3") beyond the bottom of the chamber. When the chamber is set in place, same shall be grouted to one inch (1") holes, which shall be provided in the bench base. Grout to base shall be 1:2 cement mortar.

All cast stone shall be made of the color and finish to match the approved sample. Cast stone shall have a honed finish. The stone shall be well cured, shall be dense, and shall have good edges. The cast stone shall be made of gray air entraining Portland Cement and crushed stone aggregate mixed in the proportions required to obtain a mixture of maximum density and a finished product of a color to be approved by the Engineer. The cement and aggregate shall be thoroughly mixed in a proportion of one (1) part Portland Cement to not over six (6) or less than four (4) parts of aggregate.

The aggregate shall be made by crushing selected pieces of stone to ensure uniform color and texture and shall be screened into at least three (3) sizes, the largest of which shall not exceed that which will pass a ring one-quarter inch (1/4") in diameter, furthermore, there shall be at least fifty percent (50%) of such size of aggregate that will not pass a one-eighth inch (1/8") ring. The various sizes shall used in the proportions necessary to give maximum density, all measured by weight.

Cast stone shall have a compressive strength of not less than three thousand (3,000) psi tested as cubes 2" x 2" x 2" of an age not more than twenty-eight (28) days and shall have an absorption not to exceed seven percent (7%) of the dry weight after being dried to constant weight at 150° Fahrenheit.

No chipped, broken or checked stone will be accepted. Checked stones are those showing fine hair cracks or checks on the surface.

**Color Admixture:** Cast Stone shall be integrally colored using pigment admixture, color shall be "Dark Gray" and as approved by the Engineer. The color admixture shall be a single component, pigmented, water reducing concrete admixture such as Chromix Admixture for color conditioned concrete as manufactured by L.M. Scofield Co., Douglasville, GA or approved equal.

Admixture shall be thoroughly and uniformly mixed into the concrete. Admixture shall comply with Uniform Building Code Standard No. 26-9, as evidenced by a Research Committee Recommendation from ICBO (International Conference of Building Officials).

### **PLUMBING:**

**SCOPE:** The Contractor shall furnish and install all pipe, fittings, valves, and other sundries to complete the plumbing for quick coupler and vacuum breaker.

**CONNECTION:** The Contractor shall connect the water lines as shown on the plan for a complete and satisfactory operating unit, to the satisfaction of the Engineer.

**WATER PIPING:** Water Piping shall be rigid hard temper type "K" copper tubing as shown on the plans meeting the specification for ASTM 888. Fittings shall be approved wrought copper and bronze solder -joint pressure fittings (ANSI B 16.22), Di-Electric fittings as required.

**JOINTS:** Joints shall be made by soldering, using 95-5 tin antimony solder.

**COUPLING VALVE AND KEY :**Quick coupling valve shall be solid bronze, bayonet type, locking yellow TuflTop, with a one (1") inch inlet size, Buckner Model No. QB44LRC 10, as manufactured by Storm Manufacturing Group, Inc., Torrance, CA, or approved equal. Corresponding coupling key shall be three quarter (3/4") inch inside diameter with a one (1") inch male thread, Buckner Model No. QB44K IO, as manufactured by Storm Manufacturing Group, Inc., or approved equal. One (1) key is required for each valve installed.

**VACUUM BREAKER:** Shall be of bronze construction, "FEBCO" Model No. 765, or approved equal, one-inch (1") pressure vacuum breaker with an engineered plastic bonnet.

**IRRIGATION ACCESSORIES:** Before any irrigation materials are accepted, they shall meet such tests as may be required to prove to the satisfaction of the Engineer that they are in proper working order and will do the work for which they are intended, in a satisfactory manner. The Contractor shall turnover the following items after testing to the satisfaction of the Engineer.

**Hose Swivel E11:** Hose Swivel E11 shall be bronze with one (1") inch female thread for coupler and three quarter (3/4") inch male garden thread for hose. Hose Swivel E11 must be manufactured by the same company as the Quick Coupling Valve & Key, and shall be Buckner Model HS-100 or approved equal. One required per site.

**Brass Garden Hose Adaptor:** Shall be a one (1") inch FPT, with a three-quarter (3/4") inch garden hose thread, Model # FM1076 as manufactured by George Taylor Brass and Bronze Works, Huntington, N.Y., or approved equal. One required per site.

**Siamese "Y" Connectors:** Siamese "Y" connectors shall be brass, with shut-off valves at each connection. Size shall be three quarter (3/4") inch by three quarter (3/4") inch. Two required per site.

**Nozzle:** Nozzle shall be a solid brass nozzle to fit a three-quarter (3/4") inch hose, Midsize #529 as manufactured by Gilmour, Chicago, IL or approved equal. One required per site.

**Brass Rose:** Rose shall be Brass, four (4") inches in Diameter with protective rubber guard and metric to inch hose thread converter, Model #5408, as manufactured by Dramm Corporation, Manitowoc, Wisconsin, or approved equal. One required per site.

**Extension Handle:** Extension handle shall be extruded aluminum tubing, thirty (30") inches long, with forged brass hose couplings and comfort hand grip, Model # 130-G, as manufactured by Dramm Corporation, Manitowoc, Wisconsin, or approved equal. One required per site.

**Shut-Off Valve:** Shut-off valve shall be brass with Teflon® seals and a hard chrome plated ball, Model #300, as manufactured by Dramm Corporation, Manitowoc, Wisconsin, or approved equal. One required per site.

**Sprinkler Head With Base:** Sprinkler head shall be brass and stainless steel impulse type mounted on a Rezimar wheeled base, six and one half inches (6 1/2') wide by nine inches (9") high, one and one half (1 1/2) pounds minimum weight for stability, with ergonomic grip and swivel coupling and a powder coated finish, to fit three-quarter (3/4") inch hose. Sprinkler head and base shall be "Pulsating Sprinkler" Model # 50260 as manufactured by Nelson, Peoria, IL or approved equal. Two required per site.

**Hose:** Hose shall be garden hose, three-quarter (3/4") inch diameter in four (4) fifty (50') foot lengths, with a burst pressure of 500 psi minimum, equipped with approved connectors. Hose

shall be "Flexogen" as manufactured by Gilmour, Chicago, IL or approved equal. 200 feet of hose required per site.

**Hose Reel:** Hose Reel shall be constructed of one (1") inch diameter steel frame, with heavy-duty ten (1") inch wheels. Cart and reel shall have a baked enamel finish and be capable of holding two hundred (200') feet of 3/4" hose. Hose reel shall be as manufactured by A.M. Leonard or approved equal. One required per site.

**Soaker Hose:** Shall be porous pipe constructed primarily of recycled rubber tires. Hose shall weep along its entire length. Hose shall be five eighth (5/8") inch diameter in fifty (50') foot coupled lengths. All fittings shall be nickel plated brass. Hose shall be No. 17010 ColorStorm Premium 50 Foot Soaker Garden Hose as manufactured by Dramm, or approved equal. 100 linear feet of hose required per site.

**Anchor Pins for Soaker Hose:** Shall be five (5") inch x one (1") U-shaped 11 gauge steel pins. Each package shall contain ten (10) pins. Two packages required per site.

**INSTALLATION:** The cast stone chamber shall be installed on a concrete pad in accordance with the Standard Details.

**Connections:** All field connections to be made by a Master License Plumber. All other plumbing work required to complete the installation, including making water supply connections to the Quick Coupler shall be done in the field. All parts shall be installed in such a manner as to facilitate removal for purposes of replacement. Water lines shall be pitched away from the quick coupler. Pockets in rigid piping that cannot be drained by gravity will not be allowed.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture.

**SHOP DRAWINGS:** The Contractor shall submit catalog cuts of the vacuum breaker and the quick coupling valve for approval.

**SAMPLE:** Before starting work, the Contractor shall submit, for approval of the Engineer, finished samples of the cast stone they propose to use to show the extreme range in color, finish, texture, and quality of the stone. Samples shall be marked with the name of the material, contract number, grade, finish, and producer's name. All cast stone used in the work shall be equal to the approved sample.

**MEASUREMENT AND PAYMENT:** For the construction and installation of a **QUICK COUPLING VALVE AND VACUUM BREAKER WITH CHAMBER**, complete with all

plumbing work in accordance with the plans, specifications and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Quick Coupling and Vacuum Breaker With Chamber and shall include the cost of all labor, materials and equipment necessary to complete the work, including reinforcing steel, cement, cast stone, color admixture, miscellaneous iron and steel, irrigation accessories, and all plumbing work and connections to water service within five feet (5') from the face of the Chamber, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Plug Valve, Valve Box, Excavation and Concrete shall be paid for separately under their respective contract items.

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>
PK-ESCR-614	Quick Coupling Valve and Vacuum Beaker with Chamber	EA

**END OF SECTION**

PARKS-270

## SECTION PK-ESCR 615 – FIRE HYDRANT WITH FENDERS

**WORK:** Under this Item, the Contractor shall furnish and install **FIRE HYDRANT WITH FENDERS** in accordance with the plans, specifications, and directions for the Engineer.

**WORK INCLUDED:** The Contractor shall employ a licensed plumber to install a new DEP-approved fire hydrant, steel pipe fenders and concrete pad as shown on the plans and as directed by the Engineer. Work shall include all necessary excavation, backfill, blocking, bracing, and broken stone for hydrant drainage. Hydrant lateral pipe, shut-off valve, valve box, and fittings shall also be paid for under this item. Wet connection and pipes to connect to the existing water main will be paid for separately.

**CODE AND REGULATION:** In accordance with the New York City Building Code §1702.17 27-948, there shall be at least one fire hydrant (city or private) located within two hundred and fifty (250') feet of a building. The hydrant shall be supplied by at least an eight (8") pipe, and the domestic water supply may be connected to this private supply provided a shut-off valve is installed in a curb box in the domestic supply within six (6') feet of the hydrant shut-off valve.

**MATERIALS:** All materials and installation shall conform to DPR Standard Detail and to the requirements set forth by the New York City Bureau of Water Supply, Department of Environmental Protection (D.E.P.).

HYDRANT: All hydrants installed shall be a two-piece "Breakaway" hydrant, Types S2-LP or D2-LP, as shown on BWS Standard Drawing Nos. 43250-Z or 43142-Z, respectively. Hydrant shall be the "A.P. Smith Hydrant" as manufactured by U.S. Pipe and Foundry, Birmingham, AL, or the "Dresser 500 Style" as manufactured by M & H Valve, Anniston, AL, or equivalent model pre-approved by D.E.P. **Any models not pre-approved by D.E.P. will NOT be acceptable.**

All parts of the hydrant shall be interchangeable with similar parts of hydrants of the same size and type. An arrow and the word "OPEN" shall be cast in relief on top of the hydrant showing the direction to turn in order to operate the hydrant. All bolt holes shall be accurately drilled from templates. All joints shall be faced smooth, so as to make a perfectly water-tight joint. Hydrant hose caps shall be securely attached to the hydrant by means of chains. The connections and nozzles shall have threads matching those in use by the New York City Fire Department.

Each hydrant shall be shop tested under 300 psi applied above the compression valve. Any hydrant showing sweating of the metal or leaking or other defects shall be rejected. All tests shall be made at the expense of the Contractor.

GATE VALVE: Shut-off valve shall be U.S. Pipe, model No. 5460, or approved equal, with mechanical joint pipe ends, cast iron body, bronze mounted, non-rising stem, 200 psi with two inch (2") valve operating nut.

VALVE BOX: 5 1/4" diameter valve boxes shall be Bingham & Taylor Fig. No. 4908 with a Fig No. 4904-L locking cover, or approved equal. The cover shall have the designation "WATER" cast thereon. The boxes shall extend within the limits called for on the plans.

LATERAL PIPE: Pipe shall be Ductile Iron Pipe Class 52 and better, meeting requirements of ANSI Specifications A-21.51 and AWWA Specifications C-151. Size of pipe shall be as shown on the drawings.

All pipes shall be cement-mortar lined in conformance with ANSI 21.4. The exterior surface of pipe shall receive a standard foundry coal tar dip coating. Cement Lined Ductile Iron Water Pipe

shall consist of bell and spigot type Ductile Iron Pipe Tyton Joint sections with Field Lock Gasket Joints, similar or equal to that manufactured by the U.S. Pipe & Foundry Co., Birmingham, AL, and shall conform to the American National Standards Institute C151 and American Water Works Association A21.51, Thickness Class 52 and better. Pipe shall be laid true to line and grade with bells upstream and shall have a full, firm and even bearing on a bed of broken stone, as shown in the details.

**HYDRANT FENDERS:** Fenders shall be extra heavy galvanized steel pipe, 5.6" O.D. and shall conform to ASTM Serial Designation A-120, Schedule 80, except that pipe shall be unthreaded and untested for water pressure. A malleable iron or cast iron screw cap shall be tack welded to cap the fenders after the pipes are filled with concrete.

**PAINT:** Paint for standpipe shall be heavy-duty enamel paint VOC-complying, color shall be black. Paint for hydrant dome and steel fenders shall be heavy-duty rust resistant aluminum paint, such as "Silver-Brite<sup>®</sup> Heavy Duty Rust Resistant Aluminum Paint" as manufactured by The Sherwin-Williams Company, Woodside, NY, or approved equal.

**CONCRETE PAD:** Concrete pad around hydrant and fenders must meet the requirements of B-32 Concrete per the NYCDOT Standard Highway Specifications.

**INSTALLATION:** Each hydrant shall be installed and connected to the existing water main as shown on BWS Standard Drawing No. 18581-B-Z, "Standard Hydrant Connection for Steel and Ductile Cast Iron Water Mains". Installation of hydrant and all related plumbing work shall be performed by a licensed plumber.

**HYDRANT:** Hydrant shall be placed so that centerline of hydrant is approximately two (2'-0") feet back of the face of curb. The pumper nozzle shall face the road. Hydrants shall be set plumb and installed to proper height.

Each fire hydrant shall be installed on a concrete pad not less than six (6") inches thick and have a minimum area of three (3') feet by five (5') feet. Concrete pad shall have a broom finish. The backside of the hydrant, opposite the pipe connection shall be firmly blocked against the vertical face of the trench to prevent the hydrant from blowing off the line. If the character of the soil is such that the hydrant cannot be securely blocked, then bridle rods and rod collars shall be used. Bridle rods and rod collars shall be less than three-fourths (3/4") inch stock, and shall be thoroughly protected by painting with acid resisting paint.

Around the base of each hydrant shall be placed not less than seven (7) cubic feet of broken stone to ensure the complete drainage of the hydrant when closed. All backfill around hydrants and valves shall be thoroughly and carefully compacted after correct positioning. Before installing any hydrant, care shall be taken to see that all foreign material is removed from the interior of the barrel. When hydrant is ready for service, the hydrant and valve shall be opened and closed to see that all parts are in working condition. After closing the main valve, a nozzle cap shall be removed and the standpipe interior inspected to make sure of proper drainage.

**HYDRANT FENDERS:** Two (2) steel pipe hydrant fenders must be installed with the hydrant, unless otherwise directed by the Engineer in writing, in accordance with DPR standard detail, and BWS Standard Detail No. 45161-Z-A. Posts shall be set in class B-32 concrete footings and, once installed, the steel pipe shall be filled with concrete. Post caps shall be tack welded to the fender pipe.

All fenders shall be set plumb and true to line and grade. The distance between the fenders shall be 4'-6", with the hydrant in the center.

**PAINTING:** After the hydrant has been installed, the standpipe above the ground line shall be thoroughly cleaned and, with the exception of the dome, shall be given one heavy coat of quick drying black enamel paint. The dome and hydrant fenders shall receive one heavy coat of bright aluminum paint, as specified above. On the standpipe, just below the nozzles, on the roadway face of the hydrant, shall be stenciled, in white numerals five (5") inches high, the size of the water main to which the hydrant is connected. Paint for white numerals shall be an oil type paint, designed for exterior use. It shall cover solidly in one coat and dry to a satisfactory gloss.

**TESTS:** The Contractor shall not backfill over any pipe until directed by the Engineer. The pipe system shall be tight and show no leaks when filled with water, sealed, and subjected to an internal hydrostatic pressure of one-hundred twenty-five (125) pounds per square inch. Temporary caps shall be placed where required to permit making the tests where valves are not available. The tests shall be made in the presence of the Engineer.

**MEASUREMENT AND PAYMENT:** The quantity of **FIRE HYDRANTS WITH FENDERS**

to be paid for under this item shall be the number of hydrants furnished and installed in accordance with the plans and specifications to the satisfaction of the Engineer.

The price bid shall be a unit price for **EACH** Fire Hydrant with Fenders furnished and incorporated in the work complete and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work including unclassified excavation, concrete pad, hydrant fenders, painting, broken stone, lateral pipe, plumbing lines between shut-off valve and hydrant, shut-off valve, valve box and fittings, and testing, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Saw-cutting (if necessary), Wet Connection, and Cement Lined Ductile Iron Water Pipe from the shut-off valve to the existing water main shall be paid for under their respective contract items.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR 615	Fire Hydrant With Fenders	EA

**END OF SECTION**

**SECTION PK-ESCR 616 – DECORATIVE STEEL SPRAY FIXTURES DELANCEY STREET**

**SECTION PK-ESCR 617 – DECORATIVE STEEL SPRAY FIXTURES HOUSTON STREET**

**SECTION PK-ESCR 618 – DECORATIVE STEEL SPRAY FIXTURES 10TH STREET**

**WORK:** Under this Item, the Contractor shall furnish and install **DECORATIVE STEEL SPRAY FIXTURES** (including Activation Bollard and Winterization Drainage Structure, where indicated) on concrete footings, all in accordance with the plans, specifications, and directions of the Engineer. In addition, the Contractor shall furnish extra material to the Engineer as specified under the heading INCIDENTAL MATERIALS.

**MATERIALS:** Except as otherwise provided for herein, all materials and methods of construction shall conform to the specifications and requirements of the NYCDOT Standard Highway Specifications.

**Footings:** Shall be class B-32 concrete.

**Decorative Steel Spray Fixtures:** Spray fixtures shall be as manufactured by Aquajeux International, Inc., Sainte-Julie, Quebec, Canada; Vortex Aquatic Structures International, Inc., Montreal, Quebec, Canada, or approved equal.

Spray fixtures shall be constructed of Schedule 10, Type 304/304L stainless steel to form various features of varying heights as shown on the drawings. A variety of spray features including but not limited to water arch, water cactus, water cane, water column, etc., shall be set on a concrete foundation, at the proper elevations, as per the manufacturer's recommendations. All components shall include all anchor hardware and stainless steel fasteners.

Each fixture shall have a one inch (1") male or a one and one half inch (1-1/2") threaded female water inlet attached at a point relative to the bottom of the fixture to facilitate water hook up.

**In-Ground Sprays:** In-ground sprays shall be constructed of minimum Schedule 10, Type 304/304L stainless steel as per the sizes shown on the drawings. Each fixture shall have a one inch (1") threaded female water inlet attached at a point relative to the bottom of the fixture to facilitate water hookup. Sprays shall be equipped with a removable brass cover and shall be set on a concrete base in the locations indicated on the plans and approved Shop Drawings.

**Flush Mounted Jets:** Flush mounted jets shall be constructed of 2" diameter, Schedule 10 (minimum) Type 304/304L stainless steel housing threaded to accept tamper resistant brass nozzle. The nozzle shall produce a single water stream. The direction of the water stream shall be adjustable to a maximum of 25 degrees from the vertical. A special tamper resistant tool and a winter cap shall be included with the assembly. The water inlet connection shall be 3/4" NPT male stainless steel. Flush mounted jets shall be set on a concrete base in the locations indicated on the plans and approved Shop Drawings.

**Nozzles:** Where applicable, spray fixtures shall contain either interchangeable five (5) piece solid brass nozzles, or one piece in-pipe brass nozzles, and shall be concealed in a recessed nozzle socket to ensure that all spray devices are concealed within the spray fixture. Nozzles must be of tamper resistant design, secured in the nozzle socket by means of security tooling specifically designed to fit only hardware, nozzles, and fasteners. All nozzle installation shall be performed after the thorough flushing of the entire system (see Testing). Nozzles shall be secured as per manufacturer's installation instructions to the satisfaction of the Engineer.

**Coating:** Fixtures shall receive a polyester powder coat, similar to that manufactured by Tiger Drylac U.S.A. Inc., or approved equal. The shop coat shall conform to manufacturer's

recommendations for surface preparation and mil. thickness of coating. The color shall be as indicated on the plans.

Activation Bollard: Where shown on the drawings, activation bollard shall be provided by the manufacturer. The bollard shall be constructed of stainless steel, Schedule 10, Type 304/304L, with powder coated external finish (see Coating). There shall be a stainless steel connection supplied for drainage.

The activator shall operate on 24V and shall be accessible by removing the activation cap or back door with a special tamper-resistant tool provided by the manufacturer of spray fixtures. There shall be an internal stainless steel conduit from the activator to the underground conduit. A reducing coupler shall be provided as needed to connect to the conduit. All wiring shall be as specified and approved by the manufacturer of spray fixtures.

Programmable Controller: The controller shall be meet the following specifications:

Time Switch: The time switch shall be a 24 Hour/ 7 Day programmable digital time switch with a 100 hour battery backup system in case of power failure. The switch shall have the ability to program a different schedule for each day of the week or have several days operate on the same schedule.

Timers: Timers shall be two solid states to activate the valves. They shall be individually set and Each has range of 0.1min to 30hours.

Transformer: Transformer shall be 120V primary/24V secondary with a built in electrostatic shield – protection.

Selector switches: Selector switches shall be three positions to select among automatic manual and off mode.

Enclosure: Enclosure shall be watertight fiber reinforced electrical enclosure with quick release latches that can be secured with a padlock.

Solenoid Valves: The Solenoid valves shall be a normally closed 24 VAC, 50/60 Hz, solenoid actuated globe pattern with a balanced pressure diaphragm as manufactured by Rain Bird Sprinkler Corp., Glendora, California or approved equal.

The valve shall have a manual flow control for manual opening and closing the valve without electrically energizing the solenoid. The valve shall have a flow range of 5 to 40 GPM for 1” diameter and 20 to 130 GPM for 1 ½” diameter. The operating pressure shall be 15 to 220 PSI. At 24AVC average, inrush current shall not exceed 0.41 amps. Average holding current shall not exceed 0.23 amp. The valve body and bonnet shall be constructed of brass and all other internal parts shall be made of bronze and stainless steel to ensure corrosion resistance.

Flow Distribution Manifold: The manifold shall be constructed of three (3”) inch, Schedule 10 (minimum) Type 304/304L stainless steel pipe, with female threading at both ends. Unit shall be factory assembled and water pressure tested. It shall be equipped with pressure gauge, mounting brackets and anchor bolts for mounting on a concrete wall.

Copper Tubing: The water service pipe shall be hard temper Type "K" copper tubing meeting the Department of Purchase Specification No. 32-T-1.64 and ASTM No. B88-1974. All tubing and fittings shall be as specified and paid for in the 'Copper Tubing' Item. Copper tubing and fittings are to be supplied from valves on the water supply line to the fixtures, with the connection at the fixture to be made with a dielectric coupling.

Fittings: Fittings shall be approved red brass Class "A" threadless type, containing no less than eighty five percent (85%) copper, adaptable for copper tubing.

Joints: Joints shall be made by soldering, using 95-5 tin antimony solder.

Hardware: All hardware, fittings, and fastenings shall be as indicated on the shop drawings and as required to complete the installation. Lag bolts shall be of best quality stainless steel with sideslot flat type vandal proof head in the sizes indicated on the plans. Anchors shall be stainless steel in the sizes required. Tamper proof hardware shall be stainless steel.

Exterior Control Wires: Control wires shall be 24-volt solid wires approved for installation in conduit and in accordance with Section D "Special Electrical Work and Equipment". Minimum wire size: 14 gauge; 12 gauge for common wire.

PVC Conduit for Control Wiring: All underground exterior 24 volts control wiring for activation bollard shall be installed in PVC rigid (non-metallic) conduit with fittings. The conduit shall be manufactured to NEMA TC-2 Federal Specifications and UL 651 Specifications. The cement for PVC rigid conduit shall be approved equal to all weather quick set cement (5° – 100°F) Series VC9981 through VC9984. All conduit shall requirements set for in Section D "Special Electrical Work and Equipment".

Sleeves For Control Wires: Sleeves shall be installed under all walks and paving and where indicated on drawings. Sleeves shall be PVC schedule 40 or galvanized heavy wall steel pipe conduit, as shown on the drawings.

Winterization Drainage Structure: The materials and construction shall be in accordance with ASTM C913 'Standard Specification for Precast Concrete Water and Wastewater Structures', as shown on the plans, or approved equal.

Concrete for Winterization Drainage Structure: All concrete shall fulfill the material requirements of Section ESCR-4.06, except that compressive strength shall be 5,000 psi at 28 days. All precast concrete shall have a honed finish. The precast concrete shall be well cured, shall be dense and shall have good edges. The cement and aggregate shall be thoroughly mixed in a proportion of one (1) part Portland Cement to not over six (6) or less than four (4) parts of aggregate. The aggregate fine and course shall conform to ASTM C-33. Aggregate shall be free of all deleterious substances which cause reactivity with oxidized hydrogen sulfides. Aggregate shall be graded to produce a homogeneous concrete mix.

Reinforcement for Winterization Drainage Structure:

Steel Fabric Reinforcement: Steel fabric shall meet the requirements given for cold drawn steel wire for concrete reinforcement, sample shall be taken as directed by the Engineer. All steel fabric (welded wire reinforcement) shall meet ASTM Specification A-1064, latest revision. □

Steel fabric shall consist of longitudinal members with transverse members at right angles thereto. All points of intersection of the members shall be firmly connected in approved manner.

All steel fabric shall be delivered in flat sheets or rolls of such widths as to fit the concrete pavement slabs as shown on the plans.

All outside wire shall not be more than three inches (3") from edges of slabs; when the sheets or rolls are not full length or width they shall overlap at least six inches (6"). All bars shall be bent cold. Only competent mechanics shall be employed for cutting and bending, and proper appliances shall be provided for such work. □

Steel Bar Reinforcement: The reinforcement shall be bent to the shapes shown on the plans. Bends for stirrups and ties shall be made around a pin having a diameter not less than two times the minimum thickness of the bar. Hooks shall conform to Section C-26-1526.0, N.Y. City Building Code. Bends for other bars shall be made around a pin having a diameter not less than six times the minimum thickness of the bar, except that for bar larger than one inch the pin shall not be less than eight times the minimum thickness of the bar.

Reinforcement shall be formed to the dimensions indicated on the plans before it is embedded in the concrete.

Before any concrete is placed, all mortar shall be cleaned from the reinforcement. No concrete shall be poured until the Engineer has inspected the placing of the reinforcing metal and permission to place concrete is granted. All concrete placed in violation of this provision shall be rejected and removed.

Top slab for Winterization Drainage Structure: Shall be eight inch (8") thick reinforced concrete. Top slab shall be of size shown on the Drawings and shall accommodate access door.

Frame and Door for Winterization Drainage Structure: The access doors should be as manufactured by "BILCO DOORS", stainless steel Double Door. The double door should be #JD-3H20, Size 48" H x 72" L x 6" D or approved equal.

Ladder Runs for Winterization Drainage Structure: Ladder rungs for each precast detention tank shall be constructed of copolymer polypropylene plastic manhole steps as manufactured by M. A. Industries, or approved equal.

Incidental Work for Winterization Drainage Structure: The Contractor shall furnish materials for and do all incidental work to complete the structures including the work of providing openings for piping and setting and adjusting the frames. No additional payment will be allowed for any incidental work.

Waterproofing for Winterization Drainage Structure: The detention tank shall have internal waterproofing, provided by the precast manufacturer and is subject to approval by.

the Engineer, the Contractor shall receive the unit price bid.

Drain Ball Valves for Winterization Drainage Structure: The Winterization Drain Valves should be 150 psig WSP, 600 psig WOG, 2-piece bronze body, solid blow-out proof stem, teflon seats, chrome plated brass ball, teflon seals, corrosion resistant steel lever handles with vinyl grips, balancing stop, and threaded or solder ends. Acceptable Manufacturers: Conbraco, Hammond, Milwaukee, Nibco, and Watts or approved equal. **EXECUTION:**

**Excavating for Foundation:** All excavation shall be cut accurately to required lines and dimensions for work on drawings, and shall be large enough to provide adequate clearance for the proper execution of the work within them.

**Cast in Place Footings Inspection:** When the excavation has been carried to the required depth, as shown on the drawings, the Contractor shall do no more work until after the inspection by the Engineer, who shall order the foundation work to proceed, or further excavation as the conditions indicate, and no other work shall be done until the excavation has been approved by the Engineer.

**Forms:** Forms for footings shall be lined with exterior grade plywood. The formwork shall be coated with an approved oil or lacquer.

**Curing:** All finished concrete shall be protected and kept moist continuously for three days, as directed by the Engineer.

**Water Feature Fixtures:** Spray fixtures shall be installed in accordance with the manufacturers written directions. Entire assemblies shall be installed in accurate locations, square and plumb on concrete footings and in required locations to surrounding finished grade, as shown on the plans. Anchor bolts shall be accurately set, plumb and true, in concrete footings, using templates supplied by the manufacturer.

Electrical work: A Licensed Electrician shall perform all electrical work as per The S-Pages, Article 20. This includes the connection of the power supply and activation bollard to the controller. All field wiring shall be waterproof with heat shrink-wrapping.

Field Connection: All field connections to be made by a Licensed Master Plumber, as per the S-Pages.

Testing: Before backfilling, the entire system shall be pretested and inspected. This shall include maintaining full pressure on the entire system for no less than one hour. Following the pressure test, it is imperative that all components be flushed by running the water supply through the fixture for a period of time to ensure all debris has been removed from the entire system prior to installation of any nozzles and in the presence of the Engineer. Nozzles shall be secured to the spray fixtures utilizing the security tooling provided by the manufacturer and all work shall be performed to the satisfaction of the Engineer. After paving is completed, all nozzles shall be adjusted and secured for proper operation and spray patterns, to the satisfaction of the Engineer.

M&O Orientation and Demonstration: After testing is completed and approved by the Engineer, a orientation and demonstration session shall be held for the NYCDPR M&O staff. The installed spray feature system shall be demonstrated for the district M&O Staff. The demonstrations shall include manual and automatic operations. The demonstration shall also include identification and operation of each component, trouble shooting for each component, winterizing the system, removal and replacement of defective components, general and specific requirements for system maintenance, and a check list for frequent attention of components. Highlights of the demonstration, including identification of components shall be videotaped for future M&O orientation.

O&M Manual and Video: The Contractor shall furnish six (6) copies (see Submittals) of the O & M Manual (Operation & Maintenance Manual) for the spray shower system and the associated mechanical system. The manual shall include a checklist for trouble shooting and corrective measures in addition to operation and maintenance instructions. The Contractor shall also furnish an instructional video (DVD or USB) of highlights of the M&O Orientation and Demonstration, including identification of components of the spray shower system.

**INCIDENTAL MATERIALS:** The Contractor shall furnish (furnish only, not install) and deliver, to the Engineer, incidental materials obtained from the approved spray equipment manufacturer. Contractor shall also furnish to the Project Resident Engineer any catalogs, invoices, statements, etc. for verification that a complete set of all maintenance and operations manuals, Repair Kit tools, materials, etc. have been furnished. All furnished material shall be properly identified with the installation location. Incidental materials shall include the following:

1 (One) - Tools and Hardware Maintenance Repair Kit, complete with toolbox, fastener, tamper resistant tool wrenches for each nozzle size included with the equipment. The repair kit shall be clearly marked with the Contract Number and the Playground name. Marking shall be done with permanent marker or other method approved by the Engineer.

One (1) – Winterizing Caps EACH In-Ground Spray installed shall be provided if these spray features are included in the equipment.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture and in accordance with the requirements of the S-Pages.

Shop Drawings for Spray Fixtures: The Contractor shall submit Shop Drawings of the spray fixtures (including spray nozzles and colors), activation bollard, programmable controller, solenoid valve, flow distribution manifold for approval.

Shop Drawings for Winterization for Drainage Structure: The Contractor shall submit Shop Drawings and catalog cuts, including concrete structure, frame, door, drain valves, joints, waterproofing, and sealing the pipes extending through the wall of the structure.

Operation and Maintenance Manual: The Contractor shall furnish an Operation and Maintenance (O & M) Manual prepared in conjunction with the manufacturers of equipment in this specification. The O & M manual shall contain the following:

- 1) Description of system operation and operating modes.
- 2) Start-Up Procedures.
- 3) Troubleshooting and Repair Guide.
- 4) List of parts with their model numbers.
- 5) Electrical diagram showing the valve assembly, the controller, the activation bollard, the power supply, and all operating switches.
- 6) O & M Manual & Video: The six (6) copies of the Operation & Maintenance Manual and one (1) instructional video (all labeled with name of site and contract number) shall be distributed by the Engineer as follows:

One (1) laminated manual to be kept at the site, either in the equipment room or in the equipment vault.

One (1) O&M manual and one (1) instructional video to DPR Training Academy (contact- Michael Crescenzo 718-760-6588).

Two (2) manuals to Borough Supervisor of Mechanics (S.O.M.).

Two (2) manuals to Construction division (file, map file).

**MEASUREMENT AND PAYMENT:** For furnishing and installing all **DECORATIVE STEEL SPRAY FIXTURES** (including Activation Bollard and Winterization Drainage Structure, where indicated) complete, in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

The price bid shall be a **LUMP SUM**, and shall include the cost of all labor, materials, equipment, and incidentals necessary or required to complete the work including unclassified excavation, backfill, concrete footings, hardware, fittings, dielectric coupler, activation bollard, programmable controller, control panel, solenoid valves, drain valves, flow distribution manifold, Electrical conduit & control wiring (from electrical panel to activation bollard), testing, orientation and all components integral with the spray fixtures, in accordance with the plans and specifications, to the satisfaction of the Engineer.

The Engineer will retain ten (10%) of **DECORATIVE STEEL SPRAY FIXTURE(S)** bid amount until the Contractor completes the requirements of the Testing, M&O Orientation and Demonstration, and O&M Manual and Video sections of this specification, to the satisfaction of the Engineer.

In addition, the Contractor shall deliver INCIDENTAL MATERIALS as outlined above to the Engineer. No additional payment shall be made for incidental materials. The Contractor shall include cost in the bid price

Backflow Preventer, Water Meter, Booster Pump, Copper Tubing, Gate Valves, Globe Valves, Valve Boxes, Broken Stone and Electric service to the panel, where applicable, shall be paid for separately under their respective Contract Items.

PARKS-280

## SECTION PK-ESCR 619 – SPORTS STEEL SPRAY FIXTURE

**WORK:** Under this Item, the Contractor shall furnish and install a hydraulic **SPORTS STEEL SPRAY FIXTURE** with concrete footing, all in accordance with the plans, specifications, and directions of the Engineer. In addition, the Contractor shall furnish incidental material to the Engineer as specified under the heading INCIDENTAL MATERIALS.

**MATERIALS:** Except as otherwise provided for herein, all materials and methods of construction shall conform to the specifications and shall meet the requirements of the NYCDOT Standard Highway Specifications.

Concrete Footings: Concrete for footings shall be 3,200 psi Average Class B-32 Concrete per the NYCDOT Standard Highway Specifications.

Sports Steel Spray Fixture: Sports steel spray fixture shall be activated by a mechanical push button, constructed of Schedule 10, Type 304L stainless steel tubing, six (6") inches O.D. The sports spray fixture shall be set in a concrete footing, at the proper elevations, as shown on contract plans. The Sports spray fixture shall be eighty-four (84") inches in height from finish grade and welded to a three-eighth (3/8") inch thick stainless steel plate for anchoring into concrete footing. The Sports Spray Fixture shall be provided with a 3/4" NPT female threaded coupling for connection to water supply.

Sports spray fixtures shall be manufactured by Aquajoux International, Inc., Quebec, Canada, or approved equal and shall be one of the following models as shown on the contract plans or as directed by the Engineer:

- Model 1506-MALF-09 – Recommended for installation in asphalt pavement, natural turf, or other paved areas. Equally distributed nine (9) low flow Super Mist nozzles located, at 40 degrees, at the top of a 12.75" outer diameter spray head. o Model 1506 - MALF-06 – For installation against wall or fence only. Total of six (6) Super Mist nozzles, at 40 degrees, located at the top of the spray head and sprayed along one side of the post.
- Model 1507 - MALF -09 – Recommended for installation in synthetic turf, spray shower areas, or other free draining areas. Total of nine (9) low flow Super Mist Nozzles located nine (9") inches apart vertically in three levels. All nozzles shall be spaced evenly and offsets each other.
- Model 1507 - MALF-08 – For installations against wall or fence only. Total of eight (8) Super Mist nozzles located nine (9") inches apart vertically in three levels. All nozzles shall be offset and sprayed along one side of the post.

Nozzles: Nozzles shall be made of brass and built recessed into the structure body. Each nozzle shall achieve a maximum flow rate of 2.1 GPH at a water pressure of 20 psi. Nozzles shall be manufactured by Aquajoux International, Inc., or approved equal.

Coating: The Sports Spray Fixture shall receive one UV resistant, non-toxic, lead free electrostatic powder color coating and one non-toxic, lead free, electrostatic powder clear coating. Color of the sports spray fixture shall be "Red" or another contrasting color to surrounding turf or pavement, as noted on the contract plans or directed by the Engineer.

Pneumatic Activated Valve: Push button for activation shall be Aquajoux Add-on for Mechanical Push-button Model No. "MECPB", or approved equal. Push button shall be factory assembled and integrated to the fixture. Access door to permit access to the valve shall be located at the side of the spray post, protected by stainless steel, tamper resistant screws. Activation time

shall be adjustable from thirty (30) seconds to one hundred and twenty (120) seconds. Exact activation time shall be as directed by the Engineer.

Copper Tubing: The water service pipe shall be hard temper Type "K" copper tubing meeting the Department of Purchase Specification No. 32-T-1.64 and ASTM No. B88. All tubing and fittings shall be as specified and paid for in the contract item for 'Copper Tubing'. Copper tubing and fittings are to be supplied from valves on the water supply line to the post, with the connection at the fixture to be made with a dielectric coupling.

Fittings: Fittings shall be approved red brass Class "A" threadless type, containing no less than eighty five (85%) percent copper, adaptable for copper tubing

Hardware: All hardware, fittings, and fastenings shall be as indicated on the shop drawings and as required to complete the installation. Anchor bolts shall be stainless steel in the sizes required. Tamper proof hardware shall be stainless steel.

### **EXECUTION:**

Excavating for Foundation: All excavation shall be cut accurately to required lines and dimensions for work on drawings, and shall be large enough to provide adequate clearance for the proper execution of the work within them.

Cast in Place Footings Inspection: When the excavation has been carried to the required depth, as shown on the drawings, the Contractor shall do no more work until after the inspection by the Engineer, who shall order the foundation work to proceed, or further excavation as the conditions indicate, and no other work shall be done until the excavation has been approved by the Engineer.

Forms: Forms for footings shall be lined with exterior grade plywood. The formwork shall be coated with an approved oil or lacquer.

Curing: All finished concrete shall be protected and kept moist continuously for three days, as directed by the Engineer.

Sports Steel Spray Fixture: The sports spray fixture shall be installed in accordance with the manufacturer's written directions. Entire assemblies shall be installed in accurate locations, square and plumb in concrete footings and in required locations to surrounding finished grade, as shown on the plans. Anchor bolts shall be accurately set, plumb and true, in concrete footings, using templates supplied by the manufacturer. Concrete footings shall be below finish grade unless otherwise shown on the contract plans.

Field Connection: All field connections to be made by a Licensed Plumber.

Testing: Before backfilling, the entire system shall be pretested and inspected. This shall include maintaining full pressure on the entire system for no less than one hour. Following the pressure test, it is imperative that all components be flushed by running the water supply through the fixture for a period of time to ensure all debris has been removed from the entire system prior to installation of any nozzles and in the presence of the Engineer. Nozzles shall be secured to the spray post utilizing the security tooling provided by the manufacturer and all work shall be performed to the satisfaction of the Engineer. Where appropriate, the Contractor shall winterize the system prior to turning over the site as directed by the Engineer.

Manufacturer's Orientation and Demonstration: After testing is completed and approved by the Engineer, an orientation and demonstration session shall be held for the NYCDPR M&O staff. The session shall be performed by the manufacturer of the sports spray fixture. The demonstration shall include identification and operation of each component, trouble shooting for each component, winterizing the system, removal and replacement of defective components,

general and specific requirements for system maintenance, and a check list for frequent attention of components.

**INCIDENTAL MATERIALS:** The Contractor shall furnish (furnish only, not install) and deliver, to the Engineer, incidental materials obtained from the approved sports spray fixture manufacturer. Contractor shall also furnish to the Engineer any catalogs, invoices, statements, etc. for verification that a complete set of all maintenance and operations manuals, materials, etc. have been furnished. All furnished material shall be properly identified with the installation location. Incidental materials shall be the following:

- 1 (One) - Tools and Hardware Maintenance Repair Kit, complete with toolbox, fastener, tamper resistant tool wrenches for nozzle included with the equipment. The repair kit shall be clearly marked with the Contract Number and the name of Park. Marking shall be done with permanent magic marker or other method approved by the Engineer.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Shop Drawings:** The Contractor shall submit Shop Drawings of the sports steel spray fixture showing all connection details, nozzle type and sizes for approval prior to manufacture. Contractor must demonstrate that the nozzle is appropriate for the flow rate and water pressure specified.

**Operation and Maintenance Manual:** The Contractor shall furnish an Operation and Maintenance (O&M) Manual prepared in conjunction with the manufacturers of equipment in this specification. The O&M manual shall contain the following:

- 1) Description of system operation and operating modes.
- 2) Start-up procedures.
- 3) Troubleshooting and Repair Guide.
- 4) List of parts with their model numbers.
- 5) M&O Manual: The six (6) copies of the Operation & Maintenance Manual shall be distributed by the Engineer as follows:
  - One (1) laminated manual to be kept at the site, either in the equipment room or in the equipment vault.
  - One (1) O&M manual to DPR Training Academy (contact- Michael Crescenzo 718-760-6588).
  - Two (2) manuals to DPR Borough Supervisor of Mechanics (S.O.M.).
  - Two (2) manuals to DPR Construction division (file, map file).

**MEASUREMENT AND PAYMENT:** For each **SPORTS STEEL SPRAY FIXTURE** furnished and installed in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Sports Steel Spray Fixture, and shall include the cost of all labor, materials, equipment, and incidentals necessary or required to complete the work including excavation, backfill, concrete footing, hardware, fittings, pneumatic activation valve, drain valves, testing, orientation session, submittals, all components integral with the sports spray and copper tubing within five (5') feet from the edges of the sports spray fixture, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Backflow Preventer, Water Meter, Copper Tubing beyond five (5') feet of the fixture, all valves and Valve Boxes, where required, shall be paid for separately under their respective Contract Items

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>
PK-ESCR 619	Sports Steel Spray Fixture	EA

**END OF SECTION**

**SECTION PK-ESCR 620 – WATER TAP 1½" DIA.**

**SECTION PK-ESCR 621 – WATER TAP 2" DIA.**

**WORK:** Under these Items, the Contractor shall make a **WATER TAP** or **WET CONNECTION** of the size shown on the plans, to the existing water main in accordance with the plans, specifications, and directions of the Engineer. The Contractor shall obtain a permit from NYCDEP, saw cut pavement, prepare opening, abandon, disconnect, cap, or plug any existing water service from the existing water main in accordance with the Rules of the Bureau of Water Supply, arrange NYCDEP installation, arrange inspection (where required) prior to backfilling and restore street pavement.

**PERMITS:** The Contractor shall employ a licensed Certified Master Plumber to obtain a permit from the New York City Department of Environmental Protection (NYCDEP) (NYCDEP). All permits for work requiring opening or obstructing a street and/or sidewalk shall be contingent on approval by the Department of Transportation (DOT) or the agency having jurisdiction to authorize such opening. All permits shall be displayed at the work site.

**MATERIALS & EXECUTION:** The Contractor shall notify the Engineer three (3) days prior to intended date of work. Water taps and wet connections to a City Main shall be inserted or installed only by NYCDEP employees, unless waived by NYCDEP. The Contractor shall set up appointment with NYCDEP and pay all NYCDEP fees under this item. The Contractor shall erect proper barricades and all other protective devices in strict compliance with City ordinances governing the protection of the public. All materials, excavation, saw cutting, and restoration of street pavement (where applicable) shall be performed in accordance with NYCDEP and New York City Department of Transportation requirements. Size of excavation for water tap or wet connection shall be in accordance with the requirements of NYC Department of Environmental Protection "Rules governing and Restricting the Use and Supply of Water" Appendix Table #4 and Detail Figure No.1. If subsurface conditions prevent a plumber from making an excavation of the dimensions indicated therein, the plumber shall immediately notify the Engineer. The Engineer, in turn shall notify NYCDEP, who has the discretion to determine whether the dimensions should be changed, and what the new dimensions for the excavation shall be. Where excavations are required to be larger than Appendix Table #4, such excavation shall be paid separately under the item "Unclassified Excavation". All excavations shall be made safe by sheeting and bracing, where depth of excavation exceeds five (5) feet. Hand excavate as necessary to protect underground utilities. Arrange for inspection by NYCDEP (where necessary) prior to compacting backfill in six (6") inch lifts and street pavement restoration.

**INSPECTION:** Where required by NYCDEP, the connection shall be inspected prior to backfilling.

**MEASUREMENT AND PAYMENT:** For each **WATER TAP** or **WET CONNECTION** made in accordance with the plans, specifications, directions of the Engineer and provisions of the NYCDEP permit, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Water Tap or Wet Connection made and shall include furnishing all labor, material, equipment, and incidental expenses including obtaining permits, saw cutting, gooseneck connection for copper water tubing, unclassified excavation and/or hand excavation as required, all fees to NYCDEP, backfilling and compaction to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation beyond what is required by NYCDEP Appendix Table #4, Cap water line, Maintenance and protection of traffic, Restoration of Street Pavement, water line beyond the

gooseneck connection, and Temporary Sheeting (where applicable) shall be paid under separate contract items.

PK-ESCR-620	Water Tap 1½" DIA.	EA
PK-ESCR-621	Water Tap 2" DIA.	EA

**END OF SECTION**

**SECTION PK-ESCR 622 – CURB AND PROPERTY LINE VALVES – 1½" DIA.**

**SECTION PK-ESCR 623 – CURB AND PROPERTY LINE VALVES – 2" DIA.**

**WORK:** Under this Item, the Contractor shall furnish and install **CURB & PROPERTY LINE VALVES** set of the size shown on the plans, in strict accordance with the plans, specifications, and directions of the Engineer. Each set shall consist of one curb valve and one adjacent property line valve.

**INTENT:** The Property Line Valve is intended for use as an on-site, shut-off valve to decrease use of the Curb Valve, and shall be located in an accessible area inside the Park's property line.

**CURB VALVES:** "The curb valves and boxes shall be set in the service pipe in the sidewalk area at the curb or within 2 ft. of the curb. Curb valves shall be of the gate type nonrising stem valve, designed for a minimum of 150 psi wwp." [NYC Building Code: RS16, P107.2(a) 9 and NYC DEP Rules and Regs. Section 138]. Valves shall be Stockham No. LFB-103; Nibco T113-LF; Milwaukee UP105, or approved equal. Curb Gate Valves shall have bronze body, bronze bonnet, inside screw, non-rising stem, solid wedge disk, and threaded ends.

EFFECTIVE JAN. 4TH, 2014, ALL PROPOSED INSTALLATIONS/ REPAIR OF VALVES TO BE UTILIZED ON ALL DOMESTIC DRINKING WATER SERVICES FOR HUMAN CONSUMPTION, MUST BE LEAD-FREE IN COMPLIANCE WITH THE AMENDED FEDERAL LAW, SAFE DRINKING WATER ACT (SDWA).

**PROPERTY LINE VALVES:** Property Line Valves two inches (2") and under shall be of the cylindrical Plug Type with a closed bottom and a top seal, fully enclosed one-quarter (1/4) turn check, straight through flow way which is resistant to turbulence of the flow stream, one piece cast bronze cylindrical plug and "T" head that aligns with the ports to provide a visual check of valve position, inside screw ends with I.P. threads, as is manufactured by Mueller Co. No. H-10283N, or approved equal. Adaptors are required for connecting to copper tubing.

**OPERATING KEY:** An approved operating key of proper size for each valve shall be furnished by the Contractor. However, the Contractor need not furnish more than two (2) keys for each type of valve, regardless of the quantity of valves called for in the Contract. For valves 2" diameter, the operating key shall be Stockham No. 1V437 for Stockham Valves, or the appropriate key for an approved equal valve.

**SUBMITTALS:** Provide Product Data including Manufacturer's catalog sheets and specifications for each valve type. List type of valves, manufacturer's model number, and size for each service application.

**MEASUREMENT AND PAYMENT:** The quantity of **CURB & PROPERTY LINE VALVES**

to be paid for under this Item shall be the number of **SETS** consisting of both valves of each size, furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price for each **SET** of **CURB & PROPERTY LINE VALVES** (two valves) of each size, and shall include the cost of all labor, materials, equipment, and other incidentals necessary to complete the Work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation, Valve boxes, water piping, including the pipe between the curb and property line gate valves shall be paid for separately under their respective contract items.

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>

**END OF SECTION**

**SECTION PK-ESCR 624 – RPZ & WATER METER W/REMOTE AND STRUCTURE – 1½" DIA.**

**SECTION PK-ESCR 625 – RPZ & WATER METER W/REMOTE AND STRUCTURE – 2" DIA.**

**WORK:** Under these Items, the Contractor shall provide all labor, materials and equipment necessary or required to furnish and install **RPZ and WATER METER W/ REMOTE & STRUCTURE** of the size indicated on the Contract Drawings, including all piping, fittings, valves, test tee, and test tee valve, if required and other incidentals necessary to complete plumbing work and connection to water service and water feed lines in accordance with the plans, specifications, and directions of the Engineer. RPZ (Reduced Pressure Zone) device is a type of Backflow Preventer. Water Meter W/ Remote Reader shall include Water Meter, Water Meter Strainer and Automatic Reading & Billing System (also known as Remote Reading Device). All factory plumbing work is to be done by a Licensed Plumber. All on-site plumbing work is to be done by a New York City Master Licensed Plumber.

EFFECTIVE JAN. 4TH, 2014, ALL PROPOSED INSTALLATIONS/ REPAIR OF BACK FLOW PREVENTER (BFP) DEVICES AND ALL ASSOCIATED VALVES TO BE UTILIZED ON ALL DOMESTIC DRINKING WATER SERVICES FOR HUMAN CONSUMPTION, MUST BE LEAD-FREE IN COMPLIANCE WITH THE AMENDED FEDERAL LAW, SAFE DRINKING WATER ACT (SDWA).

**DEP APPROVED PLANS:** The RPZ/Water Meter installation plans have been submitted to the NYC Department of Environmental Protection (DEP), Bureau of Water and Sewer Operation's (BWSO) Cross Connection Control Unit for approval. No work shall be done prior to receiving DEP approval of the aforementioned plans. Upon receiving approval, the plans shall be provided to the Contractor as a Supplemental Drawing, on or about the Order-to-Work (OTW) date.

To complete work under this item, the Contractor shall pay for the DEP Review Fees, including but not limited to the Backflow Prevention Device Review Fee, under the contract item "ALLOWANCE FOR DEP BPD REVIEW FEE". Checks shall be made payable to the New York City Water Board.

**MATERIALS:** Unless otherwise provided for herein, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications. Entire unit shall be fabricated and installed in accordance with this specification and Contract Drawings.

**Precast Concrete Structures:** Enclosure structures for the RPZ and water meter shall be as manufactured by A.C. Miller Concrete Products Inc., Spring City, PA., or approved equal.

**Concrete:** All concrete shall fulfill the material requirements Class A-40 concrete per NYCDOT Standard Highway Specifications Section 3.05., except that compressive strength shall be 5,000 psi at 28 days. All precast concrete shall have a honed finish. The precast concrete shall be well cured, shall be dense and shall have good edges. The cement and aggregate shall be thoroughly mixed in a proportion of one (1) part Portland Cement to not over six (6) or less than four (4) parts of aggregate. The aggregate fine and course shall conform to ASTM C-33. Aggregate shall be free of all deleterious substances which cause reactivity with oxidized hydrogen sulfides. Aggregate shall be graded to produce a homogeneous concrete mix. All exposed concrete edges shall be finished with a forty-five (45°) degree, three-quarter (3/4") inch chamfer.

**Coating For Concrete:** Above grade portion of precast concrete boxes shall be patched to conceal holes and then receive one (1) coat of a 100% acrylic polymer coating with a pebble

finish similar to Color Coat #3107, as manufactured by BASF Senergy, Florham Park, NJ or approved equal. Color to be Sage.

Reinforcement: Steel reinforcement shall conform to the provisions of the NYCDOT Standard Highway Specifications. Reinforcement shall be placed as shown on the drawings.

Ladder Rungs: Ladder rungs for each water meter structure shall be constructed of copolymer polypropylene plastic, as manufactured by M.A. Industries, Peachtree City, Ga., or approved equal.

RPZ Structure Access Doors: Shall be high security flat plate stainless steel, single leaf, similar to JustSet Doors as manufactured by Pennsylvania Insert Corp., Spring City, PA, or approved equal. The two (2) types of RPZ Structure Access doors are as follows:

Two (2) vertical 30" x 24" (hinged) high security stainless steel access doors, painted. One (1) Horizontal 12" x 24" (no hinges) high security stainless steel access door, painted.

Stainless steel doors for RPZ structure shall be painted with one primer coat and one finish coat. All three doors shall be cleaned with solvent to remove oil, grease, dirt and other foreign material, then primed with a low VOC, water based wash primer, free of heavy metals and mineral acids, similar to DTM Wash Primer as manufactured by Sherwin Williams Protective & Marine Coatings, Edison, NJ or approved equal. Finish coat shall be high gloss enamel paint similar to Industrial Enamel HS (B54Z-400 series) as manufactured by Sherwin Williams Industrial Coatings, Edison, NJ or approved equal. Color to be Sage to match coating for concrete.

Water Meter Structure Access Door: Access door shall be 36" x 30" size, heavy duty (H20 loading) high security, color (brown) anodized aluminum, similar to JustSet Door as manufactured by Pennsylvania Insert Corp., Spring City, PA, or approved equal. Frame shall have integral drain channel, anchor flanges, and neoprene gasket. A one-and-one half inch (1 1/2") drain coupling shall be located on the corner of the frame. Operation shall be spring assisted for easy operation. A hold open arm shall automatically lock the door in the 90° position. Hinge shall be heavy forged brass with a stainless steel pin. Door shall be provided with two locks. Lock shall be "Ford" lifter worm lock with waterworks bronze pentagonal bolt type "LL". All hardware shall be zinc or cadmium plated.

Construction Accessories: Frames shall be 3/16" x 2" x 2" angle welded with joints ground smooth, after fabrication. Hinges shall be heavy duty and welded to door and frame.

Security Bolts for RPZ Structure doors: Security Bolts for RPZ Structure shall be NYC DPR pattern # 83 registration # "116183", Part # H11777155, as manufactured by McGard, Orchard Park, NY, or approved equal. Threads for security bolts shall be at least one-third (1/3) bolt dia. for proper "bite". Vertical doors shall have two (2) security bolts; 7/16 - 20 x .750. Horizontal door for RPZ structure shall have four (4) security bolts; 7/16 - 20 x .750. For security reasons, one security bolt key for each RPZ installed shall be shipped by McGard directly to the attention of: The Administrative Assistant to the Director of Engineering, NYC Parks Olmsted Center, Corona, NY 11368. Under no circumstances shall the Contractor be provided with a key.

Security bolts for Water Meter Structure Horizontal Access Door: Security bolts for Water Meter Structure Horizontal Door shall be two (2) pentahead security bolts. Special Design Criteria For Security Bolts:

- 1) Bolt must be made from alloy steel, heat treated to 150,000 psi tensile strength.
- 2) Head of bolt must be selectively hardened to Rc 60 min. to prevent the use of files, hacksaws, and chisels.

- 3) Bolt is to be made with either a flat or 120<sup>o</sup> cone seat as required.
- 4) Bolt will be torqued by means of a recessed curvilinear ("Daisy") groove in the top face of bolt head. A special mating key is required to operate in groove for installation and removal of bolt.
- 5) Bolts are to be zinc nickel plated in order to meet an ASTM B-368 C.A.S.S. test for 22 hours.
- 6) Bolt lengths are to be held to +/- .01".
- 7) Bolt threads are to be class UNC-2A.

Water Piping: Shall be hard temper type 'K' copper tubing meeting the Department of General Services; Division of Municipal Supplies, Dept. of Purchase, Specification No. 32-T-1.64 and ASTM No. B88-1974. Fittings shall be approved wrought copper and bronze solder -joint pressure fittings (ANSI B 16.22).

RPZ: The RPZ device shall be Febco Model LF825YA, or approved equal. Size shall be as indicated on the Contract Drawings and shall fit inside the precast concrete structure as shown on Contract Drawings. The RPZ shall meet the requirements of American Society of Sanitary Engineers (ASSE) Standard 1013 and the American Water Works Association (AWWA) Standard Code 506-78. RPZ shall be lead free in compliance with the amended Federal Law Safe Drinking Water Act (SDWA).

The RPZ shall consist of two independently operating center guided, spring loaded, "Y" pattern check valves and one hydraulically dependent differential relief valve. Mainline valve body and caps including relief valve body and cover shall be bronze. Check valve and relief valve components shall be constructed so they may be serviced without removing the valve body from the line. Shut-off valves and test cocks shall be full ported resilient seated ball valves.

Gate Valves: The House Control Valve (HCV) and Valve for Test Tee shall be a Class 125, all bronze gate valve, with non-rising stem and solid disc, with screwed bonnet and threaded ends, such as Stockham Figure LFB-103, or approved equal. For water meters up to 1" size, a plain-tip (end faucet) test tee shall be used. For meters larger than 1.5", the test tee shall be with a valve and capped.

Ball Valves: The Meter Inlet Control Valve (MICV) and Meter Outlet Control Valve (MOCV) shall be lead free, brass, full port ball valve, such as Ultra Pure UPBA400 P2, or approved equal.

Electrical Grounding: For continuity of Electrical Grounding (during RPZ Maintenance) the Contractor is to furnish and install one (1) #2 tinned copper ground conductor and copper alloy ground connectors as per O.Z. Gedney, Type ABG for 1" & 1-1/2" dia. and CG for 2" dia. pipe or approval equal. Ground work is to be done prior to any painting or insulation if needed.

Water Meter: The one (1") inch water meter shall be Neptune T-10, as manufactured by Neptune Technology Group, Inc., Tallassee, AL, or AccuStream manufactured by Sensus, Raleigh, NC or approved equal. The one and one-half (1 ½") inch water meter shall be Neptune T-10 manufactured by Neptune Technology Group, Inc., or Omni C<sup>2</sup> manufactured by Sensus or approved equal. The two (2") inch water meter shall be Omni C<sup>2</sup> manufactured by Sensus or evoQ4 Electronic manufactured by Elster AMCO Water, LLC, Ocala, FL, or approved equal.

All water meters furnished shall conform to the "Standard Specifications for Cold Water Meters", AWWA Standard C700 latest revision. Only meters on the current "List of Approved Water Meters and Related Equipment", published by NYC DEP will be accepted as an approved equal.

The size, capacity and meter lengths shall be as specified in AWWA Standard C700, latest revision. The maximum number of disc nutations is not to exceed those specified in AWWA C700 latest revision to minimize premature wear. The installation of water meters shall comply with RCNY Title 15, Chapter 20, "Rules and Regulations Governing and Restricting the Use and Supply of Water".

Meter Maincase: All one (1") inch meter maincase shall be the removable bottom cap type with the bottom cap secured by six (6) bolts. Bottom caps shall be interchangeable, size for size, between frost-protected synthetic polymer or cast iron and non-frost protected (bronze) models. No meters utilizing frost plugs will be accepted. Non-frost protected meters shall have bronze or synthetic polymer bottom caps. The cross section of the bottom shall break clean when subjected to freezing pressure of 600-850 psi. All maincase bolts shall be of 300 series stainless steel to prevent corrosion. Bottom cap bolt lugs shall be enclosed in the maincase and shall not have externally exposed, threaded through holes. All one and one-half (1-1/2") inch and two (2") inch meters shall have a split design secured by bronze or stainless steel bolts.

Register: The register shall be of the straight reading sealed magnetic drive type and shall contain six (6) numeral wheels. Registers must be sealed and dry. All direct reading register lenses shall be flat, of high strength, and impact resistant glass to prevent breakage. The dial shall be of the center sweep pointer type and shall contain 100 equally divided graduations at its periphery. The register must contain a low flow indicator with a 1:1 disc nutating ratio to provide leak detection. Register boxes shall be bronze.

All meters must be adaptable to digital encoder register without interruption of the customer's service for the purpose of pit, remote, or central meter reading. The registers shall be secured to the maincase by means of a plastic tamperproof seal pin to allow for in-line service replacement. Seal screws are not acceptable.

Register retainer rings shall have an impact resistant design which absorbs register glass lens impact. All registers shall have the size, model, and date of manufacture stamped on the dial plate.

Measuring Chamber: The measuring chamber shall be a nutating disc type, the flat nutating disc shall be molded of a non-hydrolyzing hard rubber or synthetic polymer and shall contain a type 316 stainless steel spindle. The nutating disc shall be equipped with a synthetic polymer thrust roller with a stainless steel shaft located within the disc slot. The roller head shall roll on the buttressed track provided by the diaphragm in the measuring chamber. The measuring chamber shall be of a 2-piece snap-joint type. The measuring chamber shall be made of non-hydrolyzing synthetic polymer, shall be smoothly and accurately machined and shall contain a removable molded diaphragm of the same material as that of the chamber. No screws shall be used to secure the chamber together. The control block shall be the same material as the measuring chamber and be mounted on the chamber top to provide sand ring protection. The control block assembly shall be removable to facilitate repairing. Control block assemblies shall be designed to allow no magnetic slippage which would result in a loss of revenue. The measuring chamber outlet port shall be sealed to the maincase outlet port by means of an "O" Ring gasket to eliminate chamber leak paths.

Guarantee: All meters and registers will be guaranteed for one year on material and workmanship. To ensure accuracy, each meter must be accompanied by a factory test tag certifying the accuracy at the flows required by AWWA C700 (low, intermediate, and full flow). All meters shall be guaranteed adaptable to the Neptune ARB Encoder Electronic Meter Reading Systems.

Strainer: The strainer shall be located near the inlet maincase port, before the measuring chamber and control block assembly.

Remote Reader: The Remote Reader shall be Neptune Proread ARB System ® as manufactured by Neptune Technology Group, Inc., Tallassee, AL, or ECR or Full Electronic Register as manufactured by Sensus, or Scancode Emulation as manufactured by Elster, or approved equal. The Remote Reader shall be a self-contained encoder register metering system designed to obtain remote simultaneous water meter registration directly from the register odometer. The metering information shall be obtained through a remotely located receptacle using a compatible data capture system.

Encoder Meter Register: Shall be direct mounted with encoded odometer wheels and digital data stream. Batteries or pulses are not allowed.

Registration: The register shall provide a six digit visual registration at the meter. The unit shall, in a digital format, simultaneously encode the four or six most significant digits of the meter reading for transmission through the remotely located receptacle. (The most significant meter registration digits are defined as those digits on the register number wheels that denote the highest recorded values of water consumption.) A quick indexing mechanism shall be employed which shall prevent ambiguous reading. The register shall have a full test sweep hand or dial divided into gradients of down to 1/100th of the units of registration. Register test rings shall be available for shop testing. The units of registration shall be in U.S. gallons. These units shall be clearly designated on the face of the register. The month and year of manufacture and other identification information shall appear on the face of the register. The register shall employ a leak detection indicator on the dial face. Registers using pulse generation or conversion of pulses to digital output is not permitted. Batteries shall not be required.

Mechanical Construction: Materials used in the construction of the register shall be compatible with the normal water meter environment and with each other. The unit shall possess a copper bottom and incorporate a rubber O-ring seal. Where indicated, pit set registers must be provided with moisture protection for all internal components when operating under flooded pit conditions. The register and mounting base shall be integral components and should not allow for disassembly. The register shall be attached to the meter case by a bayonet attachment. Fastening screws or nuts shall not be required. A tamperproof plastic seal pin shall be used to secure the register to the main case. No special tools shall be required to remove the register. The register head must swivel 360 degrees without removing the seal pin to facilitate visual reading and ease of wiring. The register shall be removable from the meter without disassembling the meter body and shall permit field installation and/or removal without taking the meter out of service. Provision shall be made in the register for the use of seal wires to further secure the register. Terminal screws must be accessible on the register for transmission wire connection to the remote receptacle or future connections to a telephone system.

Electrical Construction: The materials employed for contacts and connectors shall inhibit corrosion and shall suffer minimal effect from environmental conditions to which they are exposed. The number wheels used in the register assembly shall be provided with spring-type bifurcated metal contacts to ensure a high probability of information transmission.

Connection shall be made to the register by three screw-type terminals, sonically inserted into the register top. Access to the terminals shall be available to all models of register. A port cover shall be provided to cover the terminals after they have been wired. Digitally formatted data transmitted from the register shall incorporate a check sum character to verify correct information transmission and integrity. Data errors shall be indicated by the reading equipment.

Meter Reading Information: The encoder register shall provide up to six digits of information to the reading equipment. A ten digit identification number shall also be provided with each reading. The utility shall have the option to reprogram the internal register identification number an unlimited number of times. The encoder register must have the capability to provide additional

custom information to the reader. This information shall be programmed (and reprogrammed at any time) by the utility. Information on programming the register, equipment needed, and encoder meter reading output shall be provided with each proposal.

Remote Mounted Receptacle: Remote receptacle shall provide a communication link for the transmission of information from the register.

Mechanical Construction: Where indicated, a remote receptacle must be provided for attachment to a pit meter lid with another unit also designed for attachment by wall mounting. The materials employed shall be corrosion resistant, resist ultraviolet degradation, unaffected by rain or condensation, and compatible with rugged service and long life. The pit mounted receptacle shall be mounted to the water meter access door of the meter concrete structure using two screws to be provided by the utility. The hole size to be drilled in the access door shall not exceed 3/8" each. The pit mounted receptacle shall be provided with a minimum length of ten feet of wire connected and sealed at the receptacle without terminal exposure.

Electrical Construction: The receptacle construction shall incorporate the function of a cable clamp or strain relief. Design of the unit shall be such that it provides for mechanical and electrical connection between the receptacle and interrogation equipment.

Cable: The connecting cable shall be of the two-wire conductor type in a sheath which shall be abrasion and moisture resistant. Each conductor shall be color coded.

#### **INSTALLATION:**

Excavation: The Contractor shall excavate to the lines as shown in the drawings. Temporary sheeting is required in excavation for the precast concrete structure.

Temporary Sheeting: All shoring work shall meet or exceed the requirements of the New York State Department of Labor, Industrial Code Rule 23 and Title 29 Code of Federal Regulations Part 1926, Safety and Health Regulations for Construction (OSHA).

The type of sheeting and bracing shall be satisfactory to the Engineer and subject to the Engineer's approval, but the approval by the Engineer of a method to be used does not relieve the Contractor of the Contractor's responsibility for protection and safety.

Setting of Precast Concrete Water Meter Structure: The precast concrete water meter structure shall be set on a six (6) inch thickness of broken stone with additional stone added inside the twelve inch (12") x twelve inch (12") drain sleeve to the top of the bottom slab. The RPZ Structure shall be set on the Water Meter Structure, as shown on the Contract Drawings.

The Contractor shall install supports for the water meter at the height shown on the Contract Drawings. The meter shall be set so that the dial faces upward and is horizontal. The dial shall not be more than three (3) feet above the floor. The encoder register shall be installed on meter as per manufacturer's instructions. The remote reader receptacle shall be installed in the pit cover as per the manufacturer's directions and recommendations, allowing reading of the meter from above ground level. The Contractor to allow sufficient Water Meter Remote Reader cable slack for manhole cover removal. The RPZ shall be installed as shown on the Contract Drawings and per manufacturer's instructions.

Connections: The Contractor shall connect the water piping as shown on the Contract Drawings for complete and satisfactory operating unit to the satisfaction of the Engineer. Connections shall be made to The Water Meter by coupling union or flange union on both inlet and outlet ends of the meter and bored for sealing with holes not less that one-eighth (1/8) of an inch in diameter - solder connections are not permitted. Connections to the RPZ shall be as shown on the Contract Drawings and per manufacturer's instructions.

**SUBMITTALS:** Provide Product Data including Manufacturer's catalog sheets and specifications for each item type.

**Shop Drawings:** The Contractor shall submit Shop Drawings showing installation of the complete RPZ assembly, water meter, piping, pipe supports, precast concrete structures, doors and the coatings.

**Catalog Cuts:** The Contractor shall submit Catalog Cuts of the RPZ, water meter, meter reading system, control valve, and all connected piping for approval prior to installation.

**Certifications:** The Contractor shall be responsible for obtaining all Certification necessary to comply with the NYC Department of Environmental Protection (DEP), Bureau of Water and Sewer Operation's (BWSO) Cross Connection Control Unit for approval & the NYS Department of Health regulations for RPZ's (after installation) including:

1. Certification by Backflow Prevention Device Tester, Certification of Master Plumber responsible for the RPZ & Water Meter installation, and
2. A Professional Engineer's or Registered Architect's Certification that the installation is in accordance with the Approved Plans.

The Contractor shall be held completely responsible to ensure that all Work is in compliance with NYC form GEN-215B.

**MEASUREMENT AND PAYMENT:** For the furnishing and installation of **EACH** size of the **RPZ and WATER METER W/ REMOTE AND STRUCTURE** indicated, including installation of all plumbing work, certifications, etc., in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** size RPZ and Water Meter w/ Remote and Structure and shall include the cost of all labor, materials, equipment, and any incidental expenses necessary, including unclassified excavation, temporary sheeting, broken stone base, certifications, all plumbing work within the structure, connection to the water service at the structure; and precast concrete structure, including reinforcing steel, brick masonry, rungs, and access doors, and DEP review fee, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Copper tubing and all water service beyond the exterior face of the concrete structure shall be paid for separately under their respective contract items.

**SECTION PK-ESCR 629 – PLUG VALVE – 2" DIA.**

**WORK:** Under these Items, the Contractor shall furnish and install **PLUG VALVES**, of the sizes and type shown on the plans, in strict accordance with the plans, specifications, and directions of the Engineer.

**PLUG VALVES:** Valves two inches (2") and under shall be of the cylindrical Plug Type with a closed bottom and a top seal, fully enclosed one-quarter (1/4) turn check, straight through flow way which is resistant to turbulence of the flow stream, one piece cast bronze cylindrical plug and "T" head that aligns with the ports to provide a visual check of valve position, inside screw ends with I.P. threads, as is manufactured by Mueller Co. No. H-10283N, or approved equal. Adaptors are required for connecting to copper tubing.

EFFECTIVE JAN. 4TH, 2014, ALL PROPOSED INSTALLATIONS/ REPAIR OF VALVES TO BE UTILIZED ON ALL DOMESTIC DRINKING WATER SERVICES FOR HUMAN CONSUMPTION, MUST BE LEAD-FREE IN COMPLIANCE WITH THE AMENDED FEDERAL LAW, SAFE DRINKING WATER ACT (SDWA).

**OPERATING KEY:** An approved operating key of proper size for each valve shall be furnished by the Contractor, except that the Contractor need not furnish more than two (2) keys for each type of valve, regardless of the quantity of valves called for in the contract. For plug valves two inches (2") and under, the operating key shall be Mueller Co. No. H-10322N, or approved equal.

**SUBMITTALS:** Provide Product Data including Manufacturer's catalog sheets and specifications for each valve type. List type of valves, manufacturer's model number, and size for each service application.

**MEASUREMENT AND PAYMENT:** The quantity of **PLUG VALVES** of various sizes to be paid for under these items shall be the number of valves of each size, furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price for **EACH** valve of the type and size specified, and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation shall be paid for separately under its own item.

**SECTION PK-ESCR 630 –TYPE "K" COPPER TUBING – 1" DIA.**

**SECTION PK-ESCR 631 – TYPE "K" COPPER TUBING – 1¼" DIA.**

**SECTION PK-ESCR 632 – TYPE "K" COPPER TUBING – 1½" DIA.**

**SECTION PK-ESCR 633 – TYPE "K" COPPER TUBING – 2" DIA.**

**SECTION PK-ESCR 638 – TYPE "K" COPPER TUBING – 3" DIA.**

**WORK:** Under these items, the Contractor shall furnish, install and connect the water pipe of the size shown in accordance with the plans, specifications and directions of the Engineer.

**PIPE:** The water service pipe shall be rigid (drawn) temper type "K" copper tubing in straight lengths meeting the specification for ASTM designation No. B88.

**Exception:** If the distance between the water tap to the curb valve is greater than ten (10') feet or cannot be spanned with a single piece of rigid tubing, ductile (annealed) copper tubing may be installed, as approved by NYCDEP and NYCDPR.

**FITTINGS:** Fittings shall be approved wrought copper and bronze solder - joint pressure fittings (ANSI B 16.22), Di-Electric fittings as required.

**JOINTS:** Joints shall be made by soldering, using 95-5 tin antimony solder. Except from the curb valve to the water tap, joints shall be of the "flared" type.

**INSTALLATION:** The pipe shall be laid true to line and grade with a cover as indicated on the plans or as directed by the Engineer. When the foundation is good firm earth, the earth should be pared or molded to give a full support and if necessary a layer of fine gravel, sand or other suitable material should be placed. The same means of securing firm foundation should be adopted in case the excavation has been made deeper than necessary, in which case the Contractor shall furnish the fine gravel, sand or other suitable foundation material at the Contractor's own expense.

Where the bottom of the trench is in rock, fresh fill, soil of low bearing power or other situations where special foundations are required, the Contractor shall provide such foundation in accordance with the written order of the Engineer. The work shall be paid for at the unit prices bid for the materials used in the work.

**TESTS:** The Contractor shall not backfill over any pipe until ordered by the Engineer. The pipe system shall be tight and show no leaks when filled with water, sealed and subjected to an internal hydrostatic pressure of 100 psi for thirty minutes. Temporary caps shall be placed where required to permit making the tests where valves are not available. The tests shall be made in the presence of the Engineer.

**MEASUREMENT AND PAYMENT:** The quantity of **TYPE "K" COPPER TUBING** to be paid for under these items shall be the number of **LINEAR FEET** (laying length), of each size, including fittings, furnished and incorporated in the work in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be unit price per **LINEAR FOOT** of Type K Copper Tubing of each size and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including fine gravel or sand foundation material (where needed), in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation, water tap and restoration shall be paid for separately under their respective contract items.

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>

**END OF SECTION**

**SECTION PK-ESCR 634 – CAST IRON VALVE BOX, 5¼" DIA.**

**WORK:** Under this Item, the Contractor shall furnish and install **CAST IRON VALVE BOX, 5 1/4" DIA.** in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** All materials should be as follows:

**Box:** 5 1/4" diameter valve boxes shall be Bingham & Taylor Fig. No. 4908 (2-Piece Sliding Type Adjustable Valve Box) with a Fig No. 4904-L locking cover, or approved equal. The cover shall have the designation "WATER" cast thereon. The boxes shall extend within the limits called for on the plans.

**Setting:** The valve boxes shall be set plumb, as shown on the plans, on a footing of brick laid in cement mortar, supported on a foundation of broken stone. The entire area surrounding the valve box shall be fully compacted after setting.

**Brick:** The brick shall be made from clay or shale, well burned, of a quality approved by the Engineer. The mortar shall be composed of one-part Portland Cement and two parts sand.

**Broken Stone:** The broken stone shall be clean broken traprock, or other approved stone, all of which shall pass a one-inch square opening screen and retained on a 5/8-inch square opening screen.

**SHOP DRAWINGS:** The Contractor shall submit Shop Drawings indicating box manufacturer, box size and material.

**MEASUREMENT & PAYMENT:** The quantity of **CAST IRON VALVE BOXES, 5 1/4"**

**DIA.** to be paid for under this item shall be the number of boxes, including brick and broken stone setting bed furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **EACH** Cast Iron Valve Box and shall include the cost of all labor, materials, equipment and other incidentals necessary to complete the work, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation will be paid for separately.

**END OF SECTION**

## SECTION PK-ESCR 635 – BOTTLE FILLER

## SECTION PK-ESCR 636 – BOTTLE FILLER W/DOG BOWL

## SECTION PK-ESCR 637 – BOTTLE FILLER W/HI-LO DRINKING FOUNTAIN BASINS

**WORK:** Under these items, the Contractor shall provide all labor, materials, and equipment necessary or required to furnish and install **BOTTLE FILLER** and/or **BOTTLE FILLER W/DOG BOWL** and/or **BOTTLE FILLER W/HI-LO DRINKING FOUNTAIN BASINS**,

including concrete foundation, all internal plumbing, access panels and all external plumbing work and connection to water service and drain within five feet (5') of the tubular body, all in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Except as otherwise provided for herein, the materials shall meet the requirements of the NYCDOT Standard Highway Specifications.

**Broken Stone Base:** Shall consist solely of crushed ledge rock. Stone shall be no. 3 size and shall be of approved size and quality as specified in the NYCDOT Standard Highway Specifications.

**Geotextile –Drainage:** shall be FX-60HS (nonwoven) as manufactured by Carthage Mills, Cincinnati, OH, or 160N (nonwoven) by Mirafi, Inc., Charlotte, NC, or TerraTex N06 (nonwoven) by Hanes Geo Components, Edison, NJ, or approved equal.

**Polyethylene vapor retarder:** shall be a Reinforced Vapor Retarder 3-ply laminate, combining 2 layers of high-density polyethylene and 1 high strength non-woven cord grid similar to Griffolyn Type-65 as manufactured by Reef Industries, Inc., Houston, Texas or approved equal.

**Concrete pad, Concrete pipe support and Cleanout:** (for Bottle filler and Bottle Filler w /Dog Bowl) Concrete shall be 3,200 psi Average class B-32 Concrete per the NYCDOT Standard Highway Specifications.

**Cleanout manhole cover and frame:** (for Bottle filler and Bottle Filler w /Dog Bowl) shall be heavy dutycast iron per ASTM A48, latest revision Class 30 or better. Manhole cover shall be a locking cover with frame, similar to Pattern No. 1000010 as manufactured by Campbell Foundry, Harrison, NJ or approved equal. See **Hardware:** paragraph.

**Sand:** surrounding cleanout shall be cushion sand as described in the NYCDOT Standard Highway Specifications.

**Drain pipe:** Shall be cast iron.

**Cleanout ferrule:** Shall be similar to model # CO-380 cast iron cleanout with gasketed brass countersunk plug, no hub connection as manufactured by Watts Drainage products, Spindale, NC or approved equal.

**Expansion joint with sealant:** material shall be one of the following: A premolded bituminous fiber joint filler, as specified in Section "B" (requires a bond breaker and sealant) or, a premolded closed cell expanded polyethylene foam joint filler, such as MasterSeal 920 by BASF Inc., Shakopee, MN (requires only sealant) or, an approved equal of any of the above. If bituminous fiber material is used, a bond breaker such as one-half inch (1/2") width polyethylene tape or five-eighths inch (5/8") diameter expanded polyethylene foam backer rod shall be installed as recommended by manufacturer. A bond breaker will not be required for a premolded foam joint or a shredded recycled rubber aggregate joint filler, but sealant is always required. Prepared expansion joints shall be coated with a primer followed by installation of a bond breaker and a self-leveling two-component polyurethane-based elastomeric sealant. The Contractor shall apply Sikaflex 429 primer with Sikaflex - 2C SL sealant, manufactured by Sika Corp., Lyndhurst, N.J; or BASF

MasterSeal P 173 with MasterSeal SL 2 sealant, by BASF, Inc., Shakopee, MN, or approved equal. Color of sealant shall be concrete gray. Asphalt cement will not be approved as a sealant.

Precast Concrete plumbing pit: (for Bottle Filler w/Hi-lo Drinking Fountain Basins) The Concrete Plumbing Pit shall be precast, manufactured by Key Cast Stone Company, Inc., Amityville, NY, Pro Concrete Precast, Jamaica, NY, or approved equal.

Cement: Air entrained Portland cement shall comply with the requirements of the ASTM Designation C150. It shall be Type IIA, moderate sulfate resistant.

Cast stone shall have a compressive strength of not less than forty-five hundred (4,500) pounds per square inch when tested as 2" x 2" x 2" cubes at an age of not more than twenty-eight (28) days and shall have an absorption rate not to exceed seven (7%) percent of the dry weight after being dried to constant weight at 150 degrees Fahrenheit. No chipped, broken, or checked stone showing fine hair cracks or checks on the surface will be accepted.

Aggregate: Natural Sand and gravel shall conform to the requirements of ASTM C33. Calcium Chloride: Do not use calcium chloride in precast concrete.

Reinforcing Bars: ASTM A 615, Grade 40 or Grade 60 as necessary. Bars are to be used to handle transportation and handling stresses.

Welded Wire Fabric: Shall meet ASTM A1064/1064M.

Supports for Reinforcement: Provide supports for reinforcement including bolster, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing.

Miscellaneous Iron and Steel: Access into the concrete plumbing pit shall be via a two (2') foot diameter ductile cast iron frame and "Parks Leaf" manhole cover as shown on contract plans. Manhole Covers shall be of gray iron per ASTM A48, latest revision, Class 30 or better. Covers shall be as manufactured by Campbell Foundry Co., Harrison NJ or EJ USA, Inc., East Jordan, MI or approved equal. All covers shall be suitable for highway traffic, meeting the requirements for heavy duty H-20 loading, per AASHTO M306-10.

Hardware: Each cover shall be furnished with two (2) Stainless Steel Penta-Head bolts as supplied by Campbell Foundry Co., Harrison, NJ, or approved equal. Typical plastic end caps are to be supplied with hardware and installed on Penta-Head bolts.

**Bottle Filler:** Shall be Model #10125-SM-NYC as manufactured by Most Dependable Fountains, Inc. Arlington, TN, Model #M-OBFX-NYC as manufactured by Murdock Manufacturing, City of Industry, CA, Model #LK4400BF-NYC as manufactured by Elkay, Oak Brook, IL, or approved equal.

**Bottle Filler w/dog bowl:** Shall be Model #10125-SM-DB-LHB-NYC as manufactured by Most Dependable Fountains, Inc. Arlington, TN, Model #M-OBFX-PF-NYC-HB6 as manufactured by Murdock Manufacturing, City of Industry, CA, Model #LK4400-DB-BF-LHB-NYC as manufactured by Elkay, Oak Brook, IL, or approved equal.

**Bottle Filler w/ Hi-Lo Drinking Fountain basins:** a "Hi-Lo" drinking fountain is defined by ADA as a unit where one fountain basin is accessible to those who use wheelchairs and one fountain basin is at a standard height convenient for those who have difficulty bending.

**Bottle Filler w/ Hi-Lo Drinking Fountain basins:** Shall be Model #10145-SM-NYC as manufactured by Most Dependable Fountains, Inc. Arlington, TN, Model #GYQ5X-NYC as manufactured by Murdock Manufacturing, City of Industry, CA, Model #LK4430-BF-1U-NYC as manufactured by Elkay, Oak Brook, IL, or approved equal.

Customization of bottle fillers for NYC use:

Manufacturer's identification shall be displayed discreetly on the unit's access panel to facilitate ordering replacement parts.

All parts and installation shall meet applicable requirements of N.Y.C. Codes, including type "K" copper tubing throughout for water supply within unit.

Sensor operated bottle filler and freeze resistant valves are Not required under this specification.

Tubular Body: Shall be either pipe or tubular steel or fabricated 304 stainless steel, 12 gauge or better.

Access covers: shall be located for easy access to facilitate maintenance and replacement of parts and shall be fastened with vandal resistant stainless steel screws.

Surface mount: Shall be either stainless steel mount or optional stainless steel surface carrier.

Corrosion Resistant Treatment: All fabrication and welding shall be completed prior to application of the corrosion resistant coating, metal pieces shall be cleaned of all weld spatter, mill scale, varnish, rust, grease, and the like and the surface mechanically and chemically prepared to receive the coating. This corrosion resistant coating shall be a thermal spray zinc coating or electrostatic or immersion applied primer with a minimum thickness of 3 mils. All metal pieces, including welds, shall receive the coating inside and out.

Polyester Powder Coating: A surface coat shall be applied to the thermal zinc coated metal pieces in such a manner that the coating will not peel off. The manufacturer shall perform all processes required to achieve a smooth material bond. An epoxy or acrylic polymer primer shall be applied prior to application of powdercoating. The surface coat shall be an electrostatically sprayed, lead-free, superdurable TGIC (triglycidyl isocyanurate) polyester powder coating applied to a minimum of three (3) mils thickness which shall be oven cured. The TGIC polyester powder coating shall be UV resistant and comply with the ASTM standards.

Material manufacturer's directions for storage and use shall be adhered to. Material surfaces shall be protected during shipment so as to arrive mar and scratch free in the field.

Color- shall be Blue, Green, Black or Silver/Gray, as shown on the drawings and/or as selected by the Engineer. Where Silver/Gray color is specified, satin finish stainless steel (without powder coating) may be substituted.

NYC Water Logo: shall be a vinyl decal with ultraviolet (UV) cured ink, designed for outdoor use, minimum thickness 5 mil. Decal shall include a UV protected laminate. Adhesive shall be guaranteed to perform at temperatures as low as -10 degrees F. Minimum durability shall be 3 years. Dimension of decal shall be 3 7/8" in width, 7 3/8" in height, light blue color shall be Pantone Process Cyan (4 color print CMYK 100,0,0,0), white color shall be Pantone Process White (4 color print CMYK 0,0,0,0) or approved equal. Logo shall be placed in recess as shown on attached sketch or as approved by the Engineer.

Hardware: All hardware, fittings, and fastenings shall be tamper resistant 18-8 stainless steel, type 304 in accordance with ASTM F593 of sizes as indicated on the shop drawings and as required to complete the installation. Anchor bolts shall be minimum 3/8 inch, ten (10") inches long and may be either stainless steel or galvanized steel, quantity as required by the manufacturer.

Bubbler Head: Bubblers shall be rounded one piece design, vandal-resistant type, certified to be lead-free. Bubblers may be either 18-8 stainless steel type 304 or chrome plated cast brass.

Push Button: Shall be stainless steel valve body with a 1 1/2" diameter feather touch vandal resistant push button. Push button for bottle filler and accessible "lo" basin shall be activated by a maximum five (5) pounds of pressure, in compliance with ADA.

Stainless Steel Bowls: Shall be 18 gauge or better stainless steel, type 304, satin finish to comply with ASTM A380 and ASTM A967 standards, install with tamper proof stainless steel screws.

Dog Bowl: construction and finish to match the bottle filler and stainless steel bowl as specified herein.

Lockable Hose Bibb: shall be included in dog bowl/pet fountain models. Locking device shall be constructed to be vandal resistant. The Engineer shall supply the lock. A vacuum breaker shall be included.

Waste Strainer: Shall be satin chrome plated brass or stainless steel waste strainer with a 1-1/4" O.D. tailpiece. Plastic waste drain/strainers are not acceptable.

Plumbing: The manufacturer shall have all factory installed plumbing components pre-tested installed before delivery to site. All factory connections to be made by a licensed plumber.

**PLUMBING:** The Contractor shall furnish and install all pipe, fittings, valves, and other foundries to complete the plumbing for the connections and concrete pit. The drain pipe shall be extended five (5) feet beyond the foundation and connected to the sanitary drain line or dry well, as shown on the plans. The one and one-quarter (1 1/4") inch cold water line shall be extended five (5') feet beyond the foundation and connected to the water supply pipe, as shown on the plans.

Connection to water supply shall be made with a threaded, extra heavy fitting. The Contractor shall provide dielectric fitting at appropriate locations, as shown on plan.

Water Piping: Water Piping shall be one and one-quarter (1 1/4") inch rigid hard temper type "K" copper tubing as shown on the plans meeting the specification for ASTM B88. Fittings shall be approved wrought copper and bronze solder-joint pressure fitting (A.N.S.I. B16.22).

Pipes through precast concrete plumbing pit wall shall be protected with a sleeve caulked watertight with a silicone sealant. All appurtenances such as 1 1/4" Gate Valve, 3/4" drain cock, reducer coupling and 3/8" pressure regulator valve shall be installed as per plans, and as directed by the Engineer.

Pipe Supports: Pipe clamps shall be made up of 1" x 3/8" strap iron galvanized and shall be constructed to rigidly hold the pipes firmly in place. Clamps shall be held in place with anchor bolts set in fountain shaft or base.

**INSTALLATION:** Water supply and drainage lines shall be installed as shown on the detail and the plans. Prior to placement of concrete pad or precast concrete plumbing pit, the subgrade and broken stone shall be level and compacted. Concrete pad shall be a smooth, flat, broom finished surface installed flush with adjacent pavement grade and in accordance with the plans and details. Adjacent pavement shall be pitched away from bottle filler.

Bottle Filler: The unit is to be handled at lifting locations designated by the manufacturer; no chipped, cracked, or otherwise defective Bottle Filler will be acceptable.

The fixture shall be surface mounted and installed in accordance with the manufacturer's written directions. Entire assemblies shall be installed in accurate locations, square and plumb in concrete foundation and in required locations to surrounding finished grade, as shown on the plans. Anchor bolts shall be accurately set, plumb and true, in concrete foundation, quantity as recommended by the manufacturer.

Field connection: All field connections to be made by a Licensed Plumber. The factory installed portion of the cold water supply and waste water lines shall be extended from the Bottle Filler/Drinking Fountain Base at lengths indicated on the drawings. Water and Drain lines shall be pitched away from the Bottle Filler/Drinking Fountain. Pockets in rigid piping that cannot be

drained by gravity will be rejected. The plumber will be required to reinstall piping until gravity drain is achieved.

Winterization: The unit shall be winterized by shutting off water supply and opening bleeder valve (outside of fountain). The bottle filler, dog bowl and drinking fountain basins shall be designed to allow internal water to drain by gravity.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

Shop Drawings: The Contractor shall submit a catalogue cut and a complete dimensional Shop Drawing of the bottle filler showing all components including color, internal plumbing, access panels, gauges of metal and thickness of wall construction at least twelve (12) weeks prior to proposed installation. NYC Water logo decal shall be displayed on shop drawing.

Operation and Maintenance Manual: The Contractor shall furnish an Operation and Maintenance (O & M) Manual prepared in conjunction with the manufacturers of equipment in this specification. The O & M manual shall contain the following:

Description of system operation.

Troubleshooting and Repair Guide.

List of parts with their model numbers.

**MEASUREMENT AND PAYMENT:** For each **BOTTLE FILLER** furnished and installed in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH BOTTLE FILLER** and shall include the cost of all labor, materials, equipment, and incidentals necessary or required to complete the work including excavation, broken stone base, sand, polyethylene vapor retarder, geotextile, concrete, stainless steel anchor bolts, cleanout pipe, ferrule, manhole frame and cover, vandal resistant bolts, expansion joint with sealant, logo decal, submittals, all components integral with the bottle filler, all plumbing work and connections to water and drain service within five (5') feet from the center of the tubular body, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

For each **BOTTLE FILLER W/DOG BOWL** furnished and installed in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH BOTTLE FILLER W/DOG BOWL** and shall include the cost of all labor, materials, equipment, and incidentals necessary or required to complete the work including excavation, broken stone, sand, polyethylene vapor retarder, geotextile, concrete, stainless steel anchor bolts, cleanout pipe, ferrule, manhole frame and cover, vandal resistant bolts, expansion joint with sealant, logo decal, submittals, all components integral with the bottle filler including dog bowl and lockable hose bib, all plumbing work and connections to water and drain service within five (5') feet from the center of the tubular body, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

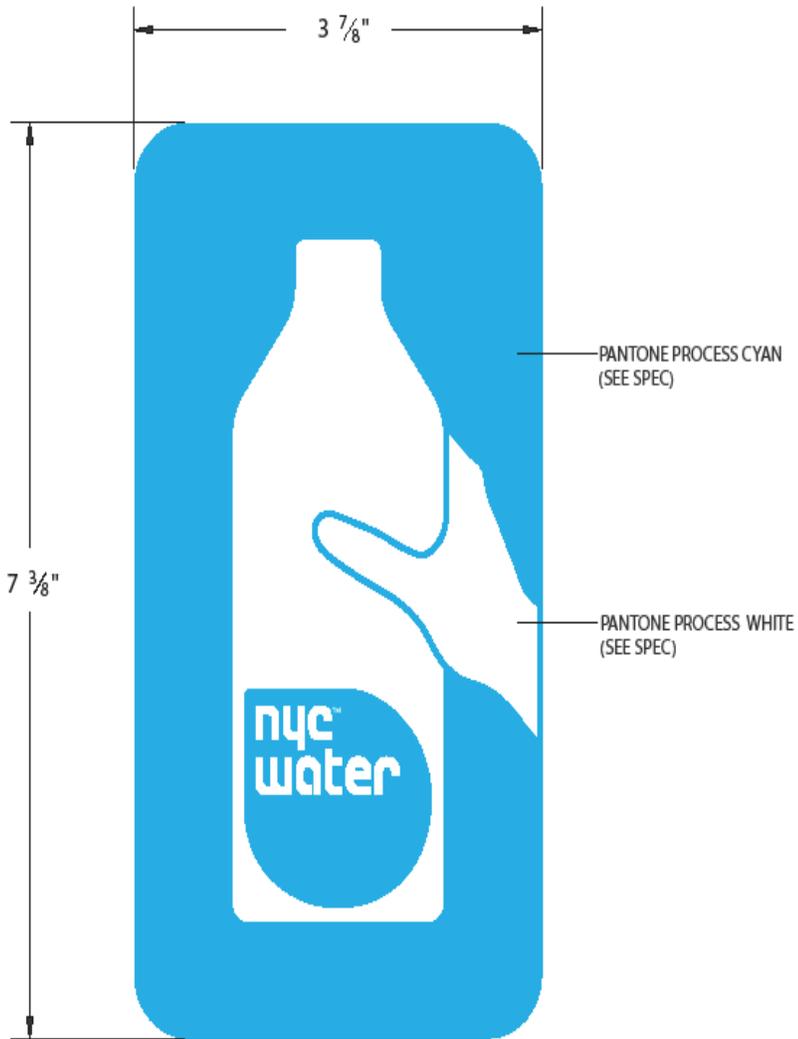

For each **BOTTLE FILLER W/ HI-LO DRINKING FOUNTAIN BASINS** furnished and installed in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH BOTTLE FILLER W/ HI-LO DRINKING FOUNTAIN BASINS** and shall include the cost of all labor, materials, equipment, and incidentals necessary or required to complete the work including excavation, broken stone, precast concrete plumbing pit, miscellaneous iron and steel, Parks Leaf manhole cover, vandal resistant bolts, hardware, logo decal, submittals, all components integral with the bottle filler, all plumbing work and connections to water and drain service within five (5') feet from the outside edges of the foundation, all in

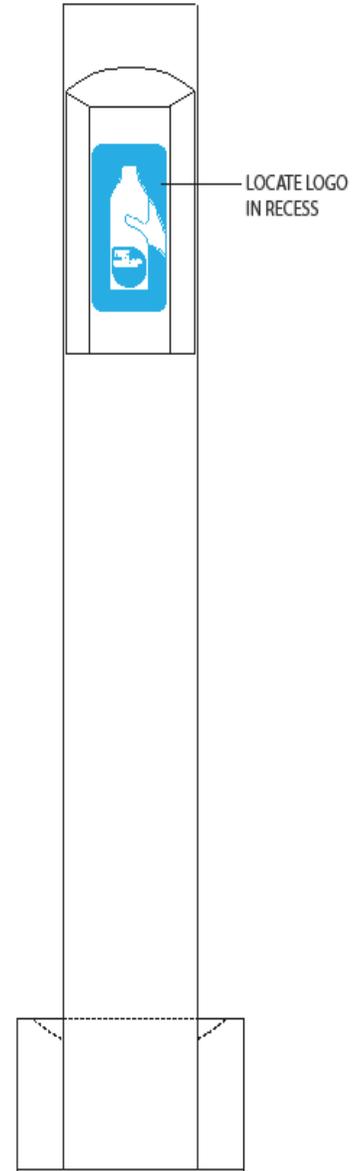

accordance with the plans and specifications, to the satisfaction of the Engineer.

## NYC WATER LOGO

AREA: 28.59 sq. in.

END OF SECTION

PARKS-305

## SECTION PK-ESCR 640 – GROUND HYDRANT – 1” DIA.

**WORK:** Under these Items, the Contractor shall furnish all labor, materials and equipment necessary or required to install **GROUND HYDRANT - 1” DIA.** including all plumbing work, connection to water service and irrigation in accordance with the plans, specifications, and directions of Engineer.

**SCOPE:** The Contractor shall furnish and install a ground hydrant, all piping, fittings, and other sundries necessary to connect the water lines and provide irrigation, as shown on the plans, to the satisfaction of the Engineer.

### **MATERIALS:**

**Hydrant:** One Inch (1”) Diameter Ground Hydrant shall be Type Z-1360-BC-HD-RK-NB as manufactured by Zurn Industries Inc., Hydromechanics Division, Erie, PA, or approved equal. Hose connection shall be one inch (1”).

Hydrant is encased, ground hydrant for flush-with-grade installation, complete with bronze casing, polished nickel bronze box, all bronze interior parts, bronze seat and replaceable seat washer, non- turning operating rod with free-floating compression closure valve with 1" connection. Polished nickel-bronze box shall have a scoriated heavy-duty cover with operating key lock and "Water" cast on cover. Depth of bury is two (2) feet minimum for both size Ground Hydrants. Four (4) keys are to be supplied to the Engineer.

**Broken Stone:** Broken Stone shall consist solely of crushed ledge rock. Stone shall be as designated on the detail and shall be of the approved size and quality specified in the NYCDOT Standard Highway Specifications.

**Coupling Valve & Key:** Quick coupling valve shall be solid red brass, bayonet type, with a one (1”) inch inlet size, Buckner Model QB44LRC10, or approved equal. Corresponding coupling key shall be three quarter (3/4”) inch inside diameter with a one (1”) inch male thread, Buckner Model QB44K10, as manufactured by Buckner Brass, Storm Manufacturing Group, Inc., Torrance, CA, or approved equal. One valve and two keys required per site.

**Hose Swivel Ell:** Hose Swivel Ell shall be bronze with one (1”) inch female thread for coupler and three quarter (3/4”) inch male garden thread for hose. *Hose Swivel Ell must be manufactured by the same company as the Quick Coupling Valve & Key*, and shall be Buckner Model HS-100 or approved equal. One required per site.

**Brass Garden Hose Adaptor:** Shall be a one (1”) inch FPT, with a three-quarter (¾”) inch garden hose thread, Model # FM1076 as manufactured by George Taylor Brass and Bronze Works, Huntington, N.Y., or approved equal. One required per site.

**Siamese “Y” Connectors:** Siamese “Y” connectors shall be brass, with shut-off valves at each connection. Size shall be three quarter (3/4”) inch by three quarter (3/4”) inch. Two required per site.

**Nozzle:** Nozzle shall be a solid brass nozzle to fit a three-quarter (3/4”) inch hose, Midsize #529 as manufactured by Gilmour, Chicago, IL or approved equal. One required per site.

**Brass Rose:** Rose shall be Brass, four (4”) inches in Diameter with protective rubber guard and metric to inch hose thread converter, Model #540B, as manufactured by Damm Corporation, Manitowoc, Wisconsin, or approved equal. One required per site.

Extension Handle: Extension handle shall be extruded aluminum tubing, thirty (30") inches long, with forged brass hose couplings and comfort hand grip, Model #130-G, as manufactured by Dramm Corporation, Manitowoc, Wisconsin, or approved equal. One required per site.

Shut-Off Valve: Shut-off valve shall be brass with Teflon® seals and a hard chrome plated ball, Model #300, as manufactured by Dramm Corporation, Manitowoc, Wisconsin, or approved equal. One required per site.

Sprinkler Head With Base: Sprinkler head shall be brass and stainless steel impulse type mounted on a Rezimar wheeled base, six and one half inches (6 ½") wide by nine inches (9") high, one and one half (1 ½) pounds minimum weight for stability, with ergonomic grip and swivel coupling and a powder coated finish, to fit three-quarter (¾) inch hose. Sprinkler head and base shall be "Pulsating Sprinkler" Model # 50260 as manufactured by Nelson, Peoria, IL or approved equal. Two required per site.

Hose: Hose shall be garden hose, three-quarter (¾) inch diameter in four (4) fifty (50') foot lengths, with a burst pressure of 500 psi minimum, equipped with approved connectors. Hose shall be "Flexogen" as manufactured by Gilmour, Chicago, IL or approved equal. 200 feet of hose required per site.

Hose Reel: Hose Reel shall be constructed of one (1") inch diameter steel frame, with heavy-duty ten (10") inch wheels. Cart and reel shall have a baked enamel finish and be capable of holding two hundred (200') feet of ¾" hose. Hose reel shall be as manufactured by A. M. Leonard or approved equal. One required per site.

Soaker Hose: Shall be porous pipe constructed primarily of recycled rubber tires. Hose shall weep along its entire length. Hose shall be five eighth (5/8") inch diameter in fifty (50') foot coupled lengths. All fittings shall be nickel plated brass. Hose shall be No. 17010 ColorStorm Premium 50 Foot Soaker Garden Hose as manufactured by Dramm, or approved equal. 100 linear feet of hose required per site.

Anchor Pins for Soaker Hose: Shall be five (5") inch x one (1") U-shaped 11-gauge steel pins. Each package shall contain ten (10) pins. Two packages required per site.

Tests: Before any irrigation materials are accepted, they shall meet such tests as may be required to prove to the satisfaction of the Engineer that they are in proper working order and will do the work for which they are intended, in a satisfactory manner.

**SUBMITTALS:** Provide Product Data including Manufacturer's catalog sheets and specifications for each valve type. List type of valves, manufacturer's model number, and size for each service application.

Operating Keys: The Contractor shall furnish four (4)-operating keys for each hydrant installed under this item.

Parts Repair Kit: Contractor shall supply one (1) Parts Repair Kit for each Ground Hydrant installed under this item.

**MEASUREMENT & PAYMENT:** For **EACH** Ground Hydrant – 1” Dia. furnished and installed, complete with all plumbing work in accordance with the plans, specifications, and directions of the Engineer, and delivery of all irrigation materials, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Ground Hydrant – 1” Dia. and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including all plumbing work and connections to water service within five (5') feet of the ground hydrant, broken stone. The following items are required per site: one (1) Quick Coupling Valve and two (2) Keys, one (1) Hose Swivel Ell, one (1) Brass Garden Hose Adaptor, two (2) Sprinkler Heads with Base, two hundred linear feet (200') of 3/4" Hose, one hundred linear feet (100') of soaker hose, twenty (20) anchor pins, one (1) Hose Reel, two (2) Brass Siamese “Y” Connectors with Shut-off Valves, one (1) Brass Rose, one (1) Extension Handle, and all submittals in accordance with the plans and specifications to the satisfaction of the Engineer.

Plug Valve, Valve Box, Excavation and Concrete for Park Structures shall be paid for under their respective items.

**END OF SECTION**

## SECTION PK-ESCR 641 – IN-GROUND IRRIGATION SYSTEM-AUTOMATIC

**WORK:** Under this item, the Contractor shall prepare and submit an irrigation design of the type specified above, prepared by an approved Irrigation Design Specialist, furnish, and install the approved **IN-GROUND IRRIGATION SYSTEM** including all labor, materials and equipment, all in accordance with the plans, specifications, and directions of the Engineer. Work under this item includes, but is not necessarily limited to, the following:

- 1) Irrigation booster pump system.
- 2) Irrigation controller.
- 3) Proposed Irrigation Layout & Shop Drawing submittals.
- 4) Trenching, excavation, and backfill for the entire system.
- 5) Installing fully operational irrigation system.
- 6) Testing all systems and making operative.
- 7) Preparing "As-built" drawings.
- 8) First Year Winterization & following Spring Activation.
- 9) Exterior solenoid valves and rain sensor
- 10) M&O Orientation and Demonstration
- 11) Operation Maintenance Manual & Instructional Video.

Irrigation Design Specialist: The Contractor shall obtain the services of an Irrigation Design Specialist to prepare an irrigation design proposal for the landscaped areas designated on the plans. The Irrigation Design Specialist shall have a minimum of three (3) year's experience performing commercial irrigation design work. The designer's experience shall be of a similar size and scope to the work shown on the drawings. Certification with a specialty in "Commercial Irrigation Design" (CID-Commercial) by the Irrigation Association, Fairfax, Va., shall be considered proof of the requisite experience, however, any equivalent combination of education and experience may be submitted for approval. Grounds for Rejection of submitted layout plan: In selection and installation of sprinkler heads, irrigation specialist shall select the appropriate sprinkler heads to keep the paved areas, sidewalks, roadways, sitting areas, playground, etc. relatively dry without compromising the full irrigation of turf and planting areas. As much as is practical, the valve boxes shall not be located in playing areas of athletic fields.

Existing trees shall be protected.

Conference: Before any work is started, a site conference shall be held between the Contractor, the Irrigation Design Specialist, the Irrigation installer, and Engineer concerning the work to be performed under this Item. The Tree Protection Plan shall be reviewed at this conference and siting, layout, hand and/or pneumatic excavation or tunneling shall be discussed. Contractor shall schedule conference at the convenience of the       r.

Coordination: The Contractor shall install PVC pipe or galvanized heavy wall steel sleeves under roadways, sidewalks, and pathways to facilitate installation of the irrigation system. The Contractor shall coordinate and cooperate with other Contractors to enable the work to proceed as rapidly and efficiently as possible.

Permits: The Contractor shall obtain all necessary permits and pay all required fees, at no additional cost to the City, to any governmental agency having jurisdiction over the work. The Contractor as required shall arrange inspections required by local ordinances during the course of construction.

Licenses: A Licensed Plumber shall make all plumbing connections.

A Licensed Electrician (where system is automatic) shall perform all electrical work.

Rejection: the Engineer reserves the right to reject any proposed design layout, material, or work, which does not conform to the Contract Documents. Rejected work shall be removed or corrected at the Contractor's expense immediately upon notification by the Engineer.

### **MATERIALS:**

For proper coordination of materials used in the Irrigation system, all materials shall be purchased from the same supply source, although not necessarily the material of a single manufacturer. Unless otherwise specified, all materials shall be as manufactured by Toro Irrigation Products, or approved equal. All materials throughout the system shall be new.

Irrigation Pump Stations:

The plumbing booster pump system will be used for the site irrigation.

Discharge Manifold for Irrigation:

The pump station discharge manifold assembly will include:

Valves

The manifold will be provided with the following valves:

a) Check Valves

Cast iron body, stainless steel disc duo flap check valves on each pump unit.

b) Isolation Valves

Cast iron body stainless steel disc insert type butterfly valves on:

- each pump unit
- the discharge line to the field

c) Air Valve

A 50 mm (2 inch) single acting air release valve complete with isolating gate valve located at the highest point in the discharge manifold.

d) Pressure Relief Valve

- A fast acting diaphragm type pressure relief valve with a fully adjustable brass pilot and control tubing with discharge pipework back to the wet well.
- The flow capacity of the pressure relief valve will be greater than the designed flow rate for the pump station.
- The pressure relief valve will be isolated from the manifold by a gate valve.

Sprinkler Heads For General Turf Areas: Sprinkler Heads For General Turf Areas shall be a

T7series rotor as manufactured by The Toro Irrigation Products, Rain Bird, Hunter or approved equal.

The full and/or part circle sprinklers shall be gear driven rotary type. Part circle models shall be adjustable from 45 to 335 degrees. The sprinkler shall be capable of covering a 5040' radius at 50 pounds per square inch pressure with a discharge rate of 11.6 gallons per minute. Water distribution shall be via one modular nozzle mounted and locked onto a 1 3/8" diameter nozzle turret. Radius reduction shall be reducible by up to 25% by means of a radius adjustment screw accessible from the top of the nozzle when the sprinkler is properly installed.

The body and cap of the sprinkler shall be injection molded from ABS, a non-corrosive, UV-resistant, heavy-duty plastic material. The sprinkler shall have a plastic filter screen sized to prevent entry of foreign material to the nozzle. All components shall be removable from the top of the sprinkler case.

The sprinkler shall have a single-piece riser/body seal that regulates flushing during pop-up and retraction to clear any debris from around the riser, and a heavy-duty stainless steel spring to ensure positive retraction. The seal shall be a single piece injection molded from Santoprene, a synthetic rubber.

The sprinkler shall be capable of accepting any one of 13 nozzles. The nozzles shall be color-coded and available in three trajectories (standard angle - 25 degrees; low angle - 15 degrees; flat angle - 7 degrees).

Rotation shall be accomplished by a sealed, oil packed gear drive assembly isolated from the water supply and driven by a variable stator that maintains a constant speed of rotation with all nozzles. The variable stator shall require no adjustments when changing nozzles. The sprinkler shall employ a modular, interchangeable nozzle technology. Any individual nozzle shall be easily removed, installed and locked if field adjustment is required.

A standard pop-up, non-commercial model shall be available with a check valve, which shall maintain 10' of elevation change. A lavender effluent water use indicator is available and can be press fit into the nozzle. A 1/4" NPT plug shall be provided with all side inlet models to plug the unused inlet.

#### Sprinkler Heads for Field Irrigation:

##### T7 Sprinkler Head Specifications

Toro Super T7 Series, or approved equal.

Radius 39' to 75'

Flow Rate 1.7 to 30.6 GPM

Operating Pressure Range: 40 -100 PSI

Recommended Operating Pressure Range: 40 - 75 PSI

- thirteen Nozzle Variations:

\* 2.0, 3.0, 4.5, 6.0, 7.0, 7.5, 9.0, 12.0, 16.0, 20.0, 24.0, 27.0 GPM, each available in:

> Standard Angle (25 Degree Trajectory)

> Low Angle (15 Degree Trajectory)

> Flat Angle (7 Degree Trajectory)

- Single Rotating stream pattern

- Full Circle (360 degrees) model
- Adjustable part circle (45 to 335 degrees) model
- Lockable Arc Adjustment
- Check-O-Matic models available
- Balanced precipitation rates
- Up to 25% reducible watering radius
- Precipitation rate: .06 - 1.29 inches per hour
- Stainless Steel Riser Sleeve
- Locking Cap
- Exposed Surface 2"
- Cap Diameter 3"
- Inlet size: 3/4" NPT Female Thread
- Trajectory (maximum height of spray at 40 PSI)

Nozzle	Std Angle	Low Angle	Flat Angle
2.0	7' 6"	4' 5"	3' 0"
3.0	7' 6"	4' 10"	2' 6"
4.5	8' 0"	5' 4"	2' 1"
6.0	8' 6"	5' 2"	2' 0"
7.5	9' 0"	5' 7"	1' 11"
9.0	10' 0"	5' 5"	2' 1"
7.0	10' 6"	5' 6"	2' 7"
9.0	11' 0"	5' 5"	2' 3"
12.0	11' 6"	5' 6"	2' 4"
16.0	12' 0"	5' 7"	2' 7"
20.0	12' 6"	5' 8"	2' 5"
24.0	13' 0"	5' 9"	2' 9"
27.0	13' 6"	6' 0"	3' 0"

- Commercial > Height: 7"
  - > Body Diameter: 2 3/8"
  - > Pop Up to the Nozzle: 3"
  - > Weight: 4.5 oz.

Sprinkler Head for Lawn Irrigation:

The sprinkler shall be of the fixed-spray type designed for in-ground installation. The sprinkler shall be capable of accepting all 300 series spray, stream, flood, and microspray nozzles and

male-threaded risers and extenders. The sprinkler shall operate within a 20-75 PSI (1.4-5.2 Bar) pressure range.

Stream Rotors must feature multiple rotating streams, a slower precipitation rate and must successfully fight wind. They should utilize Matched Precipitation Rate (MPR) nozzles to ensure precise, proportional flow for uniform water coverage. The rotors should have interchangeable arc plates and nozzles to provide versatility with the ability to cover varying arc requirements from 90 to 360 degrees and rated for Durable plastic and stainless steel body styles—pop, shrub and high-pop.

Radius: 14'-33'

- Flow Rate:
  - Lawn Pop-up and High pop: 0.57-7.51 gpm
  - Shrub: 2.07-6.36 gpm
- Operating Pressure Range: 35-50 psi
- Pop-up Height to Nozzle:
  - Lawn Pop-up: 23/4"
  - High Pop: 113/4"
- Inlet (Female-threaded):
  - Lawn Pop-up and High pop: 3/4"
  - Shrub: Combined 1/2" to 3/4"
- Large basket filter screen
- Body Diameter: 23/8"
- Cap Diameter: 3"
- Height:
  - Lawn Pop-up: 61/8"
  - High Pop: 16"
- Shrub Base Diameter: 13/4"

Nozzle	27° - Max. Ht. of Spray
01	4' 10"
02	5' 1"
03	5' 11"
63	7' 0"
93	6' 3"

The sprinkler shall be a model number as indicated on the control drawings and shall be manufactured by The Toro Irrigation Products, USA, or approved equal.

Sprinkler Heads for Planted Areas:

Rotary Sprinkler Heads shall be 570Z Series rotor as manufactured by Toro Irrigation Products, or approved equal.

The sprinkler shall be of the fixed spray type designed for in-ground installation. The sprinkler shall be capable of accepting all 570Z series spray, stream, flood, and micro spray nozzles and male-threaded risers and extenders. The sprinkler shall operate within a 20 to 75 PSI pressure range.

The body and cap of the sprinkler shall be injection molded ABS, a non-corrosive, impact-resistant, UV-resistant, heavy duty plastic material. The sprinkler shall have a color-coded riser screen filter, stainless steel or plastic, appropriately sized to prevent entry of foreign material to the nozzle. All parts shall be removable through the top of the sprinkler case.

The sprinkler shall have a single-piece riser/body seal that flushes only upon retraction to clear any debris from around the riser, and a stainless steel spring to ensure positive retraction. The sprinkler shall have no flush during pop-up to allow the maximum number of sprinklers per station. The seal shall be a single piece injection molded from Alcryl, a synthetic rubber.

The sprinkler shall be capable of nozzle alignment via a two-piece ratcheting riser. The sprinkler shall be available in models with a check valve or standard models shall be capable of accepting a check valve that will prevent low head drainage with elevation differences up to 7'. A ½" NPT plug shall be provided with all side inlet models to plug the unused inlet.

A biodegradable debris label shall be factory-installed to eliminate debris intrusion during installation and line flushing.

A lavender effluent water use indicator shall be available and capable of snap fitting to all sprinkler caps.

Sprinkler Heads Rotary – 570Z Series: The sprinkler shall be of pop-up design with an overall body height of 6 ¼", a body diameter of 1 3/8", a cap diameter of 2", and having a pop-up stroke of 4 ¼".

- Toro 570Z Series, or approved equal.
- Radius: 0'- 22'
- Flow Rate: 6.5 GPH to 4.58 GPM
- Operating Pressure Range: 20-75 PSI
- Recommended Operating Pressure Range: 25 to 50 PSI
- Optimum Operating Pressure: 30 PSI
- PCD Nozzles: 30 to 75 PSI
- Accepts all Toro spray, stream, flood, and micro spray nozzles
- Zero flush seal & cap configuration
- Exposed surface: 2" cap diameter
- Body diameter: 1 3/8" (2", 3", 4", 6" models); 1 5/8" (12" model)
- Inlet size – ½" NPT female thread

MODEL:                      HEIGHT:                      POP-UP:                      WEIGHT:

570Z-2P	4"	2"	1 oz.
570Z-3P	4 7/8"	3 1/4"	1 oz.
570Z-4P	6 1/4"	4 1/4"	1.3 oz.
570Z-6P SI	8 1/4"	6 1/4"	1.7 oz.
570Z-12P SI	15 1/2"	12"	3.9 oz.

(Side Inlet = 4 3/4" from top of sprinkler to center of side inlet)

#### Root Watering System:

The RWS consists of a perforated polyethylene cylinder in three different lengths – 36" (91,4 cm) for large trees, 18" (45,7 cm) for small trees, and 10" (25,4 cm) for shrubs and row plantings – and two different widths – 4" (10.2 cm) for trees and 2" (5,1 cm) for shrubs and row plantings. Provide cylinder supports pea gravel fill to provide better top-to-bottom water dispersion and firmness against root compression.

The RWS shall be designed with an integrated bubbler and optional check valve. All factory-assembled RWS should be pre-configured with swing assemblies and/or spiral barbed fittings in order to promote irrigation design flexibility, accommodate all tree and shrub sizes.

The RWS should support an extra-wide molded collar to provide convenient access to the bubbler and drip line fastener and support a locking grate cover to help deter vandalism. The RWS shall contain a sock option in order to prevent small particles from penetrating the RWS cylinder. The RWS shall be designed with a peripheral watering feature which allows water to flow along the perforated cylinder resulting in the wetting of soil along the vertical distance of the cylinder.

RWS units should be installed on their own watering zone in order to improve irrigation efficiency and management.

The Root Watering system shall be model as indicated on the contract drawings and shall be manufactured by Rain Bird, Toro, Hunter corporation or approved equal.

**Plastic Piping:** All main line pipe shall be Class 200; S.D.R.-13.5 or PVC schedule 80, Type 1120-1220 polyvinyl chloride (PVC) pipe and shall conform to CS-256-63. Pipe shall be rated for 200 psi pressure and pipe size shall not be less than three-quarter (3/4 ") inch diameter. Lateral pipe may be either Class 200 PVC or equivalent NSF rated polyethylene (Poly) pipe.

**Fittings:** Plastic fittings shall be Schedule 80, polyvinyl chloride (PVC) standard weight as manufactured by Spears, Dura, or approved equal. Only solvent weld or insert fittings are acceptable; no saddle type clamping of fittings will be used.

**Solvent Cement:** Shall be Compatible with PVC pipe and of proper consistency.

**Isolation Valves:** Three inch and smaller isolation and drain valves shall be screwed bonnet, bronze body, solid-wedge type gate valves with threaded ends, non-rising stems, and shall be rated for a normal operating pressure (cold water) of at least 200 PSI. They shall be comparable to code 27, as manufactured by Kitz, or approved equal.

**Valve Boxes:** Access to all main line isolation valves shall be provided by standard rectangular boxes. The valve boxes shall be Models as indicated on the contract drawings and as manufactured by "Christy Concrete", reinforced high density concrete box with steel checker plate cover, or approved equal. Valve boxes shall be set to manufacturer's

specifications at finished grade. Valve boxes shall be marked in the field with indelible black marker (V-1, V-2, etc.) and shall also be marked on the laminated layout plan to be posted at the site (See "Submittals"). Valve boxes to be green color for lawn areas and tan color for mulch areas in planting beds.

Swing Joints: Triple swing joints for T5RS Rotary sprinklers shall be ¾" triple swing joint kits with double O-ring seals at threaded connections model number E007-4 as manufactured by Dura or equal. Swing joints for Toro 640 Series or Toro T7 Series rotary sprinklers shall be 1" triple swing joint kits with double O-ring seals at threaded connections model number 5807-010 as manufactured by Spears or approved equal. Swing joint for 570PRX-Com series shall be ½". Swing joints for Quick Couple Valves shall be 1" triple swing joint kits with double O-ring seals at threaded connections and brass insert model 5815-010 as manufactured by Spears or approved equal.

Rain Sensor & Enclosure (where system is automatic): Rain sensor shall be Toro TWRFS or approved equal.

Remote Control Valve (where system is automatic): shall be 252Series as manufactured by The Toro Irrigation Products, Rain Bird, Hunter, or approved equal. The Remote-Control valve shall be of a globe/angle configuration with a female pipe thread inlet and outlet. The diaphragm shall be of rubber construction to retain flexibility and provide maximum sealing throughout its area. Valve shall have a manual flow control with the following characteristics:

- Toro 252 Series, or approved equal
- Operating Pressure - 10 to 220 PSI
- Globe/angle configuration
- Rubber diaphragm
- Active Cleansing Technology
- Flow control and internal and external bleed
- Self-cleaning metering pin (electric)
- Pressure regulation models (electric)
- Stainless steel diaphragm seat

Electric and Pressure Regulating Remote Control Valve (where system is automatic): The valve shall be as manufactured by The Toro Irrigation Products, or approved equal. The valve shall be held normally closed by internal water pressure. A 14-gauge solenoid lead wire shall be attached to a 24 VAC, 50/60 Hz solenoid with waterproof molded coil capable of being removed. Valve shall have a self-cleaning metering pin to protect bleed ports and to purge contaminants.

Exterior Control Wires (where system is automatic): Control wires from controller to valves shall be 24-volt solid wires U.L. approved for installation in conduit. Minimum wire size: 14 gauge; 12 gauge for common wire.

PVC Conduit for Control Wiring (where system is automatic): All underground exterior 24 volts control wiring for solenoid (electrical) valves shall be installed in PVC rigid (non-metallic) conduit with fittings, approved equal to UL listed Carlon Plus 40 Rigid PVC non-metallic conduit. The conduit shall be manufactured to NEMA TC-2 Federal Specifications and UL 651 Specifications and carry respective UL listing and UL labels. The cement for PVC rigid conduit shall be approved equal to all weather quick set cement (5<sup>0</sup> – 100<sup>0</sup>F) Series VC9981 through VC9984. The conduit wherever possible shall be installed in the same trench with water line.

In Line Control Wiring Boxes (where system is automatic): Also, in-line underground pull boxes as required for splicing, termination and remote connections for solenoid valves shall be furnished and installed.

Sleeves for Control Wires (For Automatic System): Sleeves shall be installed under all walks and paving and where indicated on drawings. Sleeves shall be PVC schedule 40 or galvanized heavy wall steel pipe conduit, as shown on the drawings. Sleeves for Control Wires: Sleeves shall be installed under all walks and paving and where indicated on drawings. Sleeves shall be PVC schedule 40 or galvanized heavy wall steel pipe conduit, as shown on the drawings.

Irrigation Controller: The irrigation controller should be wall mounted in the key-locking cabinet, in-door installation, capable to control up to 200 stations and should be Model CDEC-SA-200 or CDEC-SA-100 (depending on the number of station) as manufactured by Toro, Rain Bird, Hunter or approved equal.

Spare Parts: The contractor shall provide spare sprinklers and root watering systems as follows.  
Sprinklers for Field Irrigation: 50 Sprinklers of each type.

Sprinklers for Lawn Irrigation: 50 Sprinklers of each type.

Sprinklers for Planting Irrigation: 50 Sprinklers of each type.

Root Watering System: 20 Systems.

**INSTALLATION:** The Irrigation Contractor shall lay out work to the drawings as accurately as possible. The drawings may be generally diagrammatic to the extent that swing joints, offsets and all fittings may not be shown. The Contractor shall be responsible for full and complete coverage of all irrigated areas and shall make any necessary adjustments at no additional cost to the City. If not specified on the plans, the Contractor shall be responsible for proper sprinkler head placement and adjustment.

Existing Plant Material and Site Conditions: The Contractor shall take necessary precautions to protect existing plant material and site conditions. If damage is incurred, the Contractor shall repair the damage at the Contractor's own expense to the original condition to the satisfaction of the Engineer.

Protection of Site: The Contractor must become acquainted with all site conditions. If utilities not shown on the plans are found during excavations, the Contractor shall promptly notify the Engineer for instructions as to further action. Failure to do so will make Contractor liable for any and all damage thereto arising from the Contractor's operations subsequent to discovery of such utilities not shown in plans.

Contractor shall make necessary adjustments in the layout as may be required to connect to existing stubouts. Should such stubs not be located exactly as shown, Contractor may be required to work around existing work at no increase in cost to the City.

All piping installation work shall be started after completion of soil preparation; and shall be completed prior to planting, sod placement, and/or seeding.

Excavating And Trenching: Restore all surfaces, existing underground installations, etc., damaged or cut as a result of the excavations to their original condition and in a manner approved by the Engineer at no additional cost to the City.

Trenches shall be made wide enough to allow a minimum of 2 inches between parallel pipe lines. Trenches for pipelines shall be made of sufficient depths to provide minimum cover from finish grade as follows:

- 1) 18" minimum cover over main lines.
- 2) 18" minimum cover over control wires from controller to valves.
- 3) 16" minimum cover over lateral lines to sprinkler heads.

Pipe Installation: Plastic pipe and fittings shall be solvent welded using solvents and methods as recommended by manufacturer of the pipe, except where screwed connections are required. Pipe and fittings shall be thoroughly cleaned of dirt, dust and moisture before applying solvent with a non-synthetic bristle brush.

Pipe may be assembled and welded on the surface. Snake pipe from side to side of trench bottom to allow for expansion and contraction.

Make all connections between plastic pipe and metal valves or steel pipe with threaded fittings using plastic male adapters and teflon tape.

Remote Control Valve Installation (For Automatic System): Remote Control Valves shall be installed as shown on the drawings and grouped together where practical. Remote Control Valves shall be installed a minimum of 6" away from sidewalk edges, buildings and walls. As much as is practical, the valve boxes shall not be located in playing areas of athletic fields.

Mounting Rain Sensor (For Automatic System): Mount the rain sensor on a wall or roof surface close to the timer/controller inside, in order to minimize the wire length between the two, and the chance of wire breakage. The sensor and enclosure must be mounted where they will receive rainfall, but not in the path of sprinkler spray, as well as high enough to be secure from vandalism. The sensor should not be mounted on the north side of a building, or where constant shade may prevent the sensor from drying soon enough to permit activation of the sprinkler system when required.

After mounting the sensor securely, run the control wiring to the sensor in ¾" dia. PVC conduit, securing with steel straps a maximum of every five feet (5'). If an extension to the twenty-five feet (25') of wire provided is needed, the following table will determine the minimum wire gauge required:

Extension:	25 - 50'	50 - 100'	100' +
Wire Gauges	20 AWG	18 AWG	16 AWG

Automatic Controllers (For Automatic System) Remote control valves shall be connected to controller in a logical sequence to correspond with manufacturer's instructions.

Automatic Control Wiring (For Automatic System) Control wires mains and laterals shall be installed in conduit in common trenches wherever possible.

Install control wires at least 12 inches below finish grade and lay to the side and below main line. Provide looped slack at valves and snake wires in trench to allow for contraction of wires. Tie wires in bundles at ten-foot intervals.

Control wire splices will be allowed only in runs more than 500 feet. Any splices must be installed in an existing valve box or separate valve box installed flush with finished grade. All boxes and covers shall be watertight.

All wire passing under existing or future paving, construction, etc., shall be encased in galvanized steel conduit extending at least 12 inches beyond edges of paving or construction.

A total of two spare control wires shall be installed from the irrigation controller to the farthest valve on the main line. The spares shall be looped through each valve box between the irrigation controller and the farthest valve.

IMPORTANT: Closing Pipe And Flushing Lines: Cap or plug all openings as lines have been installed to prevent the entrance of materials that would obstruct the pipe. Leave in place until removal is necessary for completion of installation. Thoroughly flush out all water lines before installing heads, valves and other hydrants. Valve boxes shall located away from playing areas as much as possible.

**TESTING, BACKFILLING & OPERATIONS ORIENTATION & DEMONSTRATION:**

Hydrostatic Testing: Before backfilling, the entire system shall be hydrostatically tested and inspected. The Contractor shall notify the Engineer in writing at least 48 hours in advance of testing. Testing to be accomplished at the expense of the Contractor and in the presence of the Engineer. Center load piping with small amount of backfill to prevent arching or slipping under pressure. Apply a minimum continuous and static water pressure of 100 PSI when welded plastic joints have cured at least 24 hours and with the risers capped as follows:

- 1). Main lines and sub mains to be tested for 1 hour.
- 2). Lateral lines to be tested for 1 hour. (If laterals and individual sub-mains downstream of control valves have less than 90 PSI working pressure or less than 10 GPM flow, hydrostatic tests are waived for these laterals).

Leaks exposed during tests shall be repaired and the system re-tested to the satisfaction of the Engineer. On completion of the work, satisfactory evidence shall be furnished by the Contractor to show that all work has been installed in accordance with the ordinances and code requirements.

Backfill and Compacting: After system is operating and required tests and inspections have been made, backfill excavations and trenches with clean soil, free of aggregates larger than 3/8 inch. Backfill for all trenches, regardless of the type of pipe covered, shall be compacted to minimum 90% density. Compact trenches in areas to be planted by thoroughly flooding the backfill. Dress off all areas to finish grades.

Clean Up: Remove from the site all debris resulting from work of this section. Job site must be left clean and repaired to the satisfaction of the Engineer.

Winterization and Spring Activation: The Contractor shall perform complete blow out of the irrigation system with compressed air in the late fall, no sooner than October 15, and no later than November 15, unless otherwise directed by the Engineer. The Contractor shall also activate the system the following spring. The Engineer shall be present for both these operations.

M&O Orientation and Demonstration: After testing is completed and approved by the Engineer, an orientation and demonstration session shall be held for the NYCDPR M&O staff. The installed irrigation system shall be demonstrated for one day (maximum 6 hours) for the district M&O Staff. The demonstrations shall include manual and automatic operation including pumping. The demonstration shall also include identification and operation of each component, trouble shooting for each component, winterizing the system, removal and replacement of defective components, general and specific requirements for system maintenance, and a check list for frequent attention of components. Highlights of the demonstration, including identification of components shall be videotaped for future M&O orientation.

O&M Manual & videotape: The Contractor shall furnish six (6) copies of the O&M Manual (Operation & Maintenance Manual) for the irrigation system and the associated mechanical system. The manual shall include a checklist for trouble shooting and corrective measures in addition to operation and maintenance instructions. The Contractor shall also furnish to the

Engineer an instructional video as described above on operation and maintenance of the irrigation system.

**SUBMITTALS:** All submittals shall be as specified in the S-Pages.

**Irrigation Design Specialist Qualifications:** The Contractor shall submit for approval, the name and qualifications of the proposed Irrigation Design Specialist including CID certification. As an alternate to certification, experience and a minimum of three (3) professional references, and sample drawings for three commercial (3) designs of one (1) acre or larger, may be submitted. Submittal must be a minimum of 4 weeks prior to the proposed irrigation system installation date. The Irrigation Design Specialist shall meet the qualifications listed on the first page of this item under the heading Irrigation Design Specialist:

**Irrigation Layout and Shop Drawings:** The Contractor shall submit the Design Proposal and Shop Drawings in accordance with the requirements of the S-Pages prior to manufacture. The system shall be designed to cover turf grass areas and planting beds as shown on the planting plan. A shop drawing is required, showing layout of the complete irrigation system, including the main line pipe, controller locations, remote control valves, quick-coupling valves, all sprinkler heads locations and spray pattern. All drawings must be prepared, signed and sealed by the approved Irrigation Design Specialist. Also, see Grounds for Rejection, Irrigation Design Specialist heading.

**Catalog Cuts:** The Contractor shall submit Catalog cuts of the sprinkler heads, valves, and all connected piping for approval prior to installation.

**As-Built Drawings:** The Contractor shall prepare "As-Built" drawings in accordance with Section C, Article 9. Submission of As-Built drawings for this item shall not be waived and shall be submitted as soon after installation as possible. Drawings shall show the irrigation system as installed, including the main line pipe, electrical controller locations, remote control valves, quick-coupling valves, all sprinkler heads, drip areas, etc. Deviations from the shop drawings made during construction shall be noted. The drawings shall also indicate and show approved substitutions of size, material and manufacturer's name and catalog name and catalog number.

**Warranty:** The Contractor shall submit the manufacturers' standard warranties for sprinkler heads and valves.

**O & M Manual & videotape:** The Contractor shall furnish six (6) copies of the Operation & Maintenance Manual and one (1) instructional videotape (all labeled with name of site and contract number) to be distributed by the Engineer as follows:

- One (1) laminated manual to be hooked to wall at the site (see below)
- One (1) O&M manual and one (1) instructional videotape to DPR Training Academy (contact- Michael Crescenzo 718-760-6588 ).
- Two (2) manuals to Borough Supervisor of Mechanics(S.O.M.) Three (3) manuals to Construction division (file, map file)

**Laminated Reference Materials:** The following submittals shall be prepared in a reasonable size/scale, laminated and mounted or hooked on the wall in the building at the site, as directed by the Engineer.

- A. Schematic color-coded layout (by zone) of the irrigation system along with step- by-step, clear operating instructions. Valve boxes shall be labeled on the plan and correspondingly marked in the field with indelible black marker.
- B. A detailed suggested watering schedule for the site. If automatic system, include

start times, days and run time.

- C. One copy of a laminated O & M Manual hooked to wall as described above.
- D. Name and phone number of supplier(s) for all replacement parts.
- E. Detailed guide for trouble-shooting common system operation problems.
- F. Detailed Winterization / Spring Activation instructions.

**MEASUREMENT AND PAYMENT:** The quantity of In-Ground Irrigation System (manual or automatic) to be paid for under this item shall be the number of **SQUARE YARDS** of landscaped areas actually irrigated, measured from the planting plan, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of landscaped area irrigated and shall include all labor, materials, equipment, and incidental expenses necessary to install the complete irrigation system from the supply distribution valve, including trenching, excavation, backfill, control wiring, (where automatic is specified), testing, M&O orientation, all submittals, laminated reference materials, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Backflow Preventer (RPZ), Water Meter, Booster Pump, and Utility Structure, Hand and/or Pneumatic Excavation, Tunneling, where applicable, shall be paid for separately under their respective Contract Items.

The Engineer will retain ten (10%) of the irrigation item payment until the Contractor completes the requirements of the Testing, M&O Orientation and Demonstration, and O&M Manual & Videotape sections of this specification, to the satisfaction of the Engineer.

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>
PK-ESCR-641	In-Ground Irrigation System-Automatic	SY

END OF SECTION

**SECTION PK-ESCR 642 –GAS SERVICE MAIN – 2” DIAMETER**

**SECTION PK-ESCR 643 - GAS SERVICE MAIN – 3” DIAMETER**

**PK-ESCR 643.1 INTENT:** Under this item the Contractor shall furnish and install a new **GAS SERVICE MAIN – 3” & 2” DIAMETER**, for building of the size indicated on the plans, in accordance with the plans, specifications and directions of the Engineer.

**PK-ESCR 643.2 DESCRIPTION:** Gas service for the building shall start where the Utility Company terminated its service and extend to the inside of the building wall, including the required utility Company Service sleeve. Gas service shall be set in a bed of sand.

**PK-ESCR 643.3 MATERIALS:**

**PIRCH OR PIPE:** The new gas service main shall be pitched to low points or to street main at least one inch (1”) in thirty feet (30). Low points shall be provided with approved type gas drips when located outside of the building.

**GAS PIPE AND FITTINGS:** Pipe for the gas service shall be standard weight I.P.S. black steel pipe and shall be mill wrapped and asphaltum coated.

Fittings for pipe shall be Dresser type and shall be entirely covered with asphaltum, forming a sealed joint with the mill wrapped pipe.

**SLEEVES:** Sleeves shall be installed in all walls and shall be galvanized steel pipe.

**PK-ESCR 643.4 QUALITY CONTROL:**

**TEST:** The Contractor shall before pipe joints are covered and trenches back-filled, test the entire installation with pressure equal to 100 p.s.i.g. Test pressure shall show no loss for period of 30minutes. All defects shall be required and rest repeated until pipe is proven tight under conditions outlined.

The contractor shall notify the Engineer, Utility Company, and all other agencies that have jurisdiction before tests are made. No test will be considered valid unless witnessed by the representative of the various agencies having jurisdiction and their approval received in writing.

**PK-ESCR 643.5 MEASUREMENT AND PAYMENT:** The quantity of **GAS SERVICE MAIN – 3” & 2” diameter** to be paid for under this item shall be the number of **LINEAR FEET** (laying length) of black steel pipe furnished and incorporated in the work, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of laying length of black steel pipe, sleeves and fittings and shall include the cost of furnishing, delivering, handling, laying, coating, testing, and all labor, materials, and incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer. The Contractor shall obtain and pay for all permits necessary or required and the cost shall be included in the unit price bid for this item. Excavation and Sand are to be paid for separately.

*Payment will be made under:*

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR-642	GAS SERVICE MAIN – 3” DIA.	LF
PK-ESCR-643	GAS SERVICE MAIN – 2” DIA.	LF

**END OF SECTION**

PARKS-322

**SECTION PK-ESCR 644 – SERVICE WEIGHT CAST IRON SOIL PIPE – 4” DIA.**

**WORK:** Under these Items, the Contractor shall furnish and install SERVICE WEIGHT CAST IRON SOIL PIPE (formerly known as Extra Heavy Cast Iron Soil Pipe) of the sizes called for and shown on the plans or as directed by the Engineer.

**MATERIALS:** Service Weight Cast Iron Soil Pipe shall consist of hub and spigot joint cast iron soil pipe and fittings, similar or equal to that manufactured by the Tyler Pipe Co., Tyler, Texas, or approved equal, and of the grade called for.

**INSTALLATION:** Service Weight Pipe shall be laid true to line and grade with hubs upstream and shall have a full, firm and even bearing. Joints are to be connected with SV Ty Seal Gasket, as manufactured by Tyler Pipe Co., Tyler, Texas, or approved equal.

**CONNECTION:** The Contractor shall do all the work necessary to join the Cast Iron Soil Pipe to the existing sewer as shown on the Plans. The cost for doing this shall be included in the unit price bid for this Item.

**MEASUREMENT AND PAYMENT:** The quantity of SERVICE WEIGHT CAST IRON SOIL PIPE to be paid for under this Item shall be the number of linear feet (laying length) of each size pipe, including fittings, clean-out structures, measured in its final position, furnished and placed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per LINEAR FOOT of laying length Service Weight Cast Iron Soil Pipe of each size shown and shall include the cost of all labor, materials and equipment necessary pipe to complete the Work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation shall be paid for separately under its own Item.

<b>PK-ESCR 644</b>	<b>SERVICE WEIGHT CAST IRON SOIL PIPE – 4” DIA.</b>	<b>LF</b>

**END OF SECTION**

**SECTION PK-ESCR 646 – MISCELLANEOUS IRON AND STEEL**

**PK-ESCR 646.1.**     **WORK:** Under this item, the Contractor shall furnish and place all cast iron, cast steel, wrought iron and steel, not especially included under other items, as shown on the plans and for miscellaneous castings, etc.

**PK-ESCR 646.2.**     **MATERIALS:** All materials shall meet the requirements as given in NYCDOT Standard Highway Specifications or as directed by the Engineer.

**PK-ESCR 646.3.**     **CLEANING:** Except otherwise ordered by the Engineer, immediately prior to the final inspection the Contractor shall clean unimbedded surfaces that show evidence of loose mill scale, non-adherent rust, peeling paint and other deleterious matter in accordance with SSPC SP2, Hand Tool Cleaning, a method generally confined to wirebrushing, sandpaper, hand scrapers or hand impact tools.

**PK-ESCR 646.4.**     **MEASUREMENT AND PAYMENT:**

The quantity of **MISCELLANEOUS IRON AND STEEL** to be paid for under this item shall be the number of **POUNDS** furnished and placed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **POUND** and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

PK-ESCR 646	MISCELLANEOUS IRON AND STEEL	LBS.

**END OF SECTION**

## **SECTION PK-ESCR 650 – TEMPORARY POWER FOR FIRE BOAT HOUSE**

**GENERAL:** Under this item the contractor shall furnish and install Temporary Power to Fire Boat House during construction as specified on drawings in compliance with National Electrical Code and NYC Electric Code.

The item shall include the labor, material, equipment installation with all required accessories such as electrical conductors, switches, portable generator, fuel etc. All the work shall be done in compliance with all required code.

### **GENERAL SPECIFICATIONS:**

1. All Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
2. All construction must conform to all local codes designed by NY City.
3. Comply with NFPA 70.
4. Comply with NECA 1 and NECA 413.
5. All Electrical work shall be performed by a Licensed Electrician, as specified by NYC Building Department in a neat manner and in accordance with best practices. All work shall comply with the National Electrical Code (NEC), all New York City amendments to that code, state and Federal rules and regulations.
6. An onsite evaluation is required to determine conduit, wiring etc. requirements before any work.
7. Notify the Engineer before any work is done. All work must be done under the direction of a licensed electrician.

### **WORK INCLUDED:**

1. The Contractor shall make all necessary arrangements to provide temporary power to Fire Boat House to power building heater and lighting 24 hour per day & seven days a week from September 1<sup>st</sup> to match 31<sup>st</sup>.
2. Contractor to provide electrical capacity equal to 50KW, 208/120 Volts, 3 Phase, 4 Wire portable generator or temporary electric service with appropriate switches, cable, connectors etc. according to NEC standards.
3. The temporary power system shall be determined, designed and maintained by the contractor. Contractor to submit temporary power plan for review and approval.
4. The temporary power cables may be routed above grade with heavy duty cable protector to protect the cables from damage and maintain a safe work site.
5. Wiring for temporary 3-phase power shall, in general, consist of 4 wire, 120/208 volt connected to the existing Fireboat house service and panelboard.
6. Upon completion of the project, remove all temporary power work and restore all affected finishes and connections.

**MEASUREMENT & PAYMENT:** Temporary Power shall be paid on monthly basis and installed in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be monthly base, furnished and installed and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including testing, generator, fuel, personnel, temporary Con-Ed service, Con-Ed invoices, etc. all in accordance with the plans and specifications to the satisfaction of the Engineer.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR-650	TEMPORARY POWER FOR FIRE BOAT HOUSE	Each Month

**END OF SECTION**

## **SECTION PK-ESCR 651 – ELECTRIC VEHICLE SINGLE CHARGING STATION**

## **SECTION PK-ESCR 652 – ELECTRIC VEHICLE DUAL CHARGING STATION**

**GENERAL:** Under this item the contractor shall furnish and install new Electric Vehicle Charging Station specified on drawings in compliance with National Electrical Code and NYC Electric Code.

The item shall include the labor material and equipment for installation of EV Charging Station with all required accessories such as EV Cables, Controllers, Equipment, EV Connector, EV Inlet, anchor bolts and mounting hardware, etc. All the work shall be done in compliance with NYC Electrical code requirements. All associated material for complete installation of EV Charging Station shall be included under this item.

### **SPECIFICATIONS FOR EV CHARGING STATION:**

1. All Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
2. All construction must conform to all local codes designed by the City of New York.
3. Comply with NFPA 70 and NYC electrical code.
4. Comply with NECA 1 and NECA 413.
5. An onsite evaluation is required to determine conduit and wiring requirements from panel to proposed "Charging Station" parking spaces.
6. EV Charging station should be manufactured by Chargepoint Model Number CT4000 Family.
7. EV chargers must be sized at 125% of the load on each leg of three phase panel in accordance with National Electrical Code (NEC) requirements. 40A breakers are required with maximum load of 32A accordance with NEC code for continuous load devices.
8. EV Charging Equipment Mounting should be Concrete Pedestal Mounted.
9. All mounting work should follow the mounting specification and instructions from Chargepoint.
10. All mounting components must have galvanized washers, Heavy Galvanized Hex Nuts (DH Rated), Hot dipped galvanized threaded bolts, etc.
11. Field verify EV Charging station mounting location.
12. Enclosure Should be rated for environmental condition at installed location.
  - a. Outdoor Locations: NEMA 250, Type 3R, UL 50E
  - b. Aluminum and UV-resistant plastic.
  - c. Paint and Anodized.
  - d. Charging components protected by security screws.
  - e. Charging connectors in locking holsters.
  - f. Meter, modem, and CPU tamper resistant.

13. EV Cable and Connectors:
  - a. SAE J1772 connector.
  - b. Connectors with locking holster.
  - c. 18-foot cable with cable management system.
14. Status Indicator LED to indicate power, vehicle charging, charging complete, system status, faults, and service, as well as authorization.
15. Display Screen should be VGA-resolution, daylight-viewable LCD screen with UV protection. Daylight readable and fingerprint resistant.
16. Single vehicle: AC Level 2 at up to 7.2 kW (CT4000) per vehicle.
17. Dual vehicles, AC Level 2 at up to 7.2 kW (CT4000) per vehicle.
18. Install EV charging equipment on 24-inch nominal-diameter and 35-inch reinforced concrete base.
  - a. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
  - b. Install anchor bolts to elevations required for proper attachment to supported equipment.
  - c. Secure EV charging equipment to concrete base according to manufacturer's written instructions.
19. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
20. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for the duration of an active ChargePoint Network Service Plan.
21. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
22. Ensure wiring, circuit protection and metering is in place at the station installation by reviewing PE Engineer approved drawings, wiring diagram, grounding requirements and specifications.
23. If possible, avoid making any wire splices.
24. Evaluate and measure 3G Version or AT&T cellular signal levels and identify suitable locations for the placement if any necessary cellular signal booster equipment.
25. Allow for thermal movements from ambient and surface temperature changes.
26. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
27. Examine roughing-in for EV charging equipment electrical conduit to verify actual locations of conduit connections before equipment installation.
28. Examine areas and pavement for suitable conditions where EV charging equipment will be installed.
29. Proceed with installation only after unsatisfactory conditions have been corrected.
30. The voltage of either line, relative to ground, must not fall below 80 volt.

31. Neutral is not used to power the station but must be properly connected to ground, at panel or transformer, to provide the necessary voltage reference relative to ground.
32. Wiring Method: Conceal conductors and cables in rigid conduit.
33. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.
34. Comply with EV charger manufacturer requirements for installation of Low-Voltage Conductors, Cables, Conduits, Grounding & Bonding etc.
35. Connect wiring according to the manufacturer's wiring specifications.
36. EV equipment and pedestal to be effectively bonded and grounded.
37. Provide bronze ground bushing on all conduit ends and bond to EV pedestal and ground terminal.
38. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
39. Provide engraved stainless steel cable tags indicating the panel fed from and circuit number within the EV pedestal.
40. Complete installation and startup check according to manufacturer's written instructions
41. Upgrade Service: At Substantial Completion, remotely update software to latest version. Install and program software upgrades that become available while an active ChargePoint Network Service Plan is maintained. Upgrading software shall include operating system and new or revised licenses for using software.
42. Utilize ChargePoint Station Management Services and ChargePoint Assure Services, or Train Owner's maintenance personnel to adjust, operate, and maintain EV charging equipment.
43. Contractor Should coordinate the work and delivery of EV Charging equipment between manufacturer and supply all parties involved with the relevant information required to construct.

**TESTING AFTER INSTALLATION:** The cable shall be tested after installation but before final connections for the continuity and insulating. The insulation resistance must comply with the NETA recommended testing requirements.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
2. Engage a factory-authorized service representative to perform startup service. All startup must be performed in the presence of the factory-authorized service representative.
3. Perform tests and inspections with the assistance of a factory-authorized service representative.
4. For each unit of EV charging equipment, perform the following tests and inspections:
  - a. Unit self-test.
  - b. Operation test with load bank.

- c. Operation test with EV.
  - d. Network communications test.
5. EV charging equipment will be considered defective if it does not pass tests and inspections.
  6. Prepare test and inspection reports, submit to the Engineer.

**MEASUREMENT & PAYMENT:** Electric Vehicle Charging Station shall be payed and installed in accordance with the plans, specifications and directions of the Engineer.

The price bid will be a unit price for each Electric Vehicle Charging Station, furnished and installed and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including testing, all in accordance with the plans and specifications to the satisfaction of the Engineer.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR-651	ELECTRIC VEHICLE SINGLE CHARGING STATION	EA
PK-ESCR-652	ELECTRIC VEHICLE DUAL CHARGING STATION	EA

**END OF SECTION**

## **SECTION PK-ESCR 653 – PHOTOVOLTAIC SYSTEM – SOUTHERN M&O CANOPY**

## **SECTION PK-ESCR 654 – PHOTOVOLTAIC SYSTEM – NORTHERN M&O CANOPY**

**PK-ESCR 653.1 INTENT:** Under this item the Contractor shall furnish and install a complete Electric Photovoltaic System and canopy lighting system with all incidentals required and as shown on the drawings as specified herein. All work shall be performed in a neat and workmanlike manner.

All materials to be furnished and all work to be performed shall be in strict compliance with the requirements of the latest specifications and standard practice of the New York City Electric Code. The Contractor shall submit shop drawings of all equipment to be furnished and drawings must be approved by the Engineer before beginning the manufacture of the equipment.

**PK-ESCR 653.2 DESCRIPTION:** The work shall include, but shall not be limited to the following: Furnish and install and connect all items of labor and material for a complete electrical system as indicated on the drawings and specified herein. Small and sundry items not necessarily indicated or specified, but required for the complete installation, shall be included in the Contractor's lump sum cost and incorporated in the Work.

1. Photovoltaic (PV) Panels.
2. Inverter & PV Cables.
3. Conduit and Wire
4. Pull Boxes, Junction Boxes
5. System and Equipment Grounding
6. PV Production Meter Panelboard with circuit breakers
7. Rails and support assemblies
8. Junction boxes
9. Monitoring systems
10. LED Light Fixtures and Drivers
11. Misc. supports and equipment.

**ACCESS FOR EQUIPMENT:** All work must be installed so that adequate access is provided for operation, maintenance and repair.

**CODES, PERMITS AND CERTIFICATES:** All items of labor and material shall be in accordance with the requirements of the latest edition of the New York City Electric Code, and the rules, regulations, standards, etc. of all other local or national agencies having jurisdiction. No materials shall be used that are not listed by the Underwriters' Laboratories and the N.Y. Board of Fire Underwriters. In addition, all applicable regulations and requirements of Con-Edison shall apply to work under the Contract.

The Contractor shall pay all fees, give all notices, file all necessary drawings, obtain all permits and certificates of approval as may be required in connection with the Work under this Contract.

1. All materials and workmanship shall comply in all respects with the rules and regulations of the Electrical Code of the City of New York.
2. The materials and workmanship shall comply in every respect with the contract specifications and drawing and fulfill the full intent thereof.

### **PK-ESCR 653.3 SUBMITTALS:**

Provide following appropriate applications and submittals which includes but not limited to the Engineer.

1. Shop Drawings:

- a. Submit sufficient information to demonstrate compliance with drawings and specifications.
  - b. Include electrical ratings, dimensions, mounting details, materials, required clearances, terminations, weight, wiring and connection diagrams, accessories, and nameplate data.
2. Product Manufacturer's catalog sheets:
    - a. Inverter & Cables.
    - b. Photovoltaic (PV) Panels and Micro Inverter.
    - c. Rail and support assemblies.
    - d. Ground wire, ground rods, exothermic welds and compression connectors
    - e. Panelboard with circuit breakers
    - f. Junction boxes.
    - g. Monitoring systems and PV production meter
    - h. LED Light Fixture & Drivers
  3. For PV connection on the load side of electric meter and connection to the grid, prepare appropriate applications and submittals to the Engineer and the electric utility. Provide written documentation confirming the utility's approval of the interconnection of the solar energy electrical power generation system with the utility system.
  4. Certification from the manufacturer that the system has been seismically tested to NYC Building Code requirements.
  5. Submit a complete maintenance and operating manual that includes at the minimum technical data sheets, wiring diagrams, and information for ordering replacement parts.
  6. Certification by the Contractor that the solar energy electric generation system has been properly installed, adjusted, tested, commissioned, and warranted. Contractor must make all necessary field measurements and investigations to ensure that the equipment and assemblies meet contract requirements.
  7. Estimated Annual Power Output: Submit calculated annual power output for each of the proposed solar photovoltaic systems and provide all necessary calculations.
  8. If equipment submitted differs in arrangement from that shown on the drawings, provide shop drawings that show the rearrangement of all associated systems. Approval will be given only if all features of the equipment and associated systems, including access, are equivalent to that shown in the contract documents and acceptable to the Engineer.

**PK-ESCR 653.4 QUALITY ASSURANCE:**

1. Solar Energy Electrical Power Generation System installer(s) must demonstrate that they have successfully installed at least four projects within the past five years that, in aggregate, equal or exceed the size of the proposed project. References shall be provided for each of the referenced qualified projects.
2. Supports and racking for solar photovoltaic system must be submitted for review and approval. The submittal must include environmental loading analyses (including wind, snow, hail, and seismic) and the rack and substrate's ability to withstand these environmental forces as per manufacturer specification's and NYC Building Code requirements.
3. For paralleling arrangement, the system shall have anti-islanding capability such that it is incapable of exporting power to the utility distribution system in the absence of utility

power. Paralleling must be approved by serving electric utility. Provide written correspondence from the utility confirming its requirements.

4. Investigate any other local ordinances that may apply to installation of a solar energy electrical generating system in the proposed location.
5. Warranties: The solar energy electrical generating system shall be subject to the terms of FAR Clause 52.246-21, except that the warranty period shall be as noted for the items below:
  - A. Solar photovoltaic modules and inverter: 25-year manufacturer's warranty against defects in materials and workmanship.
  - B. Power output: 25-year manufacturer's Peak System AC power output warranty, with the first 10 years at 90% minimum rated power output and the balance of the 25 years at 80% minimum rated power output. 8% 25-year DC power decline.

**TESTS AND GUARANTEE:** The entire electrical system and equipment furnished and installed under the Contract shall test free of shorts and grounds. Insulation resistance tests shall be performed on all wiring and equipment with instruments as approved. Insulation resistance as measured shall conform to the requirements of the New York City Electrical Code. The Contractor shall provide all equipment and personnel necessary to perform such tests. Performed tests shall be made in the presence of the Engineer.

All items of labor and material provided under the contract shall be guaranteed free of defects for a period of one year from the date of completion. Any defects appearing in this period shall be immediately corrected by the Contractor upon notification by the Engineer without additional charge.

#### **PK-ESCR 653.5 MATERIALS:**

Provide materials to fabricate functioning photovoltaic system in accordance with ASTM, IEEE, NEMA, NFPA, and UL, as specified in this section, and as shown on the drawings.

Factory-prefabricated solar equipment packages which include photovoltaic modules, mounting racks, inverters, and controls and which meet the requirements of this section are acceptable.

#### **ELECTRICAL SERVICE:**

Electric Service shall be at three phase, four wire, 60 Hertz, 120/208 volt power source as indicated on the drawings.

#### **SOLAR PHOTOVOLTAIC (PV) PANELS:**

Submittals Product Data: Includes but not limited to Catalog sheets, specifications and installation instructions.

1. Shall be listed to UL1703 (Type 2 Fire Rating), IEC 61215, IEC 61730, IEC 62716.
2. Shall be RoHS, OHSAS 18001:2007, lead free, REACH SVHC-163, PV Cycle.
3. Shall be Potential-Induced Degradation free: 1000 V10.
4. Shall be rated for IP-65.
5. Hail Protection: Compliant with testing procedure per ASTM E-1038.
6. Lightning Protection: Shall ground according to manufacturer instructions per UL 1703.
7. Operating Temperature shall be 40° F to +185° F (–40° C to +85° C).

#### **INVERTER:**

Submittals Product Data: Includes but not limited to Catalog sheets, specifications and installation instructions.

1. Shall be listed to UL 1741-SA and ANSI C12.1.
2. Shall Integrated ARC fault protection and rapid shutdown as per NEC 2014 & 2017.
3. Shall comply with IEEE 519 and IEEE 1547.
4. Shall be listed per FCC Part 15 Class A.1.
5. Shall have stand-alone, utility-interactive, or combined capabilities.
6. Shall include maximum power point tracking (MPPT) features.
7. Shall include anti-islanding protection for paralleling arrangement.
8. Shall include integrated safety switch and RS485 Surge protection.

### **CONDUIT, HOT DIPPED GALVANIZED RIGID STEEL:**

The ends of all conduits shall be carefully reamed before installation and after the application for the die. Where it becomes necessary to cut a length of conduit it shall be done with a hacksaw or a specially approved cutter. Care shall be taken to secure a square end on all conduit.

Provide No. 10 drag wire in all empty conduit raceways.

The entire conduit and wiring system shall be thoroughly grounded in an approved manner. Exposed connection of ground wires shall be suitable protected from mechanical injury with rigid conduit and approved clamps and fittings.

Running threads shall not be used. Where conduit with tapered threads cannot be coupled with standard conduit couplings, O.Z. Split Couplings, Erickson Couplings, Crouse Hinds Couplings, or approved equal shall be used. Underground, or where coupling is to be covered with concrete, a watertight union shall be used. All male threads of steel conduit shall be coated with red lead or graphite base pipe compound. Do not paint female threads.

All appurtenances, fittings, hangers, with RGS steel conduit shall be galvanized and asphaltum coated.

During installation, the conduit shall be plugged tightly with conduit caps at the close of each day's work or whenever work is discontinued for any length of time, to prevent the entrance of earth, water or other foreign matter. Paper or wood plugs are not acceptable.

After laying, all conduit runs shall be tested for clear bore and correct installation. Snaking the conduits shall be done in the presence of Engineer. Any conduit, which rejects the mandrel, shall be removed at once, the Contractor bearing all costs of replacing defective conduit and restoring the ground or structure around it.

The end of each conduit one inch and smaller shall be provided with a lock nut and bushing where it enters a sheet steel cabinet box, etc. For conduits 1-1/4 inches and larger, insulated grounding bushings shall be used. Care shall be taken to see that all conduits form a permanent and continuous ground return back to the service ground connection point. Ground bushings shall be bronze type "RBLG", O.Z., Thomas & Betts, Crouse-Hinds or equal.

All conduit shall be manufacturer's best grade delivered to the site in full pipe lengths, each trademarked by the manufacturer. All conduit connectors shall have insulated throats.

All ground connections to water pipes shall be made with type KH ground clamp Penn-Union, O.Z., Thomas & Betts, or approved equal.

In general, conduits shall be installed exposed and shall run parallel or perpendicular to wall lines.

Exposed conduits shall be securely fastened in place with PVC coated galvanized pipe clamps, racks, or other approved means, in a manner acceptable to the Engineer. Wood hangers and

perforated sheet metal hanger straps will not be permitted. Spacing of conduit supports shall not exceed five (5) feet. All auxiliary items for fastening conduits shall be furnished and installed by the Contractor.

Conduit shall be of such sizes that required conductors may be pulled without strain or injury. Standard manufactured elbows shall be used for all conduits 1-1/4 inch or larger.

The routing of conduits, as shown on the plans, is diagrammatic. Before installing any work, it shall be the responsibility of the Contractor to examine the working layouts of all other trades to determine exact locations and clearances. Where equipment is installed by other trades requiring connection by the Contractor, the Contractor shall likewise determine exact conduit entry locations from shop drawings or actual piece of equipment. Modifications to conduit runs shown on the drawings as found necessary, shall be made without additional cost, all subject to the Engineer's approval.

Conduits crossing construction expansion Joints shall be installed with approved expansion fittings, 0Z Gedney type AX or EX, Cooper Industries, ABB or approved equal, and provided with approved flexible grounding bonds bypassing the fitting.

Where it becomes necessary to offset exposed conduit runs due to construction conditions, etc., such offsets shall be made using conduit "EL" fittings, or other means as approved by the Engineer.

Final connections to motors shall be made with Type 'UA' sealtite flexible conduit with external copper bonding strap.

All piping, conduits or other items to be imbedded in new concrete shall be inspected and approved by the Engineer prior to concrete placement.

**WIRE AND CABLE:** Unless otherwise specified, all wires and cables shall be single copper conductor type Cross-Linked polyethylene (XLPE) moisture and heat resistant thermoplastic insulated with Jacket USE-2; for use at 600 volts A.C. rated 75 degrees C. operating temperature suitable for wet and dry locations equal in every respect to the latest Insulated Power Cables Engineers' Association (IPCEA) Specifications(Latest Revision). The wire and cables shall have Underwriters' Laboratories, Inc. label and be surface printed throughout the entire length at two-foot intervals with permanent identifying markings indicating manufacturers' name, size, type, and voltage.

Wire shall be no more than ninety (90) days old when purchased. All wire and cables shall be furnished on reels or spools and in lengths required to minimize splicing.

All conductors No. 10 AWG and smaller shall be solid; No. 8 AWG and larger, stranded except for ground wire which shall be solid.

Wires and cables No. 2 AWG and smaller shall be of continuous solid colors in accordance with the New York City Electric Code.

All wires larger than No. 2 AWG shall be colortape coded at all terminations.

All wire and cables shall be 98 percent conductivity copper as manufactured by Rome Cable Company, Essex Wire & Cable, Okonite, Anaconda Wire and Cable Company, or other acceptable manufacturer.

**CABLE TEST DATA:** No cables shall be shipped from the manufacturer's plant until the final certified test data is received from cable manufacturer stating that such cables are approved by the Engineer and they conform with the New York City Electric Code requirements.

### **GROUNDING:**

Submittals Product Data: Includes but not limited to Catalog sheets, specifications and installation instructions.

1. All applicable components of the solar energy electrical power generating system must be grounded per latest NEC requirements.
2. DC Ground-Fault Protector:
  - a. Shall be listed per UL 1703.
  - b. Shall comply with requirements of the NEC.

### **PHOTOVOLTAIC JUNCTION BOX:**

Submittals Product Data: Includes but not limited to Catalog sheets, specifications and installation instructions.

1. Shall be listed to UL 1741.
2. Shall include internal overcurrent protection devices with dead front.
3. Shall be contained in stainless steel type 316 NEMA Type 4X enclosure.

### **SWITCH/DISCONNECTING MEANS:**

1. Shall be Heavy Duty Nema 4X, UL-listed, in accordance with the NEC, as shown on the drawings, and as specified.
2. Shall use steel conduit listed per UL 6, UL 1242, UL 797 (as appropriate), except for tracking modules.
3. Shall use expansion joints on long conduit runs.
4. Enclosures subject to weather shall be rated NEMA 4X Type 316 stainless steel or better.
5. Cable Assemblies and Junction Boxes.

### **JUNCTION AND PULL BOXES:**

Submittals Product Data: Includes but not limited to Catalog sheets, specifications and installation instructions.

Threaded type Boxes: Malleable iron with cadmium or galvanized finish for use with steel conduit, as manufactured by Appleton Electric Co., Crouse-Hinds Co., or OZ/Gedney Co., or approved equal.

1. Malleable iron boxes shall be provided with galvanized malleable iron covers with approved gaskets, held by Everdur or approved equal machine screws. All threaded entries that are not used shall be closed by threaded pipe plugs, red leaded.

Preparation: Before proceeding with the installation of junction boxes, check the locations with the Engineer and have same approved.

Specific Purpose Outlet Boxes: Use to mount equipment when available and suitable for job conditions. Unless otherwise specified, boxes shall be threaded type for exposed conduit system, PVC coated or NEMA 4X stainless steel Type 316

Supplementary Junction and Pull Boxes: In addition to junction and pull boxes indicated on the drawings and required by the NEC, provide supplementary junction and pull boxes as follows:

1. When required to facilitate installation of wiring.
2. At every third 90 degree turn in conjunction with raceway sizes over 1".
3. At intervals not exceeding 100' in conjunction with raceway sizes over 1".
4. The box sizes shall be in accordance with code requirements.

## **LED LIGHT FIXTURES AND DRIVERS:**

Submittals Product Data: Includes but not limited to Catalog sheets, specifications and installation instructions.

1. All work Shall Comply with NFPA 70.
2. LED and all associated components must be UL listed and in compliance with NEC code.
3. LEDs and drivers shall be rated for IP66, protect against dust, water ingress & corrosion.
4. Shall be rated for Vandal Resistance.
5. LEDs shall be Long-life, high-efficacy, surface mount.
6. Driver & LED Life Rating not less than 100,000 hours.
7. LED driver and junction box shall be NEMA 4x.
8. Drives shall accept 120 – 277 volts or 480 volts, 60 Hz.
9. Contractor shall submit product data shall indicate that luminaire, LED arrays, and drivers fully comply with contract documents.
10. Contractor shall submit LED photometric data.
11. Warranty Period for LEDs, drivers and electrical components shall be Ten years from date is installed.
12. All metal parts shall be free of burrs and sharp corners and edges.
13. Housings shall be rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use.
14. All Exposed Hardware Material shall be Stainless steel.

**SERVICE SWITCH:** Service switch to be heavy duty, NEMA 4X stainless steel with removable ground-neutral link. Switch to be 208/120 volt, 3 phase, 4 wire, 600 volt rated. Service switch to be located within electrical service and distribution cabinet.

**CUTTING AND PATCHING:** The Contractor shall perform all cutting and patching of work that may be required. All patching shall be done by qualified personnel.

The Contractor shall coordinate with all trades so that all cutting and patching required for the work is performed in a timely manner.

Wherever possible, the Contractor shall provide sleeves for new concrete, to avoid cutting and patching. Install sleeves and equipment shown on electrical drawings in forms, before concrete is placed. Where utility sleeves are not installed before concrete is placed, complete all cutting and core drilling required to install all new conduit or other required new items as shown on the drawings. Holes cut for new conduit shall be done with core-boring tools. Holes for large items shall have edges neatly cut with a power saw.

The Contractor shall be responsible for the patching of all openings to provide a snug and waterproof seal. Any other damages to the structures shall be properly repaired at no additional cost.

The use of power driven impact tools will not be permitted to install openings.

**INSTALLATION OF CONDUCTORS IN CONDUIT OR RACEWAY:** No wire shall be pulled until the conduit and/or raceway system for a specified section or area is complete.

All feeders and mains shall be of the sizes shown on the Contract Drawings all in accordance with these specifications. All wires to be installed in any one conduit shall be pulled in at the same time and directly from reels. For pulling wires and cables, an approved lubricant may be used. All wires shall be continuous without splices between boxes, panelboards, cabinets, etc. Sufficient slack shall be left in all boxes for splicing wires and making proper connections.

All cable taps and splices in boxes shall be made secure with solderless compressive type connectors as manufactured by Burndy or approved equal. Connectors shall be installed with  
PARKS-337

approved hydraulic tools to assure a permanent mechanically secure high conductivity joint. Insulation tape shall be 3M No. 23 Plymouth, Ideal or approved equal. Jacket tape shall be applied over the insulation tape to a thickness of two times thickness of cable jacket. Jacket tape shall be water-resisting type 3M Scotch No. 88 Plymouth, Ideal or approved equal. All splices and tape shall be waterproof.

All wiring in troughs shall be neatly tied and racked. Wires shall be grouped as to the equipment they serve, and shall have brass tags attached thereto. Tags shall have engraved lettering indicating panel or equipment source, circuit number and equipment served.

All conduit shall be carefully cleaned before and after erection. All ends shall be free from burrs and inside surfaces shall be free from all imperfections likely to injure the wires and cables. Immediately before the wires and cables are pulled into any conduit run, such completed conduit run shall be snaked with a steel band to which shall be attached an approved tube cleaner equipped with an approved spherical mandrel of a diameter not less than 85 percent of the nominal inside diameter of the conduit. All conduit through which this mandrel does not pass shall be removed and replaced by the Contractor at their own expense.

**REGULATORY REQUIREMENTS:** Special caution note: The Contractor is fully aware that the work involved is an active roadway and in some cases requires additional safety precautions. The Contractor is responsible to protect workers in the performance of the work.

Codes:

1. General: Comply with the requirements of American National Standards Institute (ANSI), National Electrical Manufacturers Association (NEMA), Underwriters Laboratories (UL), New York City Department of Transportation, (NYCDOT), New York State (NYS), New York City (NYC), & Federal, etc. codes referred to in these specifications, except where requirements of these specifications are more restrictive or stringent. Such codes shall be the date of latest revision in effect at the time of performing the work, unless the date is given.
2. Building Code: Comply with the requirements of the New York State Uniform Fire Prevention and Building Code and New York City Building Code.
3. Electrical Codes:
  - a. Work Area: Electrical Work shall conform to the requirements of the latest edition of the NYC Electrical Code (NYCEC) and National Electrical Code (NEC), and all state and local codes. The Engineer shall be the sole judge of the interpretation of these rules and requirements.
  - b. Work and Off-Site Staging Area: Electrical Work shall conform to the requirements of the Electrical Code of the City of New York, latest edition and NYS DOT latest edition and Addenda.
  - c. All applicable regulations of the local utility companies.
4. Safety and Health: Comply with applicable requirements of the Occupational Safety and Health Act, including most recent amendments and New York State safety, health and labor regulations and contract documents.
5. In the event of conflict between codes, the most restrictive requirements shall apply as interpreted by the Engineer.
6. Permits and Inspections:
  - 1) Underwriters' Certificate: Work Within Limits of the Contract: A New York Board of Fire Underwriters Inspection Certificate is required.
  - 2) Certificate of Inspection: Work Within Limits of the Contract: An inspection and certificate by the City of New York, Dept. of Public Works, Bureau of Electricity, is required.

3) NYC DOT DSL shall review and approve shop drawings, installation and final system.

Listings: Equipment and materials for which Underwriters' Laboratories, Inc. (UL) provides product listing service, shall be listed and bear the listing mark.

1. Alternately, ETL Testing Laboratories, Inc. Product Safety Testing Listing is acceptable if the listed product has been tested to the applicable UL Standard.
2. Equipment shall have New York City Board of Standards and Appeals listing as required.

**SHOP DRAWINGS:** Shop drawings shall be submitted for all equipment to be installed. Shop drawings shall include all required information and details to show compliance to the contract plans and specifications. Contractor shall submit shop drawings to Engineer for all site lighting equipment.

Shop Drawings shall include, but not be limited to the following:

1. Photovoltaic (PV) Panels.
2. Inverter & PV Cables.
3. Conduit and Wire
4. Pull Boxes, Junction Boxes
5. System and Equipment Grounding
6. PV Production Meter
7. Panelboard with circuit breakers
8. Rails and support assemblies
9. Junction boxes
10. Monitoring systems
11. LED Light Fixtures and Drivers
12. Misc. supports and equipment.

**PK-ESCR 653.6 MEASUREMENT AND PAYMENT:** For furnishing and installing electrical work in accordance with the specifications, contract drawings, and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

The price bid shall be a **LUMP SUM** price for this item and shall include the cost of all labor, materials, equipment, and incidental expenses necessary and required for installing the electrical work with connection, and other items necessary or required to complete the work, including, but not limited to miscellaneous site work, permits, etc., in all accordance with the plans, specification, and as directed by the Engineer. The lump sum item for electric work will not include excavation, backfill and restoration of finished surface.

*Payment will be made under:*

<u>ITEM NO.</u>	<u>ITEM</u>	<u>PAY ITEM</u>
PK-ESCR-653	Electrical, Lighting and PV Work for Southern M&O Area 1 Canopy	LS
PK-ESCR-654	Electrical, Lighting and PV Work for Northern M&O Area 2 Canopy	LS

**END OF SECTION**

**SECTION PK-ESCR 655 – ELECTRIC SERVICE AND DISTRIBUTION WORK AT  
CENTRAL M&O FACILITY**

**SECTION PK-ESCR 656 – ELECTRIC SERVICE AND DISTRIBUTION WORK AT  
NORTHERN M&O FACILITY**

**SECTION PK-ESCR 657 – ELECTRIC SERVICE AND DISTRIBUTION WORK AT  
AMPITHEATER AREA AND FLOODLIGHTING**

**SECTION PK-ESCR 658 – ELECTRIC SERVICE AND DISTRIBUTION WORK AT  
GRAND STREET FERRY**

**SECTION PK-ESCR 664 – ELECTRIC SERVICE AND DISTRIBUTION WORK AT  
EAST 10<sup>TH</sup> STREET BRIDGE STORAGE ROOM**

**SECTION PK-ESCR 692 – ELECTRIC CABINET AND PANEL WORK AT EAST RIVER  
HOUSES PARKING LOT**

**GENERAL:** Under this item the Contractor shall furnish and install a complete Electric Service and Distribution work with all incidentals required and as shown on the drawings as specified herein. All work shall be performed in a neat and professional manner.

All materials to be furnished and all work to be performed shall be in strict compliance with the requirements of the latest specifications and standard practice of the New York City Electric Code. The Contractor shall submit shop drawings of all equipment to be furnished and drawings must be approved by the Engineer before beginning the manufacture of the equipment.

**WORK INCLUDED:** The work shall include, but shall not be limited to the following: Furnish and install and connect all items of labor and material for a complete electrical system as indicated on the drawings and specified herein. Small and sundry items not necessarily indicated or specified, but required for the complete installation, shall be included in the Contractor's proposal and incorporated in the Work.

1. Con-Ed CT Cabinet
2. Conduit and Wire
3. Pull Boxes, Junction Boxes
4. System and Equipment Grounding
5. Heavy Duty Safety Switch
6. Panelboard with circuit breakers
7. Misc. supports and equipment.

Cabinet

**WORK NOT INCLUDED:**

1. Concrete pads are paid for under ESCR-4.06 Concrete

**ACCESSIBILITY:** All work shall be installed so as to be readily accessible for operation, maintenance and repair. Minor deviations from the drawings may be made to accomplish this, but no changes shall be made without the prior approval, in writing, of the Engineer.

**CODES, PERMITS AND CERTIFICATES:** All items of labor and material shall be in accordance with the requirements of the latest edition of the New York City Electric Code, and the rules, regulations, standards, etc. of all other local or national agencies having jurisdiction. No materials shall be used that are not listed by the Underwriters' Laboratories and the N.Y. Board of Fire

Underwriters. In addition, all applicable regulations and requirements of Con-Edison shall apply to work under the Contract.

The Contractor shall pay all fees, give all notices, file all necessary drawings, obtain all permits and certificates of approval as may be required in connection with the Work under this Contract.

1. All materials and workmanship shall comply in all respects with the rules and regulations of the Electrical Code of the City of New York.
2. The materials and workmanship shall comply in every respect with the contract specifications and drawing and fulfill the full intent thereof.

**CONTRACT DRAWINGS:** The contract drawings are diagrammatic but shall be followed as closely as conditions at the site of work or the work of other trades will permit.

See contract drawings for equipment sizing, requirements, etc.

**TESTS AND GUARANTEE:** The entire electrical system and equipment furnished and installed under the Contract shall test free of shorts and grounds. Insulation resistance tests shall be performed on all wiring and equipment with instruments as approved. Insulation resistance as measured shall conform to the requirements of the New York City Electrical Code. The Contractor shall provide all equipment and personnel necessary to perform such tests. Performed tests shall be made in the presence of the Engineer.

**ELECTRICAL SERVICE:** Electric Service shall be at three phase, four wire, 60 Hertz, 120/208 volt power source as indicated on the drawings.

**CONDUIT, HOT DIPPED GALVANIZED RIGID STEEL:**

The ends of all conduits shall be carefully reamed before installation and after the application for the die. Where it becomes necessary to cut a length of conduit it shall be done with a hacksaw or a specially approved cutter. Care shall be taken to secure a square end on all conduit.

Provide No. 10 drag wire in all empty conduit raceways.

The entire conduit and wiring system shall be thoroughly grounded in an approved manner. Exposed connection of ground wires shall be suitable protected from mechanical injury with rigid conduit and approved clamps and fittings.

Running threads shall not be used. Where conduit with tapered threads cannot be coupled with standard conduit couplings, O.Z. Split Couplings or Erickson Couplings shall be used. Underground, or where coupling is to be covered with concrete, a watertight union shall be used. All male threads of steel conduit shall be coated with red lead or graphite base pipe compound. Do not paint female threads.

The excavation for the installation of the conduit is specified in other sections of this Contract. Payment limit lines are shown on the drawings.

All appurtenances, fittings, hangers, with RGS steel conduit shall be galvanized and asphaltum coated.

During installation, the conduit shall be plugged tightly with conduit caps at the close of each day's work or whenever work is discontinued for any length of time, to prevent the entrance of earth, water or other foreign matter. Paper or wood plugs are not acceptable.

After laying, all conduit runs shall be tested for clear bore and correct installation. Snaking the conduits shall be done in the presence of Engineer. Any conduit, which rejects the mandrel, shall be removed at once, the Contractor bearing all costs of replacing defective conduit and restoring the ground or structure around it.

The end of each conduit one inch and smaller shall be provided with a lock nut and bushing where it enters a sheet steel cabinet box, etc. For conduits 1-1/4 inches and larger, insulated grounding bushings shall be used. Care shall be taken to see that all conduits form a permanent and continuous ground return back to the service ground connection point. Ground bushings shall be bronze type "RBLG", O.Z., or equal.

All conduit shall be manufacturer's best grade delivered to the site in full pipe lengths, each trademarked by the manufacturer. All conduit connectors shall have insulated throats.

All ground connections to water pipes shall be made with type KH ground clamp Penn-Union, O.Z., Thomas & Betts, or approved equal.

In general, conduits shall be installed exposed and shall run parallel or perpendicular to wall lines.

Exposed conduits shall be securely fastened in place with PVC coated galvanized pipe clamps, racks, or other approved means, in a manner acceptable to the Engineer. Wood hangers and perforated sheet metal hanger straps will not be permitted. Spacing of conduit supports shall not exceed five (5) feet. All auxiliary items for fastening conduits shall be furnished and installed by the Contractor.

Conduit shall be of such sizes that required conductors may be pulled without strain or injury. Standard manufactured elbows shall be used for all conduits 1-1/4 inch or larger.

The routing of conduits, as shown on the plans, is diagrammatic. Before installing any work, it shall be the responsibility of the Contractor to examine the working layouts of all other trades to determine exact locations and clearances. Where equipment is installed by other trades requiring connection by the Contractor, the Contractor shall likewise determine exact conduit entry locations from shop drawings or actual piece of equipment. Modifications to conduit runs shown on the drawings as found necessary, shall be made without additional cost to the City, all subject to the Engineer's approval.

Conduits crossing construction expansion Joints shall be installed with approved expansion fittings, OZ type AX or EX or approved equal, and provided with approved flexible grounding bonds bypassing the fitting.

Where it becomes necessary to offset exposed conduit runs due to construction conditions, etc., such offsets shall be made using conduit "EL" fittings, or other means as approved by the Engineer.

Final connections to motors shall be made with Type 'UA' sealtite flexible conduit with external copper bonding strap.

All piping, conduits or other items to be imbedded in new concrete shall be inspected and approved by the Engineer prior to concrete placement.

**WIRE AND CABLE:** Unless otherwise specified, all wires and cables shall be single copper conductor type Cross-Linked polyethylene (XLPE) moisture and heat resistant thermoplastic insulated with Jacket USE-2; for use at 600 volts A.C. rated 75 degrees C. operating temperature suitable for wet and dry locations equal in every respect to the latest Insulated Power Cables Engineers' Association (IPCEA) Specifications(Latest Revision). The wire and cables shall have Underwriters' Laboratories, Inc. label and be surface printed throughout the entire length at two-foot intervals with permanent identifying markings indicating manufacturers' name, size, type, and voltage.

Wire shall be no more than ninety (90) days old when purchased. All wire and cables shall be furnished on reels or spools and in lengths required to minimize splicing.

All conductors No. 10 AWG and smaller shall be solid; No. 8 AWG and larger, stranded except for ground wire which shall be solid.

Wires and cables No. 2 AWG and smaller shall be of continuous solid colors in accordance with the New York City Electric Code.

All wires larger than No. 2 AWG shall be colortape coded at all terminations.

All wire and cables shall be 98 percent conductivity copper as manufactured by Rome Cable Company, Essex Wire & Cable, Okonite, Anaconda Wire and Cable Company, or other acceptable manufacturer.

**CABLE TEST DATA:** No cables shall be shipped from the manufacturer's plant until the final certified test data is received from cable manufacturer stating that such cables are approved by the Engineer and they conform with the New York City Electric Code requirements.

**JUNCTION AND PULL BOXES:** Submittals Product Data: Catalog sheets, specifications and installation instructions. Samples: One of each product.

Threaded type Boxes: Malleable iron with cadmium or galvanized finish for use with steel conduit, as manufactured by Appleton Electric Co., Crouse-Hinds Co., or OZ/Gedney Co., or approved equal.

1. Malleable iron boxes shall be provided with galvanized malleable iron covers with approved gaskets, held by Everdur or approved equal machine screws. All threaded entries that are not used shall be closed by threaded pipe plugs, red leaded.

Preparation: Before proceeding with the installation of junction boxes, check the locations with the Engineer and have same approved.

Specific Purpose Outlet Boxes: Use to mount equipment when available and suitable for job conditions. Unless otherwise specified, boxes shall be threaded type for exposed conduit system, PVC coated.

Supplementary Junction and Pull Boxes: In addition to junction and pull boxes indicated on the drawings and required by the NEC, provide supplementary junction and pull boxes as follows:

1. When required to facilitate installation of wiring.
2. At every third 90 degree turn in conjunction with raceway sizes over 1".
3. At intervals not exceeding 100' in conjunction with raceway sizes over 1".
4. The box sizes shall be in accordance with code requirements.

**ELECTRICAL CABINET:** Electric service and distribution cabinets mounted on concrete pad. cabinet to be stainless steel type 316. Continuous hinge rainproof NEMA 4X enclosure. sized to fit all equipment required. Contractor to submit cabinet layout drawing with all equipment and associated clearances.

**SERVICE SWITCH:** Service switch to be heavy duty, NEMA 4X stainless steel with removable ground-neutral link. Switch to be 208/120 volt, 3 phase, 4 wire, 600 volt rated. Service switch to be located within electrical service and distribution cabinet.

**CON-ED CT CABINET:** Cabinet shall be rated NEMA 3R and shall be constructed from the code gauge galvanized or galvanized steel. Bus Bar shall be Silver or Tin Plated and shall be sized per the NEC. Cabinet design shall have provisions for a solid door to allow for the meter enclosure to be mounted remotely from the cabinet. Contractor to only use only manufacturer's approved lug and other mounting accessories. Only factory prefabricated knockouts on the enclosure shall be used. Electric Service requires a disconnect switch before the CT Cabinet.

**CUTTING AND PATCHING:** The Contractor shall perform all cutting and patching of work that may be required. All patching shall be done by qualified personnel.

The Contractor shall coordinate with all trades so that all cutting and patching required is performed in a timely manner.

Wherever possible, the Contractor shall provide sleeves for new concrete, to avoid cutting and patching. Install sleeves and equipment shown on electrical drawings in forms, before concrete is placed. Where utility sleeves are not installed before concrete is placed, complete all cutting and core drilling required to install all new conduit or other required new items as shown on the drawings. Holes cut for new conduit shall be done with core-boring tools. Holes for large items shall have edges neatly cut with a power saw.

The Contractor shall be responsible for the patching of all openings to provide a snug and waterproof seal. Any other damages to the structures shall be properly repaired at no additional cost.

The use of power driven impact tools will not be permitted to install openings.

**INSTALLATION OF CONDUCTORS IN CONDUIT OR RACEWAY:** No wire shall be pulled until the conduit and/or raceway system for a specified section or area is complete.

All feeders and mains shall be of the sizes shown on the Contract Drawings all in accordance with these specifications. All wires to be installed in any one conduit shall be pulled in at the same time and directly from reels. For pulling wires and cables, an approved lubricant may be used. All wires shall be continuous without splices between boxes, panelboards, cabinets, etc. Sufficient slack shall be left in all boxes for splicing wires and making proper connections.

All cable taps and splices in boxes shall be made secure with solderless compressive type connectors as manufactured by Burndy or approved equal. Connectors shall be installed with approved hydraulic tools to assure a permanent mechanically secure high conductivity joint. Insulation tape shall be No. 23 M.M.M. or approved equal. Jacket tape shall be applied over the insulation tape to a thickness of two times thickness of cable jacket. Jacket tape shall be water-resisting type Scotch No. 88 M.M.M. or approved equal. All splices and tape shall be waterproof.

All wiring in troughs shall be neatly tied and racked. Wires shall be grouped as to the equipment they serve, and shall have brass tags attached thereto. Tags shall have engraved lettering indicating panel or equipment source, circuit number and equipment served.

All conduit shall be carefully cleaned before and after erection. All ends shall be free from burrs and inside surfaces shall be free from all imperfections likely to injure the wires and cables. Immediately before the wires and cables are pulled into any conduit run, such completed conduit run shall be snaked with a steel band to which shall be attached an approved tube cleaner equipped with an approved spherical mandrel of a diameter not less than 85 percent of the nominal inside diameter of the conduit. All conduit through which this mandrel does not pass shall be removed and replaced by the Contractor at the Contractor's own expense.

**PANELBOARDS AND CIRCUIT BREAKERS:** Panelboard shall be 208/120 volt, 3 phase, 4 wire copper bus bar with NEMA 4X stainless steel enclosure. Circuit breakers to be bolt on type. Panel to be rated for 22 KAIC. Branch disconnecting devices shall consist of circuit breakers, built in molded composition, of type, voltage, capacity and trip element ratings and number of poles as indicated on the panel schedule. The branch circuit breaker units shall be quick-break, trip-free toggle-mechanism type with distinct Off and On indications and clearly numbered with circuit numbers and trip ratings. They shall be interchangeable and operable in any position, and removable from the front of the panel without disturbing adjacent units. Circuit breaker

interrupting capacity shall be 22,000 symmetrical amps (R.M.S.). Circuit breakers shall be bolt on type, Cutler Hammer type adjustable trip Series C or approved equal.

**CIRCUIT BREAKERS:** Branch disconnecting devices shall consist of circuit breakers, built in molded composition, of type, voltage, capacity and trip element ratings and number of poles as indicated on the panel schedule. The branch circuit breaker units shall be quick-break, trip-free toggle-mechanism type with distinct Off and On indications and clearly numbered with circuit numbers and trip ratings. They shall be interchangeable and operable in any position, and removable from the front of the panel without disturbing adjacent units. Circuit breaker interrupting capacity shall be 22,000 symmetrical amps (R.M.S.). Circuit breakers shall be bolt on type, Cutler Hammer type adjustable trip Series C or approved equal.

**GROUNDING:** The entire conduit system and equipment shall be permanently, continuously, and effectively grounded. The conduit system shall be made electrically continuous by using threaded fitting with joints made up tight. Use a conductive copper compound as a lubricant on all pipe threads. Where boxes or fittings are made of sheet steel having no threaded hubs, electrical continuity shall be obtained by using grounding bushing type IBC-L-BC series, 0.Z. or approved equal.

All grounding shall be in strict accordance with Art. 8 of the New York City Electrical Code and other agencies having jurisdiction. Contractor shall furnish and install all items of material and labor for the grounding systems, including conduits, cables, clamps, fittings and connections.

All underground ground connections to be made by exothermic welds.

**BONDING:** All boxes and metal frames, conduits, etc. shall be bonded in an approved manner, using not less than #6 AWG gauge, bare, stranded, tinned, soft drawn or annealed copper wire.

**REGULATORY REQUIREMENTS:** Special caution note: The Contractor is fully aware that the work involved is an active roadway and in some cases requires additional safety precautions. The Contractor is responsible to protect workers in the performance of the work.

Codes:

1. General: Comply with the requirements of American National Standards Institute (ANSI), National Electrical Manufacturers Association (NEMA), Underwriters Laboratories (UL), New York City Department of Transportation, (NYCDOT), New York State (NYS), New York City (NYC), & Federal, etc. codes referred to in these specifications, except where requirements of these specifications are more restrictive or stringent. Such codes shall be the date of latest revision in effect at the time of performing the work, unless the date is given.
2. Building Code: Comply with the requirements of the New York State Uniform Fire Prevention and Building Code and New York City Building Code.
3. Electrical Codes:
  - a. Work Area: Electrical Work shall conform to the requirements of the latest edition of the NYC Electrical Code (NYCEC) and National Electrical Code (NEC), and all state and local codes. The Engineer shall be the sole judge of the interpretation of these rules and requirements.
  - b. Work and Off-Site Staging Area: Electrical Work shall conform to the requirements of the Electrical Code of the City of New York, latest edition and NYS DOT latest edition and Addenda.
  - c. All applicable regulations of the local utility companies.
4. Safety and Health: Comply with applicable requirements of the Occupational Safety and Health Act, including most recent amendments and New York State safety, health and labor regulations and contract documents.

5. In the event of conflict between codes, the most restrictive requirements shall apply as interpreted by the Engineer.
6. Permits and Inspections:
  - 1) Underwriters' Certificate: Work Within Limits of the Contract: A New York Board of Fire Underwriters Inspection Certificate is required.
  - 2) Certificate of Inspection: Work Within Limits of the Contract: An inspection and certificate by the City of New York, Dept. of Public Works, Bureau of Electricity, is required.
  - 3) NYC DOT DSL shall review and approve shop drawings, installation and final system.

Listings: Equipment and materials for which Underwriters' Laboratories, Inc. (UL) provides product listing service, shall be listed and bear the listing mark.

1. Alternately, ETL Testing Laboratories, Inc. Product Safety Testing Listing is acceptable if the listed product has been tested to the applicable UL Standard.
2. Equipment shall have New York City Board of Standards and Appeals listing as required.

**SHOP DRAWINGS:** Shop drawings shall be submitted for all equipment to be installed. Shop drawings shall include all required information and details to show compliance to the contract plans and specifications. Contractor shall submit shop drawings to Engineer for all site lighting equipment.

Shop Drawings shall include, but not be limited to the following:

1. Con-Ed CT Cabinet
2. Conduit and Wire
3. Pull Boxes, Junction Boxes
4. System and Equipment Grounding
5. Heavy Duty Safety Switch
6. Panelboard with circuit breakers
7. Misc. supports and equipment.
8. Cabinet

**MEASUREMENT AND PAYMENT:** For furnishing and installing electrical work in accordance with the specifications, contract drawings, and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

The price bid shall be a **LUMP SUM** price for this item and shall include the cost of all labor, materials, equipment, and incidental expenses necessary and required for installing the electrical work with connection, and other items necessary or required to complete the work, including, but not limited to miscellaneous site work, permits, etc., in all accordance with the plans, specification, and as directed by the Engineer.

The lump sum item for electric work will not include excavation, backfill and restoration of finished surface.

**END OF SECTION**

## **SECTION PK-ESCR 660 – SPORTS FIELD FLOOD LIGHTING – FIELDS 1 & 2**

### **SECTION PK-ESCR 661 – SPORTS FIELD FLOOD LIGHTING – FIELD 6**

#### **SCOPE OF WORK:**

Under this item the Contractor shall furnish and install a complete sports floodlighting system with Floodlight poles, luminaires, crossarm assemblies, mounting brackets, pole wiring fusing and aiming with all incidentals required and as shown on the drawings as specified herein All work shall be performed in a neat and workmanlike manner and all requirements of the General Conditions and Special Conditions shall apply to all items and materials furnished and installed under the Contract.

All materials to be furnished and all work to be performed shall be in strict compliance with the requirements of the latest specifications and standard practice of the New York City Electric Code. The Contractor shall submit shop drawings of all equipment to be furnished and drawings must be approved by the Engineer before beginning the manufacture of the equipment.

#### **WORK INCLUDED:**

The work shall include, but shall not be limited to the following: Furnish and install and connect all items of labor and material for a complete electrical system as indicated on the drawings and specified herein. Small and sundry items not necessarily indicated or specified, but required for the complete installation, shall be included in the Contractor's proposal and incorporated in the Work.

1. System and Equipment Grounding
2. Recreational Sports Lighting fixtures, poles , Crossarm assemblies, mounting brackets and connections
3. Pole wiring, fuses, fuse holders, fuse cabinet, aiming, etc. as required for a complete system.

The primary goals of this lighting project are:

1. Balance of lighting factors: Minimize spill light to adjoining properties and glare to the players, spectators and neighbors. Minimize uplight component to preserve a dark sky. Maximize playability and safety to the players.
2. Life-cycle Cost: To reduce operating costs, the preferred lighting system shall be energy efficient and cost effective to operate. System energy consumption is to be maintained over the life of the system and will not increase as the system ages.

#### **REGULATORY REQUIREMENTS:**

Codes:

1. General: Comply with the requirements of American National Standards Institute (ANSI), National Electrical Manufacturers Association (NEMA), Underwriters Laboratories (UL),

New York City Department of Transportation, (NYCDOT), New York State (NYS), New York City (NYC), & Federal, etc. codes referred to in these specifications, except where requirements of these specifications are more restrictive or stringent. Such codes shall be the date of latest revision in effect at the time of performing the work, unless the date is given.

2. Building Code: Comply with the requirements of the New York State Uniform Fire Prevention and Building Code and New York City Building Code.
3. Electrical Codes:
  - a. Work Area: Electrical Work shall conform to the requirements of the latest edition of the NYC Electrical Code (NYCEC) and National Electrical Code (NEC), and all state and local codes. The Engineer shall be the sole judge of the interpretation of these rules and requirements.
  - b. Work and Off-Site Staging Area: Electrical Work shall conform to the requirements of the Electrical Code of the City of New York, latest edition and NYS DOT latest edition and Addenda.
  - c. All applicable regulations of the local utility companies.
4. Safety and Health: Comply with applicable requirements of the Occupational Safety and Health Act, including most recent amendments and New York State safety, health and labor regulations and contract documents.
5. In the event of conflict between codes, the most restrictive requirements shall apply as interpreted by the Engineer.
6. Permits and Inspections:
  - 1) Underwriters' Certificate:
    - a. Work Within Limits of the Contract: A New York Board of Fire Underwriters Inspection Certificate is required.

Listings: Equipment and materials for which Underwriters' Laboratories, Inc. (UL) provides product listing service, shall be listed and bear the listing mark.

1. Alternately, ETL Testing Laboratories, Inc. Product Safety Testing Listing is acceptable if the listed product has been tested to the applicable UL Standard.
2. Equipment shall have New York City Board of Standards and Appeals listing as required.

#### CODES, PERMITS AND CERTIFICATES:

All items of labor and material shall be in accordance with the requirements of the latest edition of the New York City Electric Code, and the rules, regulations, standards, etc. of all other local or national agencies having jurisdiction. No materials shall be used that are not listed by the Underwriters' Laboratories and the N.Y. Board of Fire Underwriters. In addition, all applicable regulations and requirements of Con-Edison shall apply to work under the Contract.

The Contractor shall pay all fees, give all notices, file all necessary drawings, obtain all permits and certificates of approval as may be required in connection with the Work under this Contract.

Before final payment will be made, the Contractor shall furnish the Parks with final certificates of approval from the New York Board of Fire Underwriters, which shall certify:

1. That all materials and workmanship comply in all respects with the rules and regulations of the Electrical Code of the City of New York.
2. That the materials and workmanship comply in every respect with the contract specifications and drawing, and fulfill the full intent thereof.

**TESTS AND GUARANTEES:**

The entire electrical system and equipment furnished and installed under the Contract shall test free of shorts and grounds. Insulation resistance tests shall be performed on all wiring and equipment with instruments as approved. Insulation resistance as measured shall conform to the requirements of the New York City Electrical Code. The Contractor shall provide all equipment and personnel necessary to perform such tests. Performed tests shall be made in the presence of the Engineer.

All items of labor and material provided under the contract shall be guaranteed free of defects for a period of one year from the date of completion. Any defects appearing in this period shall be immediately corrected by the Contractor upon notification by the Engineer without additional charge.

**SPORTS LIGHT WARRANTY:**

The fixtures, poles and cross-arm assemblies shall be warranted (Limited Warranty) for a period of seven (7) years warrants to the purchaser that all assemblies shall be free from defects in materials and workmanship from the date of shipment. A copy of the manufacturer's warranty shall be submitted.

**ELECTRICAL SERVICE:**

Power for the floodlighting shall be obtained from a new Con-Edison service at three phase, four wire, 60 Hertz, 120/208 volt power source as indicated on the drawings. The Contractor is responsible to fully coordinate the work with Con-Edison.

**LIGHTING PERFORMANCE:**

- A. Illumination Levels and Design Factors: Playing surfaces shall be lit to an average target illumination level and uniformity as specified on the contract drawings. Lighting calculations shall be developed, and field measurements taken on the grid spacing with the minimum number of grid points of 84 for baseball outfield & multi-purpose field and 25 points for baseball infield.
- B. Average illumination level shall be measured in accordance with the latest IESNA Sports and Recreational Area Lighting requirements.
- C. Illumination levels to meet target values in accordance with latest IESNA Sports and Recreational Area Lighting.

**ENVIRONMENTAL LIGHT CONTROL:**

- A. Light Control for Luminaires: All luminaires shall utilize multi-layer optical system including silicone TIR and reflector optics designed to minimize glare and spill light while maintaining the poles for aerial play. No full-cutoff luminaires shall be permitted.
- B. Spill Control: To minimize impact on adjacent properties, maximum horizontal spill shall not exceed 0.5fc 150' from the edge of the fields. No fixture mounted anywhere on the poles shall be aimed above the horizon. No up-lighting will be permitted.
- C. Photometric Report: A photometric report that shows aiming points of each luminaire shall be provided to demonstrate the capability of achieving the specified performance.

## **MATERIALS**

### **SPORTS LIGHTING GENERAL DESCRIPTION:**

Sports Lighting System shall consist of light poles, cross arm assemblies, luminaires, junction boxes, aiming devices, wiring, cable, and assembly mounting hardware, pre-wired from handhole to fixtures.

All components shall be designed and manufactured as a system. Pole structure, luminaires, control and integral driver system shall be provided from an approved manufacturer.

The entire sports lighting system (poles, crossarms, wiring and fixtures) must be supplied by a single entity that underwrites the warranty. The complete lighting system shall consist of the listed equipment as follows:

1. Hot-dip galvanized painted steel poles.
2. LED luminaires: complete, integral unit, factory assembled and vacuum sealed.
3. Crossarms: factory pre-wired and assembled, hot-dip galvanized steel.
4. All wiring from the load side of the breaker to the luminaire.
5. Aiming method for alignment and realignment of fixtures.

The entire pole fixture assembly shall be capable to withstand the design forces without damage to any part or assembly. The contractor is responsible to repair and or replace any damaged equipment as directed.

The fixture and pole manufacturer is responsible to furnish the contractor with bolt tightening torque requirements and mounting and aiming instructions and include in the shop drawings.

### **SPORTS LIGHT POLE AND CROSS ARM:**

Poles cross arms and accessories shall be as manufactured by Carolina High Mast (CHM) Industries, Saginaw, TX, MSM, Eaton or approved equal.

### **POLE STRUCTURE:**

- A. The poles shall be designed for allowable stresses in accordance with latest AASHTO Standard Specification for Structural Supports for Highway Signs, Luminaires and Traffic Signals.
- B. The pole structure shall consist of a modular pole assembly. This shall consist of no more than two shaft components. No single component shall weigh over 1500 pounds to allow handling by light duty equipment in order to minimize damage to site.
- C. Each section of pole shaft material shall be of single-ply material and be made from a single sheet of steel with no circumferential welded splices. The pole shafts cross-section shall be round. The pole shaft sections shall be high-strength steel meeting the requirements of ASTM A570 GR65 (65 ksi yield) and/or ASTM A595 GR55 (55 ksi yield).
- D. Pole shaft sections shall be hot dip galvanized in accordance with the requirements of ASTM A123 specifications. Each shaft assembly must be completely coated, inside and out, in a single dip. Double dipping will not be permitted in compliance to USGA (United States Galvanizing Association) recommended practices and procedures to prevent acid entrapment. All miscellaneous connecting hardware shall be galvanized in accordance with ASTM A153 specifications.
- E. The structure shall be designed for the combined effective projected area (EPA) and weight of all applicable accessories (i.e. luminaires, crossarms, and other components such as speakers/mounting brackets). Concrete poles or pole sections are not acceptable due to excessive weight and mobilization costs.
- F. Wind loads – structure shall be based on the latest specifications of AASHTO and designed to withstand wind speeds of 120 MPH.

## 2.1

### CROSSARM ASSEMBLY:

- A. All crossarms shall be factory pre-wired and assembled.
- B. All crossarms shall be hot dip galvanized in accordance with the requirements of ASTM A123 specifications
- C. All wiring/connections should be factory assembled from the fixture mounting location to the base of the pole.
- D. Strain relief device(s) must be factory installed in pre-wired crossarm assembly to ensure no weight or tension is placed on electrical connections.
- E. All factory pre-wiring must be done in a manner that requires no electrical connections inside the pole or crossarm assembly to be made in the field.

Submit Shop Drawings for lighting fixtures, floodlights and poles with the following information:

1. The fixtures shall be photographically illustrated. No line Drawings will be accepted unless accompanied by a separate photograph or sample.
2. The details of the assembled fixtures shall be illustrated or described and shall include, but not be limited to, the mounting methods, locations and type of hinges and latches, gasketing

methods, enclosure assembly methods, location of wireways, input wattage, output lumens, actual dimensions of the fixtures, gauge and types of metals used, finishes and corrosion protection, fusing, wiring, etc. Include all dimensions and weights etc.

3. The following photometric data shall be furnished with each fixture:

Floodlighting Fixtures: Photometric test report indicating the lighting distribution of the fixtures for all angles between 0 degree and 80 degrees minimum, beam efficiency, total efficiency, beam spread in horizontal and vertical degrees, NEMA type and average maximum candlepower. In addition horizontal Isofootcandle curves shall be submitted in addition to the independent test lab photometric test report.

4. Provide a complete photometric diagram, Isofootcandles on 10' grid, of the site for courts to be illuminated indicating the illumination levels and aim points for all fixtures.
5. Provide footcandle array for courts including average maintained, minimum, maximum, ave/min, max/min, CV, # points, initial lumens, LLF design lumens, etc.
6. Provide photometrics and calculations demonstrating conformance with reducing off-site and sky light pollution using the methodology and design criteria per USGBC LEED 2.2 SSc8 'Reducing Light Pollution', ambient illumination zone LZ3 medium.

#### FLOODLIGHT FIXTURES:

The floodlight fixtures shall be manufactured by Carolina High Mast, GE Lighting Solution, Eaton or approved equal.

A. LUMINAIRE: The luminaires must be an integral unit with maximum distance of 18 inches between power supply, driver and LEDs to minimize power loss and EMI (electromagnetic interference).

B. The fixture shall meet the following specifications:

1. General:
  - a. UL Certified for wet locations
  - b. Operating temperature range rating between -40°C and +40°C
  - c. Certified to UL 844 and ANSI C136.31, 3G vibration requirements
  - d. IP Rating: IP66
  - e. Lumen output < 92,000
  - f. Power consumption < 640W
  - g. Efficacy of ≥120 lumens/watt
  - h. Correlated Color Temperature (CCT) of 5700K

- i. CRI of  $\geq 70$
  - j. L90 lumen depreciation rating:  $>55,000$  hours certified based on IES recommended 6x measured data extrapolation limitation. No extrapolation beyond 6X permitted.
  - k. Weigh  $\leq 75$ lbs, including power supply, bracket, and controls
  - l. Fixture weight evenly distributed between 2-piece assembly of light head and power/controls box
  - m. Effective projected area (EPA)  $\leq 1.8$  ft<sup>2</sup>
  - n. Pre-aiming for orientation around the mounting location bolt
  - o. Pre-aiming for tilt on the yoke with locking pin with increments under 2°
  - p. Luminaires must be listed on the QPL of Design Lights Consortium® to ensure minimum quality and energy-efficiency standards are met for qualification in energy efficiency programs.
2. Integrated and Thermally Isolated Power Supply:
- a. Wide input range of 120VAC to 277VAC.
  - b. Power factor:  $>0.96$  @ 277VAC and  $>0.95$  @480VAC
  - c. THD (Total Harmonic Distortion)  $\leq 20\%$
  - d. Dim to off capability
  - e. Luminaire shall contain two power supplies (drivers) such that if one driver is not operational the other continues to power all the LEDs in the light head.
  - f. Drivers, controls connections and all wiring connections shall be contained in an IP66 enclosure. No exposed connections permitted. No additional junction box permitted.
  - g. Driver case temperature shall be maintained at or below 55°C at 40°C ambient in order to preserve long term reliability
  - h. No remote ballast solutions are permitted because of parasitic power consumption and high installation costs.
3. Optical system:
- a. Fixture shall have a glass sealed glass cover to protect the optics and LEDs. No exposed optics permitted.
  - b. Luminaire shall incorporate silicone TIR optics in combination with reflector optics over each LED source in order to minimize glare perception. LED light source shall be Chip-on-Board (COB) technology.
4. Construction
- a. Luminaire shall and be installed as a 2-piece assembly of light head and

- power/controls for ease on handling and installation.
- b. Power shall be integral to fixture assembly and separated from the LED thermal heatsink by greater than 2 inches to maintain reliability.
  - c. Aluminum shall be chromate conversion coated and then two-stage architectural grade powder-coated for long term resistance to corrosion and UV exposure

Floodlights shall have internal glare louvers, and meet Marine Rateng (UL 1598A).

### **WELDING:**

**Welding shall be in accordance with American Welding Society (AWS) Structural Welding Code D1.1, Sections 1 through 8 and shall be performed by welders certified in accordance with the AWS Code.**

### **LIGHTNING PROTECTION:**

All structures shall be equipped with lightning protection meeting standards established by NFPA 780 (National Fire Protection Association) and UL 96. There shall be provided at each structure at least three copper-clad steel ground rod of not less than 5/8" in diameter and not less than 10-0" in length.

The ground rod(s) shall be connected to the structure by a copper main down conductor. This conductor shall be not less than a #2/0 copper conductor

The main down conductor shall extend from the base of the steel pole to the ground rod(s) and be bonded to the equipment ground. All metal components on the pole shall be bonded to the pole.

Provide air terminals on all poles. Lighting air terminals pole at both ends of crossarm to extend 24" above floodlight fixtures.

BC-50L Series, Raco Inc.'s 1212 Series, or Thomas & Betts Corp.'s 3870 Series, or approved equal.

### **SPLICE CONNECTORS FOR EQUIPMENT GROUNDING CONDUCTOR:**

Exothermic Type Weld: Erico Products Inc.'s Cadweld Process, Genesis Systems, NVent or approved equal.

Compression Connectors: AMP Special Industries' Ampact Grounding System, Burdy Corp.'s Hyground System, or Thomas & Betts Corp.'s Grid and Ground Rod System, or approved equal.

Indent Type: Burndy Corp.'s Hydent, or Thomas and Betts Corp.'s Compression Connectors, Graybar or approved equal.

### **INSULATED GROUNDING BUSHINGS:**

Appleton Electric Co.'s GIB-50 Series, Efcor Inc.'s 56-50-4 Series, Midwest Electric Mfg. Corp.'s GLL Series, OZ/Gedney Co.

## **EXECUTION:**

### **SPORTS LIGHT INSTALLATION:**

Provide, mount and wire floodlights complete with junction boxes, on each sports light pole as indicated on the Drawings and specified herein.

Pole Finish: Contractor shall touch up any marred or scratched surfaces after erection of poles to the satisfaction of the Engineer.

### **FIXTURE AIMING:**

Aiming Diagram: The manufacturer shall provide for record a computer derived point by point illuminance calculation and an aiming diagram showing the aiming point on the field. Aiming diagram shall show the fixture arrangement as viewed from the rear of the crossarm assembly and horizontal and vertical angles and field coordinates of the aiming point as well as photometric ID number.

Aiming Requirements for Pre-Aimed Units: The fixtures shall be factory-mounted to the crossarms and aimed according to the diagram. The reflectors shall be removed, packed and shipped separately. The aiming position of the socket holder shall be secured, marked and protected during shipping. Each fixture shall be identified and each crossarm shall be identified to match the corresponding pole.

### **NIGHT TIME AIMING:**

Provide necessary personnel and material including final aiming diagram to demonstrate to the Engineer the proper floodlight aiming.

Mark all aiming points from manufacturers aiming diagram on finished grade with temporary marking, i.e., 10" diameter paper plates secured to ground.

Adjust and readjust any fixture that the Engineer determines is not properly aimed until it is finally approved. The cost of personnel climbing the poles and adjusting the fixtures shall be included in the contractors bid.

The Engineer will determine the acceptability of the lighting uniformity. Readjust fixtures until accepted by the Engineer at no additional cost.

The contractor can use a laser aiming device to demonstrate aiming points and aim the fixture at no additional cost.

### **GLARE CONTROL:**

At completion of installation the contractor with the engineer shall travel the adjacent streets to determine if there is any objectional glare associated with the lighting system. The engineer will note the problem area to the contractor.

The contractor is responsible to re-aim the fixtures in question and/or install glare shield and repeat the above procedure until the engineer is satisfied.

The above shall be included in the contractors bid and there shall be no additional payments for testing, re-aiming or adding glare shields.

Glare shield shall be structurally able to withstand the wind forces and not vibrate during the wind force.

The contractor shall immediately replace any fixtures with damaged parts including hardware, shield, housing, fuse, lamp, sockets etc.

The decision of the Engineer is not final until the system is accepted.

**GROUNDING:**

The entire conduit system and equipment shall be permanently, continuously, and effectively grounded. The conduit system shall be made electrically continuous by using threaded fitting with joints made up tight. Use a conductive copper compound as a lubricant on all pipe threads.

Where boxes or fittings are made of sheet steel having no threaded hubs, electrical continuity shall be obtained by using grounding bushing type IBC-L-BC series, O.Z. or approved equal.

All grounding shall be in strict accordance with Art. 8 of the New York City Electrical Code and other agencies having jurisdiction. Contractor shall furnish and install all items of material and labor for the grounding systems, including conduits, cables, clamps, fittings and connections.

All ground connections to water pipes shall be made with Type KH ground clamp Penn-Union, Thomas & Betts, Burndy or approved equal.

**BONDING:**

All boxes and metal frames, conduits, etc. shall be bonded in an approved manner, using not less than #6 AWG gauge, bare, stranded, tinned, soft drawn or annealed copper wire.

**SHOP DRAWINGS:**

Shop drawings shall be submitted for all equipment to be installed. Shop drawings shall include all required information and details to show compliance to the contract plans and specifications. Contractor shall submit shop drawings to Engineer for all site lighting equipment.

Shop Drawings shall include, but not be limited to the following:

1. System and equipment grounding
2. Recreational sports lighting fixtures, poles and connections
3. Pole wiring, fuses, fuse holders, fuse cabinet, aiming, etc. as required for a complete system.
4. Miscellaneous supports and equipment.
5. Floodlight fixtures with point-by-point photometrics

**MEASUREMENT AND PAYMENT**

For furnishing and installing electrical work in accordance with the specifications, contract drawings, and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

The price bid shall be a **LUMP SUM** price for this item and shall include the cost of all labor, materials, equipment, and incidental expenses necessary and required for installing new sports light poles, fixtures and all electrical work with connections and other items necessary or required to complete the work, including, but not limited to miscellaneous site work, permits, etc., in all accordance with the plans, specification, and as directed by the Engineer.

**END OF SECTION**

## SECTION PK-ESCR 662 – LED SOLAR LIGHT

### SECTION PK-ESCR 663 – LED 120 VOLT LIGHT SIMILAR TO SOLAR LIGHT

**GENERAL:** Under this item, the Contractor shall furnish and install Solar Powered LED Light, complete with fittings, including light pole, mounting brackets, hardware, wiring harness, PV panels, batteries, LED Cobrahead luminaire, controller, and all required accessories, in accordance with the plans, details, specifications, and directions of the Engineer.

**INTENT:**

1. It is the intent of this item shall be supplied by a single manufacturer.
2. The Contractor shall coordinate the work and delivery of the Solar Powered LED Light between manufacturer and supply all parties involved with the relevant information required to construct, finish, and install the Solar Powered LED Light.
3. All Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
4. All construction must conform to all local codes designed by NY State and NYC.
5. Comply with NFPA 70.
6. Comply with NECA 1 and NECA 413.
7. LED 120 volt light similar to solar light to look identical to solar lights (pole, brackets, etc.), but luminaire to be 120 volt with solar panels, batteries, solar engine, controller provided as spare not operating/connected equipment.

**MANUFACTURER:** The Solar Powered LED Light is manufactured by Sol, inc. 2637 E Atlantic Blvd #40620, Pompano Beach, FL 330623210SW 42nd Avenue, Palm City, FL 34990, Tel. 1-800-959-1329, Fax. 772-872-5321, Email: info@solarlighting.com, WWW.solarlighting.com or approved equal.

**MATERIALS:** All materials of construction should be UL listed and shall comply with specification and drawings or approved equal.

1. Pole: 6" Long / 3.5"O.D. Schedule 40 straight aluminum pole, standard 20ft. pole to cut to the size.
2. Color: Black Aluminum
3. Solar Engine: CE 2004-108-CE, EN 61547 for emissions and immunity.
3. LED Luminaire: XSP1HO High Output LED Luminaire, Type II Long, Type III Medium, Type IV Medium, 3000K, 280W, Black Grey powder coat
4. Solar PV Panel: 310 Watt Panel, tilted at 30.
5. Batteries: Carmanah Solar AGM Deep Cycle solar battery mounted high with battery enclosure
6. Controller/ Driver: EverGEN®
7. Mounting Hardware, Brackets, and Wiring Harnesses
8. Steel Bar Reinforcement: Reinforcement shall meet the requirements of the applicable paragraphs of the NYCDOT Standard Highway Specifications, the N.Y.C. Building

Code, and the latest ASTM specification for "Deformed and Plain Billet-Steel Bars for Concrete Reinforcement", Designation A-615 and in accordance with the Item "Steel Bar Reinforcement". Reinforcement shall be of the sizes and dimensions shown on the plans.

**EXECUTION:**

Pole Installation: The Contractor shall refer to Installation and Owner's Manual for the Pole assembling, Installation, Operation, and Maintenance for the Solar Powered LED Light.

**SUBMITTALS:**

Manufacturer's Catalog Cut Sheets, Product and Technical Data: Pole, LED Luminaire, Solar PV Panel, Battery, controller/ Driver

Color and Finish Sample: Contractor shall submit two (2) samples of shop-applied finish coats and color.

Shop Drawings: Shop drawings are required. Shop Drawings shall show general layout including pole foundation details with complete anchoring and foundation with dimensional information. Provide point by point photometric calculations for esplanade and walkway areas where solar lights are being provided.

**Warranty:**

Manufacturer's Warranty:

1. Battery: Ten (10) Years
2. Solar PV Panel Output Power: Minimum Twenty (20) Years
3. Mounting Hard: Ten (10) Years
4. Pole( provided by Manufacturer): Lifetime Excluding Finish
5. LED Fixture: Ten(10) year Limited Excluding Finish
6. Electronics ( Charge Controller, LED Driver): Ten (10) Years

The Warranty shall name the City of New York as the Project Owner and Purchaser.

**MAINTENANCE:** The Contractor shall refer to Operation and Maintenance in Installation and Owner's Manual for the Solar panel cleaning, Fuse, LED Fixture and Battery Replacement.

**MEASUREMENT & PAYMENT:** For furnishing and installing Solar Powered LED Light or LED 120 Volt Light Similar to Solar Light, complete, in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be unit price for **EACH** Solar Powered LED Light and LED 120 Volt Light Similar to Solar Light furnished and installed and shall include the cost of all labor, materials, and equipment required concrete foundation, reinforcing steel, excavation, backfill, and all other incidentals necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

**END OF SECTION**

PARKS-359

**SECTION PK-ESCR 669 – 2" DIA. HIGH DENSITY POLYETHYLENE (HDPE)  
SCHEDULE 80 CONDUIT**

**GENERAL:** Furnish and install a High Density Polyethylene (HDPE) Schedule 80 conduit and fittings for exterior underground branch circuit to in compliance with National Electrical Code and NYC Electric Code.

The item shall include the labor material and equipment for installation of conduit with all required accessories such as couplings, bends, elbows, nipples, unions, reducers, etc. All the work shall be done in compliance with code requirement. All associated material for complete installation of conduit shall be included under each item.

**MATERIALS:** The High Density Polyethylene conduit material must conform to UL 651A and ASTM F2160 (Solid Wall). All conduit supplied shall be clearly marked with the appropriate ASTM as certified. Nominal conduit size is determined by an inside diameter.

**SPECIFICATIONS FOR CONDUIT:**

1. Conduits installed shall be High Density Polyethylene (HDPE) Schedule 80 with minimum wall thickness of 0.218".
2. All fittings for High Density Polyethylene (HDPE) conduit shall be of an approved type and shall be HDPE Schedule 80.
3. Conduits shall be free from blisters, cracks or injurious defects and shall be reamed at each end. All bends shall be of a long sweep free from kinks and of such easy curvature as to permit the drawings in of cable without injury.
4. Conduit ends, shall extend into pull or junction boxes, one and one-half inch (1½") and be equipped with approved bushings.
5. Each length of conduit shall bear the manufacturer's Trademark or Stamp.
6. Conduits ends shall clean cut, straight and true.
7. Contractor shall be responsible for all excavation, backfilling, and restoration necessary for the installation of conduits as shown on drawing.
8. All capped conduits shall be provided with a HDPE Schedule 80 Steel cap securely fastened to end of conduit.
9. When necessary to connect conduits in other than the regular manner, Contractor shall utilize couplings approved by an engineer.
10. All conduits which are installed underground shall be not less than twenty-four inches (24") below final grade, unless otherwise indicated on the Contract Drawings.
11. Conduit bends shall be made without kinking conduit or appreciably reducing the internal diameter. The radius of the inner edge of any field bend shall be not less than six (6) times the normal diameter of the conduit. Where changes of directions are necessary, long gradual sweeps shall be installed rather than short bends. Pull boxes shall be installed as required to provide a maximum of three (3) right angle bends between pulling points.
12. The Contractor shall bend conduit as required to avoid interferences and provide proper clearance.

13. Conduits and fittings shall be manufactured by Dura-Line, Blue Diamond Industries or approved equal.
14. The Contractor shall test and clean all conduits installed under this Contract and all existing conduits to be re-used by pulling a test ball and brush of approved size through each conduit. If any obstructions remain so that the cleaning devices cannot be rodded or pulled through clearly, the conduit shall be replaced. After testing and cleaning, each spare conduit shall be left with a ½" nylon pull line in the conduit. Each spare conduit shall be sealed by the use of "Duxseal", or approved equal, at the manholes.
15. To seal cables inside conduits entering and leaving manholes, apply untarred, unoiled jute packing around outside of and in the crotch between the cables in such a manner as to completely fill the duct. Use short pieces of the jute (2" to 6") and pack them tightly. Insert approved duct sealing material, taking care to secure a perfect bond around edge of conduit and cables. Cables shall be kept apart from edge of conduit by sealing material.
16. The HDPE conduit shall be rated for temperature range for installation, from -20 degrees C to 90 degree C operating temperature for cables.
17. The HDPE conduit shall be rated for Chemical and corrosion resistance.

**MEASUREMENT & PAYMENT:** Payment will be made at the unit price bid for the total length in feet of **HIGH DENSITY POLYETHYLENE (HDPE) SCHEDULE 80 CONDUIT** actually installed as measured in the field along the longitudinal axis of each length of conduit by the Engineer.

The price bid for this item shall be a unit price per linear foot of **HIGH DENSITY POLYETHYLENE (HDPE) SCHEDULE 80 CONDUIT** shall include the cost of furnishing all labor, materials, and equipment to install, secure in place, clean and mandrel the conduit runs shown on the drawings. Conduit shall be installed complete with all couplings, fittings, bushings, sweeps, elbows, spacers, tie wire, drag lines and fiber plugs, straps, etc.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR-669	2" DIA. High Density Polyethylene (HDPE) Schedule 80 Conduit	LF

**END OF SECTION**

**SECTION PK-ESCR 645 – 1" DIA. HOT DIPPED/HEAVY GAUGE GALVANIZED RIGID STEEL CONDUIT**

**SECTION PK-ESCR 670 – ¾" DIA. HOT DIPPED/HEAVY GAUGE GALVANIZED RIGID STEEL CONDUIT**

**SECTION PK-ESCR 671 – 1½" DIA. HOT DIPPED/HEAVY GAUGE GALVANIZED RIGID STEEL CONDUIT**

**SECTION PK-ESCR 672 – 2" DIA. HOT DIPPED/HEAVY GAUGE GALVANIZED RIGID STEEL CONDUIT**

**GENERAL:** Furnish and install hot-dipped galvanized rigid, steel conduit for exterior underground branch circuit to in compliance with National Electrical Code and NYC Electric Code.

The item shall include the labor material and equipment for installation of conduit with all required accessories such as couplings, bends, elbows, nipples, unions, reducers, strap screws, bolts, nuts, anchors, etc. All the work shall be done in compliance with code requirement. All associated material for complete installation of conduit shall be included under each item.

**SPECIFICATIONS FOR CONDUIT:**

- 1] Conduits installed shall be heavy gauge rigid galvanized steel for exterior underground.
- 2] All fittings for galvanized metal conduits shall be of an approved type and shall be malleable iron castings, hot dipped galvanized. Conduit fittings shall be provided with gasket and metal covers and shall be equal to Crouse-Hinds Form 8.
- 3] Conduits shall be free from blisters, cracks or injurious defects and shall be reamed at each end. All bends shall be of a long sweep free from kinks and of such easy curvature as to permit the drawings in of cable without injury.
- 4] Conduit ends, except for threaded cast boxes, shall extend into pull or junction boxes, one and one-half inch (1½") and be equipped with approved bronze ground bushings. Locknuts and bushings shall be provided where conduits terminate in metallic boxes.
- 5] Conduits shall be of the sizes noted on Contract Drawings which are indicated as the nominal inside diameter and shall be of standard weight and equal in quality as called for in the Standard Specifications of the American Society for Testing Materials. Minimum size conduit shall be ¾". Each length of conduit shall bear the manufacturer's Trademark or Stamp.
- 6] Conduits shall have standard conduit threads, clean cut, straight and true. The threads shall be protected during transit and installation, and shall be of sufficient length to permit the proper coupling connections as noted heretofore.
- 7] Contractor shall be responsible for all excavation, backfilling, and restoration necessary for the installation of both the exterior and the interior conduits as shown on drawing.
- 8] Long running threads will not be permitted on any part of the work.
- 9] All capped conduits shall be provided with a galvanized cast iron cap securely screwed into a clean cut factory threaded end of conduit.
- 10] When necessary to connect conduits in other than the regular manner, Contractor shall use "Erickson" or similar couplings, or approved equal.
- 11] All conduits which are installed underground shall be not less than twenty-four inches (24") below final grade, unless otherwise indicated on the Contract Drawings.
- 12] Conduit bends shall be made without kinking conduit or appreciably reducing the internal diameter. All bends in conduit of 2 inch size or larger shall be made with a hydraulic or power pipe bender. The radius of the inner edge of any field bend shall be not less than

six (6) times the normal diameter of the conduit. Where changes of directions are necessary, long gradual sweeps shall be installed rather than short bends. Pull boxes shall be installed as required to provide a maximum of two (2) right angle bends between pulling points.

- 13] The Contractor shall bend conduit as required to avoid interferences and provide proper clearance.
- 14] Where conduits pass through foundation walls, concrete or floors, O.Z. Type "FSK" fitting or approved equal, of proper diameter, shall be installed.
- 15] Conduits and fittings shall be manufactured by Allied, Triangle, Crouse-Hinds Company, or approved equal.
- 16] The Contractor shall test and clean all conduits installed under this Contract and all existing conduits to be re-used by pulling a test ball and brush of approved size through each conduit. If any obstructions remain so that the cleaning devices cannot be rodded or pulled through clearly, the conduit shall be replaced. After testing and cleaning, each spare conduit shall be left with a ½" nylon pull line in the conduit. Each spare conduit shall be sealed by the use of "Duxseal", or approved equal, at the manholes.
- 17] To seal cables inside conduits entering and leaving manholes, apply untarred, unoiled jute packing around outside of and in the crotch between the cables in such a manner as to completely fill the duct. Use short pieces of the jute (2" to 6") and pack them tightly. Insert approved duct sealing material, taking care to secure a perfect bond around edge of conduit and cables. Cables shall be kept apart from edge of conduit by sealing material.

**MEASUREMENT & PAYMENT:** Payment will be made at the unit price bid for the total length in linear feet of **HOT-DIPPED/ HEAVY GAUGE GALVANIZED RIGID STEEL CONDUIT** actually installed as measured in the field along the longitudinal axis of each length of conduit by the Engineer.

The price bid for this item shall be a unit price per linear foot of **HOT-DIPPED/ HEAVY GAUGE GALVANIZED RIGID STEEL CONDUIT** shall include the cost of furnishing all labor, materials, and equipment to install, secure in place, clean and mandrel the conduit runs shown on the drawings. Conduit shall be installed complete with all couplings, fittings, bushings, sweeps, elbows, spacers, tie wire, drag lines and fiber plugs, straps, splice and junction boxes, etc.

END OF SECTION

## SECTION PK-ESCR 675 – TELEPHONE CONDUIT – 4" DIA.

**WORK:** Under this item, the Contractor shall furnish and install **TELEPHONE CONDUIT** of the required size including PVC pipes with all hardware and fittings underground as directed by the Engineer. All necessary straps, clamps, hangers and fastening devices shall be furnished and installed as a part of this item.

**INTENT:** The intent of this item is to install the PVC pipe as a conduit underground, to pull through future telephone wiring without disturbing the paths and pavements. Unless otherwise directed, the conduit shall be four (4") inches in diameter for the entire length from building to curb.

### **MATERIALS:**

Conduit: Shall be PVC Type 40 Conduit for applications in underground, direct burial applications in accordance with the National Electrical Code (Article 347). The pipe, under this item, shall be furnished and installed with couplings, elbows, bends, etc., as required.

Conduit shall be equal to Carlon Plus 40, 90°C, UL rated, manufactured by Carlon, or approved equal. Material shall comply with NEMA Specification TC-2 (Conduit), TC-3 fittings UL-514), and UL-651 (Standard FOR rigid non-metallic conduit). The conduit and fittings shall carry a UL label (on each 10 foot length of conduit and stamped molded on every fitting).

The conduit shall be made from polyvinyl chloride compound which includes inert modifiers to improve weatherability, heat distortion. Clean rework material, generated by the manufacturer's own conduit production, may be used by the same manufacturer, provided the end products meet the requirements of this specification.

The conduit and fittings shall be homogeneous plastic material free from visible cracks, holes or foreign inclusions. The conduit bore shall be smooth and free of blisters, nicks or other imperfections, which could harm conductors or cables.

Conduit, fittings and cement shall be supplied by the same manufacturer to assure system integrity.

Testing and Acceptance Criteria: Conduit and fittings shall be tested in accordance with the testing requirements defined in NEMA TC-2, NEMA TC-3, & UL -651 and UL-514 (fittings). The acceptance criteria shall be as given in the same standards.

**INSTALLATION:** All conduit and fittings shall be solvent cemented in applications in accordance with instructions from the manufacturer.

In installing the conduit, particular care must be taken in cutting it to the proper length so that the ends will fit exactly into the outlet boxes. Where conduits terminate in cabinets they shall be neatly arranged and all ends shall be at the same level. The ends of all conduits shall be carefully plugged with a bushette so as to avoid the entrance of foreign materials or moisture and kept so until the telephone service feeder is installed. The ends of the conduit in boxes and similar apparatus and devices shall be furnished with end bushings to avoid the damage during pulling the cable

Underground: The PVC pipe shall be installed underground minimum twenty-four (24") inches below grade on six (6") inches layer of sand bed. All necessary couplings, elbows, bends T fittings

or any other fitting and hardware required shall be installed. The pipes shall not be installed without proper soil bearing. The pipes joints shall be slip-in type with cementing material as described in previous paragraph. All conduits must slope away from building to prevent water from entering the building.

Warning tape: shall be installed six inches below finished grade minimum to cover full width throughout the length of the trench. The warning tape shall be Model "Terra Tape Extra Stretch" as manufactured by Reef Industries, or approved equal.

Drag Line: All empty pipes/conduits shall be installed with a three-eighths (3/8") inch nylon drag rope.

**MEASUREMENT & PAYMENT:** The quantity of **TELEPHONE CONDUIT** to be paid for under this item shall be the number of **LINEAR FEET** (laying length) of conduit installed measured in final position, furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of telephone conduit furnished and installed and shall include the cost of all labor, materials, equipment and incidental expenses necessary including hardware, fittings, drag line and warning tape to complete the work, all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation and sand bed for pipe installation shall be paid separately under the items "Unclassified Excavation" .

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>

**END OF SECTION**

**SECTION PK-ESCR 676 – PULLBOXES WITH FRAME AND COVER 24" L X 18" W X 26" D,  
TYPE 2418 (2-R)**

**SECTION PK-ESCR 677 – PULLBOXES WITH FRAME AND COVER 36" L X 24" W X 26" D,  
TYPE 3624 (5-R)**

**SECTION PK-ESCR 678 – PULLBOXES WITH FRAME AND COVER 48" L X 24" W X 26" D,  
TYPE 4824 (6-R)**

**GENERAL:** Under this item the contractor shall furnish and install concrete boxes, cast iron frame and cast iron cover with all required accessories in compliance with Contract Drawings and Specifications.

The concrete boxes shall be made of pre-cast reinforced concrete. The box shall include cast iron frame and cover.

The contractor shall refer to Contract Drawings & NYC DOT Division of Street Lighting for construction details. All work shall be done in compliance with the standard details and specifications given on the above drawing.

The item title dimensions shown are clear inner dimensions of the concrete box. Overall dimension shall be larger for walls and bottom thickness of the box. All non-current carrying metal components within the box shall be bonded to ground as shown on the drawings in compliance with National Electrical Code. All ground bonding connections shall be included under this item.

These concrete boxes shall be furnished with required knockouts for conduit entrances. All unused knockouts shall be sealed with waterproofing concrete mixture.

**Excavation:** The excavation and backfill for this item is not included in this item. Contractor shall under this item, cut, dig or drill trenches or pits to install manholes.

**Construction**

- 1] **Construction:** Precast concrete similar to property line box except as detailed on the drawings. Floors to be free of pockets to slope ¼" per foot to drain points. Refer to Contract Drawings for additional Details.
- 2] **Drains:** Cast iron, slotted or perforated, hinged cover, 9" dia., 4" outlet, with a short length of outlet pipe terminating in a drywell below the floor.
- 3] **Frame & Cover:** Cast iron, with sizes indicated on Drawings, heavy duty roadway type. Cast iron of uniform quality free from blowholes, hard spots, shrinkage distortion or other defects. Cast iron shall be well cleaned by shot blasting and coated with asphalt paint resulting in a smooth, tough and tenacious coating; conform to ASTM spec. for gray iron.

Manufacture castings true to pattern, of non-rocking design or shall have bearing surfaces machined to prevent rocking and rattling.

- 4] **Covers:** Indented solid top design, with two drop handles; cast integral letters at least 2" high reading " N.Y.C. Parks Electrical" on upper side.
- 5] **Accessories:** Provide embedded inserts in pullbox walls for cable racks. Provide pulling-irons in walls opposite each duct bank entrance and in floor opposite pullbox opening.

Pulling-in irons shall be securely fastened to reinforcing bars. Provide racks at 3' centers on pullbox perimeter, to be clear or present and future conduit entries. Provide racks and a set of porcelain insulators for per set of cables for each entering conduit.

- 6] **Grounding:** Wherever continuous ground wire from system grounding is not available for bonding, providing a 3/4" driven ground rod, at least 10' long or as required to reach ground water. Extend top 6" above pullbox floor. Connect all non-current carrying metal parts in the pullbox to the ground rod with a #6 AWG bare copper conductor.
- 7] **Installation:** Set pullbox to approximate grade using a minimum of a 24" deep brick throat. Add or remove bricks as required to achieve final cover elevation.
- 8] **Cable Racks:** Provide fiberglass cable racks in all pullboxes larger than 18" width or 36" length (interior) for supporting cables.

**MEASUREMENT & PAYMENT** For furnishing and installation of this item Pull boxes with all accessories described in the specifications, the contractor shall furnish unit bid price.

The bid price shall be a unit price for each Pull Box installed with cover and frame and shall include the cost of all labor, materials and equipment necessary to complete the work in accordance with the specifications, and to the satisfaction of the Engineer.

The payment shall be made for actual number of Pull Boxes installed.

**END OF SECTION**

## SECTION PK-ESCR 679 – ELECTRICAL MANHOLES

**GENERAL:** Under this item the contractor shall furnish and install concrete manholes, cast iron frame and cast iron cover with all required accessories in compliance with park standard details.

The concrete boxes shall be made of pre-cast reinforced concrete. The box shall include cast iron frame and cover.

The contractor shall refer to Con-Edison standard for M11-6 manhole for construction details. All work shall be done in compliance with the standard details and specifications given on the above drawing.

The item title dimensions shown are clear inner dimensions of the concrete box. Overall dimension shall be larger for walls and bottom thickness of the box. All non-current carrying metal components within the box shall be bonded to ground as shown on the drawings in compliance with National Electrical Code. All ground bonding connections shall be included under this item.

These concrete boxes shall be furnished with required knockouts for conduit entrances. All unused knockouts shall be sealed with waterproofing concrete mixture.

**Excavation:** The excavation and backfill for this item is not included in this item. Contractor shall under this item, cut, dig or drill trenches or pits to install manholes. Contractor shall also ensure that spaces around manholes are restored to **original** or better condition.

### **Construction**

- 1] **Construction:** Precast concrete or field constructed as detailed on the drawings. Floors to be free of pockets to slope ¼" per foot to drain points. Refer to Parks Standard Details Sheet #65 for additional Details.
- 2] **Drains:** Cast iron, slotted or perforated, hinged cover, 9" dia., 4" outlet, with a short length of outlet pipe terminating in a drywell below the floor.
- 3] **Frame & Cover:** Cast iron, with sizes indicated on Drawings, heavy duty roadway type. Cast iron of uniform quality free from blowholes, hard spots, shrinkage distortion or other defects. Cast iron shall be well cleaned by shot blasting and coated with asphalt paint resulting in a smooth, tough and tenacious coating; conform to ASTM spec. for gray iron.

Manufacture castings true to pattern, of non-rocking design or shall have bearing surfaces machined to prevent rocking and rattling.

Units shall meet AASHTO H20 wheel loading requirements. Manufacture, workmanship and certified proof-load tests shall conform to ASASHTO M306-89.

A. Cast iron: ASTM A48, Class 30B or 35B.

B. Frames:

Round, 6-1/2 inches high.

Minimum bearing area of the flange on the masonry: 645 sq. inches.

Minimum weight: 156 lbs.

C. Covers:

Round, approximately 1-1/2 inches thick at the perimeter bearing surface.

Minimum one inch wide perimeter bearing surface.

Perforated checkered surface design.

Concealed type pick holes.

Minimum weight: 215 lbs.

- 4] **Covers:** Indented solid top design, with two drop handles; cast integral letters at least 2" high reading " N.Y.C. Parks Electrical" on upper side.
- 5] **Accessories:** Provide embedded inserts in manholes walls for cable racks. Provide pulling-in irons in walls opposite each duct bank entrance and in floor opposite pullbox opening. Pulling-in irons shall be securely fastened to reinforcing bars. Provide racks at 3' centers on pullbox perimeter, to be clear or present and future conduit entries. Provide racks and a set of porcelain insulators for per set of cables for each entering conduit.
- 6] **Grounding:** Wherever continuous ground wire from system grounding is not available for bonding, providing a 3/4" driven copperclad ground rod, at least 10' long or as required to reach ground water. Extend top 6" above manhole floor. Connect all non-current carrying metal parts in the pullbox to the ground rod with a #6 AWG bare copper conductor with exothermic welds.

Manholes Containing Feeder Circuits Over 600 Volts:

- A. Install rod electrode in each manhole near a wall. Install rod electrode thru floor into earth below manhole with 4 inches protruding for ground connection.
  - B. Bond manhole cover frame, steel cable support assemblies and splices (cable shields for non-lead type cables) to rod electrode with No. 6 AWG bare copper ground conductor.
  - C. Make connection to rod electrode with exothermic type weld or compression connectors.
- 7] **Installation:** Set manhole to approximate grade using a minimum of a 24" deep brick throat. Add or remove bricks as required to achieve final cover elevation.
  - 8] **Cable Racks:** Provide fiberglass cable racks in all pullboxes for supporting cables. Cable Support Assemblies (Steel): A.B. Chance Co.'s 1225 rack, 1231 Series support arms, 1121 porcelain insulators, or McGraw-Edison's DU10B Series rack, DU9S Series support arms, DE12U porcelain insulators.

Cable Support Assemblies (Nonmetallic): Underground Devices Inc.'s CR36 rack, RA Series support arms.

- A. Depth: Install manholes at depth required to bring top of manhole covers 2 inches above finished grade in lawns, and flush with paved surfaces of walks, roads, or parking spaces.
- B. Bricked-Up Throat: Mortar brick into place. Set manhole frame with mortar. Waterproof exterior of throat with minimum thickness of 3/32 inch elastic bituminous plastic cement coating.

- C. Cable Supports: Install racks, support arms and insulators of size and number to provide one insulator (or equivalent space on nonmetallic support arms) on each cable support assembly for each conduit entering the manhole:

**MEASUREMENT & PAYMENT** For furnishing and installation of this item "MANHOLE" with all accessories described in the specifications, the contractor shall furnish unit bid price.

The bid price shall be a unit price for each manhole installed with cover and frame grounding, cable supports, etc. and shall include the cost of all labor, materials and equipment necessary to complete the work in accordance with the specifications, and to the satisfaction of the Engineer and Utility.

The payment shall be made for actual number of manholes installed.

The price shall not include the cost of excavating. This cost shall be paid under separate item "Unclassified Excavation".

**SECTION PK-ESCR 666 #10 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 667 #8 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 668 #4 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 680 – #12 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 681 – #6 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 682 – #2 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 683 – #1/0 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 684 – #4/0 AWG COPPER, 600V WIRE**  
**SECTION PK-ESCR 685 – 500 KCMIL COPPER, 600V WIRE**  
**SECTION PK-ESCR 686 #2/0 AWG COPPER, 600V WIRE**

**GENERAL:** Under this item the contractor shall furnish and install new wire and cable as specified on drawings.

The work shall include but not limited to furnishing and installation of cable in conduit and boxes including cleaning of the conduits, splices, terminations and final connection on line and load sides of Electrical existing installations and newly supplied under this contract and supplied by others.

All work shall be done in compliance with National Electrical Code and NYC Electric Code.

- 1] All wiring shall be in conduit as shown on drawing and protected from mechanical injury by metal coverings. All electrical parts shall be approved by the National Board of Fire Underwriters and the Bureau of Electrical Control and shall comply with the National Electric Code. The cable shall be U.L. Listed for exterior application Type USE-2 with EPR insulation.
- 2] Wire & cable up to 600v shall be copper and have current carrying capacity not less than indicated and shall conform to the standards of the Underwriter's Laboratories, Inc. Conductor sizes shall be as indicated on the drawings. 75C insulation shall be used for all size of wire, unless otherwise noted on plans and in accordance with the requirements of N.Y.C. Dept. of Buildings, Bureau of Electrical Control.
- 3] Factory color coding for cable shall be as follows: 120/208 volts black, red, blue, and white; white conductors shall serve as neutral conductors.
- 4] Unless otherwise particularly approved, no wires shall be pulled in until the conduit system is completed. No grease or oil shall be used to facilitate the pulling of the wires; only approved pulling compound shall be used. All wire shall be continuous between pull boxes & lamp posts.
- 5] Joints that become necessary in circuit work at the outlets shall be made with approved pressure connectors. All joints shall be covered with an insulation equal to that on the conductors. Approved pressure connectors, Ideal Wingnuts, Scotch-lock, Buchanan, Thomas and Betts or as accepted, shall be used in lieu of solder and tape. The cost of splices shall be a part of this item.
- 6] All existing conduits are to be cleaned prior to cable installation.
- 7] New conduit to be used for installation of cable shall be properly cleared from one end to the other with mandrel approximately 85% diameter of the conduit size.

### **SPLICING:**

- 1] Splices in the run are not permitted.
- 2] Splicing shall conform to the National Electrical Code in accordance with the requirements of the Department of Buildings, Bureau of Electrical Control, "Specification for Single Conductor Wire and Cable".
- 3] Maintain splices and joints in accessible enclosures, where easy inspection is available.
- 4] Join, tap and terminate stranded 120/208 volt conductors #6 AWG and larger by means of long barrel copper butt splice crimp sleeves with oil stops, approved taps and two hole compression lugs. Exclude connectors and lugs of the types which apply set screws directly to conductors. Apply pressure indent type connectors, taps and lugs utilizing tools manufactured specifically for the purpose and having features preventing their release until the final pressure has been exerted on the lug or connector. Heat shrink sleeve over entire splice. 3M or equal scotch coat over entire shrink sleeve. Wrap one half lapped layer of electrical tape over entire splice. Burndy, T & B, MAC products or approved equal.

Except where wire nuts are used, build up insulation over conductor joints to a value, equal both in thickness and dielectric strength, to that of the factory applied conductor insulation. Insulation of conductor taps and joints shall be by means of half-lapped layers of rubber tape, with an outer layer of friction tape, by means of half-lapped layers of approved plastic electric insulating tape, or (in the case of bolted type connector joints) by means of split insulating casings molded specifically to insulate the particular connector & conductor, and fastened with stainless steel or non-metallic snaps or clips.

**Protection:** The Contractor shall protect and be responsible for the Contractor's materials, tools, work and equipment until completion thereof and until the acceptance of same by the Engineer.

### **CABLE SAMPLES:**

- 1] The Engineer shall take samples of each size of cable not less than ten feet in length for tests. These samples will be taken by the Engineer in the field and the Engineer may select same from any reel at random.
- 2] The Engineer may order any reel delivered to a City approved laboratory for test. Transportation of such reel to and from the laboratory and all costs of testing shall be at the expense of the Contractor.

**CABLE TAGS:** Furnish and install approved tags with the wire identification permanently marked thereon so that all wires may be traced from box to box, where splices occur, install a tag on the wire on all sides of every splice. Tag shall equal to Panduit PLM marker ties.

**TESTING AFTER INSTALLATION:** The cable shall be tested after installation but before final connections for the continuity and insulating. The insulation resistance must comply with the NETA recommended testing requirements.

**MEASUREMENT & PAYMENT:** The quantity of wires to be paid for under each of the items shall be the number of linear feet of wire installed in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be a unit price per linear foot, including splices, furnished and installed and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including testing, all in accordance with the plans and specifications to the satisfaction of the Engineer.

**END OF SECTION**

**SECTION PK-ESCR 688 – STAINLESS STEEL ENCLOSURE FOR GAS METER**

**PK-ESCR 688.1**     **WORK:** Under these Items, the Contractor shall furnish and erect **STAINLESS STEEL ENCLOSURE FOR GAS METER** of the type and sizes shown on the plans, in accordance with the plans, specifications, and directions of the Engineer.

**PK-ESCR 688.2**     **MATERIALS:**

**STAINLESS STEEL ENCLOSURE** shall be constructed of stainless steel 304 angles, plates and mesh of the sizes shown on the plans. All material shall conform to Specification AISI 304.

**FABRICATION – STAINLESS STEEL ENCLOSURE:** Enclosure shall be fabricated in strict accordance with the plans and approved Shop Drawings. Posts and rails shall be formed into panels of the shapes on the plans and joints completely welded with welds of proper size and shape; all welds ground smooth to a neat finish. Connections shall be provided as indicated on the plans.

Posts and pickets shall, in all cases, be truly vertical. Rails and bars shall be parallel to grade as shown on the plans.

**DOOR and DOOR FRAME:** shall be constructed of stainless steel 304 angles and mesh of the size shown on the plans.

**HINGES:** shall be w210-10, Heavy Duty Stainless Steel Hinge, 7.87 L x 0.91 DIA., as manufactured by Sierra Pacific, Long Beach, CA; Stanley Hardware, New Britain, CT; Shanon Gates and Railings, Deer Park, NY, or approved equal.

**PADLOCK:** The Contractor shall furnish one padlock for each enclosure. The padlocks shall be American No. 5571 as manufactured by American Lock Co., Crete, IL., or approved equal. All padlocks for the same park facility shall be keyed alike, with two inch (2") wide by three-quarter inch (3/4") thick brass body, maximum security, five (5) pin tumblers with hardened alloy steel chrome plated shackle no less than three-eighth inch (3/8") diameter and two inch (2") clearance (elongated shackle). A galvanized steel chain, nine inches (9") long shall be fastened to the door and body of the lock. The chain shall be five-sixteenths inch (5/16") by one and three-eighths inch (1-3/8"). The Contractor shall furnish two (2) keys for each padlock.

**PK-ESCR 688.3**     **INSTALLATION:** The enclosures shall be erected as shown on the contract drawings.

Any steel enclosure not set plumb and true to line and grade shall be removed and replaced at the Contractor's expense. The Contractor shall maintain the enclosure during the life of the contract and shall repair replace all members that are disturbed, damaged, or destroyed.

**PK-ESCR 688.4**     **SUBMITTALS:** Shop Drawings: shall be submitted prior to manufacture.

**PK-ESCR 688.5**     **MEASUREMENT AND PAYMENT:**

The quantity of **STAINLESS STEEL ENCLOSURE** to be paid for shall be the number of **EACH ENCLOSURE** furnished and erected complete, in accordance with the plans, specifications, and directions of the Engineer.

<b>PK-ESCR 688</b>	<b>STAINLESS STEEL ENCLOSURE FOR GAS METER</b>	<b>EA</b>

**END OF SECTION**

PARKS-374

## SECTION PK-ESCR 690 – CONDUIT INTERIOR SEALING FITTING

**GENERAL:** Under this item the contractor shall furnish and install new Conduit Interior Seal Fitting specified on drawings in compliance with National Electrical Code and NYC Electric Code.

The item shall include the labor material and equipment for installation of Conduit Seal with all required accessories such as Cables, Screws, Fittings, Frames/Seals, Lubricant etc. All the work shall be done in compliance with code requirement. All associated material for complete installation of Conduit Interior Seal shall be included under each item.

### **GENERAL SPECIFICATIONS:**

1. All Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
2. All construction must conform to all applicable codes.
3. Comply with NFPA 70.
4. Comply with NECA 1 and NECA 413.
5. An onsite evaluation is required to determine conduit and wiring requirements before Conduit Seal Installation.
6. Any change to the Installation detail must be approved by The Engineer.
7. Conduit Interior Seal must be watertight and dust tight manufactured by Roxtec Inc.
8. Contractor to provide Shop Drawings, Catalog Sheets, Installation Instructions and etc.
9. All Conduit Interior Sealing work is specified in drawings and specification but not limited to it.

### **MATERIALS:**

All work material should be according manufacturer is specified in drawings and specification.

#### **ROXTEC Frames:**

1. RG M or approved equal

#### **ROXTEC Seals:**

1. H3 UG Seal or approved equal

#### **ROXTEC Modules:**

1. RM Modules or approved Equal

#### **Sealing Components:**

Contract shall use ROXTEC lubricant to provide a correct compression and a secure seal.

1. ROXTEC Natural Grease Lubricant 25ML ALT0000003000.
2. ROXTEC Assembly Gel 30ML ALT0000004000.

#### **Fittings:**

1. EN 1.4404 Fitting
2. ROXYLON Rubber
3. MC6S M6x70 AD Screws

### **INSTALLATION:**

1. Contractor shall coordinate with manufacturer for On Site installation orientation and post installation inspection for safe on-site installation.

2. Install systems in accordance with UL systems, and manufacturer's specifications.
3. Thoroughly clean surfaces and spaces to receive materials, removing foreign matter such as dirt, dust, moisture, rust, laitance, mill scale, oil, paint, lacquer, form coatings, water repellents and protective coatings.
4. Do not use cleaning solvents which leave residue. Do any solutions for cleaning unless which in not recommended by the sealant manufacturer.
5. Follow manufacturer's directions for specific products and surfaces.
6. Remove the knock-out of the sleeve before inserting the seal.
7. The seal must always be installed in the correct end of the knockout sleeve.
8. Use the flange as template for the drilling of the bolt holes.
9. Attached the frame to the structure using suitable sealing method and suitable stainless fasteners.
10. Weld the ROXTEC seal to the wall according to the ROXTEC welding guidelines.
11. Make all cables go straight, not angled through the seal.
12. Warm up the installation lubricant to soften it when installing in the cold areas.
13. Only One Cable is permitted through each module.

**TESTING:**

1. Check for Mechanical Damage
2. Check that only one cable passes through each module.
3. Check that there is no center core missing.
4. Check the bolts are tightened similarly.
5. Verify the frame is push all they way to the sleeve.
6. Make sure the cable goes straight through the frame.
7. Verify the correct utilization of the entire packing space.
8. Make sure the front fittings are positioned.
9. Check the compression
10. Check that there no visible gap between cable/pipe and modules.

**MEASUREMENT & PAYMENT:** Conduit Interior Sealing Fittings shall be payed and installed in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be Each, furnished and installed and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including testing, all in accordance with the plans and specifications to the satisfaction of the Engineer.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR-690	CONDUIT INTERIOR SEALING FITTING	EA

**END OF SECTION**  
PARKS-376

## SECTION PK-ESCR 701 – SAFETY SURFACING

**WORK:** Under these items, the Contractor shall furnish and install SAFETY SURFACING of various types in accordance with the plans, specifications and directions of the Engineer.

Note: The safety surfacing shall be installed as soon as possible after the play equipment installation is complete. The Contractor shall be responsible for temporarily barricading the Play Equipment prior to completion of the safety surfacing installation.

**INTENT:** In general, mats shall be utilized according to ASTM F1292 (latest issue) drop height criteria as follows: tot unit play areas shall be surfaced with mats which meet or exceed 5 foot drop height criteria; ten foot high play swing areas shall be surfaced with mats which meet or exceed 10 foot drop height criteria; all other areas shall be surfaced with mats which meet or exceed 8 foot drop height criteria.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications.

**Molded Rubber Mats:** Safety surfacing shall be a waffle type compression molded rubber mat with an abrasion resistant surfacing and ribs underneath which will provide an air entrained cushion. Each material shall be of a thickness necessary to meet or exceed the standards and testing requirements as stated in this specification. Color shall be as shown on the drawings. All colors (other than red) shall be paid as colored. Color speckles on black background shall be paid as red. Color speckles on color background shall be paid as colored. Marbleized color design shall be paid as colored.

Compression molded synthetic rubber mats shall consist of a minimum one-quarter (1/4") inch thick abrasion resistant top membrane with a cushion-course rib system underneath. Material shall not have more than one-sixteenth (1/16") inch surface distortion and shall be of uniform specified color and appearance.

Safety surfacing must be one of the following products, subject to conformance with all testing criteria:

- "EZ Fall" as manufactured by Mitchell Rubber Products Inc., Mira Loma, CA
- "SpectraLock" as manufactured by Play Safe Surfaces LTD, Syosset, NY
- "M2" as manufactured by Mitchell Safety Surface, Pomona, CA
- "SaferZone Tiles" as manufactured by Sutcliffe Play Limited, Upton, West Yorkshire, England
- Or approved equal

Premolded synthetic polyurethane safety surfacing consisting of rubber crumbs bound together with a polyurethane binder and/or poured in place safety surfacing are not acceptable under this specification.

**Adhesives:** Any variation from pre-approved adhesives must be submitted as per "Submittals". The following adhesives have been pre-approved for specific applications:

"Epoxygrout" 2 Part Epoxy as manufactured by U.S. Epoxy, Patchogue, NY, or approved equal, for plastic or rubber anchor to asphalt applications.

Lord® Cyanoacrylate Adhesive as manufactured by Lord Chemical Products Corp., Cary, NC, or approved equal, for rubber to rubber applications. Cyanoacrylate adhesive is commonly known as “Superglue”, or “Crazy Glue”.

**STANDARDS:** All safety surface material shall meet the latest suggested guidelines published in the "Handbook for Public Playground Safety" by The U.S. Consumer Product Safety Commission (C.P.S.C.), and The American Society for Testing and Materials (ASTM) as outlined below.

**TESTS:** Safety surfacing must meet the following test requirements and criteria:

1. Critical Fall Height Laboratory test - When tested in accordance with ASTM F1292 (latest issue) Test Method F355, Procedure C (Metal Headform), the surface shall not impart to the headform upon impact, a peak deceleration exceeding 200 times the acceleration due to gravity (200G's) and shall not exceed 1000 Head Injury Criteria (HIC). Test submittals must clearly state that test was performed in a laboratory, over the seam and anchoring system, and on the body of the tile. The drop height(s) used in this test shall be the height(s) as noted on the contract drawings.

2. Weathering (Aging) - After being subject to fifty (50) freeze-thaw cycles in accordance with ASTM C67, “Freezing and Thawing”, and after being subject to 200°F for 7 days in accordance with ASTM D573, "Rubber Deterioration in an Air Oven", the same sample shall be re-tested in compliance with ASTM F1292 at 72°F only. A peak deceleration reading not exceeding 200G's shall be maintained. HIC testing is not required for re-testing.

3. Slip Resistance - When using the "British Portable Skid Resistance Tester" in accordance with ASTM E303, the wet-dynamic reading shall not be less than 40.

4. Flammability - When tested in accordance with ASTM E648, "Standard Test Method for Critical Radiant Flux of Floor Covering Systems Using a Radiant Heat Energy Source", the material shall have a minimum critical radiant flux of 0.22 Watts/cm<sup>2</sup>

**INSTALLATION:** Installation of all types shall be in accordance with CPSC guidelines and manufacturers installation instructions approved by the Engineer. The safety surfacing should not create new hazards; hence, all installations shall be done as carefully as possible in a neat and professional manner.

All safety surfacing shall either be recessed with the top flush with surrounding finish grade, or have a beveled perimeter transition piece along its entire open perimeter to allow for a smooth, easy transition between the surrounding finish grade and the level of the safety surfacing. Safety surfacing in swing areas shall be installed with full thickness to the fence or curb except in the entryway, which shall have a beveled edge.

Molded rubber mat installation must be by mechanical means of each individual tile. Adhesives to hold small, cut pieces of mat to pavement surface are unacceptable. Adhesives are only to be used with anchoring devices, transition piece, or caps as described in “Adhesives”. Shop drawing shall clearly show that every piece is connected by mechanical means. The installation shall be vandal resistant and be firmly secured so that it cannot be pulled up from the playground surface.

Mats shall have either: a) all center tiles secured individually to the playground surface with vandal-resistant anchors, or b) mechanically locked together to prevent separation or removal of blocks from play area. The perimeter transition pieces shall be secured to the pavement with vandal-resistant anchors or approved adhesives.

Any anchoring system used shall not create "hard" spots within the surfacing which fails to meet test requirement No. 1 and ASTM F1292. All plugs shall be installed flush with or slightly recessed (1/8" maximum) below the rest of the surfacing; plugs shall not protrude above the surrounding surfacing. All mats shall be installed so that they will be hand tight in hot weather. Necessary adjustments shall be made for installation in cool weather.

**SPECIAL CONDITIONS:** Where surfacing may cover a drain opening, the surfacing shall be drilled or slotted in a pattern matching the basin openings to allow for drainage. Where surfacing covers a basin or manhole, the Contractor shall drill six (6) one-quarter (1/4") inch holes at an angle of 45° providing a vent for the basin or manhole. Surfacing shall be formed around tree pits and not cover granite block, provided that such elements are outside the fall zone.

**ADDITIONAL TESTING:** The City reserves the right to make any additional tests it feels necessary, and the Contractor shall furnish material when needed for testing.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture and in accordance with the requirements of the S-Pages.

**Material:** For approval and prior to installation, the Contractor shall submit two samples of each drop height specified of the safety surface material no larger than one foot by one foot (1' x 1') in size representing color, composition and thickness proposed to be used, the drop height used, and the supporting certified test data showing that the material meets or exceeds the test requirements of this specification. Per ASTM F1292 paragraph 4.3.4, the laboratory test used to determine critical fall height of materials shall have been conducted no more than five years prior to the date of installation of the playground surface. In addition, all anchoring / attachment components and product literature for necessary adhesives which vary from preapproved adhesives shall be submitted for approval.

**Shop Drawings:** A Shop drawing of the proposed safety surfacing layout shall be drawn in 1/4" = 1'-0" scale (unless otherwise specified by the project manager) and shall clearly show the following details: actual size of mats or modular tiles; size of transition pieces; size of cut pieces, if any; location of all mechanical anchors, rods, or clips; type of adhesive to be used; and exact location of all play equipment, posts, springs or other support systems. As-built deviations from the proposed safety surfacing layout made during installation shall be approved in the field by the Engineer in writing on the shop drawing.

**Installer Certification.** Installer must be trained and certified by the manufacturer. Installer's certification on manufacturer's letterhead shall be submitted to the Engineer.

**Insurance Certificate:** The Contractor shall furnish a Manufacturer's Certificate of Product Liability Insurance for a minimum of one (1) million dollars naming "The City of New York" as Additional Insured. Insurance shall be for eighteen months, starting at Substantial Completion.

**Warranty Against Shrinkage:** The Contractor shall furnish a standard one year manufacturer's warranty, enhanced as follows: For eighteen months, starting from the date of Substantial Completion, the Manufacturer agrees to reinstall or replace material which shrinks, creating a gap between mats of more than one-half (1/2") inch. Measurement shall be performed at ambient temperature of 72 °F + 5 °F.

**Manufacturer's Recommended Installation Instructions and Maintenance and Repair Instructions.** Installation, maintenance and repair of all types of safety surfacing, including adhesives, graffiti

removal, etc. shall be per manufacturer's instructions. Instructions shall be submitted and subject to approval by the Engineer.

**MEASUREMENT AND PAYMENT:** The quantity of **SAFETY SURFACING** of various types to be paid for under this item shall be the number of **SQUARE FEET** furnished and installed in accordance with the plans, specifications, and directions of the Engineer. No deduction shall be made for cut surfacing removed for cross section of posts.

The price bid shall be the unit price per **SQUARE FOOT** of each type and shall include the cost of all labor, materials and incidentals necessary to complete the work, in accordance with the plans and specifications to the satisfaction of the Engineer.

Upon submission and approval of the required shop drawings, the Contractor shall receive two (2%) percent of the total bid price. Partial payment for stored materials may be granted in accordance with the NYCDOT Standard Highway Specifications, **Section 1.06.35**.

**END OF SECTION**

## SECTION PK-ESCR 703 – ADULT FITNESS EQUIPMENT

**WORK:** Under this item, the Contractor shall furnish and install all **ADULT FITNESS EQUIPMENT** in accordance with the plans, specifications and directions of the Engineer. In addition, the Contractor shall furnish incidental materials to the Engineer, as specified under the heading INCIDENTAL MATERIALS.

**MATERIALS:** Unless otherwise specified herein, all materials shall conform to applicable portions of the NYCDOT Standard Highway Specifications.

The Adult Fitness Equipment shall be as shown on the contract drawings and shall be various pieces, either moving or stationary types, as manufactured by Landscape Structures Inc., Delano, MN, Gametime Inc., Ft. Payne, AL, Kompan Inc., Pflugerville, TX, or approved equal. All Adult Fitness Equipment shall meet ASTM F3101 – Latest Revision “Standard Specification for Unsupervised Public Outdoor Fitness Equipment” and the Consumer Product Safety Improvement Act (CPSIA) of 2008.

**Footings:** Footings shall be Concrete as described in Section ESCR-4.06 as per the dimensions shown on the contract plans.

### Steel Members:

**Posts:** Posts, railings and vertical members shall be Structural Steel tubing as specified below. Tubing for posts shall have a minimum thickness of 0.120".

**Rails and Fixtures:** Railings and fixtures shall be structural tubing of such thickness that the railings shall not sag or bend during use. Any tubing that bends, sags or does not meet ASTM F3101-Latest revision, shall be replaced and upgraded by the manufacturer at no additional cost to the City.

**Tubular Steel:** Tubular steel shall be structural tubing of the sizes and shapes shown in the approved shop drawings. Steel shall meet the specifications for ASTM A500, Grade B which has a minimum tensile strength of 58,000 psi (for round and shaped) and a minimum yield point of 42,000 psi for round structural tubing and a minimum yield point of 46,000 psi for shaped structural tubing. Material shall be load-tested under ASTM F3101-Latest Rev., after fabrication.

**Caps:** All exposed ends of steel members shall be plugged with metal or injection molded polyamide – nylon caps. Metal caps shall be riveted in place with spot welding or self-sealing rivets. Polyamide – nylon caps shall be set onto posts and secured with steel fasteners. Steel fasteners shall be in accordance with this specification.

**Instructional Signage:** Instructional signage shall be constructed of 11 gauge aluminum, 6 mm thick polycarbonate sheets, or other approved material. Instructional signage shall be installed on each station or unit and shall show, at a minimum, proper exercise technique, correct body position and the muscle groups targeted and shall be as shown on the approved shop drawings.

**Seats, Benches, Arm Pads, Foot Pads, Pedals and Handgrips:** Seats, benches, arm pads, foot pads, pedals and handgrips shall be rotationally molded from color-compounded, first quality, linear lowdensity or high-density polyethylene or manufactured from flexible polyvinylchloride (PVC) vinyl compounds. Dry blended or molded-in resins are not acceptable for polyethylene. Polyethylene shall be ultraviolet stabilized to UV-8 and have anti-static additives. Seats, bench coverings, and arm pads may also be manufactured from nylon polyamide or polyurethane

materials. All plastic materials shall have a minimum tensile strength of 2,500 psi per ASTM D638. Wall thickness shall vary by component and as shown on the approved shop drawings. Color shall be as shown on the contract plans.

Fittings and Clamps: All fittings and clamps shall be as indicated on the approved shop drawings and as may be required to complete the installation. All fittings shall be of the best quality malleable iron, drop-forged steel or steel plate as indicated. Clamp fittings shall be cast aluminum or 12 gauge drawn quality or better steel and finished to match vertical components and shall be smoothly constructed with no projections or sharp edges. All clamps shall have tamper resistant fasteners. Clamps used on components subjected to vertical loads shall be pinned to prevent slipping and twisting.

Fasteners: All fasteners including, but not limited to, bolts, lag screws, tie rods, threaded rods, nuts and washers, shall be of the sizes indicated on the approved shop drawings. Fasteners shall be either stainless steel per ASTM F879 or carbon steel treated with a corrosion resistant coating per applicable ASTM plating specifications. All threaded fasteners shall include a locking patch type material that will meet the minimum torque requirements of Industrial Fastener's Institute (IFI)-125 "Test Procedure for the Locking Ability Performance of Chemical Coated Lock Screws". The fitness equipment manufacturer shall provide special tools for pinned tamperproof fasteners. All protruding bolts, screws, and other threaded connectors shall be cut off to within two threads of nut, washer, etc., then satisfactorily peened to prevent removal by unscrewing, and filed completely smooth to remove all sharp edges.

Resistance Mechanism: Resistance mechanisms, where installed, such as pistons, rubberized components, gearboxes or other such components designed to incorporate resistance-training shall be fully enclosed. Exposed resistance mechanisms on fitness equipment will be rejected.

Post Coverings: If required by the manufacturer, post coverings for fitness equipment posts shall be UV stabilized, wear resistant, maintenance free EPDM rubber. Post coverings dimensions including thickness shall be as shown on the approved shop drawings.

**STEEL FABRICATION:** All steel components to be welded shall be welded in complete accordance with the standards of the American Welding Society. All welds shall be continuous around the entire perimeter. All welds shall be ground smooth. NO TACK WELDING AND NO FIELD WELDING SHALL BE PERMITTED.

All steel components shall be either powder coated or hot-dipped galvanized and shall meet the following requirements:

Corrosion Resistant Treatment: All fabrication and welding shall be completed prior to application of the corrosion resistant coating, metal pieces shall be cleaned of all weld spatter, mill scale, varnish, rust, grease, and the like and the surface mechanically or chemically prepared to receive the coating.

Galvanizing: Hot dipped galvanization of steel shall be in accordance with ASTM A123/A123M – Latest Revision - "Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products".

Polyester Powder Coating: Prior to powdercoating a corrosion resistant coating of thermal spray zinc coating or electrostatic applied primer shall be applied with a minimum thickness of 3 mils. All metal pieces, including welds, shall receive the coating. A surface coat shall be applied to the

thermal zinc or iron phosphate coated metal pieces in such a manner that the coating will not peel off. The manufacturer shall perform all processes required to achieve a smooth material bond. The surface coat shall be an electrostatically sprayed, lead-free, TGIC (triglycidyl isocyanurate) polyester powder coating applied to a minimum of 5 mil thickness which shall be oven cured at temperatures between 400 and 450 degrees Fahrenheit for a period of 20 minutes. The TGIC polyester powder coating shall be similar to Secural by Spraylat, Tiger Drylac Series 49 as manufactured by Tiger Drylac U.S.A., Reading, PA, Clear Polyester TGIC ENVIROCRON Powder Coat, as manufactured by PPG Industries, College Station, TX, or approved equal and shall comply with ASTM standards as follows:

<u>PHYSICAL PROPERTIES</u>	<u>TEST METHODS</u>	<u>ACCEPTANCE CRITERIA</u>
Adhesion cross hatching	D3359B	5B (0% area removed)
Flexibility conical mandrel	D522	Pass 3/8" mandrel
Pencil hardness	D3363	Pencil hardness 2H minimum
Impact resistance	D2794	80 inch pounds minimum
Overbake resistance- Adhesion	D2454	5B
Overbake resistance- Hardness	D2454	Pencil hardness 2H minimum
Overbake resistance- Direct Impact	D2454	140 inch pounds minimum
Humidity resistance-250 hours	D4585	No visible change to surface
Weatherability	D822	No visible change to surface
Salt Spray Resistance	B117	1000 hours
Corrosion Resistance	D1654	Rating 6 or greater
UV Exposure	G154, 340 bulb	2000 hours rating delta E of 2 90 percent gloss reduction

Colors of powder coating shall be as shown on the contract plans. (Submittals required, see Submittals). Material manufacturer's directions for storage and use shall be adhered to. Material surfaces shall be protected during shipment so as to arrive mar and scratch free in the field.

**INSTALLATION:** Asphalt pavement shall be neatly saw-cut prior to excavation for footings. All tubular steel posts shall be set square and plumb in concrete footings as shown on the approved shop drawings to grade required, assuring level installation. Footings shall have the top surface finished so as to provide sheet drainage away from steel uprights, level and free from surface fluctuations that could contribute to an uneven surface in overlaying safety surfacing.

Equipment shall be assembled to configuration as shown on the approved shop drawings. All fastenings shall be made as shown on the drawings and shall be securely tightened with an impact and/or torque wrench (as per manufacturer's specification). The Contractor shall take precautions while trimming bolt projections to prevent metallic contamination (rust bloom) of the corrosion resistant bolts to the satisfaction of the Engineer. These precautions include the use of previously unused grinding wheels, and applying zinc rich paint on trimmed galvanized bolts. All work shall be done so that no hazardous projections or rust bloom shall be left in the finished work. All work shall be done by skilled mechanics in a professional manner.

**FIELD INSPECTION:** An authorized manufacturer's representative, who is not the qualified installer, shall inspect and approve the installation of the fitness equipment prior to acceptance by the Engineer. The authorized manufacturer's representative shall certify that the fitness equipment was correctly installed in accordance with the manufacturer's written instructions, that all fastenings are securely installed meeting the manufacturer's maximum torque value, and meeting all requirements set for in ASTM F3101 – Latest Revision. A Document of Acceptance shall be provided by the authorized manufacturer's representative stating that a field inspection was conducted and the installation is accepted by the authorized manufacturer's representative (See Submittals).

**MATERIALS:** The Contractor shall furnish (furnish only, not install) and deliver, to the Engineer, incidental materials obtained from the approved adult fitness equipment manufacturer. Contractor shall also furnish to Engineer any catalogs, invoices, statements, etc. for verification that a complete set of all maintenance and operations manuals, tools, etc. have been furnished. All furnished material shall be properly identified with the name of park and contract number. Incidental materials shall be the following:

1 (One) - Tools And Hardware Maintenance Repair Kit, complete with tool box, special tools for tamper proof fasteners, fastener wrench and hardware (nuts, bolts screws etc.), to be provided by manufacturer. The repair Kit shall be clearly marked with the Contract Number and the Park name. Marking shall be done with permanent magic marker or other method approved by the Engineer.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages. The Contractor shall submit the following for review and approval prior to manufacture:

Shop Drawings: The Contractor shall submit shop drawings indicating as a minimum: the fitness equipment layout, elevations, footings layouts and dimensions, training envelope and clearance, fall height, materials, finishes, supports, hardware, fittings, moving and resistance components, post coverings, torque schedule, accessories, custom components and compliance with ADA requirements including access details. Where safety surfacing is required, the shop drawings shall show the distance in linear feet from outside edge of the safety surfacing to a minimum of three (3) closest adjacent fixed outside structures such as curbs, fences, benches or trees.

Deviations From Layout: Any deviations from the contract drawings must be submitted for review and approval by the Engineer.

Color Samples: Color samples shall be submitted for approval before any powder coating is done.

Document of Acceptance: An authorized representative of the fitness equipment manufacturer must inspect and approve the completed installation. The adult fitness equipment will not be accepted by the manufacturer or the Engineer until they are satisfied with the installation. No additional compensation will be given for any necessary corrective work. A document of acceptance signed by the authorized Manufacturers' representative must be submitted to the Engineer before the final 20% payment is made to the Contractor for this item.

Guarantee: The manufacturer shall guarantee replacement of any items or components found to be defective during the manufacturers' guarantee period. The engineer shall submit the original guarantee certificate to the Capital Liaison in the Maintenance Division at the completion of the project. The Contractor shall furnish the original and 4 (four) copies of the manufacturers' guarantee.

One (1) - Installation and Maintenance Manual, complete, as provided by manufacturer.

**MEASUREMENT AND PAYMENT:** For furnishing and installing all **ADULT FITNESS EQUIPMENT** in accordance with the approved shop drawings, specifications and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

The price bid shall be a **LUMP SUM** for all **ADULT FITNESS EQUIPMENT and ADULT FITNESS EQUIPMENT, CHALLENGE COURSE** and shall include the cost of all labor, materials, equipment and incidentals necessary to complete the work, including unclassified and/or Hand/Pneumatic excavation, concrete footings, instructional signage, saw-cutting and all submittals in accordance with the contract plans, approved shop drawings and specifications, to the satisfaction of the Engineer.

In addition, the Contractor must deliver **INCIDENTAL MATERIALS** as outlined above to the Engineer. No additional payment shall be made for incidental materials. Contractor shall include cost in the bid price.

Safety surfacing, if required, shall be paid for under its own contract item.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>

<b>PK-ESCR 703 B</b>	<b>ADULT FITNESS EQUIPMENT, CHALLENGE COURSE</b>	<b>L.S.</b>

**END OF SECTION**

## SECTION PK-ESCR 705 – SWINGS 7, 8, 10 FOOT HIGH

**WORK:** Under these Items, the Contractor shall furnish and install **SWINGS 7'-0" or 8'-0" HIGH**, and **PLAY SWINGS-10'-0" HIGH** and, in accordance with the plans and specifications where shown on the plans, or as directed by the Engineer.

Each play swing unit 10'-0" High consists of a swing frame and two (2) flat seats. Each eight foot (8'-0") High and seven (7'-0") foot high swing unit consist of a swing frame and two (2) swing seats. The seat combinations shall be two (2) tot bucket seats, two (2) strap seats, or one (1) inclusive seat and one (1) tot bucket seat.

**STANDARDS:** All swings shall meet or exceed the latest requirements as published in the Handbook for Public Playground Safety - Volumes I and II by the National Bureau of Standards for the U.S. Consumer Product Safety Commission and the ASTM F-1487-latest rev. "Standard Consumer Safety Performance Specification for Playground Equipment for Public Use". Swing design and construction shall also comply with the Guide to ADA Accessibility Guidelines for Play Areas, Final Rule. See Parks Standard Details: Play Swing 10'-0" High, Swing 8'-0" High, Swing 7'-0" High.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall conform to the requirements of the NYCDOT Standard Highway Specifications. Swings shall be as manufactured by All City Play Equipment Inc., Metuchen, NJ; Shannon Gates and Railings, Deer Park NY; or approved equal.

Concrete Footings: Shall be 3,200-psi minimum compressive strength class B-32 per the NYCDOT Standard Highway Specifications, Section ESCR-4.06.

Powder Coated Pipe and Fittings: Pipe shall be Schedule 40, steel pipe conforming to the requirements of ASTM A-53 and shall be of the same sizes and dimensions indicated on the plans. Pipe shall be hot dipped galvanized in accordance with ASTM F1083 and powder coated with TGIC-Polyester. Galvanizing of pipes and fittings shall provide an acceptable substrate so that applied powder coatings will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. No lacquer, urethane or other coatings which would prevent proper adhesion of powder coating shall be applied to the pipe or fittings. All coated parts shall first receive phosphating and chromating treatments to improve the adhesion of the surface coating.

The TGIC-Polyester shall be applied to pipe and fittings at a film thickness of 3 to 6 mils by electrostatic spray process and bake finished per manufacturer's directions. The TGIC-Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point. Color to be black unless otherwise indicated on the plans.

Laboratory Test For TGIC-Polyester Powder Coat: At the discretion of the Engineer, a sample TGIC-Polyester powder coated pipe and/or fitting shall be laboratory tested for bonding of the powder coating to the surface. Test shall be the CrossHatch test per ASTM D3359, method B. Failure to satisfactorily pass this test shall be a basis for rejection.

Fittings, Swing Clamps and Hangers: Shall be of cast ductile iron as shown on the standard details, and shall be galvanized by the hot-dip process after fabrication. Ductile iron tensile strength shall meet a minimum of 65,000 psi, in accordance with ASTM specification A536-84

Class 65-45-12. Galvanizing shall withstand a minimum of five (5) one-minute dips by the Preece Test. Fittings and swing clamps shall be powder coated to match frame.

Bronze Bushings: Shall be frictionless oil-bearing bronze oilite flange bushing, 1/2" bore, as manufactured by Isostatic Industries, Chicago, IL, Catalogue No. FB812-4, or approved equal.

Swing Clamps and Hangers: Shall be ductile iron, as manufactured by All City Play Equipment, Metuchen, NJ, Shannon Gates and Railings, Deer Park, NY or approved equal.

Fastenings: All pipe rails and standards shall be let into fittings from four and a half (4 ½") to five inches (5") as shown on the plans by step head on inside of fitting, and shall be pinned through with steel pins of sizes shown on the plans with ends countersunk riveted. Holes in fittings shall be drilled and countersunk in the shop before galvanizing. Pins shall be galvanized or stainless steel. Holes in the steel pin supports shall be drilled to the exact size as shown on the plans. No hole burning of steel will be permitted. All fastenings shall be coated with high locking adhesive, provided by the manufacturer, immediately prior to tightening. The locking adhesive shall be Loctite® 271 manufactured by Henkel Corporation, Westlake, OH, or approved equal.

The horizontal pipe for each swing shall be in one piece extending through center fitting, and for kindergarten swings shall be long enough to extend through end fittings and shall be provided with cast frive pattern end plugs as shown on the plans.

All rivets and bolts shall be galvanized by the hot-dip process as specified above for fittings. Bolts and nuts shall be galvanized after threading.

Chain Shackle: Shackle shall be a three-eighths (3/8") inch dia. D- shackle, fabricated from type 316 forged stainless steel. The shackle shall have a minimum working load limit of 1,200 pounds. Pin for shackle shall be a flush non-snag screw pin with a tamper resistant, hex drive, flat head shoulder bolt. Shackle shall be as manufactured by Suncor, Pembroke, MA, Item No. S0115NS10; or approved equal. The pin shall be installed with shim washers and tightened with an Allen wrench. The shim washers shall be installed on both sides of the chain's end link to center link on pin. The Contractor shall coat the threads with a high locking adhesive immediately prior to closing of the shackle. The locking adhesive shall be Loctite® 271 manufactured by Henkel Corporation, Westlake, OH, or approved equal.

Chain: Chain for all types of swings shall be one-quarter inch (1/4") carbon steel chain, hot galvanized after fabrication, exception is accessible seat. Chain shall be made of welded links, proof tested for a working load limit of 2,600 pounds in accordance with ASTM Designation A413, Class Grade 43-High-test chain. Chain shall be Campbell, System 4, High Test Chain grade 40 as manufactured by Campbell Corp., York, PA, or approved equal. At specific intervals, links shall be embossed with a "C4" quality grade mark, or equal marking.

S-Hook: S-Hook for all applications shown on the drawing shall be three-eighths inch (3/8") wire size carbon steel, hot galvanized after fabrication. S-Hook shall be Campbell No. 120 catalogue 610-1234, as manufactured by Campbell Corp., York, PA, or approved equal. S-Hook shall be closed to 1 mm (.04 inches) or less as shown on the standard detail.

Full Bucket Tot Seats: Shall be molded, U.V. resistant, full-bucket rubber tot seats encapsulating a reinforcing metal plate. Seat shall be Model No. S100 as manufactured by Jensen Swing Products, Inc., Santee, CA, or approved equal. The yokes for Bucket tot Swing Seats shall be furnished by the seat manufacturer. Seat shall have a rubber sticker that advises users of the

maximum weight limitation of the seat firmly attached to the front and rear of the seat. Color of seat to be black, warning label shall have white letters with a black background.

**A NOTE REGARDING BUCKET SEATS: Although the drawings show the full bucket rubber tot seat for 8' High Swing described herein, the intent of this item is to install the "dog resistant" type of this seat (described below) where a "dog problem" has been identified at the site. The existence or non-existence of a "dog problem" shall be determined by the Engineer, in consultation with NYCDPR M&O.**

Dog Resistant Bucket Tot Swing Seat: Dog Resistant Bucket tot Swing Seat shall be S175NYC Rotational Molded Infant Seat as manufactured by Jensen Swing Products, Santee, CA, or NYCS75 as manufactured by Superior International Industries, Carrollton, GA, or approved equal. The Dog Resistant Bucket Swing Seat shall be seat shall be rotationally molded with linear low-density polyethylene in fade resistant black. Each swing seat shall include (2) two stainless steel integral yokes and associated hardware. The Dog Resistant Bucket tot Swing Seat yokes shall be bolted to the seat with a maximum of two threads projecting below the eyebolt nuts.

Strap Seat for 8' High Frame: Shall be approximately twenty-four (24") inches long by six inches (6") wide by five-sixteenths (5/16") inch thick with stainless steel hangers. Seat shall be a U.V. resistant, EPDM, strap rubber seat reinforced with Kevlar insert, or approved equal. Strap seats with steel insert will not be accepted as an equal. The swing seat shall be capable of supporting a center load of at least eight hundred- (800) lbs. without showing a permanent deflection and no visible fracture or cracking. Strap seat shall be Kevlar Insert Strap Seat No. S 140, as manufactured by Jensen Swing Products, Santee, CA, or approved equal. Color to be black.

Note: Installing strap and bucket seats in the same unit (bay) is prohibited.

Inclusive Seat with Chain: Shall be Zero-G Chair #8554 for ages 2 to 5 years as manufactured by Gametime, Ft. Payne, AL, or Molded Bucket Seat (2-5), with Harness (Model No. 218671) manufactured by Landscape Structures, Delano, MN, approved equal. The accessible seat shall be rotationally molded with linear low-density polyethylene conforming to the specifications herein. The accessible seat shall incorporate a "Roller Coaster" style Brace and Latch to secure the user in place. The Brace and Latch shall be rotationally molded with linear low-density polyethylene conforming to the specifications herein. The accessible seat shall include a stainless steel chain, fabricated from standard 7/32" diameter stainless steel wire chain appropriate to hang from a seven or eight foot high swing frame.

Steel Yoke for Flat Seats: Steel Yoke for Flat Play Swing Seats shall be one-half inch (½") diameter. Yoke shall be cold drawn, hot-dipped galvanized steel formed to dimensions as shown on DPR Standard Details for Swings. Yokes are available for purchase from All City Play Equipment, Metuchen, NJ, or approved equal. Yoke for play swing seat shall be securely fastened to seat with vandal resistant heavy weight zinc plated elastic locknuts; yoke for full-bucket or strap seat shall be integrally fastened at each end of seat with a bracket and three steel rivets.

Flat Play Swing Seats: Shall be approximately twenty inches (20") long by nine and one-half inches (9 ½") wide. Seats shall be molded, shock absorbing, U. V. resistant, flat rubber seats reinforced with an aluminum plate. The swing seat shall be capable of supporting a center load of at least one thousand (1,000) lbs. without showing a permanent deflection and no visible fracture or cracking. Play swing seat shall be one of the following:

Model No. SRE 185 as manufactured by Sutcliffe Play Ltd., Yorkshire, England or

Model No. 289-80797, Flat Swing Seat as manufactured by Landscape Structures, Inc., Delano, MN, or approved equal. Color of seat to be black.

**Holes in Play Swing seats must accept std. One-half (1/2") inch dia. metal yokes.**

**INSTALLATION:** The swing supports shall be erected on concrete for park structures footings prepared to receive them as shown on the plans and Parks Standard Details. Concrete footing shall be finished so that the surface is plane and level and safety surfacing will not buckle.

**TOUCH-UP & REPAIR:** For minor damaged caused by installation or transportation, clean damaged area, then;

1. On damaged galvanized surfaces, apply organic zinc repair paint complying with ASTM A780, then repair powder coating per number 2 below. Galvanizing repair paint shall have 65 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of 6 (six) feet.

**Dog Resistant Bucket Tot Swing Seat:** The Dog Resistant Bucket Tot Swing Seat yokes shall be bolted to the seat with a maximum of two threads projecting below the eyebolt nuts.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture and in accordance with the requirements of the S-Pages.

**SHOP DRAWINGS:** Where required, the Contractor shall submit shop drawings for approval in accordance with the S-Pages.

**FOUNDRY CERTIFICATES:** A foundry certificate verifying authenticity of the cast ductile iron supplied on this Contract shall be submitted. Certificate shall be on foundry letterhead, dated and signed by an officer of the company with Contract name and #, Contractor Name & Class of Ductile provided. A metallurgical analysis certifying that the material is cast iron performed by an independent, accredited, laboratory may be accepted in lieu of the Foundry Certificate.

**PROOF TEST CERTIFICATE:** Manufacturers Certificates: Certificates are required for the shackle assembly and the chain to substantiate evidence of working load limit. Where a metallurgical analysis is submitted in lieu of the Foundry Certificate, the Contractor shall also submit the working load limit certificate from an independent, accredited laboratory for the swing clamps. Submit to the Engineer.

**MEASUREMENT AND PAYMENT:** For **EACH** Swing 7'-0" or 8'-0" high consisting of a frame and two swing seats, furnished and installed in accordance with the plans and specifications and directions of the Engineer, the Contractor shall receive the unit price bid.

For **EACH** Play Swing 10'-0' high, consisting of a frame and two swing seats, furnished and installed complete in accordance with the plans and specifications and directions of the Engineer, the Contractor shall receive the unit price bid.

The prices bid shall be a unit price for **EACH** 7'-0" or 8'-0" or 10'-0" high Swing unit and shall include the cost of all labor, materials, unclassified excavation, concrete footings, Seats (flat, strap, full bucket, or inclusive seat) including yokes, equipment, powder coating, locking adhesive for all fastenings, and incidental expenses necessary to furnish and install swings in accordance with the plans, and specifications to the satisfaction of the Engineer.

Hand and/or Pneumatic Excavation or Rock Excavation, if required, shall be paid for separately under their respective contract items.

**END OF SECTION**

## SECTION PK-ESCR 711 – CHAIN LINK FENCE

**WORK:** Under these Items, the Contractor shall furnish and erect powder coated chain link fences and powder coated chain link fence gates of the heights and sizes shown on the drawings, in accordance with the plans and specifications and directions of the Engineer.

**INTENT:** It is the intent of these items to effectively enclose the areas shown on the plans, and when new fences terminate at existing or new structures or fences within the areas or adjacent to the areas, the clear spaces between the fences and structures shall not exceed three and one half (3 1/2") inches. Closures, if necessary, shall be made by the Contractor in a manner approved by the Engineer. Payment for such closures will be made per linear foot or a fraction thereof, at the unit prices bid for the fences.

**MATERIAL:** All fittings, hardware and equipment shall be designed to carry one hundred percent (100%) overload.

Malleable iron castings shall be powder coated after hot dipped galvanizing in accordance with ASTM Serial Designation: A153.

Pressed steel fittings and appurtenances shall be powder coated after hot dipped galvanizing in accordance with ASTM Serial Designation: A123.

All fittings, hardware and equipment shall be powder coated of a color to match the framework and shall be of the materials listed in the following schedule:

### **FENCE/GATE PART**

### **MATERIAL**

Boulevards, Corner (Split)  
Fittings and End Fittings  
Post Caps and Post Line Tops  
Couplings

Malleable Iron or Pressed Steel-3/16" thick

Gate Hinges

Malleable Iron or Pressed Steel - 3/16" thick  
Galv. Steel Pipe - 1/8" thick with 1/4" Dia.  
Full Depth Rivet

Bolts and Nuts

Malleable Iron or Pressed Steel-1/4" thick  
with 1" Dia. Stainless Steel Pin Welded to  
1/2" thick Pin Support  
Galv. Steel or Stainless Steel as indicated  
on Plans

Tension Bars

1/4" x 3/4" Galv. Steel for 2" and 1-3/4"  
Mesh, 3/16" x 3/8" Galv. Flat Steel for 1"  
Mesh

Tension Bands  
Truss Rods  
Truss Tightener  
Truss Clamp  
Locking Device

1/8" x 1" Pressed Steel  
1/2" Dia. Galv. Steel  
3/8" x 1" Galv. Steel  
1/4" Pressed Steel

Gate Stop

Powdercoated steel, dimensions as shown  
on the Standard Detail.

Drive Pins and Set Screws

7/16" thick malleable iron  
Stainless Steel, 18-8

**POSTS AND RAILS:** TYPE I - Posts and rails shall be standard weight galvanized steel pipe of the sizes shown on the plans and shall conform to ASTM Serial Designation F-1083 Schedule 40, except for chain link fence posts 20'-0" height, which shall be Schedule 80. Posts and rails shall be hot dip galvanized inside and outside in accordance with ASTM Serial Designation F-1083 or: For fence up to and including ten (10) feet height, posts and rails may be TYPE II, SS-

40 steel tubing as manufactured by Allied Tube and Conduit Corp. of Harvey, Illinois, or approved equal. Tubing must conform to ASTM A1011/A1011M, cold rolled steel pipe and coated with a minimum of 0.9 ounces of zinc per square foot, a minimum of 15 micrograms of zinc chromate per square inch. Steel pipe supplied under this option shall be of the same outside diameter as Schedule 40 pipe and achieve minimum yield strength of 50,000 p.s.i.

**SURFACE COATINGS:** All posts, rails and fittings shall be powder coated with either polyvinyl chloride (PVC) or TGIC-Polyester (with the exception of the turnbuckles and threaded ends of the truss rods, both of which shall be sprayed with powder coat touch-up after installation).

Galvanizing of all components shall provide an acceptable substrate for applied powder coatings. No lacquer, urethane or other coatings which would prevent proper adhesion of powder coating shall be applied to the pipe. The powder coating shall be applied to the galvanized surfaces in such a manner that the coating will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. All galvanized parts, prior to powdercoating, shall first receive phosphating and chromatizing treatments to improve the adhesion of the surface coating. Color to be black unless otherwise indicated on the plans.

The entire fence installation shall be coated with one of the two following types of powder coating, (with the exception of gates, all of which shall be TGIC-Polyester and fabric which shall always be PVC). All Fence components shall be coated on all surfaces, of a color to match the framework. All coated surfaces shall comply with the adhesion specifications listed in ASTM F1043.

**TYPE A - Polyvinyl Chloride Powder Coating:** PVC Powder coating shall be applied to the galvanized steel or iron by the fluid bed method to a preheated base which has been cleaned and primed prior to submersion in vinyl, resulting in a firm bond between the PVC and the metal. PVC shall be applied to a film thickness of 10 to 15 mils on framework and fittings, and 7 to 12 mils on fabric without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

**TYPE B - TGIC-Polyester Powder Coating:** TGIC-Polyester Powder shall be applied to the galvanized steel or iron in such a manner that the coating will not peel off. The TGIC-Polyester shall be applied at a film thickness of 3 to 6 mils by electrostatic spray process and bake finished per manufacturer's directions. The TGIC-Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

### **TESTS:**

**Field Test for PVC Powder Coating:** As per ASTM F668, three sample sections of the PVC powder coated fence shall be tested for bonding of the powder coat to the metal. Each test will consist of making two cuts parallel to the axis of the pipe or fitting, through the coating, appx. 1/16 inch (1.6 mm) apart, at least 1/2 inch (12.7 mm) long. With a knife peel back a section of the coating between 1/8 inch (3.2 mm) and 1/4 inch (6.4 mm) long to produce a tab. Attempt to remove the 1/16 inch strip of coating by pulling the tab. The fence shall be deemed acceptable if the coating breaks rather than separates from the metal on all three (3) samples.

**Laboratory Test for TGIC-Polyester Powder Coat:** At the discretion of the Engineer, a sample of the TGIC-Polyester powder coated fence shall be laboratory tested for bonding of the powder coating to the metal. Test shall be the Cross Hatch test per ASTM D3359, Method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**TOUCH-UP AND REPAIR:** For minor damage caused by installation, transportation, field welding and cutting of metal powder coated surfaces: clean welds, bolted connections, abraded or sawcut areas, then:

1. On welded and cut surfaces, apply organic zinc repair paint complying with ASTM A780, then repair powder coating per number 2 below. Galvanizing repair paint shall have 65 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of six feet (6').

**FABRIC:** Fabric shall be hot dip galvanized steel wire mesh as per ASTM A641, with a thermally fused polyvinyl chloride powder coating of 7 to 12 mils thick as per ASTM F668 class 2b. Color to match framework. Fabric shall be produced by methods recognized as good commercial practices. Core wire tensile strength shall be 75,000 psi (517 MPa).

Wire used for the manufacture of fabric shall meet the requirements of ASTM F668 and shall be capable of being woven into fabric without the PVC coating cracking or peeling. PVC coating shall be a dense, impervious covering free of voids. Excessive roughness, bubbles, blisters, bruises and flaking will be a basis for rejection. PVC shall be thermally fused. Bonded or extruded and glued surface coating will not be permitted. Fabric shall be stretched to provide a smooth, taut, uniform appearance free from sag.

**Field Test:** PVC coating on fabric shall be field tested for adherence to the metal as outlined elsewhere in this specification.

**Thickness of Fabric: One (1) Inch Mesh:** Uncoated wire dimension shall be 0.120 inches in diameter (11 gauge). Zinc coating shall be 0.30 ounces per square foot of wire surface.

**One and Three Quarter (1-3/4) Inch and Two (2) Inch Mesh:** Uncoated wire dimension shall be 0.148 inches in diameter (9 gauge). Zinc coating shall be .3 ounces per square foot of wire surface.

**Selvages:** Fabric shall be barbed at the top and knuckled at the bottom on fences over 6'-0" high. Fabric on fences 4'-0" and 6'-0" shall be knuckled top and bottom. Loops of knuckled fabric shall be closed or nearly closed. The wire ends of barbed selvages shall be twisted in a closed helix of 1- matching turns and cut at an acute angle. The length of the ends beyond the twist shall be at least 1/4 inch long. One (1) inch mesh shall be knuckled both top and bottom.

**TIES:** Tie-wire core thickness shall be 9 gauge (0.148") wrought aluminum alloy 1100-H16 wire with an extruded vinyl coating in accordance with ASTM A641 Class 3. PVC shall be applied to a film thickness of 20 to 22 mils. Ties shall be spaced fifteen (15) inches apart on rails and twelve (12) inches apart on posts. The ends of ties shall be wound in a telegraph twist two and one half turns. Color to match mesh. Contractor shall touch-up PVC coating on ties damaged as result of installation.

**GATES:** Gates shall be furnished and installed on reinforced concrete slabs where indicated on the plans or directed by the Engineer. All gates shall be galvanized steel and shall be TGIC Polyester powder coated after fabrication per requirements for fence framework outlined elsewhere in this specification. Welded joints shall have a suitable rust preventive coating applied to the welds prior to powder coating. Gate fabric shall match line fabric adjacent to gate opening. Gates shall be installed plumb, level and secure for full opening without interference. The hinges shall be so designed to permit the gate to swing a full 180 degrees.

**Gate Locking Device:** Gate locking device shall be fabricated in accordance with the Standard Details and shall be the "Strong Arm Latch" for single gates and the "Commercial Double Gate Latch" for double gates, both manufactured by DAC Industries, Grand Rapids, MI or approved equal. Latch shall be bolted and welded to the gate/fence frame in accordance with the standard detail. In addition to the locking mechanism there shall be a steel drop bolt arranged to engage the gate stop. The drop bolt shall have a flange that meets a fixed locking eyelet, welded on the gate, to lock the gate in the open and closed position. All necessary fittings and gate holders to lock gates in both open and closed positions shall be furnished. The gate locking device shall be installed to face the fenced in area, unless otherwise directed by the Engineer. All welds shall be ground smooth to a neat finish and shall conform to the requirements of the NYCDOT Standard Highway Specifications. All field welds shall be touched-up as specified under the heading "Touch-up and Repair."

**Padlock:** The Contractor shall furnish one (1) padlock for each single gate and for each leaf of the double gates. The padlocks shall be American No. 5571 as manufactured by American Lock Co. of Crete, Illinois, or approved equal. All padlocks for the same park facility shall be keyed alike, with two (2) inch width by three-quarter (3/4) inch thick brass body, maximum security, five (5) pin tumblers with hardened alloy steel chrome plated shackle no less than three-eighths (3/8) inch diameter and two (2) inch clearance (elongated shackle). The Contractor shall furnish two (2) keys for each padlock.

**REINFORCED CONCRETE SLAB:** At gates shall be as shown on the standard details and as specified under "Reinforced Concrete Pavement".

**Concrete:** Concrete shall be 3,200 psi class B-32 per the NYCDOT Standard Highway Specifications Section ESCR-4.06.

**ERECTION:** The posts shall be set in holes which shall have been formed in the concrete curb as shown on the plans or directed by the Engineer. Voids for posts shall be formed in the concrete by removable waxed sonotubes or galvanized sheet metal sleeves to remain.

**Core drilling is not permitted.** After the posts have been set in place and properly supported to hold them in line and grade, the resulting space shall be neatly filled with a grout consisting of one (1) part cement and two (2) parts sand or approved equal. All gates and all end, corner and gateposts, regardless of height of fence shall have a 1/2" diameter truss rod and turnbuckle. Rod shall be tied to the mesh every 12 inches on center with tie-wires. Bolts on the turnbuckle shall be tack welded to prevent loosening. The only exception to the above is that truss rods are not required for end, corner and gateposts for fences 4'-0" ht. and under.

Chain link fabric shall be attached to line and corner posts and top, intermediate and bottom rails. Maintain a min. 1" (inch) clearance between finished grade and fence fabric. Posts shall be set plumb and true to line and grade. Any post not set true to line and grade shall be removed and replaced at the Contractor's expense. Bending posts to make them plumb will not be permitted.

The Contractor shall maintain the chain link fences and gates during the life of the contract and shall repair and replace all members that are disturbed, damaged, or destroyed from any cause at no cost to the City.

**Bolt and Hardware Installation:** Nuts and bolts shall be galvanized but not powder coated. Cans of TGIC-Polyester or PVC touch-up powder coating shall be used to paint the nuts and bolts per manufacturer's recommendations. The ends of all bolts shall be peened after tightening.

Bolts which are installed six feet (6') or less above grade shall not protrude more than 1/4" beyond the nut after tightening. All rough edges resulting from the cutting of bolts to achieve this requirement shall be filed smooth to the satisfaction of the Engineer. All post caps, corner and

end fittings, and gate hinges on all fence elevations are to be secured in place with #14 SS drive screws to the satisfaction of the Engineer.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Certification:** The Contractor shall submit, at the Contractor's own expense, a certification from the supplier for the following:

1. All castings are made from malleable iron.
2. All hot-dipped galvanized items have met the ASTM serial designations as indicated in this specification.
3. All powder coating meets the ASTM serial designations as indicated in these specifications.

**Shop Drawings:** Before the work in the shop is started, the Contractor shall submit shop drawings for approval. Include plans, elevations, for entire length including all radial panels, sections, details, attachments to existing and stepped conditions, connectors, anchoring and connecting hardware, fence height, post spacing, gate locking device, gate construction, dimensions and unit weights of framework, and lightning protection for all fences. Include schedule for fence uprights and fabrications methods. Indicate all field and shop welds. Detail custom conditions at non-90° angles.

**Samples:** Prior to erection of the fence the following shall be submitted: Fence framework: One piece of each pipe size, twelve (12") inches long. Fence Fabric: One piece twelve (12") inches square.

**Shipping Lists:** The shipping list for the materials furnished shall be certified by the manufacturer that the materials used comply with these specifications.

**MEASUREMENT AND PAYMENT:** The quantity of **CHAIN LINK FENCE** to be paid for shall be the number of **LINEAR FEET** of each height, furnished and erected complete in accordance with the plans, specifications and directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of **CHAIN LINK FENCE** of each height and shall include the cost of all labor, material, equipment and all incidental expenses necessary to complete the work, including powder coating and powder coating touch-up, required to furnish and erect chain link fence with PVC powder coated steel fabric, all in accordance with the plans and specifications, and as shown on standard Parks drawings here and therein, to the satisfaction of the Engineer.

The quantity of **GATES** for chain link fence with PVC powder coated fabric shall be the number of TGIC-Polyester powder coated gates for chain link fence with PVC powder coated steel fabric (including both leaves of two-leaf gates, gate posts, locking device with drop bolt, gate stop and chain link fence over the gates) furnished and erected complete in accordance with the plans, specifications, and directions of the Engineer.

The price bid for PVC powder coated gates shall be a unit price for **EACH GATE** for the height of fence specified and shall include the cost of all labor, material, equipment and all incidental expenses necessary to complete the work, including gate stop, padlocks, powder coating and powder coating touch-up required to furnish and erect gates with PVC powder coated steel fabric, and incidentals, all in accordance with the plans and specifications, and as shown on standard Parks drawings here and therein to the satisfaction of the Engineer.

The cost of excavation and concrete shall be paid for separately under their respective contract items. No deductions will be made for openings in fence except where gates occur. The cost for installing portals, as shown on the plans, shall be deemed included in the unit prices bid for these items.

END OF SECTION

**SECTION PK-ESCR 715 SC - ALLOWANCE FOR SECURITY CAMERA SYSTEM WORK AT EAST RIVER HOUSING PARKING LOT**

**ESCR 715 SC.1. DESCRIPTION.**

Under this item, the Contractor is required to perform the removal and installation of the security camera system due to the demolition of the existing security building and relocation of the parking lot entrance at the parking lot at East River Housing (ERH) as directed by the Engineer. The security camera system installation work will consist of:

- relocating existing and associated electrical wiring and security camera systems to a location as directed by the Engineer;
- replacement of associated electrical wiring and security camera systems to a location as directed by the Engineer
- installation of a new security camera system, as well as related mounting systems and / or free standing support systems as approved by the Engineer;
- All other unforeseen security camera system related work.

**PK-ESCR 715 SC.2. QUALITY ASSURANCE.**

The Contractor or subcontractor that will relocate and / or install the security camera systems shall have not less than ten (10) years of continuous experience in the installation operations required to install security camera systems or other related electrical work that may be required to complete the work.

**PK-ESCR 715 SC.3. MATERIALS.**

The Contractor must provide manufacturer documentation in order to verify new materials to be installed or constructed as directed and approved by the Engineer.

**PK-ESCR 715 SC.4. CONSTRUCTION DETAILS.**

Prior to performing any work within the ERH property, i.e. demolition as well as prior to performing any work under this Item, the Engineer will coordinate with the Contractor to define the scope of "security camera system work" required. The Contractor will then provide the Engineer an estimate to perform the agreed to work. The Engineer will then review and once approved, direct the Contractor to begin work.

If during the course of the work there is an unforeseen changed condition that was not documented in the scope of "security camera system work", the Contractor must stop work and notify the Engineer. All parties must agree to any changes to the original scope prior to restarting the additional security camera related work.

The Contractor is responsible to complete the "security camera system work" to the satisfaction of the Engineer.

**PK-ESCR 715 SC.5. MEASUREMENT.**

The unit price for the security camera system work shown in the Bid Schedule for this item must be included in the total bid price; however, actual payment to the Contractor will be based on the actual invoices submitted by the Contractor. The invoice must be based on the approved Contractor's estimate and satisfactorily completed with signoff from the Engineer.

**PK-ESCR 715 SC.6. BASIS OF PAYMENT.**

The "unit price" shown in the proposal for the security camera system work must be considered the price bid for this item. The unit price is not to be altered in any manner by the bidder. Should the amount shown be altered, the new figures will be disregarded and the original price will be used to determine the total amount bid for the contract. The sum of the unit prices is included in the bid solely to ensure that sufficient monies will be available to pay the Contractor for this work. No guarantee is given that the total amount shall be fully or partly used.

The "unit price" payment made under this item must be equal to the sum of all invoices of approved estimates per the scope submitted by the Contractor for this item, as approved by the Engineer.

The unit price must cover the cost of all labor, materials, equipment, insurance, and incidentals necessary to complete the work as per the Engineer's approved scope of "Security Camera System", and in accordance with the new design if applicable, the contract drawings, the specifications and the directions of the Engineer. Pavement restoration will be paid for separately under the appropriate items.

Payment will be made under:

Item No.	Item	Pay Unit
PK-ESCR 715 SC	ALLOWANCE FOR SECURITY CAMERA SYSTEM WORK AT EAST RIVER HOUSING	F. S.

**END OF SECTION**

**\_SECTION PK-ESCR 717 – SHREDDED BARK MULCH**

**WORK:** Under this Item, the Contractor shall furnish and place SHREDDED BARK MULCH in accordance with the plans, specifications, and directions of the Engineer.

**MATERIAL:** Shredded Bark Mulch shall be a natural forest product composed of shredded bark or wood not exceeding three inches (3”) in length and one inch (1”) in width. Mulch shall be derived from tree material, not from wood waste or by-products like sawdust, shredded pallets, or other debris. Mulch shall be natural in color and not dyed. It shall be of a uniform grade with no additives or any other treatment. Mulch with leaves, twigs, and/or debris shall not be acceptable. The pH factor should range from 5.8 to 6.2.

**Commercial Fertilizer Low Phosphorus (Slow Release):** shall have the following composition by weight: Nitrogen (N) shall be min. 7% - max. 10%, of which min. of 50% is slow-release; available Phosphorus (P) shall be min. 1% - max. 2%; and soluble Potash (K) shall be min. 4% - max. 12%.

Fertilizer shall be a pesticide free (no weed-and-feed) product such as “Healthy Turf (8-1-9)” as manufactured by Plant Health Care, Inc, Pittsburgh, PA; or Safer Ringer Lawn Restore (10-2-6) as manufactured by Woodstream Corp., Lifitz, PA; or Nutrients Plus (7-2-12) as manufactured by Nutrients Plus, Virginia Beach VA, or approved equal.

All Commercial Fertilizer Low Phosphorous (Slow Release) shall be delivered in standard size bags of the manufacturer, showing weight, analysis, and name of manufacturer. It shall be stored as directed by the Engineer in such a manner that its effectiveness will not be impaired.

**METHOD:** Upon completion of planting and prior to application of shredded bark, Commercial Fertilizer Low Phosphorous (Slow Release) shall be incorporated into soil to a depth of three inches (3”) at the rate of twenty pounds per thousand square feet. ((20 lbs./1,000 s.f.)

Shredded bark mulch shall be applied to the surface of the beds and tree pit areas, as shown on the plans or Standard Details and as directed by the Engineer. Mulch shall be applied to a uniform depth of three to four inches (3”-4”) over the tree pit and shrub bed areas and two to three inches (2”-3”) over groundcover beds, and shall be so distributed as to create a smooth level cover over the exposed soil. Plants shall not be covered.

**MEASUREMENT AND PAYMENT:** The quantity of **SHREDDED BARK MULCH** to be paid for under this item shall be the number of **SQUARE YARDS** of mulch measured in final position, furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** and shall include the cost of all labor, materials, and equipment necessary or required to complete the work including furnishing and applying Commercial Fertilizer Low Phosphorous (Slow Release), mulch, and watering, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Landscape Fabric shall be paid for separately under its own item.

**END OF SECTION**

## SECTION PK-ESCR 727 – PERMEABLE CONCRETE PAVER AND STONE BASE

**WORK:** Under this Item, the Contractor shall furnish and install **PERMEABLE CONCRETE PAVERS ON STONE BASE** and **SUBBASE MATERIAL FOR PERMEABLE PAVEMENT** in accordance with the plans, specifications, and directions of the Engineer.

Under the item “Permeable Concrete Pavers On Stone Base”, the Contractor shall install permeable concrete pavers, the specified bedding course with joint filler, and the specified base course. Under the item “Subbase Material for Permeable Pavement”, the Contractor shall install the specified subbase material at locations shown on contract plans.

**MATERIALS:** Unless otherwise specified, the materials shall meet the requirements of the NYCDOT Standard Highway Specifications.

**Permeable Pavers:** Pavers shall be as shown on plans have interlocking spacer bars and be installed in the pattern as shown on the plans. Pavers shall be as shown on the plans and shall be manufactured from high quality, atmospherically cured precast concrete having a minimum compressive strength of 7,500 P.S.I. and a maximum water absorption of five (5%) percent. Pavers shall conform with ASTM C936. The face of pavers shall be at right angles with all sides, except where circular or other specialty pavers are specified. However, all pavers to be used on the work shall be of the same manufacture and thickness.

**Permeable Stone Base and Joint Filler:** Stone for permeable base and joint filler shall consist solely of crushed ledge rock and shall be broken stone or gravel as defined in the NYCDOT Standard Highway Specifications free draining, well graded, uniformly mixed washed stone aggregate. All stone shall be washed with less than 1% passing the No. 200 sieve. The total thickness of the foundation base shall be as shown on the drawings. Foundation base shall consist of three layers, a subbase course, a base course and a bedding course. Materials shall be in accordance with ASTM D448 and shall meet the gradations shown below:

### **Subbase Course ASTM D448 No. 2 (2 ½” – 3” Clean Stone)**

<b><u>Sieve Size</u></b>	<b><u>Percent Passing</u></b>
3”	100 %
2 ½”	90 – 100 %
2”	35 – 70 %
1 ½”	0 – 15%
¾”	0 – 5%

### **Base Course ASTM D448 No. 57 (¾” Clean Stone)**

<b><u>Sieve Size</u></b>	<b><u>Percent Passing</u></b>
1 ½”	100 %
1”	95 – 100 %
½”	25 – 60 %
No. 4	0 – 10%
No. 8	0 – 5%

**Bedding Course ASTM D448 No. 8 (1/4" – 3/8" Clean Stone)**

<u>Sieve Size</u>	<u>Percent Passing</u>
1/2"	100 %
3/8"	85 – 100 %
No. 4	10 – 30 %
No. 8	0 – 10%
No.16	0 – 5%

**Joint Filler ASTM D448 No. 9 (No.4 – No. 16 Clean Stone)**

<u>Sieve Size</u>	<u>Percent Passing</u>
3/8"	100 %
No. 4	85 – 100 %
No. 8	10 – 40%
No.16	0 – 10%
No. 50	0 – 5%

Expansion Joint: The expansion joint material shall be one of the following:

- A. premoulded bituminous fiber joint filler as specified in Section "B" (requires a bond breaker and sealant) or,
- B. premoulded closed cell expanded polyethylene foam joint filler such as MasterSeal 920 by BASF, Inc., Shakopee, MN (requires only sealant) or an approved equal.

Bond Breaker: If bituminous fiber material is used, a bond breaker such as one-half (1/2) inch width polyethylene tape or five-eighths (5/8) inch diameter expanded polyethylene foam backer rod shall be installed as recommended by manufacturer. A bond breaker will not be required for a premoulded foam joint, but sealant is always required.

Sealant: Prepared expansion joints shall be coated with a primer followed by installation of a bond breaker and a self-leveling two-component polyurethane-based elastomeric sealant. The Contractor shall apply Sikaflex 429 primer with Sikaflex - 2C, SL sealant, or BASF MasterSeal SL P 173 with MasterSeal SL 2 sealant, or approved equal. Color of sealant shall be concrete gray. Asphalt cement will not be approved as a sealant.

Sikaflex products are manufactured by Sika Corp., Lyndhurst, N.J. MasterSeal products are manufactured by BASF, Inc., Shakopee, MN.

Geotextile: Geotextile around the permeable foundation base shall conform to the standard specification for "Geotextile – Drainage".

**INSTALLATION:**

Preparation of Subgrade: Before any stone base is placed upon the fine grade, the fine grade shall be prepared to line and grade and compacted where practicable with an approved self-propelling roller weighing not less than ten (10) tons. All hollows and depressions which develop under rolling shall be filled with acceptable material and shall again be rolled. This process of shaping, filling, and rolling shall be repeated until no depressions develop.

The Contractor shall remove from the subgrade all debris, foreign material, and all other undesirable material designated by the Engineer. The fine grade shall not be muddy or otherwise

unsatisfactory when the foundation material is placed upon it. If the fine grade becomes rutted or displaced, due to any cause whatsoever, the Contractor shall regrade same without additional payment.

Geotextile: After the ground has been prepared, the fabric shall be rolled directly on the ground. All seams shall be overlapped approximately six (6") inches. No equipment, materials or machinery shall be placed on or be transported over exposed fabric. Stone base shall then be carefully placed to prevent dislocation of the fabric.

If the fabric is damaged during installation, the rupture shall be removed and the damaged area shall be covered with a patch of new fabric which will overlap the undamaged fabric approximately six (6") inches in all directions. All repaired fabric surface costs will be deemed part of the price bid.

Base Material for Permeable Pavement: Subbase and base course material shall be evenly spread on a prepared sub-grade in the position shown on the plans or directed by the Engineer, in four inch (4") lifts, each lift to be rolled while moist with a seven (7) to twelve (12) ton tandem roller (or other approved method satisfactory to the Engineer), to the thickness shown on the plans or as directed by the Engineer. The surface tolerance of the compacted base shall not deviate more than one (1") inch over a ten (10') feet straightedge.

Bedding Course: The spreading of the bedding course shall be accomplished using suitable equipment from piles dumped along the proposed site. The bedding course material shall be evenly spread over the compacted base so that the course will have, after rolling, the required thickness. No segregation of large or fine materials will be allowed, but the bedding course, as spread, shall be well graded with no pockets of fine material.

Concrete Pavers: Pavers shall be clean when placed. Pavers which are not satisfactorily clean shall be washed before placing. The pavers shall be placed according to the patterns shown on the plans, true to line and grade unless otherwise noted on the plans, joints shall be hand tight. The bedding course in front of the pavement shall not be disturbed or walked on during the laying of the pavers.

After the pavers are placed, the joint filler material shall be swept into the joints and pavers settled into the bedding course with a mechanical vibrator of adequate size. Additional joint filling material shall be added as necessary to fill the joints and the area re-compacted. All joints shall be completely filled and water sprayed to ensure compaction of the joint filler in the joints. After the joints are completely filled, the pavement shall be swept clean.

After a sufficient area of pavement has been laid, the pavement shall be tested with a ten foot straight edge and any depressions exceeding one-quarter inch (1/4") shall be corrected and brought to proper grade. Any pavers disturbed in making replacements or correcting depressions shall be settled into place by ramming.

Pattern: The paver pattern shall be subject to approval by the Engineer. Laying patterns and paver designs which are approved for the work are indicated on the contract plans. All edges, borders, and corners of paved areas shall be finished to true and neat lines. Special cutting, color patterns, various shapes, and variations in size and finish, are all to be included in the square yard bid price of this item.

**SUBMITTALS:** All submittals shall be in accordance with S-Pages.

Samples: The Contractor shall submit two (2) full samples for each color specified, of the pavers they propose to use for approval by the Engineer. All pavers used on the work shall conform to the approved samples.

Permeable Stone Base: One three-pound (3 lb.) bag for each layer of the permeable stone base shall be submitted for approval, with a sieve analysis and name of supplier attached. All samples shall be clearly labeled with Contract No. and name of supplier.

Mockups: Build mockups to set quality standard for fabrication and installation. The Contractor must provide a mockup of a 20'x20' area. Approved mockups may be incorporated into the final work, if approved by the Engineer.

**MEASUREMENT AND PAYMENT:** The quantity of **PERMEABLE CONCRETE PAVERS ON STONE BASE** to be paid for under this Item shall be the number of **SQUARE YARDS** of pavement constructed in accordance with the plans and specifications, as directed by the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of Permeable Concrete Pavers On Stone Base including bedding course, joint filler, and base course and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

The quantity of **SUBBASE MATERIAL FOR PERMEABLE PAVEMENT** to be paid for under this Item shall be the number of **CUBIC YARDS** of subbase constructed in accordance with the plans and specifications, as directed by the Engineer.

The price bid shall be a unit price per **CUBIC YARD** of Subbase Material For Permeable Pavement and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation and geotextile-drainage shall be paid for separately under its own contract item.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>

**END OF SECTION**

## SECTION PK-ESCR 730 – STEEL FLAGPOLE

**WORK:** Under this item, the Contractor shall furnish and erect a single **STEEL FLAGPOLE - 45 FOOT HIGH**, complete with fittings, including construction of foundation, granite base, halyard, and flags, in accordance with the plans, specifications, and directions of the Engineer.

**INTENT:** The intent of this item is to construct a complete flagpole fabricated by a single manufacturer. The completed flagpole shall be delivered to an approved factory for hot dip galvanizing and shop applied finish coatings in accordance with the Contract Plan, Specifications, and the approved Shop Drawings.

The Contractor shall coordinate the work and delivery of the flagpole between manufacturer and galvanizer and supply all parties involved with the relevant information required to construct, finish, and install the flagpole.

**MANUFACTURER:** The flagpole shall be similar in design and manufacture to that fabricated by Pole-Tech, Inc., East Setauket, N.Y., or approved equal. The galvanizing and finish coats for flagpole shall be similar to Duragalv, Primergalv, and Colorgalv, as manufactured by Duncan Galvanizing Corp., Everett, MA, or approved equal.

**MATERIALS:** Unless otherwise herein specified, all materials of construction shall comply with the requirements of the NYCDOT Standard Highway Specifications.

**Hardware:** Shall be stainless steel 18-8.

**Foundation:** Concrete for foundation shall be air-entrained, Controlled Concrete ( $f'c=4,000$  psi), with a minimum of seven (7) bags of cement per cubic yard of concrete. Controlled concrete shall meet all requirements set forth in Chapter 19 of the New York City Building code, as amended to date. Cement shall comply with the A.S.T.M. specifications for Portland Cement, Designation C150 and shall be Type IIA, moderate sulfate resistant.

**Grounding:** Grounding system shall consist of three (3) copper bonded ground rods, copper grounding cable (size #2/0), PVC through sleeve and grounding connectors. Grounding system shall comply with all national and local laws, ordinances and safety standards that apply to lightning protection. All components shall be similar to that manufactured by Heary Brothers Lightning Protection Co., Inc., Springville, N.Y., or approved equal.

**Steel Bar Reinforcement:** Reinforcement shall meet the requirements of the applicable paragraphs of the NYCDOT Standard Highway Specifications, the N.Y.C. Building Code, and the latest ASTM specification for "Deformed and Plain Billet-Steel Bars for Concrete Reinforcement", Designation A-615 and in accordance with the Item "Steel Bar Reinforcement". Reinforcement shall be of the sizes and dimensions shown on the plans. **Flagpole:** The flagpole shall be cone tapered steel having a uniform straight line taper of one inch for every 7.14 feet of height. The flagpole shall have a butt diameter of eight and five-eighth inch (8 5/8") and a minimum butt wall thickness of 0.322". Steel for pole shall conform to ASTM A53 type S, Grade B.

**Granite:** Granite shall be sound, durable, properly quarried, free from reeds, rifts, laminations, and minerals which, by weathering, would cause discoloration, reasonably uniform in quality and texture throughout, free from an excess of mica and feldspar, seams, scales, or evidence of disintegration. Granite shall be "Mt. Airy White", as manufactured by North Carolina Granite, Mt. Airy, NC, or "Bethel White" or "Barre Gray" as manufactured by Prestige Stone Designs, North

Arlington, NJ, or "Iridian", as manufactured by Cold Spring Granite, Cold Spring, MN, approved equal.

All exposed surfaces of granite shall have a thermal finish. All exposed surfaces must be out of wind, free from waves, projections, or depressions on the faces of the granite. Arrises must be cut sharp and true to square or pattern.

The granite base shall consist of a single piece of granite, perforated to leave a hole for flagpole, and provided with Lewis holes on concealed surfaces, for handling.

Sleeve Tube Assembly: The corrugated steel sleeve tube and plate with three T-ribs cut to wedge shape and welded at bottom shall be as shown on the detailed drawing. The entire sleeve tube assembly shall be hot-dip galvanized after fabrication.

Collar: The Ornamental collar at the base of the flagpole shall be constructed of cast aluminum alloy 43-F. It shall be cast in one piece and shall have a minimum thickness of one-quarter inch (1/4"). The profile shall be as shown on the detail.

Mortar: All mortar for pointing and setting granite shall be composed of one part non-staining Portland Cement and two (2) parts of fine screened sand.

Truck: The truck shall be non-fouling, double revolving type with stainless steel ball bearing races, and cast aluminum body with two (2) two and three-eighth inch (2 3/8") diameter aluminum sheaves as shown on the detailed drawings or as directed by the Engineer.

Ball: The finial shall be a ten inch (10") diameter copper ball with 23 Kt. gold leaf finish, attached to a five-eighth inch (5/8") copper diameter rod and mounted on the truck.

Aluminum Cleat: One (1) nine inch (9") cast aluminum cleat finished to match pole shaft, and secured to the pole with two inch (2") stainless steel flathead machine screws.

Cleat Cover Box: Install a new single cleat cover box. The new single box shall be radial in shape and constructed to enclose the cleat as shown on the detailed drawings. The new box shall be constructed of either steel or aluminum. The steel version of the new single box shall be fabricated of ten (10) gauge plate steel with joints welded with a continuous, full penetration weld and ground down flush with the adjacent surface and slightly rounded at corners, with a stainless steel piano hinge and hasp spot welded. The piano hinge shall have a fast pin of stainless steel. The steel box shall be hot dip galvanized after fabrication. The aluminum version shall be constructed either of sand-cast aluminum or welded aluminum plate. The sand-cast box is fabricated of aluminum alloy 43F, with a thickness of one-quarter (1/4") inch, given a satin finish and heavily waxed. The welded aluminum box is fabricated of one-quarter (1/4") inch thick 6063-T6 aluminum alloy with joints welded and ground down flush with the adjacent surface and slightly rounded at the corners. Hinges and hasp shall be of stainless steel 18-8, secured to the box with SS rivets or tamperproof 1/2"-20 NC machine screws. Hinges shall have fast pins of stainless steel. The box shall be secured to flagpole with stainless steel machine screws at a height of ten (10') feet above grade to centerline of cleats. The new box shall be similar to that manufactured by Pole-Tech, Inc., East Setauket, N.Y., or approved equal. The Contractor shall also furnish a one and one-half (1 1/2') inch brass padlock with five (5) pin tumblers, for hasp of box, similar or equal to American Lock No. 5531, as manufactured by American Lock Co., Crete, IL. Two (2) keys shall be supplied to the Engineer. Contractor shall submit shop drawing showing all dimensions and hardware.

Halyard: The Contractor shall furnish and install one (1) halyard. The halyard shall be 5/32" overall diameter clear vinyl coated 7 x 19 strand core stainless steel aircraft cables secured with four (4) hot galvanized wire rope clips. Two brass boat snaps per halyard, equal to catalogue No. 249 of Mahony-Clarke, Inc., No. 2 size, three-quarter inch (3/4") inside diameter of eye and three and one-half inch (3 1/2") overall length, shall be attached to the halyard with two (2) additional wire rope clips in such a way to allow passage of the halyard around the sheaves.

Galvanizing and Finish Coats: The entire steel flagpole, except aluminum and non-ferrous components shall receive three (3) coats. After surfaces have been cleaned in a sodium hydroxide solution, they shall be finished as follows:

**First Coat:** Apply hot-dip galvanized coating with a minimum 0.05 percent nickel content. Thickness of coating to be 6 to 8 mils. Coating shall conform to ASTM A123 and A153. The galvanized coating shall be Duragalv, as manufactured by Duncan Galvanizing Corp., Everett, Ma., or approved equal.

**Second Coat:** Apply a shop coat of polyamide epoxy primer within twelve (12) hours after galvanizing. Thickness of prime coat shall be a minimum of two (2) mils. The primer shall be Primergalv as manufactured by Duncan Galvanizing Corp., Everett, MA., or approved equal.

**Third Coat:** Apply a shop coat of polyurethane color topcoat immediately after application of the prime coat. The topcoat shall be Colorgalv 10 semi-gloss, as manufactured by Duncan Galvanizing Corp., Everett, MA., or approved equal.

Painting: All aluminum and non-ferrous components of flagpole shall receive two (2) shop coats. After surfaces have been solvent cleaned and prepared, they shall be painted as follows:

**First Coat:** Sherwin Williams # Kem Bond® HS Metal Primer, B50WZ4, off white, as manufactured by Sherwin Williams Company, Woodside, NY, or approved equal. Primer is an fast drying, 81% + 2% weight solids, low VOC, rust inhibiting, modified alkyd metal primer with a dry film thickness of 3-4 mils. Paint requires two and a half (2 ½) hours drying time before recoating (with alkyds). Performance shall meet or exceed the standards of Federal Specification TT-P-664D.

**Second Coat:** Sherwin Williams Steel Master 9500 Silicone Alkyd, as manufactured by Sherwin Williams Company, Woodside, NY, or approved equal. Topcoat is a silicon alkyd, high gloss coating having a dry film thickness of 2 -4 mils. Paint shall perform in accordance with ASTM G-53.

Color: Flagpole shall be finished in white. The ornamental collar shall be finished in black enamel. All flagpole parts shall be painted prior to installation.

## **EXECUTION:**

**Excavation:** Excavation shall be cut accurately to the lines and levels shown on the plans, and where soil conditions allow, excavation shall be finished true and square so that concrete foundations may be poured without use of forms. Bottom of excavation shall be filled with concrete, and under no circumstances shall excavated material be used for such filling below footing.

If forms are used for construction of concrete foundations, the excavation shall be at least one foot larger than the concrete work, to permit work on the forms. After the removal of the forms, the space around the concrete footing shall be backfilled with acceptable material, thoroughly rammed and tamped in place.

No concrete shall be poured until after the excavation has been inspected and approved by the Engineer.

**Concrete:** The concrete foundation shall be placed in two (2) pours. The concrete for the footing shall be poured and allowed to set before setting and grouting of socket tube. Concrete for upper portion of the foundation shall be placed after socket tube, inserts, reinforcing and PVC sleeve for ground cable have been properly set and secured to maintain their proper position during pouring. Concrete, during and immediately after placing, shall be thoroughly tamped to remove all voids in the mix. Concrete mix per Section ESCR-4.06.

Where it is necessary to extend the footings to obtain satisfactory bearing, the Contractor will be paid for the additional excavation and concrete under their respective Items.

**Sleeve Assembly:** Sleeve Assembly tube shall be carefully and accurately plumbed. **Beds and Joints:** All beds and joints shall be cut full and square for at least two inches (2") at beds and may fall off not over one inch (1") in twelve inches (12"), and shall be reasonably free from large depressions. All joints shall be of uniform width of three-sixteenths inch (3/16") at arris line. All jointing shall be as shown on the plans.

**Setting:** All granite shall be set in a full bed of mortar. Granite shall be brushed, cleaned, and drenched with water immediately before setting.

**Cleaning and Protection:** After setting is completed, the granite work shall be thoroughly cleaned down with a solution of soap powder and water and a second washing with clear water so as to remove all detergents used in cleaning granites, and the use of any acid solution in cleaning is strictly prohibited. No granite shall be set during freezing weather except by written permission of the Engineer, and after setting, all corners, edges and projections shall be adequately protected from staining at all times until the completion of the work and Substantial Completion.

**Setting Pole:** The pole shall not be set until after the concrete has thoroughly hardened, and in no case sooner than eight (8) days after pouring of the concrete. The copper grounding cable shall be mounted to the grounding pad and sleeved through the concrete foundation before the pole is set.

The pole shall be set into the sleeve assembly so as to wedge securely at bottom, then carefully plumbed and wedged at top of socket hole with wedges as shown, to hold pole securely in a vertical, plumb position. After wedging the pole, the space between pole and socket hole shall be filled with dry sand to within two inches (2") of the top of hole, well compacted by tapping pole and tamping. Sand shall be heated to eliminate all moisture. The annular space at the top of the granite base shall then be packed with a non shrink grout.

The space between pole and collar shall be filled with a polyurethane elastomeric sealant similar to Sikaflex-1A or approved equal.

Protection of Flagpole: Flagpole shall be well wrapped and protected while in transit between shops and delivery to site. Damages or defects occurring shall be repaired at the Contractor's expenses. Damages to finish shall be restored with an organic zinc primer and an approved topcoating in accordance with the manufacturer's recommendations.

**SPECIAL INSPECTIONS AND TESTING:** Third-party inspections and independent testing shall be performed for soil compaction, steel welding, steel reinforcement, concrete strength, final installation, and any other materials as required by the New York City Building Code. The contractor is responsible for coordinating all third-party inspections and obtaining permits. All testing shall be performed in accordance with S-Pages.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of S-Pages.

Shop Drawings: Shop drawings are required. Shop Drawings shall show general layout including jointing of flagpole and complete anchoring and foundation with dimensional information.

Granite Samples: The Contractor shall submit to the Engineer for approval two (2) 8"x12" samples of granite they propose to use. Samples shall be dressed as specified and show the extreme variation in quality, color, and texture that will occur in the granite to be used.

Color and Finish Sample: Contractor shall submit two (2) samples of shop-applied finish coats and color of the steel flagpole.

Substitutions: A written request for substitution of manufactured products or coating systems must be submitted as per S-Pages. The Contractor shall submit this request, along with manufacturer's data sheets for approval, a minimum of two weeks prior to the intended date of construction. All substitutes must be approved in writing prior to use.

Concrete Test Results: Concrete Foundation test results shall be signed and submitted on testing company letterhead.

Coating Warranty: The Contractor shall furnish a ten (10) year coating system warranty from the flagpole coating provider. The Warranty shall name the City of New York as the Project Owner and Purchaser, and shall protect the total flagpole surface area against 10% or more visible rust over a ten year period from the effective date of the warranty.

**MEASUREMENT & PAYMENT:** For furnishing and erecting **STEEL FLAGPOLE - 45 FOOT HIGH**, complete, in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be unit price for **EACH** Steel Flagpole constructed and shall include the cost of all labor, materials, and equipment required to furnish and erect flagpole including granite, controlled concrete foundation, flags, halyard, cleat, finishing, reinforcing steel, unclassified excavation, backfill, grounding system, coordination for third-party inspections, and all other incidentals necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Piling, where required, shall be paid separately under the item "Timber Piles" or "Helical Screw Piles." Third party inspections, as required by NYC Department of Buildings, shall be paid for separately.

Item No.	Item	Pay Unit
PK-ESCR 730	STEEL FLAGPOLE	EA

END OF SECTION

PARKS-408

**SECTION PK-ESCR 736 – CORE DRILLING**

**WORK:** Under this Item, the Contractor shall Core Drill holes of the indicated sizes into rock or masonry for the setting of fence and gate posts, as indicated on the plans or as directed by the Engineer.

**METHODS:** Holes shall be drilled in masonry and rock by approved core drilling methods and equipment. The holes shall be of the sizes and depths indicated on the plans, required by local conditions or as directed by the Engineer. Care shall be taken while drilling in masonry that no damage will be done. Any damage to existing masonry resulting from drilling operations shall be repaired by the Contractor at the Contractor's own cost and expense.

**MEASUREMENT AND PAYMENT:** The quantity of **CORE DRILLING - 3" DIAMETER** and **CORE DRILLING - 4" DIAMETER** to be paid for, shall be the number of LINEAR FEET of holes actually drilled, of the indicated sizes, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of holes drilled of each size and shall include the cost of all work, labor, materials, and equipment required to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 736</b>	<b>CORE DRILLING</b>	<b>L.F.</b>

**END OF SECTION**

## SECTION PK-ESCR 737 – STEEL PIPE BOLLARD

**WORK:** Under this item, the Contractor shall furnish, erect, and powder coat **STEEL PIPE BOLLARD** in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Steel Pipe Bollard shall be as manufactured by All City Play Equipment, Metuchen, NJ, Shannon Gates and Railings, Deer Park, NY, or approved equal.

All fittings and hardware shall be of the materials listed in the following schedule:

<u>PART</u>	<u>MATERIAL</u>
Post Caps	Malleable Iron - 3/16" thick
Drive Pins and Set Screws	Stainless Steel, 18-8
Flange	Pressed Steel
"U" Bolts	Pressed Steel, Extra Heavy-3/4" X 1/2"

Malleable iron castings shall be hot dipped galvanized in accordance with ASTM Serial Designation A-153 and powder coated per this specification.

Pressed steel fittings and appurtenances shall be powder coated and hot dipped galvanized in accordance with ASTM Serial Designation A-123.

**Posts:** Posts shall be extra strong galvanized steel pipe, 4" O.D. and shall conform to ASTM Serial Designation A53, Type S, Grade B, Schedule 80, except that pipe shall be unthreaded and untested for water pressure.

**Sleeves:** Sleeves shall be standard weight galvanized steel pipe, 5" I.D. and shall conform to ASTM Serial Designation A53, Type S, Grade B, Schedule 80, except that pipe shall be unthreaded and untested for water pressure.

**Padlocks:** One padlock shall be furnished for each removable bollard. The padlocks shall be Master Pro Series 6125LJ, as manufactured by Master Lock Company, or approved equal. All padlocks for the same park facility shall be keyed alike, with two and three-eighth inch (2 3/8") width, by three-quarter inch (3/4") thick laminated steel body, maximum security, five (5) pin tumblers with hardened boron alloy shackle no less than three-eighths inch (3/8") diameter, two and one-half inches (2 1/2") vertical clearance and 29/32" inches horizontal clearance. The Contractor shall furnish two (2) keys for each padlock.

**Concrete:** Concrete shall be placed as shown. Concrete shall conform to N.Y.C. Dept. Of Transportation Standard Highway Specifications class B-32, Type II A, air entrained, moderate sulphate resistant. The batch shall contain a minimum of six (6) bags of cement per cubic yard of concrete, maximum of 6¼ gallons of water per bag, a maximum of three (3") inch slump, and a minimum compressive strength of 3,200 psi. Large aggregate shall be limited to one (1") inch.

**Cement:** Air Entraining Portland Cement shall comply with the ASTM Specification for Portland Cement, Designation C150. It shall be Type IIA, Moderate Sulfate Resistant.

**Fly Ash/GGBFS:** A maximum of thirty (30 %) percent of Portland Cement content may be substituted with Fly Ash or Ground Granulated Blast Furnace Slag. Fly Ash shall conform to the requirements for Class F as defined by ASTM C618 – "Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete". Ground Granulated Furnace Blast Slag (GGBFS) shall conform to the requirements for Grade 100 or 120 slag as defined by ASTM C989 – "Standard Specification for Slag Cement for Use in Concrete and Mortars". Portland Cement substitutions that demonstrate the same or similar properties as Fly Ash/GGBFS shall be accepted pending review and approval by the Engineer.

**ERECTION:** The posts for fixed bollards shall be set in concrete footings as shown on the plans or as directed by the Engineer. Once erected, steel pipe of the fixed bollard shall be filled with concrete for park structures. The sleeves for removable bollards shall be set in concrete footings, as shown on the plans or as directed by the Engineer.

All posts and sleeves shall be set plumb and true to line and grade. Any post and sleeve not set true to line and grade shall be removed and replaced at the Contractor's expense. Bending posts to make them plumb will not be permitted.

**POWDER COATING:** The galvanized steel pipe and fittings shall be powder coated with TGIC Polyester.

Galvanizing shall provide an acceptable substrate for applied powder coatings. No lacquer, urethane or other coatings which would prevent proper adhesion of powder coating shall be applied to the pipe and fittings. The powder coating shall be applied to the galvanized pipe and fittings in such a manner that the coating will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. All coated parts shall first receive phosphating and chromating treatments to improve the adhesion of the surface coating. Color to be black unless otherwise indicated on the plans. The TGIC-Polyester shall be applied at a film thickness of 3 to 4 mils by electrostatic spray process and bake finished per manufacturer's directions. The TGIC-Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point.

**Laboratory Test For TGIC-Polyester Powder Coat:** At the discretion of the Engineer, a sample TGIC-Polyester powder coated bollard shall be laboratory tested for bonding of the powder coating to the metal. Test shall be the Cross Hatch test per ASTM D3359, method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**TOUCH-UP & REPAIR:** For minor damaged caused by installation or transportation, clean damaged area, then;

1. On damaged galvanized surfaces, apply organic zinc repair paint complying with ASTM A780, then repair powder coating per number 2 below. Galvanizing repair paint shall have 65 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer's recommendations. Provide touch-up such that repair is not visible from a distance of 6 (six) feet.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Shop Drawings:** Before the work is started, the Contractor shall submit shop drawings for approval.

**Design Mix report:** The Contractor shall submit a design mix report per the requirements of the NYCDOT Standard Highway Specifications.

**MEASUREMENT AND PAYMENT:** The quantity of **STEEL PIPE BOLLARD** to be paid for under this item shall be the number of bollard furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be separate unit price for **EACH** Steel Pipe Bollard, furnished and erected, and shall include the cost for all labor, material, equipment, and incidental expenses necessary to complete the work, including excavation concrete for park structures, powder coating, and

padlock, where required, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 737</b>	<b>STEEL PIPE BOLLARD</b>	<b>EA</b>

**END OF SECTION**

**SECTION PK-ESCR 739 – SEED NEW LAWN**

**WORK:** Under this Item, the Contractor shall SEED NEW LAWN areas with grass seed, ground limestone, fertilizer, and shall prepare seedbed and maintain lawn areas, in accordance with the plans, specifications, and directions of the Engineer.

**INTENT:** This specification is intended for rototilling and seeding new lawn of any size on either new or existing topsoil.

**MATERIALS:**

**Grass Seed:** Grass seed shall be fresh, recleaned seed of the latest crop, mixed in the following proportions by weight and meeting the following standards of pure live seed content (Purity & Germination) and maximum allowable weed seed content. All seed shall be free of noxious weeds and undesirable grasses.

<b>GRASS SEED MIXTURE</b>				
<b>PERCENT BY WEIGHT</b>	<b>GRASS SEED</b>	<b>PURITY</b>	<b>GERMINATION</b>	<b>MAXIMUM WEED SEED</b>
60%	TALL FESCUE - One or more of the following varieties: Apache II, Arid 3, Cochise III, Coronado Gold, Falcon IV, Justice, Jaguar III, Lancer (SH), Masterpiece, Rebel IV, Rebel Jr.(SH), Rebel Sentry, Rembrandt, Tomahawk E+, RTF or approved equal			
20%	BLUEGRASS - One or more of the following varieties: Able I (SH), Blacksburg, Glade (SH) Moonlight, Midnight, America (SH) Brilliant, Ram (SH), Touchdown (SH) Warren's A-34 (SH), Bristol (SH), Lofts 1757 (SH) or approved equal.	98%	80%	10%
20%	PERENNIAL RYEGRASS - One or more of the following varieties: Brightstar II, Manhattan4, Citation Fore, Elfkin or approved equal	98%	85%	25%

NOTE: The cultivars followed by "(SH)" exhibit better shade tolerance than other varieties, under moderate shade.

All seed shall be interagency certified under the auspices of a State Seed Improvement Cooperative and must bear their seals of certification on each fifty pound (50 lb.) bag. All Grass

Seed shall be delivered in sealed standard size bags of the vendor, showing weight, analysis, and name of vendor. It shall be stored as directed by the Engineer, in such a manner than its' effectiveness will not be impaired.

The Engineer reserves the right to reject, on or after delivery, all material which does not, in their opinion, meet these specifications.

The rate of seeding shall be ten pounds (10 lbs.) per one thousand (1,000) square feet.

Ground Limestone: (Calcium Carbonate) shall have the following analysis: at least fifty percent (50%) shall pass a 200 mesh sieve, at least ninety percent (90%) shall pass a 100 mesh sieve, and one hundred percent (100%) shall pass a ten (10) mesh sieve. Total carbonates shall not be less than eighty percent (80%) or 44.8% Calcium Oxide equivalent. For purposes of calculation, limestone may be substituted at the discretion of the Engineer, when wind conditions exceed five (5) miles per hour.

The Contractor shall, at the direction and discretion of the Engineer, furnish a certified report of chemical analysis of representative samples of the limestone which he proposes to use. All samples are to be taken by the Engineer and delivered to the laboratory; the price bid shall include inspection and laboratory charges. No limestone shall be delivered until the approval of samples by the Engineer, but such approval does not constitute acceptance of the material. The Engineer reserves the right to reject, on or after delivery, any material which does not, in their opinion, meet these specifications.

All limestone shall be delivered in standard size bags of the manufacturer showing weight, analysis, and name of the manufacturer. It shall be stored in such a manner that its effectiveness will not be impaired, as directed by the Engineer.

The rate of application of limestone per thousand (1,000) square feet shall be as follows, depending on the Hydrogen Ion concentration (pH) shown by a pH test (pH test to be provided by the Contractor at no additional cost to the City).

<u>pH</u>	<u>RATE(LBS.)</u>
Below 5.0	160
5.0 to 6.0	80
Over 6.0	0

Commercial Fertilizer Low Phosphorus (Slow Release): shall have the following composition by weight: Nitrogen (N) shall be min. 4% - max. 10%, of which min. of 50% is slow-release; available Phosphorus (P) shall be min. 0% - max. 2%; and soluble Potash (K) shall be min. 4% - max. 12%.

Fertilizer shall be a pesticide free (no weed-and-feed) product such as Roots Healthy Turf (8-1-9) as manufactured by Lebanon Turf, Lebanon, PA; Safer Ringer Lawn Restore II 10-0-6 as manufactured by Woodstream corp., Lifitz, PA; or approved equal.

All Commercial Fertilizer Low Phosphorus (Slow Release) shall be delivered in standard size bags of the manufacturer, showing weight, analysis, and name of manufacturer. It shall be stored as directed by the Engineer in such a manner that its' effectiveness will not be impaired. Application of any fertilizer on lawns or non-agricultural turf within 20 feet of a water body or on paved surfaces is restricted and may not be applied unless there is a buffer at least 10 feet wide of planted or naturally occurring vegetation, such as shrubs, trees and plants between the area receiving fertilizer and the water. Fertilizer shall not be applied between December 1 and April 1.

The rate of application Two (2) applications of acceptable commercial fertilizer shall be applied by machine, each application at the rate of ten (10) pounds per thousand (1,000) square feet or

as recommended by the manufacturer. The first application shall be made at the time of installation of seed.

The second application shall be made approximately six (6) months after the first application. This treatment shall take place during the next appropriate fertilizing season; that is, the following Spring or Fall, and shall be subject to the direction of the Engineer.

The second application shall be applied to the surface only. Incorporation shall be achieved by thoroughly watering the entire area after application. The Contractor shall provide all labor and materials including water if not available from NYC sources.

**TIME OF SEEDING:** Grass Seed shall be sown in the Fall during August and September, or in the Spring during March, April, and May, or at such other times as approved by the Engineer. All seeding is to be done in moderately dry to moist (not wet) soil and at times when the wind does not exceed a velocity of five (5) miles per hour.

**PREPARATION OF SEED BED:** Prior to seeding, all areas to receive seed shall be thoroughly loosened with a rototiller to a depth of six (6") inches. All surplus material such as sticks, stones, roots, vegetation, or other objectionable material which might interfere with the formation of a finely pulverized seed bed shall be removed from the soil and a smooth uniform surface grade shall be established. Hollows, depressions, and gullies shall be filled by raking to level and topsoil added as necessary to provide a smooth surface prior to seeding operations. Topsoil shall be spread over the area to receive seed to the depth indicated on the drawings and as required to achieve the designated finished grade. The seed bed shall be graded to true lines, free from all unsightly variations, bumps, ridges, or depressions.

**Compost (where required, paid separately):** shall be thoroughly incorporated into the top five inches (5") of soil, where seed will be installed on existing topsoil and where soil testing indicates low levels of organic matter. Where required, the compost shall be spread at the rate of one (1) cubic yard per one thousand (1,000) square feet unless otherwise directed by the Engineer. Where seed will be installed on new topsoil, compost shall not be added.

**Amendments:** After the compost has been incorporated into the existing soil, limestone (where required) and Commercial Fertilizer Low Phosphorous (Slow Release) shall be worked into the top three inches (3") of soil as directed by the Engineer.

All amendments must be submitted for approval, see SUBMITTALS: The Contractor shall notify the Engineer three (3) days prior to application of amendments.

**INSTALLATION:** Grass seed shall be sown, covered to the proper depth, and firmed in such a manner that a uniform stand of grass will result. All areas to receive seed shall then be compacted, using a two hundred pound (200 lb.) roller. The seed shall be thoroughly watered immediately after placement. The Contractor shall be liable for any damage to property caused by their sodding operations. All areas and construction disturbed shall be restored to their original condition, to the satisfaction of the Engineer.

**WATERING AND MAINTENANCE:** The Contractor shall maintain all seeded areas until Substantial Completion. The Contractor shall properly water as required to maintain optimum growing conditions for the new stand of grass until Substantial Completion. Where water is supplied from City hydrants, the Contractor shall obtain a hydrant permit from the Department of Environmental Protection. The Contractor is responsible for keeping the permits current. The

permits are available from each borough office. To obtain a permit, the Contractor should bring a copy of their contract with a general description of the hydrant location(s) they propose to access. The addresses of borough offices are:

Manhattan: 1250 Broadway (8th floor)  
Brooklyn: 250 Livingston St. (8th floor)  
Bronx: 1932 Arthur Avenue (6th floor)  
Queens: 96-05 Horace Harding Ex., Corona  
Staten Island: 60 Bay St (6th floor)

If water is not available from NYC sources, the Contractor is responsible for supplying water from their own source.

In absence of adequate rainfall, watering shall be performed daily or as often as necessary and in sufficient quantities to maintain moist soil to a depth of at least four (4") inches. Watering shall be done during the heat of the day to prevent wilting.

The first mowing shall not be attempted until the Seed is firmly rooted and secure in place. Not more than forty percent (40%) of the grass leaf shall be removed by mowing. The grass height shall be maintained between one and one-half inches (1 1/2") and three inches (3"), as directed by the Engineer, until Substantial Completion.

**SUBMITTALS:** Submittals shall be as per the S-Pages.

Seed Mix: The Contractor shall submit a document from the seed source for approval prior to delivery showing the seed composition and percentages of each grass type proposed.

Substitutions: At Contractor's discretion, sod may be proposed in lieu of seed at no additional cost to the City. Where approved, grades must be set one (1") inch lower to accommodate thickness of sod, all other provisions of this specification remain identical. At Contractor's discretion, when area to be seeded is 500 square yards or larger, hydroseeding may be proposed at no additional cost to the City. Where approved, all other provisions of this specification remain identical except hydromulch and seeding procedure shall match the NYCDPR's standard specification for hydroseeding.

Amendments: The Contractor shall submit proposed soil amendments for approval prior to delivery.

Invoices: The Engineer reserves the right to request contractor's invoices for all products used in this item.

**MEASUREMENT AND PAYMENT:** The quantity of **SEED NEW LAWN** to be paid for under this Item, shall be the number of **SQUARE YARDS** of lawn area prepared, seeded, and maintained, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of seed new lawn and shall include the cost of grass seed, limestone (where needed), commercial fertilizer low phosphorus (slow release), dispose of surplus materials, and the cost of all labor, materials (including water), and equipment necessary or required to seed new lawn areas, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Topsoil shall be paid for separately. Compost (where required, for existing soil only) shall be paid for under its respective contract item. The price of water, regardless of the source, shall be

considered part of the bid price.

Payment for work performed under this item shall be made as follows:

40%- after preparation of seed bed

30%-after seeding and rolling

10%-after second application of fertilizer

20%-at the Substantial Completion, having maintained and watered new lawn to the satisfaction of the Engineer.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 739</b>	<b>SEED NEW LAWN</b>	<b>S.Y.</b>

**END OF SECTION**

**SECTION PK-ESCR 740 – HYDROSEEDING**

**WORK:** Under these Items, the Contractor shall furnish standard grass and native grass seeds, prepare soil, to accomplish HYDROSEEDING in accordance with the plans, specifications, and directions of Engineer.

**INTENT:** This hydroseeding specification is intended to be used for seeding of large areas or hillsides with greater than one thousand one hundred (1,100) square yards of coverage.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall comply with the requirements of the NYCDOT Standard Highway Specifications.

Seed Mixtures: Both types of grass seed shall be fresh, recleaned seed of the latest crop mixed in the following proportions by weight and meeting the following standards of pure live seed content. The tolerance for PLS (purity x germination) shall be those listed.

<b>LAWN GRASS SEED</b>				
<b>PERCENTAGE OF HYDROSEED MIXTURE – Proportionally, the LAWN GRASS SEED MIX shall be one half (50%) of the seed mix of the hydroseeding slurry.</b>				
<b>Percent By Wt.</b>	<b>Grass Seed</b>	<b>Purity Seed</b>	<b>Germination</b>	<b>Maximum Weed</b>
60%	TALL FESCUE – One or more of the following varieties: Apache II, Arid 3, Cochise III, Coronado Gold, Falcon IV, Justice, Jaguar III, Lancer (SH), Masterpiece, Rebel IV, Rebel Jr.(SH), Rebel Sentry, Rembrandt, Tomahawk E+, or approved equal.	98%	85%	25%
20%	BLUEGRASS - One or more of the following varieties: Able I (SH), Blacksburg, Glade (SH), Moonlight, Midnight, America (SH), Brilliant, Ram (SH), Touchdown (SH), Warren's A-34 (SH), Bristol (SH), Lofts 1757 (SH), or approved equal.	98%	80%	10%
20%	PERENNIAL RYEGRASS - One or more of the following varieties: Brightstar II, Manhattan 4, Citation Fore, Elfkin, or approved equal.	98%	85%	25%

NOTE: The cultivars followed by “(SH)” exhibit better shade tolerance than other varieties, under moderate shade.

**Hydromulch:** Shall be a wood fiber product colored with a non-toxic water-soluble green dye. It shall contain no germination or growth inhibiting factors. Hydromulch shall be of such consistency as to allow the fiber to be evenly dispersed and suspended when agitated in water. Hydromulch shall be equal to that which is manufactured by Conwed Fibers, Buffalo Grove, IL and Weyerhaeuser Co., Tacoma, WA, or approved equal. The rate of application shall be one thousand five hundred and thirty pounds (1530 lbs.) per acre, including sixty pounds (60 lbs.) of seed per acre.

**Wood Fiber Mulch Binder:** Shall be a semiporous film material capable of binding wood fiber mulch and seed to the soil. Wood fiber mulch binder shall be equal to that which is manufactured by Grass Grower, Plainfield, NJ, Trade Name: Terra Jack, or approved equal. The rate of application shall be seventy (70) gallons per acre.

**Fertilizer:** Shall be bone meal or other product containing a maximum of 0.67% phosphorous chemical fertilizer formula unless a soil test indicates the need for additional phosphorus.

Application of any fertilizer on lawns or non-agricultural turf within 20 feet of a water body or on paved surfaces is restricted and may not be applied unless there is a buffer at least 10 feet wide of planted or naturally occurring vegetation, such as shrubs, trees and plants between the area receiving fertilizer and the water. Fertilizer shall not be applied between December 1 and April 1.

**INSTALLATION:** Lawn seed shall be sown in the spring during the months of March, April, or May or in August, September, or October or as directed by the Engineer.

Prior to seeding, the area to be seeded shall be disked to loosen top six inches (6") of soil. The disked area shall be fine tilled to open the soil and render it free of rocks, roots, topgrowth, or debris over two inches (2") in greatest dimension. All debris shall be removed from the site. The chain method or another suitable and pre-approved method of cultivation shall be employed to loosen, rough grade, and prepare the seedbed.

Grass seed shall be mixed as per the above schedule. The mixed seed shall be applied at the rate of one and four-tenths pounds (1.4 lbs.) per one thousand square feet (1,000 s.f.) All seeding shall be performed in moderately dry to moist soil conditions at a time when the wind velocity does not exceed five miles per hour (5 mph).

The application of seed, hydromulch, wood fiber binder, and fertilizer shall be by an approved Hydromulcher or Hydroseeder machine with an adequate capacity expediently and the ability to uniformly mix, pump and spray a uniform slurry of the hydroseeding ingredients.

All mixtures shall be constantly agitated from the time they are mixed until they are applied to the seedbed. All seed mixtures in aqueous agitation shall be applied with eight (8) hours after mixing, except for leguminous seed, which shall be applied within one hour after mixing. Seed mixtures not applied within these limits shall be discarded and the Contractor shall receive no payment for the materials. The application shall be a two (2) part procedure:

- Apply seed, and twenty-five percent (25%) of the hydromulch.
- Apply seventy-five percent (75%) of the hydromulch and wood fiber mulch binder, or an alternate method approved by the Engineer.

The seed shall be applied uniformly on a firm, moist seedbed. The seed and fertilizer shall be mixed on site and the seeding shall be performed immediately and without interruption. The mixture shall be applied by means of a high pressure spray which shall be always directed upward so the suspended mixture shall fall like rain in a uniform spray. Nozzles or sprays shall never be directed toward the ground in any way that might produce erosion or runoff.

Particular care shall be exercised to ensure that the application is made uniformly and at the prescribed rate, guarding against missed areas and overlaps. The rate of application may be checked by observing the degree of wetting of the ground or by distributing test sheets of paper or collecting containers over the area at intervals and observing the quality of material deposited. The spray method shall not be used during periods of high winds, which prohibit satisfactory spray patterns.

**Staged Seeding Operations:** In order to minimize erosion of areas where grading is complete, the Contractor shall stage the application of groundcover hydromulching to coincide with completed construction work. Inspection and acceptance shall be provided for areas in which approved growth is achieved.

**MAINTENANCE:** The Contractor shall perform all work required to achieve rapidly established growth. The Contractor may be directed to reseed any areas which, in the opinion of the Engineer, are unacceptable. The Contractor shall adequately maintain the erosion control cover, including watering as necessary. The Contractor shall maintain all seeded areas until Substantial Completion. The Contractor shall properly water as required to maintain optimum growing conditions for the new stand of grass until Substantial Completion. Where water is supplied from City hydrants, the Contractor shall obtain a hydrant permit from the Department of Environmental Protection. The Contractor is responsible for keeping the permits current. The permits are available from each borough office. To obtain a permit, the Contractor should bring a copy of their contract with a general description of the hydrant location(s) they propose to access. The addresses of borough offices are:

Manhattan: 1250 Broadway (8th floor)  
Brooklyn: 250 Livingston St. (8th floor)  
Bronx: 1932 Arthur Avenue (6th floor)  
Queens: 96-05 Horace Harding Ex., Corona  
Staten Island: 60 Bay St (6th floor)

If water is not available from NYC sources, the Contractor is responsible for supplying water from their own source.

In absence of adequate rainfall, watering shall be performed daily or as often as necessary and in sufficient quantities to maintain moist soil to a depth of at least four (4") inches. Watering shall be done during the heat of the day to prevent wilting.

If the growth is inadequate for erosion control, the Contractor shall overseed and fertilize using half the rate of seed originally applied. If the grass and meadow seed growth is over sixty percent (60%) damaged, reseed following the originally specified rate.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Catalogue Cuts:** Contractor shall submit manufacturer's product literature for the hydromulch and wood fiber mulch binder for approval.

**Seed Mix:** The Contractor shall submit a document from the seed source for approval prior to delivery showing the seed composition and percentages of each grass type proposed. At Contractor's discretion, sod may be proposed in lieu of seed at no additional cost to the City. Where approved, grades must be set one (1") inch lower to accommodate thickness of sod, all other provisions of this specification remain identical.

Amendments: The Contractor shall submit proposed soil amendments for approval prior to delivery.

**MEASUREMENT AND PAYMENT:** The quantity of **HYDROSEEDING** to be paid for under this Item shall be the area planted, measured in **SQUARE YARDS**, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of area of seed furnished and installed, including the cost of labor, material and equipment, including discing and bed preparation, debris removal, seed mixtures, hydromulch, wood fiber binder, fertilizer, reseeding, watering, maintenance, and all related incidental work, all in accordance with the plans, specifications, and the directions of the Engineer.

The price of water, regardless of the source, shall be considered part of the bid price.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 740</b>	<b>HYDROSEEDING</b>	<b>S.Y.</b>

**END OF SECTION**

## SECTION PK-ESCR 741 – PLANT STREET TREE

**WORK:** Under this Item, the Contractor shall perform all work necessary to **PLANT STREET TREE, 2 1/2-3" CALIPER**, in accordance with the plans, specifications, and directions of the Engineer. This Item is not intended for use with the Structural Soil Item; the Tree Item shall be used for planting in the Structural Soil.

Work shall include removal of existing dead trees and stumps in the designated planting pit up to 6" cal., excavation, furnishing, mixing, and incorporating topsoil, manure, mycorrhizal inoculant, and fertilizer tablets in the backfill of all tree pits, furnishing, planting, maintaining, and replacing new trees of the type and size designated on the lists, furnishing and installing tree stakes, and all incidental work shall be completed under this Item.

The Contractor shall be liable for any damage to property caused by planting operations and related work, and all areas and construction disturbed shall be restored to their original conditions, to the satisfaction of the Engineer.

**ASIAN LONGHORNED BEETLE QUARANTINE ZONE REGULATIONS:** Due to current Federal, State and NYC DPR policy, the following host species may not be planted in the quarantine zone. Host species are as follows: Acer-Maple, Aesculus-Horsechestnut/Buckeye, Salix-Willow, Betula-Birch, Populus-Poplar, Ulmus-Elm, Albizia-Mimosa/Silk Tree, Celtis Hackberry, Fraxinus-Ash, Platanus-London Planetree, Sycamore, Sorbus-Mountain Ash.

In addition, Nurseries located within the quarantine zone shall comply with State and Federal Law and all Contractors and/or Subcontractors shall be Certified by the New York State Department of Agriculture and Markets to perform work within the Quarantine Zone (see Submittals section below).

### **TREE:**

**Names:** Plant names, size, and grading standards shall conform to those prepared by the American Association of Nurserymen Horticultural Standards, 1995 Edition, unless otherwise specified. No substitution shall be permitted except by written permission of the Engineer.

**Quality:** All trees shall be typical of their species or variety. They shall have normal well developed branches and vigorous fibrous root systems. They shall be sound, healthy, vigorous trees, free from defects, disfiguring knots, sunscald injuries, abrasions of the bark, plant diseases, insect eggs, borers, and all forms of infestation. All trees shall be tagged by the Engineer, who shall reject all trees not meeting the above specifications, and trees having damaged or missing leaders, multiple leaders, Y-crotches, or indications of topping or heading back. All trees shall be nursery grown and shall have been growing under the same climatic conditions as the location of this project for at least two (2) years prior to date of contract. Trees held in storage will be rejected if they show signs of growth during storage.

**Dimensions:** Each tree shall be dimensioned as it stands in its natural position. Stock furnished shall be a fair average of the minimum and maximum sizes specified

**PREPARATION OF TREES:** All precautions customary in good trade practice shall be taken in preparing trees for moving, and workmanship that fails to meet the highest standards will be rejected. All trees shall be dug immediately before moving, unless otherwise specified. All trees shall be dug to retain as many fibrous roots as possible. Balled and burlapped trees shall have a solid ball of earth of the minimum specified size, securely held in place by burlap and stout rope

or twine. Oversize or exceptionally heavy trees are acceptable if the size of the ball or spread of roots is proportionally increased, to the satisfaction of the Engineer. Loose, broken, or manufactured balls will be rejected.

**BACKFILL:** Material shall consist of natural loam topsoil with the addition of humus only, and no other soil type, such as a sand or clay soil type, shall be accepted. Topsoil must be free from subsoil, obtained from an area which has never been stripped. It shall be removed to a depth of one (1) foot, or less if subsoil is encountered. Topsoil shall be of uniform quality, free from hard clods, stiff clay, hardpan, sods, partially disintegrated stone, lime, cement, ashes, slag, concrete, tar residues, tarred paper, boards, chips, sticks or any other undesirable material. If a truck load of topsoil is considered by the Engineer to contain too much undesirable material to be corrected on the site, the entire truck load shall be rejected. No topsoil shall be delivered in a frozen or muddy condition.

Topsoil shall comply with the following requirements:

**CHEMICAL AND PHYSICAL COMPOSITION:** Natural loam with the addition of humus shall comply with the following requirements:

- a. Organic Matter--must be between nine (9) and twelve (12) percent by weight, as determined by the Dry Combustion Method for Total Carbon and Organic Carbon (using a multiplying factor of 2) as described in Methods of Soil Analysis, #9, Part 2, 2nd ed. published by the American Society of Agronomy. The organic content shall not exceed fourteen percent (14%).
- b. pH range--shall be 6.0 to 7.0 inclusive.
- c. Sieve Analysis -- By Wash Test, ASTM Designation C-117. Passing 2" sieve 100%  
Passing 1" sieve 95% to 100% Passing #4 sieve 90% to 100% Passing #100 sieve 30% to 60%
- d. Clay--the test method to measure the clay content of the soil shall be ASTM D 422. The Engineer reserves the right to reject topsoil in which more than 60% of the material passing the No. 100 U.S.S. Mesh sieve consists of clay as determined by the Buoyous Hydrometer or by the decantation method. All percentages are to be based on dry weight of sample.

When the topsoil otherwise complies with the requirements of the specification but shows a deficiency of not more than one (1) percent in organic matter, it may be incorporated when and as permitted by the Engineer.

Electrical Conductivity shall be less than 1500 mhos/cm. A higher level would indicate excessive salt content. The testing method must be the saturated paste method.

The Contractor shall at the direction and discretion of the Engineer furnish a certified report of an approved analytical chemist showing the analysis of representative samples of the topsoil which he proposes to use. All samples are to be taken by and delivered to the laboratory by the Engineer; the price bid shall include inspection and laboratory charges. No topsoil shall be delivered until the approval of samples by the Engineer, but such approval shall not constitute acceptance. The Engineer reserves the right to reject on or after delivery any materials which do not, in the Engineer's opinion, meet these specifications and resample. Sampling procedure shall be explained in detail at the preconstruction meeting. If the Engineer directs, topsoil which varies only slightly from the specifications may be made acceptable by such corrections as the Engineer deems necessary.

**Mycorrhizal Fungi Inoculant:** Shall be applied by means of a three ounce (3 oz.) premeasured dry formulation packet, such as Mycor Tree Saver Transplant®, as manufactured by Plant Health Care, Inc., Pittsburgh, PA, or approved equal. Packets shall contain, as a minimum: one thousand (1000) live spores of Vesicular-Arbuscular fungi, including: *Entrophospora columbiana*, *Glomus clarum*, *Glomus etunicatum*, and *Glomus sp.*; seventeen million five hundred thousand (17,500,000) live spores of Ectomycorrhizal fungi, including: *Pisolithus tinctorius*; biostimulants including *Yucca schidigera* extract; soluble sea kelp extract derived from *Ascophyllum nodosum*; humic acids; and acrylamide copolymer gel as a water absorbent medium. Three (3) three ounce (3 oz.) packets shall be added to the top six to eight inches (6-8") of backfill soil added to each pit and thoroughly mixed to distribute the inoculant.

**Water Retention Additive:** Water Retention Additives shall be a granular polyacrylamide polymer of a potassium base and not a sodium base that slowly releases moisture into the root zone such as Terra Sorb, as manufactured by Plant Health Care, Inc., Pittsburgh, Pa., or approved equal. It shall be applied at the time of planting during a dry planting as defined by Parks and Recreation. Each tree shall receive three (3) ounces or amount specified by product instructions. Half should be added at a depth of 8-10 inches and the other half just below the finished surface.

**Delivery:** Trees shall be packed, transported, and handled with utmost care to ensure adequate protection against injury. When transported in closed vehicles, plants shall receive adequate ventilation to prevent sweating. When transported in open vehicles, plants shall be protected by tarpaulins or other suitable cover material. Balled and burlapped trees shall be set on the ground and balls covered with soil. Until planted, all materials shall be properly maintained and kept adequately moist, to the satisfaction of the Engineer.

**Inspection:** Inspection may be made before digging, if the Engineer directs, but no trees shall be planted by the Contractor until inspected by the Engineer at the site of the work. All rejected trees shall be immediately removed from the site and replaced with acceptable material at no additional cost.

## **PLANT LIST:**

### Abbreviations:

Dia. - Indicates the CALIPER of the trunk of the tree.

B & B - Indicates tree to be balled and burlapped.

**Ginko biloba** - 2 1/2" -3" Dia. B & B 30" branched 6-7' from ground. Average height 11' - 13' Should have single, straight trunks with leader intact, symmetrical well branched tops.. Fibrous root system essential. Spread of 4'-5'.

**Platanus x acerifolia** - 2 1/2" -3" Dia. B & B 30". Branched 6'-7' from ground. Average height 12'-14'. Should have single, straight trunks with leader intact, symmetrical well branched tops. No limb cuts over 3/4" which have not completely calloused over. Heavy fibrous root system essential. No cut back trees.

**Sophora japonica** - 2 1/2" -3" Dia. B & B 30" branched 6-7' from ground. Average height 11'-13' branched tops. Fibrous root system essential. Spread of 4'-5'.

## **SITE SPECIFICATIONS:**

Time of Planting: Unless otherwise directed by the Engineer, deciduous trees shall be planted from March 1st to May 1st, and from October 15th to December 15th.

**Location:** Site characteristics, such as overhead power lines, existing vegetation, and infrastructure items, such as curbs and sidewalks, shall be considered. Trees that grow taller than thirty feet (30') should not be planted directly under power lines. When the design allows, the tree leader shall be offset from power lines.

**Excavation of Tree Pits:** Sizes of tree pits shall be as shown on the Planting Plan. When subsurface obstructions are encountered during excavation, the Contractor shall restore the disturbed area to its original condition. Each tree shall be planted in an individual pit as specified. Pits shall be dug three (3) times the size of the root ball in Caliper and only deep enough so that the root ball sits on undisturbed subgrade, except in situations where curbs and/or adjacent pavements prevent achievement of planting pit dimensions. Sizes of restricted planting pits (i.e. street trees) shall be at the maximum width allowed, and the same depth as the root ball being planted. Any changes in the planting pit sizes shall be broad enough to accommodate the roots fully extended and only deep enough so that the uppermost roots will be just below the original grade. No tree pits shall be dug until the proposed locations have been staked on site by the Contractor and approved by the Engineer. No tree pits shall be backfilled until approved by the Engineer. All tree pits shall have vertical sides, unless otherwise directed. Excavated material shall be removed from the site unless the Engineer determines the material is suitable for backfilling. Any amendment will be as directed and determined by the Engineer.

Extreme care shall be taken not to excavate to a depth greater than required. The subgrade below the root ball shall be tamped slightly to prevent settlement. Where, in the opinion of the Engineer, the subgrade material is unsuitable, the size of the tree pits shall be dug one-half (1/2) wider than normally required. The bottom and sides of the pit shall be backfilled with existing topsoil thoroughly worked into place.

**PLANTING:** No planting shall be done, except in the presence of the Engineer. All material shall be inspected by the Engineer as it is being removed from the truck, prior to placing in an approved storage area or the designated planting site. All rejected material shall be removed from the site and replaced with acceptable material at no cost to the City.

Place balled and burlapped material in the prepared planting pit by lifting, and carry it by the rootball. Set the tree straight and in the center of the pit, with the most desirable side facing the predominant view. All trees shall set, after settlement, at the same level at which they have grown in the nursery, with the root flare exposed. Care shall be exercised in setting the trees plumb. All ropes, stones, etc. shall be removed from the pit before backfilling. The backfilling mixture shall be loose and friable, and not frozen or solid.

Cut and remove rope or wire from the top fifty percent (50%) of the rootball and cut and remove the burlap to the edge of the ball. Remove as much woven product and twine as possible. All plastic or synthetic fabric must be removed from the ball at the time of planting. Any wire basket enclosed root ball will need to have at least 2/3 of the wire basket cut away from the sides and top of the ball, and removed from the site. Remaining lateral wires must be cut to prevent future root interference. Wire must not be galvanized or aluminum wire.

Trees shall be handled so that the ball will not be loosened. After the soil has been thoroughly firmed under and around the ball, the burlap shall be cut away from the upper half of the ball, and the remaining burlap adjusted to prevent the formation of air pockets. Where directed by the Engineer, the burlap shall be entirely removed. Soil shall be firmed at six (6") to eight inch (8") intervals and thoroughly settled with water.

All ropes, stones, etc. shall be removed from the pit before backfilling. Soil for backfilling shall be loose, friable, and not frozen. Trees shall be handled so that the ball will not be loosened.

**FINISHING SURFACE AFTER BACKFILLING:** The Contractor shall cultivate and rake over finished planting areas and shall leave them in an orderly condition. On level ground or slight slopes a shallow basin a little larger than the CALIPER of the tree pit shall be left around each tree, as shown on the details, or as directed by the Engineer. After the shallow basins have been prepared, they shall be mulched three to four inches (3" – 4") deep. Mulch shall consist of shredded wood or bark not exceeding three inches (3") in length and one inch (1") in width. Mulch with leaves, twigs, and/or debris shall not be acceptable. Mulch for tree pits shall be included in the bid price.

**STAKING:** All staking shall be done immediately after planting and all stakes and wire shall be maintained. Plants shall stand plumb after staking. Stakes shall be of white cedar with bark attached. They may have a maximum allowable deflection of ten percent (10%). Stakes of the dimensions shown on the plans and details shall be placed outside the root ball and shall be driven to the depths indicated on the plans and details.

Stakes shall be fastened to the tree with double No. 12 gauge annealed galvanized steel wire run through a suitable length (at least twelve (12") inches) of new reinforced one-half inch (1/2") rubber hose or with a suitable length of 3/4" wide, flat, woven polypropylene material as manufactured by DeepRoot, San Francisco, CA or approved equal, that is knotted and nailed to the stakes with 1" galvanized roofing nails as directed by the Engineer. Stakes shall be set parallel to the curbs, unless otherwise directed by the Engineer. The length of doubled wire between the tree and stakes shall be hand twisted several times prior to fastening to the stakes. The wires shall be tied off firmly at the stake, not crank twisted at the center. Trees shall stand plumb after staking. Stakes, wires and hoses shall be removed at the end of the one year guarantee period, unless directed otherwise by the Engineer. At the time the stakes are removed any holes left by the stake shall be filled with topsoil as specified in the specification PK-ESCR 753.

**PRUNING:** Broken or badly bruised branches shall be removed with a clean cut. Do not cut leaders or use wound paint or dressing to treat cut areas. Crossed branches shall be pruned with a sharp tool in such a manner as to preserve and encourage the plants natural growth form. Crowns of young trees shall not be cut back to compensate for root loss.

**MAINTENANCE:** At the time of planting, the soil around each tree shall be thoroughly saturated with at least twenty (20) gallons of water.

Water for the irrigation of the planted trees in this contract may be supplied by the Department of Environmental Protection free of charge, until Substantial Completion. In any event, the Contractor shall furnish and apply water, in accordance with the provisions of this contract.

Where water is supplied from City hydrants, the Contractor shall obtain a hydrant permit from the Department of Environmental Protection.

The Contractor shall maintain all planted trees within the limits of this contract, in accordance with the plans, specifications, and directions of the Engineer, until the acceptance and completion of each site of this contract.

Maintenance shall include weeding, cultivating, edging, control of insects, fungus, and other diseases by means of spraying with an approved insecticide or fungicide, pruning, adjustment and repair of stakes, anchors and wires, repair of minor washouts and gullies up to twelve inches (12") in depth, and other horticultural operations necessary for the proper growth of all trees, and

for keeping the entire area within the contract limits neat in appearance until the Substantial Completion.

All planting areas shall be cultivated and weeded with hoes or other approved tools within the period from May 1st to October 1st, and such cultivating and weeding shall be repeated at least once a week. Under no conditions shall weeds be allowed to attain more than six inches (6") of growth. The cost of maintenance shall be included in the bid price.

**REPLACEMENT:** The Contractor shall replace, in accordance with the contract plans and specifications, any Tree that is dead or, in the opinion of the Engineer, in an unhealthy or unsightly condition, and/or have lost their natural shape due to dead branches, excessive pruning, inadequate or improper maintenance, or other causes, including vandalism, prior to final acceptance. Replacement plants must be installed in the next planting season. The cost of replacements(s) shall be included in the unit price bid for the various furnished items of the contract. Where vandalism or related causes are agreed by the Engineer as the cause for tree replacement, the Contractor shall be responsible for one replacement during the one-year guarantee period after Substantial Completion.

Where dead tree has been identified, whether due to natural causes or vandalism, the Contractor shall remove the dead material, including stakes, and wire (if applicable) **within three (3) weeks of notification.**

Where dead tree has been identified, whether due to natural causes or vandalism, the Contractor shall remove the dead Tree, including stakes, burlap, and wire. Earth will be leveled and new topsoil and seed, or appropriate paving material, added at the direction of the Engineer to eliminate any hazardous conditions.

The Contractor shall maintain Replaced Tree to the standards outlined in the "Maintenance" section above.

**SUBMITTALS:** All submittals shall be as per the S-Pages. The contractor shall submit the following for review and approval prior to performing work:

State Certification (in quarantine zone only): The contractor must submit a copy of a valid Compliance Agreement issued by the State of New York Department of Agriculture and Markets, Division of Plant Industry.

**MEASUREMENT AND PAYMENT:** The quantity of **TREES, 2-1/2" - 3" CALIPER.** to be paid for under this Item shall be the number of trees of each size and species, supplied, planted, and maintained, in accordance with details and specifications, to the satisfaction of the Engineer

The price bid shall be a unit price for **EACH** tree of each size and species planted, and shall include the cost of excavating plant pits, furnishing and incorporating topsoil and manure in backfill of all tree pits, removal of dead stumps and trees up to six inches (6") Caliper in designated pits, furnishing, planting, pruning, staking, watering, maintaining, and replacing all trees, and all other work incidental thereto, including mycorrhizal fungi inoculant, and water retention additives, in accordance with the sketches, specifications, and to the satisfaction of the Engineer.

The price of water, regardless of source, is deemed included in the unit price bid. No extra payment will be made for water obtained from the Contractor's own source.

<b>PK-ESCR 741</b>	<b>PLANT STREET TREE</b>	<b>EA</b>

END OF SECTION

PARKS-427

**SECTION PK-ESCR 742 – RESILIENT SPORTS SURFACE – 13MM**

**WORK:** Under this item, the Contractor shall furnish and install RESILIENT SPORTS SURFACE -13 mm a sandwich style polyurethane track system, water impermeable, resilient, all weather resilient sports surface where shown on the plans and specifications and directions of the Engineer.

**MATERIALS:** Unless otherwise provided for herein, all materials shall comply with the requirements of the NYCDOT Standard Highway Specifications.

Sports Surfacing: shall be a two-layer sandwich style polyurethane track system. Track system shall be similar to Beynon BSS-300 as manufactured by Beynon Sports Surfacing Co., Spurtan BV, as manufactured by Advanced Polymer Technology Corp., Harmony, PA, Conipur SW as manufactured by Conica Sports Flooring, Elgin, SC, or approved equal. Sports surfacing shall conform to the following standards:

1. Minimum thickness: 13mm
2. Base Layer: black mat consisting of recycled SBR rubber granules bound in polyurethane binder-minimum 9 mm thick.
3. Second Layer: liquid applied two-component pore filling seal coat using polyurethane and EPDM powdered rubber-minimum 4 mm thick.
4. Surface Layer: liquid applied polyurethane self-leveling flood coating into which colored EPDM rubber granules are cast (embedded) and allowed to cure.
5. Colors: Red
6. Sports surfacing material shall conform to the following properties:

Physical Properties	Standard	Specification
Hardness - Shore A, @ 70° F	ASTM D2240	Top 60 ± 5 bottom 50 ± 5
Tensile Strength	ASTM D412 / IAAF test	>100 psi
Elongation at Break	ASTM D412 / IAAF test	>50%
Coefficient of Friction (wet)	IAAF	>0.50
Force reduction	Din 180383/2	Min 35%
VOC Compliance	ASTM D5116	

7. Resilient surfacing material shall exhibit a high resistance to track shoe spike traffic, cigarette burns and chemical agents.
8. Material for all cracks and patching shall be an approved material compatible with the specified surfacing. Specified material shall be per the manufacturer's specification.

Crack Filler and Patching Material: Material for all cracks and patching, if necessary, shall be an approved material compatible with the specified surfacing.

Line & Text Markings: Line & Text paint shall be supplied or approved by the sport surface manufacturer. Paint for lines and text shall be a two-component solvent based polyurethane line paint, such as “Qualipur 7600” as manufactured by Advanced Polymer Technology, Harmony, PA, or approved equal.

**CODES AND STANDARDS:** The Contractor shall follow the current guidelines as set forth by the American Sports Building Association (ASBA).

**QUALITY ASSURANCE:** The Entity who will perform the installation work shall have a minimum of three (3) years experience working on projects similar to the work specified herein, including building various athletic facilities. The Entity must submit for approval two (2) examples of similar type work completed within the last five (5) years and a minimum of two (2) verifiable references from past clients. The resilient surface shall be installed by authorized applicators of the approved manufacturer.

**INSTALLATION:** Before the resilient sports surface is placed, the asphalt surface shall be checked for suitability to receive resilient surface by the sports surface contractor and the Engineer. The asphalt surface shall be allowed to cure completely.

At least thirty (30) days shall have elapsed between completion of the asphalt surface and commencement of the resilient sports surface. If no rain has fallen since completion of the asphalt, the Contractor shall provide for the asphalt to be well hosed down with water not less than 2 days before such surfacing begins. In order to allow the asphalt base to fully cure before installing the resilient sports surface, full depth asphalt pavement or asphalt concrete top course pavement shall not be placed after August 15<sup>th</sup> without written permission from the City.

The resilient sports surface shall be laid on new or existing asphalt surface that is dry, clean and free from existing track surface and contamination by oils, dust, organic matter or chemical agents. If the surface is not satisfactorily cleaned, the Contractor shall continue cleaning until it is acceptable by the Engineer.

The asphalt surface shall be smooth, level, structurally sound, firm, true to line and grade, free from unevenness and other defects. The asphalt surface shall be maintained in this condition until the installation of the resilient surface is satisfactorily completed.

Accurate control over the entire installation of the resilient sports surface shall be maintained. This includes, but not limited to, mixture ratios, temperature range, humidity, laying, thickness and gradients. The resilient sport surface shall be allowed cure for a minimum duration of 7 days.

The surface shall be protected before, during and after installation until project's acceptance by the Engineer. The installation shall be performed in a first class, neat, careful and professional manner by workmen skilled in this type of work.

**Adjacent and Concurrent Construction:** Installation shall not take place until the completion of adjacent or concurrent construction operations which generate dust, airborne abrasives, or any other by-product that, in the opinion of the Engineer, would be harmful to the resilient sports surfacing.

**TEMPERATURE AND WEATHER:** Installation of the sports surfacing shall proceed only when temperature is at least sixty five degrees Fahrenheit (65 °F) and rising. Work shall not proceed when ice, frost or dampness is visible on the surface or when rain is imminent. Perform work when the surfaces are completely dry and will remain so until completion.

**LINE & TEXT MARKINGS:** General markings shall be spray applied, using only paint, primers and finishes supplied and guaranteed by the approved manufacturer and/or supplier.

All markings shall be spray applied under the direction of a qualified line marker, having marked a minimum of 5 athletic facilities, of similar size and scope. The line marker shall be approved by resilient surfacing manufacturer and experienced in the layout of athletic markings. Apply not less than 2 coats of paint, 2 inches wide for line work. Text shall receive not less than 2 coats of paint in patterns as indicated on approved shop drawings.

Line and text markings shall not be performed when the temperatures of the substrate is below 50 degrees °F, nor above 104 degrees °F.

**TESTING:** The City reserves the right to make any and all tests it may deem necessary to determine the physical properties, thickness and quality of the materials installed.

The City reserves the right to request that the Contractor take up to three (3) randomly selected cores of sports surfacing (minimum 1' diameter) as directed by the Engineer. All work including restoration of surface shall be included in the unit price bid for resilient sports surface. The Contractor shall supply all necessary labor and materials at the direction of the Engineer.

**DEFECTIVE SPORTS SURFACING:** In the event that portions of the completed sports surface or samples taken do not comply with the requirements of the Specifications, the Engineer shall order those affected areas to be taken up, removed and replaced with suitable materials, properly applied, leveled and incorporated in full compliance with the Plans and Specifications at no additional cost to the City. Insufficient thickness will only be remedied by cutting out to the asphalt, making the same good, and replacing with full depth material to the specified depth. Any correction ordered whatsoever will be made without additional expense to the City.

**OSHA REGULATIONS:** In compliance with OSHA regulations, the Contractor shall provide the Contractor's workers with approved equipment including protective clothing and/or respirators whenever the possibility of exposure to hazardous materials or vapor exists.

**PROTECTIONS:** The Contractor shall protect adjacent surfaces from drips, smears, splatter or other contamination by suitable taping or masking. All such marred surfaces shall be restored to a condition similar to and equally as good as that existing at the time of commencement of the work hereunder to the satisfaction of the Engineer by and at the expense of the Contractor.

**CLEAN-UP:** At the completion of the work, the Contractor shall remove accumulated debris, tools, protective coverings, equipment, containers, residual materials, etc., from the site in an approved manner, and the entire job left broom clean and acceptable.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages. The Contractor shall submit the following for review and approval prior to manufacture.

The following must be provided by the Contractor:

1. The resilient sports surface contractor shall show proof of experience in the installation of resilient sports surfacing, using the same product as specified in this contract. The Contractor shall submit a list containing a minimum of two athletic facilities that meet these requirements, constructed within the past five years along with the names of people to contact for reference.
2. Control samples of the proposed material for independent testing and use as a standard

for the site work. Samples shall be 12" x 12".

These samples should be representative of the composition, strength and texture of the material to be installed on site and will be subjected to independent testing to establish a datum performance for site quality control purposes. 3. The following additional information must be approved prior to installation:

- i. General statement of the method, by which the proposed surface is constructed, including method of site preparation and chief items of equipment used.
- ii. Statement of method by which small repairs or retexturing is achieved.
- iii. Specimen set of maintenance instructions for the resilient sports surface.
- iv. Statement of any safety precautions required by workers or bystanders at the site during the work.
- v. Submit the following test data for the product as purchased:
  - a. Hardness Shore A -ASTM D2240
  - b. Tensile Strength –ASTM D412./IAAF test
  - c. Elongation at break – ASTM D412/IAAF test
  - d. Coefficient of Friction (wet) -IAAF test
  - e. V.O.C. Compliance -ASTM D5116

Shop Drawings: The contractor shall submit shop drawings showing all line markings and layout of the running track.

Warranty: The Contractor shall submit standard Manufacturer's Warranty for five (5) years on the resilient sports surfacing and one (1) year on the line markings and all other work. Warranty shall start with the date of the use inspection.

**MEASUREMENT AND PAYMENT**: The quantity of RESILIENT SPORTS SURFACE -13mm to be paid for under this item shall be the number SQUARE FEET furnished and installed in accordance with the plans, specifications and direction of the Engineer, including line & text markings.

The price bid for this item shall be the number of SQUARE FEET of RESILIENT SPORTS SURFACE -13mm furnished and installed and shall include the cost of all labor, materials, equipment and incidentals necessary to complete the work including the adhesive, any patching necessary, line striping and testing, all in accordance with the plans and specifications to the satisfaction of the Engineer

All samples and restoration shall be included in the price bid.

Full Depth Asphalt Pavement, Asphalt Pavement Top Course, and Survey Track Lines shall be paid for under their respective items.

**END OF SECTION**

## SECTION PK-ESCR 743 – 6<sup>TH</sup> STREET TRACK AND FIELD

### PK-ESCR 743.1. INTENT

This section includes the following items: **LONG JUMP LANDING AND PIT, TRACK PERIMETER DRAIN, SURVEY TRACK LINES,** and **POLE VAULT PIT AND COVER** all in accordance with the plans, specifications and directions of the Engineer.

### PK-ESCR 743.2. DESCRIPTION

- A. Under this item, the Contractor shall construct and install a **LONG JUMP LANDING AND PIT**, in accordance with the plans, specifications and directions of the Engineer.
- B. Under this Item, the Contractor shall furnish and install **TRACK PERIMETER DRAIN**, including the channel drain, grates, edges, in-line catch basins with trash, buckets end plates, cleanouts, corrugated plastic pipe, connection to existing drainage system, and accessories necessary to complete the work, all in accordance with the plans and specifications and directions of the Engineer.
- C. **SURVEY TRACK LINES:** Under this item, the Contractor shall hire a New York State Licensed Land Surveyor to check surface tolerances for each layer of pavement which include: the compacted subgrade, asphalt binder course, and finished asphalt top course, set calibration points for lane marking of the running track and field events and furnish an "as built" drawing for the work all in accordance with the plans and specifications and directions of the Engineer.
- D. Under this item, the Contractor shall furnish and install **POLE VAULT PIT AND COVER** in accordance with the plans, specifications and directions of the Engineer.

### PK-ESCR 743.3. MATERIALS

#### A. Long Jump Landing and Pit Materials

- a. Broken Stone Base: Broken stone shall consist solely of crushed ledge rock. Stone shall be No. 3 size and shall be of approved size and quality.
- b. Perforated Polyethylene Pipe: Pipe and fittings shall be manufactured by Advanced Drainage Systems, Inc. (ADS) Staybrook Industrial Area, Ludlow, MA, or approved equal. Sizes 4 – 36 inch (N-12) shall have a full circular cross-section, with an outer corrugated pipe wall and an essentially smooth inner wall (waterway). Corrugations for these sizes may be either annular or spiral. All sizes shall conform to the AASHTO classification "Type S" (smooth waterway) or "Type SP" (smooth waterway and Class 2 perforations) as specified.
  - i. Pipe manufactured for this specification shall comply with the requirements for test methods, dimensions, and markings found in AASHTO Designations M252 and M294. Pipe and fittings shall be made from Virgin PE compounds which conform with the requirements of cell Class 324420C as defined and described in ASTM D3350.
  - ii. The minimum parallel plate stiffness values when tested in accordance with ASTM D2412 shall be as follows:

<u>Diameter</u>	<u>Pipe Stiffness</u>
4" (100 mm)	50 psi (340 kPa)
6" (150mm)	50 psi (340 kPa)
8" (200mm)	50 psi (340 kPa)
12" (300mm)	50 psi (340 kPa)
18" (450 mm)	40 psi (280 kPa)

PARKS-432

24" (600 mm)	34 psi (235 kPa)
36" (900 mm)	22 psi (150 kPa)

- c. Sock: The circular perforated pipe shall have a "DC Sock", a polyester machine knitted envelope factory applied and ready for installation. Sock not required for the slim line drainage system.
- d. Fittings: The fittings shall not reduce or impair the overall integrity or function of the pipeline. Fittings may be either molded or fabricated. Common corrugated fittings include in-line joint fittings, such as couplers and reducers, and branch or complimentary assembly fittings such as tees, wyes, and end caps. These fittings may be installed by various methods, such as snap-on, screw-on, bell and spigot, and wrap around. Couplings shall provide sufficient longitudinal strength to preserve pipe alignment and prevent separation at the joints. Coupling of the pipes shall be performed using Standard ADS (Advanced Drainage Systems) N-12 split coupler PRO LINK ST, or PRO LINK 10.8, or PRO LINK 5. Only fittings supplied or recommended by the pipe manufacturer shall be used. Where designated on the plans, a neoprene or rubber gasket shall be supplied.
- e. Geotextile – Drainage: Geotextile to conform to the requirements of specification section PK-ESCR 149, Bid Item No. PK-ESCR 149.
- f. Concrete: Concrete to conform to the requirements of specification section ESCR-4.06.
- g. Steel Bar Reinforcement: Reinforcement to conform to the requirements of specification section ESCR-4.14.
- h. Expansion Joint: Expansion joint material to conform to the requirements of specification section ESCR-4.06.
- i. Bond Breaker: Bond Breaker to conform to the requirements of specification section ESCR-4.06.
- j. Sealant: Sealant to conform to the requirements in specification section ESCR-4.06.
- k. Permeable Pavers: Pavers shall be manufactured from high quality, steam cured, pre-cast concrete having a minimum compressive strength of 7,500 p.s.i. and a maximum water absorption of five (5%) percent. All pavers shall be as indicated on the plans or approved equal. All pavers used shall be of the same thickness and manufacturer.
- l. Sand: Sand shall be masonry sand as defined by ASTM C144. Masonry sand shall consist of natural sand or manufactured sand and shall be free from all deleterious and organic material.
- m. Aluminum Pit Cover: Aluminum pit cover shall be "APC Panel" as manufactured by Aluminum Athletic Equipment Co., Royersford, PA, or approved equal. Panels shall be custom fabricated as necessary to securely fit the actual dimensions of the landing pit. Aluminum Pit Cover shall consist of a series of aluminum planks welded together and framed with an aluminum angle. Panels shall have four (4) recessed lifting handles and shall be recessed to receive track surface as per the specified thickness. Covers shall sit in a ledge formed into the concrete curb as shown in the shop drawings so that the top of the rubber athletic surface is flush to the top of curb. Contractor shall provide approved manufacturer with as-built drawing of curb measurements for proper fabrication.
- n. Auxiliary Panel Support Beams: If required, shall be "Auxiliary Support Beams for APC Panels" as manufactured by Aluminum Athletic Equipment Co., Royersford, PA, or approved equal. The aluminum support beams consist of one (1) primary support beam running the length of the pit interior set into two (2) long beam receptacles set so the top of the beam is flush to the bottom of the panels, and one

(1) secondary support beam running the width of the pit interior set into two (2) short beam receptacles set so that the top of the short beam is flush to the bottom of the long beam. Beams shall be custom fabricated as necessary to securely fit the actual dimensions of the landing pit. Contractor shall provide approved manufacturer with as-built drawing of curb measurements for proper fabrication.

**B. Track Perimeter Drain Materials:**

- a. Concrete: Concrete as per manufacturer and to conform to the requirements of specification section ESCR-4.06.
- b. Fibrous Reinforcement: Fibrous reinforcement shall be 100% virgin polypropylene fibrillated fibers containing no reprocessed olefin materials and specifically manufactured to an optimum gradation for use as concrete secondary reinforcement. Volume per cubic yard shall be a minimum of 0.1% (1.5 pounds). Fibrous reinforcement shall be Fibermesh™ with Microban™ 'B', an antibacterial additive. Fibrous reinforcement shall be manufactured by Fibermesh Company, Chattanooga, TN, or approved equal. Microban™ 'B' shall be manufactured by Microban International Ltd., New York, NY. Fibers shall have been fully tested by Underwriter's Laboratory (UL) and listed in the UL directory. Fibers shall have been evaluated by ICBO, CABO, and SBCCI. Fibers shall be manufactured by extrusion. Individual fibers shall not have been produced by slitting or chopping of sheet material, or any other process. Fibers shall be stored in sealed bags or other containers until use.
- c. Channel Drain – System: Modular trench drain system pre-cast from corrosion resistant polyester resin polymer concrete, including interlocking modular components for on-site installation. System shall include all trench drains, including radial sections, drainage and anchoring covers, and accessories. The Channel Drain System shall be a grate "U" shaped channel system No. 2000, as manufactured by ACO Sport, Chardon, Ohio or approved equal. Components for the channel drain sports system, as manufactured by ACO Sports or approved equal:
  - i. Channel: Channel shall consist of straight and curved fabricated segments of polymer concrete, formed with interlocking tongue and groove connections, which can be sealed to provide watertight connections. It shall be 6.1" wide with an internal width of 4" and 9.8" deep with radius non-sloping bottom having the following attributes:
    1. Length: 1m (39.37")
    2. Anchoring ribs: full length
    3. Longitudinal evacuation slot: 5/8"
    4. Compressive strength of specified polymer concrete: 14,000 psi.
    5. Flexural strength of polymer concrete: 3,000 psi.
    6. Channel shall be model No.2000 or approved equal.
  - ii. Edges & Turf Connection: See contract drawings and manufacturer's recommendations.
  - iii. Accessories:
    1. Catch basins (System 2000), or approved equal
    2. Galvanized trash buckets (System 2000), or approved equal
    3. Concrete and/or concrete brick base support piers, as recommended by the manufacturer.

**C. Pole Vault Box and Cover Materials**

- a. Pole vault box and cover shall be constructed of 13 gage stainless steel. Cover shall be one-quarter (1/4") inch stainless steel with reinforced stainless steel ribs. Pole vault box shall be model SSVB manufactured by Aluminum Athletic

Equipment Co., Royersford, PA, or approved equal and cover shall be model SSVV manufactured by Aluminum Athletic Equipment Co., Royersford, PA, or approved equal

### **PK-ESCR 743.3.1. REFERENCES**

#### **A. Pole Vault and Long Jump**

- a. All field event equipment must meet rules and regulations as set forth by the International Association of Athletic Federation (IAAF), the National Collegiate Athletic Association (NCAA), and the National Federation of State High School Associations (NFHS).

### **PK-ESCR 743.3.2. SUBMITTALS**

#### **A. Long Jump Landing and Pit Submittals**

- a. Shop Drawings: Contractor shall submit shop drawings for the landing pit and the pit cover showing how the pit cover shall be installed on the landing pit, and dimensions of the landing pit, the structural aluminum beams, size of panels, and the locking mechanism.
- b. Samples: The Contractor shall submit a sample of a one (1 gal.) gallon bag of sand for approval.
- c. Catalogue Cuts: Contractor shall submit catalogue cuts for the long jump/triple jump landing pit and cover.

#### **B. Track Perimeter Drain Submittals**

- a. Shop Drawings: Shop drawings shall be prepared showing all pertinent information necessary to complete the work, including but not limited to:
  - i. System layout indicating exact center line dimensions
  - ii. Installation details
  - iii. Connections to existing drainage system

#### **C. Survey Track Lines Submittals**

- a. As-Built Record Drawings: Contractor must submit as-built drawings seven (7) days after the installation of the synthetic track surface. Contractor shall submit as-built both in paper form and in AutoCAD format on a minimum 4 GB USB Drive.

#### **D. Pole Vault Box and Cover Submittals**

- a. Shop Drawings: Contractor shall submit shop drawings, showing all dimensions, installation, and construction details.
- b. Catalogue Cuts: Catalogue cuts of pole vault box and cover shall be submitted for approval, at least 14 days prior to ordering. Where a unit other than the pre-approved model number is proposed, the Contractor will also submit a technical data chart comparison proving that the proposed equipment is equal to specified model in all respects.

### **PK-ESCR 743.3.3. QUALITY CONTROL**

#### **A. Track Perimeter Drain**

- a. Qualification: The entity installing the track perimeter drain must show proof of experience in the installation of channel drain systems, of the same design as specified in this contract. Fields certified by the International Amateur Athletic Federation and the Athletic Congress shall be considered proof of the above requirements. The Contractor shall submit a list containing a minimum of two (2)

channel drain installations constructed within the last five (5) years, along with the names and phone numbers of people to contact for reference. The Contractor shall employ only qualified, experienced supervisors and technicians who are trained and skilled in the installation of the channel drain system.

**B. Survey Track Lines:**

- a. **Qualification:** The Contractor shall provide evidence showing the Licensed Surveyor of having experience in setting calibration points for at least three (3) running tracks.
- b. **Coordination:** The Contractor shall coordinate the work with others in marking the running track, this includes, and is not limited to, the Surveyor, the Prefabricated Synthetic Track Surface installer, and the Engineer. Prior to the start of construction, the Contractor will contact the Engineer and arrange a mutually convenient schedule to coordinate the work involved, including review of Lane Markings and Field Events.

**PK-ESCR 743.3.4. DELIVERY, STORAGE, AND HANDLING**

**A. Pole Vault Pit and Cover Delivery and Storage:**

- a. Contractor shall deliver the items to site and store it in the storage container as directed by the Engineer or as shown on the drawings. Contractor shall maintain all the equipment until Substantial Completion. Any equipment that is found to be damaged or missing prior to Substantial Completion shall be replaced by the General Contractor at no extra cost to the City.

**PK-ESCR 743.3.5. WARRANTY**

- A. **Track Perimeter Drain Warranty:** The contractor shall submit a Manufacturer's Warranty, which guarantees the usability for its intended use, for a period of one (1) year commencing with the date of substantial completion or two (2) years from the date of purchase or whichever occurs first. The warranty must provide full coverage including materials and workmanship.

**PK-ESCR 743.4. METHODS**

**A. Long Jump Landing and Pit Methods**

- a. **Preparation of Subgrade:** The fine grade shall be prepared to line and grade and compacted where practicable with an approved self-propelling roller weighing not less than ten (10) tons. All hollows and depressions which develop under rolling shall be filled with acceptable material and shall again be rolled. This process of shaping, filling, and rolling shall be repeated until no depressions develop.
  - i. The Contractor shall remove from the subgrade all debris, foreign material, and all other undesirable material designated by the Engineer. The fine grade shall not be muddy or otherwise unsatisfactory when broken stone base is placed upon it. If the fine grade becomes rutted or displaced, due to any cause whatsoever, the Contractor shall regrade same without additional payment.
- b. **Broken Stone Base:** The broken stone base shall be installed in two (2") inch lifts over the geotextile and compacted to a ninety percent (90%) Proctor Density, maintaining a consistent slope from the edge of the landing pit to the slotted drainage pipe in the center. The broken stone base must be free draining. After

the stone base is installed and compacted, additional drainage geotextile shall be installed on top before the installation of the permeable pavers.

- c. Geotextile – Drainage: After the ground has been prepared, the fabric shall be rolled directly on the ground. All seams shall be overlapped approximately six (6") inches. No equipment, materials or machinery shall be placed on or be transported over exposed fabric. Stone base shall then be carefully placed to prevent dislocation of the fabric.
  - i. If the fabric is damaged during installation, the rupture shall be removed and the damaged area shall be covered with a patch of new fabric which will overlap the undamaged fabric approximately six (6") inches in all directions. All repaired fabric surface costs will be deemed part of the price bid.
- d. Polyethylene Pipe: All slotted polyethylene pipe shall be laid in reasonably close conformity to line and grade and shall have a full, firm, and even bearing at each joint and along the entire length of pipe and surrounded with the broken stone base drainage material, in accordance with the plans, specifications, and directions of the Engineer. Joint misalignment shall not result in offsets, in the interior smooth liner, greater than one-quarter inch (1/4"). Pipe laying shall begin at the downstream end and progress upstream. Any single run of pipe, excluding end sections, shall consist wholly of the same type material unless otherwise directed by the Engineer. No section of pipe used shall be less than three feet (3') in length. Installation of the pipe shall be in accordance with ASTM Recommended Practice D2321. Connection(s) and fittings to the drainage system (pipes or structures) shall be deemed included in the price bid for this item.
- e. Concrete Pavers: Pavers shall be clean when placed. Pavers which are not satisfactorily clean shall be washed before placing. The pavers shall be placed according to the patterns shown on the plans, true to line and grade unless otherwise noted on the plans, sand joints shall be hand tight. The bedding course in front of the pavement shall not be disturbed or walked on during the laying of the pavers.
  - i. The pavers shall be laid on a sand base with a maximum thickness of one inch (1"). The sand cushion shall be compacted by rolling with a roller weight of one hundred fifty pounds (150 lbs.) per foot of width, or by tamping as directed by the Engineer.
  - ii. After the pavers are installed, sand shall be swept into resulting joints. Pavers shall be vibrated with a plate type compactor forcing sand to settle. Process shall be repeated until joints are full to satisfaction of the Engineer.
- f. Concrete Curb: Curb shall be constructed in independent sections and shall have smooth plane ends separated by expansion joints of the dimensions shown on the drawings. Shape of the curbs shall allow for the installation of a pit cover as shown in the shop drawings. Steel bar reinforcement between expansion joints shall be secured to chairs of the proper height to hold them in position while concrete is poured. Distance between supporting chairs shall not be greater than five (5') feet apart. Reinforcing bars at expansion joints shall be bent to the horizontal and the ends wrapped with tar paper held by duct tape.
  - i. All forms shall be set true to line and grade and held rigidly in position. They shall be either of metal or of acceptable planed and matched lumber, and of such construction that a smooth surface shall be provided. After the forms are erected and reinforcing steel is set in place, all contact

surfaces within forms shall be moistened. Concrete shall be placed in horizontal layers of uniform thickness, with each layer thoroughly consolidated before placement of the next layer. Thickness of each layer shall not exceed eighteen (18") inches with reinforced members. Stiff concrete mixes (low slump) shall be consolidated either by hand tools or by mechanical vibrators. The concrete shall be worked thoroughly around the reinforcement and around the pipe sleeves. In the use of internal vibrators, care shall be taken to avoid separation of aggregates and to avoid hitting the forms sufficiently to cause damage. Exposed concrete surfaces shall have a float finish. Surfaces shall be finished smooth and true by means of wooden or steel floats and have edges, including those of joints, rounded or chamfered.

- ii. Forms shall be left in place for a minimum of three (3) days or until the concrete has set sufficiently so that, in the opinion of the Engineer, they can be removed without damage to the curbing. The curbing shall immediately upon removal of the forms be wetted and rubbed down to a smooth and uniform surface by means of carborundum or other abrasive blocks. For this work, a competent and skilled finisher shall be employed. The Contractor shall do all the necessary work to join new curb to existing in a neat and professional manner to the satisfaction of the Engineer. The curb shape shall be formed as shown on the shop drawings.
- iii. Curb footings shall be of the same concrete as the curbs and shall be constructed as shown on the details. Concrete footings shall be installed on all curb ends and corners with concrete forming tubes of the proper diameter and cut to the required lengths.
- g. Sand: The sand shall be placed in the landing pit to the depths shown on the plans and compacted to 90% maximum dry density.
- h. Pit Cover: Contractor shall assemble and install pit cover and auxiliary panel support beams as recommended by the manufacturer and shown in the shop drawings. Covers shall sit in a ledge formed into the concrete curb as shown in the shop drawings so that the top of the rubber athletic surface is flush to the top of curb. Contractor shall demonstrate to the satisfaction of the Resident Engineer the function of the locking mechanism for the cover.

#### **B. Track Perimeter Drain Methods**

- a. Site Preparation: Excavate the area for channel placement wide enough and deep enough to accommodate the channel drain and a minimum of four (4") inch concrete encasement. Channels require a minimum of four inches of concrete support on both sides as well as underneath the channel and top of channel must be evenly aligned to the surface of the surrounding pavement.
- b. Channel Drain System: Channel drain system shall be installed in strict accordance with the Manufacturer's recommended installation instructions and the drawings. Sections of drain shall be installed from the outlet ends of the system working from the catch basins. Insert channels from above to allow ends to interlock. Channel drain sections shall be placed on brick, rebar basket, low slump concrete grout slurry, or suspended to obtain correct finished elevation. Cutting will be made, if required, by masonry or concrete saw. Cover the top of the channel with tape, plastic, or plywood strips to protect the channel surface from concrete during pouring. Place concrete in a manner that will not dislodge the channels. Any damaged components, as a result of installation or otherwise, must be immediately replaced at no additional cost to the City.

- c. Joints: Joints shall be water tight with continuous seal, as per manufacturer's recommendations.
- d. Level and Layouts: It is essential for the channel drain system to be placed in the correct alignment, and finished surface of channels drains must be perfectly level, as per manufacturer's recommendations.
- e. Clean Up: The Contractor shall provide the labor, supplies, and equipment necessary for final cleaning of surfaces and installed items. The contractor shall keep the channel drain system clean and clear of all debris throughout the construction duration. Protection shall be removed after placement of the synthetic track material, or at the discretion of the Engineer.

**C. Survey Track Lines Methods:**

- a. The Surveyor shall check tolerances for the following layers of pavements: compacted subgrade, asphalt binder, and finished grade of the asphalt top course. The surface shall not vary more than one-eighth inch in ten feet measured in any direction. The general level of the finished surface shall not deviate on a straight line from inner curb to outer curb by more than one quarter inch. Surveyor shall stretch a wire transversely across the track, from inner curb to outer curb, at 10' intervals around the entire track. Deviations exceeding tolerance limits shall be clearly marked by the Surveyor on the pavement with spray paint for correction under the item "Asphalt Pavement for Track."
- b. Surveyors shall layout and certify the location of the lane lines and calibration points. The Surveyor shall provide the Engineer with all available options permitted, including but not limited to location of finish lines, various classes of races or events to be accommodated, color code, design or markings and lane width. The Contractor shall submit all dimensions needed to properly mark the track.
- c. The Surveyor shall coordinate the work with others and supervise the marking of the running track and other field events. The Surveyor shall incorporate dimensioning as shown on the layout and marking plans in the Surveyor's work to the approval of the Engineer.
- d. The Surveyor shall perform all work necessary to calibrate the track for all track events recognized by the International Amateur Athletic Federation including the following track and field events recognized by the National Collegiate Athletic Association and the National Federation of State High School Associations. The following calibration and markings are to comply with the current rules and regulations of the IAAF, the NCAA and the NFHS:
  - 1. 100 Meter Dash
  - 2. 200 Meter Dash
  - 3. 400 Meter Dash
  - 4. 800 Meter Dash
  - 5. 1500 Meter Dash
  - 6. 3000 Meter Dash
  - 7. 1 Mile Run
  - 8. 4 x 100 Meter Relay
  - 9. 4 x 200 Meter Relay
  - 10. 4 x 400 Meter Relay
  - 11. 4 x 500 Meter Relay
  - 12. 110 Meter High Hurdles
  - 13. 400 Meter Intermediate Hurdles
  - 14. Start and Finish Lines
  - 15. Hurdle Location Markers

- 16. Lane Lines
- 17. Exchange Zones
- 18. Mark Lanes
- 19. High Jump
- 20. Long Jump/ Triple Jump
- 21. Pole Vault

- e. The critical points of the track shall be staked out as shown on the plans and every 25 feet or less between such points. The stakes shall be offset so they shall not be disturbed during construction of the track and field events. The stakes shall be stationed and cut and fill figures marked upon the side of the stake so that the top of the proposed curb can be set there from.
- f. Upon completion of the stakeout, a map showing the layout of the work, stakes and elevations, signed and sealed by the Land Surveyors shall be submitted by the Contractor to the Engineer for approval before construction of the work.
- g. Contractor shall mark locations of each side and each end of track. Location of concrete radius markers shall be established with stakes and survey tacks.
- h. "As Built" Drawing: The Contractor shall submit an "as built" drawing signed and sealed by a licensed surveyor showing all dimensions and grades. The dimensions and grades shall be guaranteed to be accurate and correct in accordance with the current rules and regulations of the International Amateur Athletic Federation. If the calibration points do not meet the minimum standards of the IAAF, the Contractor shall recalibrate and re-mark the running track and other field events at no additional cost to the city.
  - i. Date, name and address of guarantor shall appear on the drawing including a complete schedule of angles and radii necessary for calibration.
  - ii. The Surveyor shall also submit schedule of chord distances. The chord distances shall be calculated for angles less than 450 as taken from the nearest 900 mark. The chord distances shall be calculated from points at the running side of the lane line. Upon completion of the work outlined in this contract, all chord distances shall be verifiable in the field with a certified steel or fiberglass metric tape to a tolerance of +1/2".
  - iii. The Surveyor shall make all measurements and certify on the drawing that all calibration points shown on the "as built" drawing were accurately measured and properly designated on the track and where needed for field events.
  - iv. The "as built" drawing shall show the final grades of the running track after the surface tolerances have been checked and certified by the Surveyor.

#### **D. Pole Vault Box and Cover Methods**

- a. Box and cover shall be installed in reinforced concrete footings in accordance with the contract drawings and manufacturer recommendations. The pole vault box shall be aligned in the correct position and properly anchored to the concrete base. The box cover shall be set flush with the finished surface.

#### **PK-ESCR 743.5. MEASUREMENT**

For furnishing and constructing the **LONG JUMP, LANDING AND PIT**, in accordance with plans, specifications and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

The quantity of **TRACK PERIMETER DRAIN** shall be the number of **LINEAR FEET** installed in accordance with the plans, specifications and directions of the Engineer.

For surveyor's services for **SURVEY TRACK LINES** all in accordance with the plans and specifications and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid.

For furnishing and installing **POLE VAULT PIT AND COVER** in accordance with plans, specifications and directions of the Engineer, the Contractor shall receive the **LUMP SUM** price bid for each item.

#### **PK-ESCR 743.6. PRICES TO COVER**

The price bid shall be a **LUMP SUM** price for **LONG JUMP LANDING AND PIT**, and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including the slotted polyethylene drainage pipe, connection to the drainage system, broken stone base, geotextile, concrete curb, concrete pavers, sand, aluminum cover, locking mechanism, and hardware, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be a unit price per **LINEAR FOOT** of **TRACK PERIMETER DRAIN** complete the work including concrete base with fibrous reinforcement, straight and radial pieces of the channel drain, brick, edges, in-line catch basins, trash buckets, catch basin covers, connections to drainage system, and all accessories needed to complete the work, all in accordance with the plans and specifications and directions of the Engineer.

The price shall be a **LUMP SUM** of **SURVEY TRACK LINES** and shall include the cost of all labor, materials, and equipment including the checking of all surface tolerances, locating designated points, supervision of lane marking and field events, submission of drawing, 4 GB USB drive, and all other incidental expenses necessary to complete the work in accordance with the plans and specifications to the satisfaction of the Engineer.

The price bid shall be a **LUMP SUM** price for the **POLE VAULT PIT AND COVER** and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, hardware, furnishing and storing the equipment until Substantial Completion, and submittals, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Unclassified Excavation, Excavation, Lane Striping, Field Event Markings, and Resilient Sports Surface – 13mm shall be paid for separately under its respective item.

*Payment will be made under:*

**END OF SECTION**

## SECTION PK-ESCR 744 – BBQ GRILL

**WORK:** Under this Item, the Contractor shall furnish and install **BBQ-2 GRILL TYPE OR BBQ-3 GRILL TYPE**, in accordance with the plans, specifications and directions of the Engineer.

**MATERIALS:** Unless otherwise specified herein, all materials shall conform to the requirements of Section "B", Materials and Methods of Construction.

**BBQ Grill:** BBQ Grill shall be made of heavy duty steel, three-sixteenth (3/16") inch thick, thirty four (34") inches high, with two (2) twenty four (24") inch diameter grill bowls. Each grill bowl shall have a lockable swivel bottom for ash dump with a mid-hinged steel cooking grate. BBQ grill shall be finished with a black, heat resistant powder coating. BBQ Grill shall be model no. "BBG 2 SM" or "BBG 3 SM" as manufactured by Most Dependable Fountains, Inc., Arlington, TN, or approved equal.

**Mounting Plate:** Mounting plate shall be made of stainless steel, ten (10") inches in diameter. Mounting plate shall be "10" Stainless Steel Surface Carrier", as manufactured by Most Dependable Fountains, Inc., Arlington, TN, or approved equal.

**Anchor Rods:** Anchor Rods for surface mounting shall be 1/2" x 12" zinc plated steel rods and as shown in the drawings.

**Concrete Footing:** Concrete footing shall be as specified in Section ESCR-4.06 and shall be as shown in the drawings.

**Steel Bar Reinforcement:** Shall meet the requirements of the, the NYC Building Code and the latest ASTM specification for "Deformed and Plain Billet-Steel Bars for Concrete Reinforcement", Designation A-615 and in accordance with the Item "Steel Bar Reinforcement". Reinforcement shall be of the sizes and dimensions as shown in the drawings and see Section ESCR-4.14.

**INSTALLATION:** The Contractor shall install the BBQ Grills in locations as shown on the drawings per the manufacturer's instructions, and at the direction of the Engineer. Attachment to the concrete pavement shall utilize the 10" Stainless Steel Surface Carrier and anchor rods per the manufacturer's instructions. The concrete pavement and concrete footing shall be of the dimensions and at locations as shown in the drawings.

**SUBMITTALS:** All submittals shall be submitted prior to manufacture and in accordance with the requirements of the S-Pages.

**Catalog Cuts:** The Contractor shall submit catalog cuts of the BBQ Grill and Stainless Steel Surface Carrier for approval prior to installation.

**MEASUREMENT AND PAYMENT:** For each **BBQ GRILL** furnished and installed in accordance with the plans, specifications, and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** BBQ Grill and shall include the cost of all labor, materials and incidentals necessary to complete the work, including the mounting plate and anchors, concrete footings and steel bar reinforcement, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation and surrounding pavement shall be paid for separately under their respective contract items.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
PK-ESCR 744 A	BBQ – 2 GRILL TYPE	EA
PK-ESCR 744 B	BBQ – 3 GRILL TYPE	EA

END OF SECTION

**SECTION PK-ESCR 747 – ASPHALT FULL DEPTH – TENNIS COURTS**

**WORK:** Under these items, the Contractor shall furnish and install **FULL DEPTH ASPHALT PAVEMENT** and **ASPHALT PAVEMENT FOR TENNIS COURTS** in accordance with the plans, specifications, and directions of the Engineer.

**DESCRIPTION:** The asphalt pavement shall consist of a binder course and a top course to the dimensions as shown on the plans and details. The binder course shall be asphalt concrete, Type 3 and the top course(s) shall be Type 7 or Type 7F as defined by the N.Y.S. D.O.T. Standard Specifications. For tennis courts only the top course shall be installed in two (2) lifts as shown on the details. A Laser Spreader will be required for Tennis Courts. See 'Spreading of Top Course Tennis Courts Only'.

**MATERIALS:**

Asphalt: The following requirements shall apply for both Binder Course and Top Course:

Asphalt Cement shall be 100% soluble in Trichloroethylene. The mixing and placing temperature shall be 250 degrees to 325 degrees °F. The viscosity of the asphalt shall be AC 20. The mix shall have a minimum Marshall Stability of 500 lbs, flow of 8 to 16, and percent of air voids 3 to 5 percent. For full depth asphalt pavement (top and base courses) and the base course (only) for tennis courts, the asphalt mix may contain a maximum of 15% by weight of Recycled Asphalt Pavement (R.A.P.) material. The R.A.P. shall be certified by the inspection service before use and shall be free of dirt, debris, garbage, metal, glass and any other deleterious material. R.A.P. must have the binder content tested by the plant before mixing. R.A.P. shall be screened prior to mixing so that final mix meets the specification delineated below. The City reserves the right to reject the R.A.P. asphalt mix if in the determination of the Engineer, the mix is contaminated with dirt, debris, garbage, metal, or glass. R.A.P. is not acceptable for the top courses of asphalt pavement for tennis courts.

Binder Course: The material for the binder course shall meet the requirements of the latest edition of the NYSDOT Standard Specification Section 400 "Bituminous Pavements". Composition of the asphalt concrete binder shall be Type 3 as indicated in the following table:

**COMPOSITION OF BINDER TYPE 3**

<u>SCREEN SIZE</u>	<u>GENERAL LIMITS % PASSING</u>	<u>JOB MIX TOL. %</u>

Asphalt Content %	6.0-8.0	+/-0.4

Forms: The forms for this work shall be of wood of an approved type and a minimum length of ten feet (10') for tangents and curves, unless otherwise shown of the plans.

All forms shall be straight, free from bends and warps at all times, and shall be cleaned thoroughly and oiled before pavement is placed against them; this cleaning and oiling being repeated daily as the forms are moved ahead. The forms shall rest firmly upon the thoroughly compacted sub-grade throughout their entire length, shall be joined neatly and tightly and staked securely to line and grade at least two hundred feet (200') in advance of the point of placing pavement by using at least three (3) bracing pins or stakes to each ten foot (10') length of side form, so that they will resist the pressure of the pavement and the impact of the roller without springing.

Approval of Sources of Supply: Approval of the sources of supply of aggregates shall be obtained from the Engineer prior to the delivery of material.

Inspection: Equipment, materials, and preparation of the mixtures will be subject to inspection and approval at the refineries and plant as may be directed. In conjunction therewith, the

Contractor shall employ the services of an approved inspection service for the purposes of providing plant certification of the asphalt pavement mixtures conformance to these specifications.

The inspection service shall be under the jurisdiction of and shall report directly to the Engineer.

Mix Samples: The Contractor shall submit, when required by the Engineer, samples of the materials and mixtures the Contractor to use. Submittals shall be in accordance with the S-Pages. For the top course, the following samples shall be submitted:

- (a) Coarse aggregate.....2 pounds
- (b) Fine aggregate.....2 pounds
- (c) Filler..... 2 pounds
- (d) Asphalt..... 1 quart
- (e) Asphaltic mixture..... 10 pounds

Pavement Samples: The Contractor shall furnish for testing, when required by the Engineer, samples from the completed work. The areas of pavement so removed shall be replaced by new mixture and refinished without additional compensation.

Tests: Unless otherwise specifically provided, tests of materials shall be made in accordance with the latest specifications of the American Society for Testing and Materials.

Transporting: Shipments of material shall be made in tight vehicles previously cleaned of all foreign material, and delivered to the work, so that it will not become contaminated in any way.

**INSTALLATION:**

Subgrade Preparation: The subgrade shall be compacted with equipment that will yield the following density:

Cohesive Subgrade -	Minimum of 95% of AASHTO T 180 Method D density
Cohesionless Subgrade -	Minimum 100% of AASHTO T 180 Method D density

Spreading of Binder Course: Plant-Mixed binder course, shall be furnished and laid by means of a mechanical spreader of approved design to a depth which after final compaction shall be equal to the specified depth. In areas where the use of a mechanical spreader is impractical, as determined by the Engineer, other approved means of spreading and compacting may be permitted. The use of hand rakes will not be permitted. The Contractor shall use lutes where necessary.

Rolling and Compacting: Rollers used for compacting the binder course shall be well balanced, self-propelled, tandem rollers, weighing between seven (7) and eight (8) tons or approved vibratory roller. Rolling shall proceed continuously not in excess of the following rates:

<u>Method of Placement</u>	<u>Square Yards/Hour/Roller</u>
Hand	800
Machine	1200

After the final compaction, the binder course shall have a density of not less than 95% percent of the theoretical maximum density as calculated in accordance with Appendix B of the Asphalt Institute Manual, MS-2.

After the compaction of the binder course and before the placing of the top course, the binder course shall be checked for depressions. The Contractor shall check the entire area using a ten foot (10') wood or metal straight-edge. Any depression greater than one-eighth inch (1/8") shall be corrected before the placing of the top course.

Tack Coat: All contact surfaces, including binder and intermediate, shall be applied with hot asphaltic cement, RC-70 or MC-70 before the surface mixture(s) are laid.

Spreading of Top Course: The top course mixture shall be furnished and laid by means of a mechanical spreader of approved design to a depth which after final compaction shall be equal to the specified depth. In areas where the use of a mechanical spreader is impractical, as determined by the Engineer, other means of spreading and compacting may be permitted. The use of hand rakes will not be permitted. The Contractor shall use lutes where necessary.

Where suitable abutting curb or headers are not available, grade control forms satisfactory to the Engineer shall be provided for screening. No extra payment will be made for these forms, but the cost of these shall be deemed included in the price bid for this item. The forms shall be removed, or with the approval of the Engineer, may be left in place.

Mixture shall be laid only where the surface to be covered is free from loose or foreign material, dry, and only when weather conditions, in the opinion of the Engineer, are suitable.

The Contractor shall provide suitable means for keeping all small tools clean and free from bituminous accumulations.

Rolling and Compacting: Upon completion of the spreading of the top course mixture, the material shall be consolidated thoroughly and uniformly with self-propelled tandem rollers. The top course shall be free from roller marks.

Rollers used for compacting the top course shall be well balanced, self-propelled, tandem rollers, weighing between seven (7) and eight (8) tons or approved vibratory roller. The roller shall have a compression under the rear wheel of between 200 and 300 pounds per linear inch of roll at a rate not exceeding 800 square yards per hour per roller. After compaction, the surface course shall have a density not less than 97% theoretical maximum density as determined by Appendix B of The Asphalt Institute Manual MS-2.

In locations inaccessible to the roller, the compression shall be effected with vibratory plate compactors or iron hand tampers weighing not less than twenty-five (25) pounds and having a bearing area not exceeding forty-eight (48) square inches, or other impact type equipment.

Joints: Construction shall be as nearly continuous as is possible. The roller shall pass over the end of the laid mixture only when a practical necessity. When the operation of laying is interrupted, the end of the laid material shall be left unrolled until such time as work is resumed, in order that there be no joints throughout the project. If it is necessary to roll the end of the laid mixture during construction, or permit traffic to pass over such temporary end, thus consolidating it, the joint so made shall be cut back before re-commencing the operation of laying, in order to present a fresh, clean surface for contact with the newly placed material. The edges of such joints shall be painted with liquid asphalt (RC-70 or MC-70) and the use of hot smoothing irons in finishing such joints, shall not be permitted.

Spreading of Top Course for Tennis Courts Only: The top course shall be installed in two (2) lifts and laid by means of a laser spreader of approved design. After the first lift the courts shall be flooded with water and allowed to drain. Any ponding or "bird baths" remaining after 45 minutes which cover a nickel shall be filled and leveled prior to applying the second lift. Depressions greater than one-eighth inch (1/8") shall be corrected.

Finished Surface: The surface of the top course of the pavement after compression shall be smooth and true to crown and grade, free from depressions, waves, bunches, overlapping seams and unevenness in surface.

After the compaction of the top course the Contractor shall check the entire paved area for depressions, using a ten foot (10') wood or metal straight-edge. Any depressions greater than three-sixteenths of an inch (3/16") shall be corrected by removing the top course of the affected areas, and replacing with new material to form a true and even surface.

**DEFECTS:** Where defects in composition, compression or finish appear in the completed work, such finished areas shall be removed to the full depth of the course and the defective material replaced with the required thickness of pavement at the expense of the Contractor for such removing and replacing.

**COLD WEATHER:** Asphaltic pavement shall be mixed and placed in accordance with minimum placement temperature as specified in the following table:

<u>SURFACE</u> <u>TEMP. (F)</u>	<u>MINIMUM PLACEMENT TEMPERATURES</u> <u>MAT THICKNESS IN INCHES</u>					
	<u>1/2"</u>	<u>3/4"</u>	<u>1"</u>	<u>1 1/2"</u>	<u>2"</u>	<u>3"</u>
	<u>TEMPERATURE OF THE MIX</u>					
+32-40	--	--	--	305	295	280

+90	280	275	270	265	260	255

---

<u>ROLLING TIME MINUTES</u>	<u>4</u>	<u>6</u>	<u>8</u>	<u>12</u>	<u>15</u>	<u>15</u>

Unless notified by the Engineer in writing, no material shall be mixed or placed when the temperature is at, or lower than 50 degrees °F. Where paving between the temperatures of 33 and 50 degrees °F is approved in writing by the Engineer, paving shall be permitted under condition that the Engineer shall verify compliance with the minimum temperatures for both the temperature of the surface and temperature of the mix as shown in the chart above. The Contractor shall provide thermometers to verify compliance with the minimum requirements. No material shall be mixed or placed at temperatures of 32 degrees and below.

**PRECIPITATION PROBABILITY:** Placement of bituminous paving materials shall not be scheduled when the Precipitation Probability, obtained by the Contractor from the U.S. Weather Bureau within three (3) hours prior to the start of such operations, equals or exceeds fifty percent (50%). The Contractor shall notify the Engineer of the exact time at which the above information was obtained.

**MEASUREMENT AND PAYMENT:** The quantity of **FULL DEPTH ASPHALT PAVEMENT** and **ASPHALT PAVEMENT FOR TENNIS COURTS** to be paid for shall be the number of **SQUARE YARDS** of full depth asphalt pavement or asphalt pavement for tennis courts furnished and placed to the lines and grades shown on the plans or as directed by the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of Full Depth Asphalt Pavement or Asphalt Pavement For Tennis Courts, and shall include the cost of furnishing all labor, materials, and equipment, including inspection services, and other incidental expenses to complete the work in accordance with the plans and specifications and to the satisfaction of the Engineer.

All costs associated with plant inspections and laboratory tests shall be borne by the Contractor and shall be deemed included in the price bid for full depth asphalt pavement.

Excavation and foundation material, if required, shall be paid for separately under their respective contract items.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>

**END OF SECTION**  
PARKS-448

## **SECTION PK-ESCR 748 – FOUNDATION MATERIAL FOR CONCRETE (TRUCK MEASURE)**

**WORK:** Under this Item, the Contractor shall furnish and place **FOUNDATION MATERIAL FOR CONCRETE (TRUCK MEASURE)** in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall meet the requirements of the NYCDOT Standard Highway Specifications

Material for Foundation shall be a straight run of single size aggregate and shall consist of either all one and one-half (1 1/2") inch stone or all three-quarter (3/4") inch stone in accordance with ASTM C33, free from organic or other deleterious material. In addition, Foundation Material may contain no more than five (5%) percent of fines, defined as aggregates passing a No.4 sieve or smaller.

The Magnesium Sulfate Soundness loss after ten (10) cycles shall be eighteen (18%) percent or less, as per ASTM C88. Coarse aggregate may be one of the following:

- A. Broken Stone or gravel of approved quality and conforming to the requirements of the NYCDOT Standard Highway Specifications.
- B. Recycled Material consisting of at least ninety five (95%) percent by weight of the following:
  1. Recycled Portland Cement Concrete Aggregate or
  2. Recycled Portland Cement Concrete Aggregate mixed with Stone Gravel.

**LABORATORY TESTING:** The Contractor shall at the direction and discretion of the Engineer furnish a certified report by an approved Materials Testing Laboratory showing the materials composition, sieve analysis, plasticity index, and soundness of the representative samples of recycled material they propose to use.

The Engineer will deliver the samples to an independent testing laboratory. The Contractor shall bear the responsibility for all costs associated with laboratory testing. No recycled material shall be delivered to the site until positive test results have been obtained. The Engineer reserves the right to reject on or after delivery any material which does not, in their opinion, meet these specifications.

### **INSTALLATION:**

**Preparation of Fine Grades for New Construction:** Before any concrete is placed upon fine grade, the fine grade shall be prepared to line and grade and compacted where practicable with an approved self propelled roller weighing not less than ten (10) tons. All hollows and depressions developed under rolling shall be filled with acceptable material and rerolled. This process of shaping, filling, and rolling shall be repeated until no depressions develop.

The Contractor shall remove from the subgrade all debris, foreign material, and all other undesirable material designated by the Engineer. The fine grade shall not be muddy or otherwise unsatisfactory when the pavement is placed upon it. If the fine grade becomes rutted or displaced, due to any cause whatsoever, the Contractor shall regrade same without additional payment.

Preparation of Existing Foundation: Existing foundation material shall be supplemented as required to achieve the required thickness shown on the plans or provide for positive drainage of completed pavement.

Spreading: Foundation material shall be evenly spread on prepared subgrade or existing foundation in the position shown on the plans or as directed by the Engineer. Foundation material shall be laid in four (4") inch layers (maximum) and rolled while wet with a seven (7) to twelve (12) ton tandem roller (or other approved method satisfactory to the Engineer) to the thickness shown on the plans or as directed by the Engineer.

**MEASUREMENT AND PAYMENT:** The quantity of **FOUNDATION MATERIAL FOR CONCRETE (TRUCK MEASURE)** to be paid for under this Item shall be the number of **CUBIC YARDS**, measured in trucks as delivered, furnished and placed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **CUBIC YARD** of Foundation Material For Concrete (Truck Measure) furnished and placed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, including laboratory testing (if necessary) and preparation of fine grades, all in accordance with the plans and specifications, to the satisfaction of the Engineer

Excavation shall be paid for under its respective Item.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 748</b>	<b>FOUNDATION MATERIAL FOR CONCRETE (TRUCK MEASURE)</b>	<b>C.Y.</b>

**END OF SECTION**

**SECTION PK-ESCR 749 – FOUNDATION MATERIAL FOR ASPHALT (TRUCK MEASURE)**

**WORK:** Under this item the Contractor shall furnish and place **FOUNDATION MATERIAL FOR ASPHALT (TRUCK MEASURE)** in accordance with the plans, specifications, and directions of the Engineer.

**INTENT:** The intent of this item is to provide sound foundation/base material for installation of asphalt pavement on poor subgrade or for certain sports pavement including, but not limited to, tennis, running track, and roller hockey. See Standard Detail, Pavement Details No. 1 for all applications.

**MATERIALS:** Unless otherwise herein specified, all materials and methods of construction shall comply with the requirements of the NYCDOT Standard Highway Specifications.

Material for foundation shall consist of coarse aggregate per ASTM C33, free from organic or other deleterious material. Coarse aggregate shall be graded within the following limits:

<u>Passing Sieve (Dry Analysis)</u>	<u>Percent by Weight</u>
2"	100
1/4"	30-65
No. 40	5-40
No. 200	0-10

The Magnesium Sulfate Soundness loss after four (4) cycles shall be twenty percent (20%) or less per ASTM C88.

Coarse aggregate shall be Broken Stone or Gravel of approved quality conforming to the requirements of the NYCDOT Standard Highway Specifications". **No recycled material shall be permitted.**

**LABORATORY TESTING:** The Contractor shall at the direction and discretion of the Engineer, or when quantities exceed thirty (30) cubic yards , furnish a certified report by an approved Materials Testing Laboratory showing the materials composition, sieve analysis, plasticity index, and soundness of the representative samples of material they proposes to use.

The Engineer will deliver the samples to an independent testing laboratory and the Contractor shall bear the responsibility for all costs associated with laboratory testing. The Engineer reserves the right to reject on or after delivery any material, which does not, in their opinion, meet these specifications.

**INSTALLATION:**

**PREPARATION OF FINE GRADES FOR NEW CONSTRUCTION:** Before any aggregate is placed upon fine grade, the fine grade shall be prepared to line and grade and compacted where practical with an approved self propelled roller weighing not less than ten (10) tons. All hollows and depressions developed under rolling shall be filled with acceptable material and shall again be rolled. This process of shaping, filling, and rolling shall be repeated until no depressions develop.

The Contractor shall remove from the subgrade all debris, foreign material, and all other undesirable material designated by the Engineer. The fine grade shall not be muddy or otherwise unsatisfactory when the pavement is placed upon it. If the fine grade becomes rutted or displaced, due to any cause whatsoever, the Contractor shall regrade same without additional payment.

**SPREADING:** Foundation material shall be evenly spread on prepared sub-grade in the position and to the depths shown on the plans or as directed by the Engineer. Foundation material shall be laid in four inch (4") layers (maximum) and rolled while wet with a seven (7) to twelve (12) ton tandem roller (or other approved method satisfactory to the Engineer) to the thickness shown on the plans or as directed by the Engineer.

**SUBMITTALS:** All submittals shall be submitted prior to installation and in accordance with the requirements of the S-Pages.

A three (3) pound bag of stone aggregate shall be submitted for approval with a sieve analysis and the name of the supplier.

**MEASUREMENT AND PAYMENT:** The quantity of **FOUNDATION MATERIAL FOR ASPHALT (TRUCK MEASURE)** to be paid for under this item shall be the number of **CUBIC YARDS** of material installed, measured in trucks used for delivery, at the site of the work, in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **CUBIC YARD** of Foundation Material for Asphalt furnished and placed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, including laboratory testing (if necessary) and preparation of fine grades, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

Excavation shall be paid for under its own contract item.

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 749</b>	<b>FOUNDATION MATERIAL FOR ASPHALT (TRUCK MEASURE)</b>	<b>C.Y.</b>

**END OF SECTION**

## SECTION PK-ESCR 751 – STEEL PICNIC TABLE

**WORK:** Under these items the Contractor shall furnish and install **STEEL PICNIC TABLE** and/or **STEEL PICNIC TABLE – ACCESSIBLE** in accordance with the plans, details, specifications and directions of the Engineer.

**MATERIALS:** Unless otherwise herein specified, all materials of construction shall comply with the requirements of the NYCDOT Standard Highway Specifications.

**CONCRETE:** Concrete for footings shall be as described in Section ESCR-4.06 and as shown on the plans and as directed by the Engineer.

**PICNIC TABLES:** Picnic tables shall be item no. “APT #8 R Type Perforated Steel with Thermoplastic Coating (Stationary/Embedded Post)” Multi-Pedestal Picnic Table as manufactured by RJ Thomas Manufacturing Co., Inc., Cherokee, IA or approved equal.

**Standards:** Picnic table and bench standards shall be consist of galvanized high tensile strength steel tubing and frames. The tubular supports shall be provided with base angles.

The structural frame shall be three (3”) inches x six (6”) inches x one eighth (1/8”) inch thick steel tubing, frame finish hot dip galvanized, and shall be continuously welded to the tubular supports and the base angles as indicated on the plans. All components of the frameshall be in accordance with ASTM A123. Steel shall meet the specifications for ASTM A500, Grade B which has a minimum tensile strength of 58,000 psi and a minimum yield point of 42,000 psi. Exposed ends of frame posts shall be sealed with welded on end caps.

**Table and Seat Slats:** Table and seat slats shall be made from fourteen (14) gauge perforated steel with nine-sixteenths inch (9/16”) diameter holes punched on thirteen – sixteenths inch (13/16”) straight line centers. Perforated steel shall be thermoplastic coated with UV stabilized coating which is PVC free and phthalate free. After being cleaned, components shall be heated to 550-600 degrees and then lowered into an air-fluidized bed of colored polyethylene powder, which is fused and bonded to the heated metal and baked at a high temperature to cure. Thermoplastic coating shall be a textured matt finish polyethylene which is durable and colorfast, with a DNI rating. The thermo plastic coating shall be applied to a film thickness of 3 to 6 mils without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point. Color shall be “Black”, unless otherwise shown on contract drawings.

**HARDWARE AND FITTINGS:** All hardware and fittings shall be as shown on the drawings. All fittings shall be steel plate of the best quality. Steel brackets shall be ten (10) gauge galvanized steel. All fittings and hardware shall be hot-dipped galvanized, providing an acceptable substrate so that applied powder coatings will not peel off. Ensure surfaces to be coated are clean and dry and free of grease, dust, rust, etc. No lacquer, urethane or other coatings which would prevent proper adhesion of powder coating shall be applied to hardware or fittings. All coated parts shall first receive corrosion inhibiting phosphate free, high pressure, high temperature treatments to improve the adhesion of the surface coating. The TGIC Polyester shall be applied to pipe and fittings at a film thickness of 3 to 6 mils by an electrostatic spray process and bake finished per manufacturer’s directions. The TGIC – Polyester shall be applied without voids, tears or cuts that reveal the substrate and shall thoroughly adhere to the metal without peeling when scratched with a pick device or knife blade point. Color to be black unless otherwise indicated on the plans.

Screws and anchor bolts are to have vandal proof heads. All other bolts shall have heads peened after installation.

**LABORATORY TEST FOR TGIC – POLYESTER POWDER COAT:** At the discretion of the Engineer, a sample of the TGIC Polyester powder coated hardware and/or fittings shall be laboratory tested for bonding of the powder coating to the surface. Test shall be the CrossHatch test per ASTM D3359, method B. Failure to satisfactorily pass this test shall be a basis for rejection.

**INSTALLATION:** Picnic tables shall be placed at locations and installed in concrete footings as shown on the plans with one-half inch (1/2”) diameter stainless steel anchors placed through frame supports and as directed by the Engineer.

**Touch-Up and Repair:** For minor damage caused by installation or transportation, clean damaged area, then:

1. On damaged galvanized surfaces, apply organic zinc repair paint complying with ASTM A780, then repair powder coating per number 2 below. Galvanizing repair paint shall have 6 percent zinc by weight. Thickness of repair paint shall be not less than that required by ASTM A123.
2. On damaged powder coated surfaces, touch-up finish in conformance with manufacturer’s recommendations. Provide touch-up such that repair is not visible from a distance of six (6) feet.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of . S-Pages.

**Shop Drawings:** Contractor shall submit shop drawings showing all dimensions, materials, and details for approval. Tables shall not be ordered until approval is received.

**MEASUREMENT AND PAYMENT:** For each **STEEL PICNIC TABLE** and **STEEL PICNIC TABLE – ACCESSIBLE** furnished and installed, in accordance with the plans, specifications and directions of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** type of picnic table and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including hardware and concrete footings all in accordance with the plans and specifications to the satisfaction of the Engineer.

Excavation shall be paid for separately under its own contract item.

**END OF SECTION**

## SECTION PK-ESCR 753 – TOPSOIL FOR PLANTING PITS AND BEDS

### PK-ESCR 753.1. DESCRIPTION

- A. This section describes the furnishing and installation of **TOPSOIL FOR PLANTING PITS AND BEDS** in accordance with the plans, specifications and directions of the Engineer.

### PK-ESCR 753.2. MATERIALS

- A. Topsoil: Shall be a sandy/ loam, friable soil that has been removed to a depth of one foot (1') or less, if subsoil is encountered. Topsoil shall be of uniform quality, free from hard clods, stiff clay, hard pan, sods, partially disintegrated stone, lime, cement, ashes, slag, concrete, tar residues, tarred paper, boards, chips, sticks, or any other undesirable material. No topsoil shall be delivered in a frozen or muddy condition.

- a. Organic Content: Topsoil shall contain at least three percent (3%) organic matter determined by loss on ignition, of moisture-free samples dried in accordance with the current method of the Association of Official Agricultural Chemists. The organic matter shall not exceed twelve (12%).
- b. The acidity range shall be pH 6.0 to pH 7.5 inclusive.
- c. Topsoil shall consist of the following percentages of sand, silt and clay. Any soil that does not meet the requirements below will be rejected and removed from the site.

Sand (0.05 to 2 mm)	40% to 75%
Silt (0.002 to 0.05 mm)	15% to 65%
Clay (<0.002 mm)	20% maximum

- d. Nutrients: Topsoil test results shall show recommendations for soil additives or fertilizers to correct nutrient deficiencies as necessary. Soil additives and fertilizers shall be incorporated as necessary at the Contractor's expense. Follow the fertilizer recommendation as provided by the required laboratory.
- e. Electrical Conductivity: maximum of 1.0 mmhos/cm. A higher level would indicate excessive salt content and material will be rejected and removed from the site.
- f. Testing Frequency: The Contractor shall at the direction and discretion of the Engineer, or when quantities exceed one hundred (100) cubic yards, furnish a certified report of the approved Testing Laboratory showing the analysis of representative samples of the topsoil which they propose to use. All samples are to be received by the Engineer and delivered to the laboratory, and the price bid shall include inspection and laboratory charges. Samples shall be submitted 48 hours prior to the delivery of topsoil.
- g. No topsoil shall be delivered until the approval of samples by the Engineer, but such approval shall not constitute acceptance. The Engineer reserves the right to reject on or after delivery any material that does not, in their opinion, meet these specifications.

- B. Compost: As defined under the item "Compost."

### PK-ESCR 753.2.1. SUBMITTALS

- A. Testing Laboratory Qualifications: Submit qualifications of Soil Testing Laboratory to be utilized for soil testing, including the resume of the staff anticipated to perform the required

work of the project. Once approved, the contractor shall use the same soil testing laboratory for all testing, unless otherwise approved in writing by the Engineer.

- B. Proposed Samples and Test Results: Submit two (2) five pound (5 lb.) bags to the Engineer, with the testing report attached, for approval prior to delivering material to the site.
- C. The Contractor shall at the direction and discretion of the Engineer, or when quantities exceed one hundred (100) cubic yards, furnish a certified report showing the analysis of representative samples of the topsoil which they propose to use. Testing shall be performed by the laboratory as approved in writing by the Engineer. Laboratory testing performed more than six months prior to the Contractor's submittal date will be rejected. The testing shall include: pH, organic matter content (loss on ignition method), soluble salt level and soil textural analysis. Price bid shall include all inspection and laboratory fees.
- D. No topsoil shall be delivered to the site until the approval of samples by the Engineer, but such approval shall not constitute acceptance.
- E. Delivery ticket with name and address of vendor, date, and estimated volume must be supplied to the Engineer prior to truck measurement.

#### **PK-ESCR 753.2.2. QUALITY CONTROL**

- A. Soil Testing Laboratory: An independent soil testing laboratory with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein, including the ability to make recommendations about soil blending ratios and methods, amendment recommendations, and issuing reports as specified herein.
  - a. Verify Testing Laboratories have the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein.
  - b. Subject to meeting the requirements, the following are acceptable testing laboratories:
    - i. Physical and Chemical Testing of Soils:
      - 1. Rutgers Cooperative Research & Extension Testing Laboratories, New Brunswick, NJ, (848) 932-9295.
      - 2. Penn State Analytical Services Lab, University Park, PA, (814) 863-0841
      - 3. McNitt & SerenSoil Testing, LLC, State College, PA, (610) 360-5985.
      - 4. Turf & Soil Diagnostics – NY, Trumansburg, NY, (855) 769-4231.

#### **PK-ESCR 753.2.3. DELIVERY, STORAGE, AND HANDLING**

- A. Accessory and Packaged Materials:
  - a. Store and handle packaged materials in strict compliance with manufacturer's instructions and recommendations. Protect all materials from weather, damage, injury and theft.
- B. Bulk Materials:
  - a. Sequence deliveries to avoid delay. On-site storage space is permissible only with written notice from the Engineer. Coordinate material deliveries only after preparations for placement of planting soil have been completed.

- b. Stockpile Topsoil without intermixing with other materials.
- c. Stockpiled topsoil shall not be placed in mounds greater than six feet high. Provide all means and methods required to prevent anaerobic conditions within stockpiles at no additional cost to the Owner.
- d. Place, grade, and shape stockpiles to drain surface water. Cover stockpiles to prevent windblown dust and protect from erosion.
- e. Topsoil that is stockpiled on site for more than 24 hours shall be covered with tarpaulin or other soil erosion system acceptable to Engineer. Protect stockpiles from contamination from other materials, from erosion and deposition of water and wind borne materials of any kind.
- f. Prohibit vehicular and pedestrian traffic on stockpiled topsoil.

C. Environmental Requirements:

- a. Do not deliver handle, mix, haul, or deliver topsoil when excessively dry, wet, or frozen. Topsoil shall not be handled, mixed or hauled when wet, during or immediately after a heavy rainfall. Topsoil should be handled only when the moisture content is less than or equal to the optimum water content. If the topsoil glistens or free water is observed when the topsoil is patted in the palm of hand, the topsoil is too wet and shall not be worked. The Engineer shall determine if the topsoil is too wet to handle.

D. Delivery and Approval:

- a. The Contractor shall notify the Engineer a minimum of 48 hours prior to the intended topsoil delivery date. All imported topsoil shall be delivered in trucks and will be subject to visual inspection and additional testing. The topsoil shall NOT be spread until the Engineers' sampling and testing is completed, unless otherwise directed. The Engineer reserves the right to reject any topsoil which does not fall within acceptable limitations of this specification and the initial submittal to design including the approved sample and the approved test report. Where the topsoil is rejected, it shall be immediately removed from the site. Where it has been determined by the Engineer that soil amendments are allowable, the correction shall be made at the Contractor's expense, except as outlined below. Additional testing after amending shall also be at the Contractor's expense. All testing shall be performed by the approved testing laboratory.
- b. Engineer's determination based on test results of delivered material: Under no circumstances shall the organic content exceed twelve percent (12%). Should the Engineer's test results of delivered material show organic content greater than twelve percent (12%), the soil shall be rejected and removed from the site. Should test results show pH between pH 5.0 and 6.0, and where directed by the Engineer, limestone may be added at the Contractor's expense to bring the soil to the required minimum pH 6.0. The Contractor will be required to re-test after incorporation of limestone to assure a minimum pH 6.0. Should Engineer's test results of delivered material show a pH greater than 7.5 the soil shall be rejected and removed from the site.
- c. The Engineer reserves the right to reject on or after delivery any material that does not, in their opinion, meet these specifications.
- d. APPEAL PROCESS: The Engineer shall visually check for discrepancies between the delivered soil and the approved submittal and sample. If the Engineer suspects

that the topsoil delivered to the site has excessively high levels of organic matter, clay, etc. that would not be within the allowable levels listed in this specification, the soil will be rejected until additional testing proves otherwise. Should the Contractor contest the Engineer's determination, the Engineer will take samples so additional tests may be performed at Contractor's expense. Testing shall be performed by the approved testing laboratory. These results shall be considered final.

**PK-ESCR 753.2.4. SUPPLIERS**

- A. Subject to meeting the requirements, the Topsoil material is available from the following suppliers:
  - a. Island Topsoil, Syosset, NY
  - b. Long Island Compost, Yaphank, NY
  - c. Natures Choice, Jersey City, NJ
  - d. New York Recycling and Materials, Inwood, NY
  - e. Approved equal.

**PK-ESCR 753.3. METHODS**

- A. Preparation of Subgrade: Hollows, depressions, and gullies shall be filled with acceptable material free from stones over two inches (2") in diameter, cinders, rubbish, and other unsuitable material. All surplus material and debris shall be removed and disposed of as directed by the Engineer. Loosen subsoil by scarifying, ripping or tilling using disks, harrows or other suitable equipment to a depth of (4"- 6") immediately before placing any topsoil. Repeat cultivation in areas where equipment used for hauling and spreading topsoil has compacted subsoil.
- B. Placement and Spreading of Topsoil: No topsoil shall be handled when, in the opinion of the Engineer, it is too wet. Place and spread approved topsoil in dry weather on dry unfrozen grade. Topsoil for groundcover and herbaceous plant areas shall be mixed with compost in the proportions of seven (7) cubic yards of topsoil to two (2) cubic yards of compost and spread to a compacted depth of nine (9"), or as indicated on the drawings. No deduction shall be made for the volume of compost in the measurement of topsoil quantities.
- C. Preparation of Final Grade: Thoroughly cultivate topsoil to minimum depth of (4") by rototilling or hand methods where compaction has occurred and to break up all soil lumps. Hand rake until surface is smooth.

**PK-ESCR 753.4. MEASUREMENT**

- A. The quantity of TOPSOIL FOR PLANTING PITS & BEDS to be paid for under this Item shall be the number of CUBIC YARDS of topsoil furnished, mixed with compost and, placed and incorporated in the completed work in accordance with the plans, specifications, and directions of the Engineer, measured in trucks used for delivery, at the site of the work. No topsoil shall be furnished until ordered by the Engineer.

**PK-ESCR 753.5. PRICES TO COVER**

- A. The contact prices per cubic yard (CY) for Item No. PK-ESCR 753 TOPSOIL FOR PLANTING PITS & BEDS shall cover the cost of all labor, materials, and equipment necessary to prepare topsoil areas, test, furnish, place, and incorporate compost and all other work incidental thereto, in accordance with the plans and specifications, to the satisfaction of the Engineer.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>

**END OF SECTION**

## SECTION PK-ESCR 764 – TREE AND PLANTING PROTECTION

### PK-ESCR 764.1. INTENT

This section describes the work of providing a Tree and Planting Protection around existing trees and planting beds during construction.

### PK-ESCR764.2. DESCRIPTION

The work shall consist of the fabrication, furnishing, installation, erection, maintenance, and subsequent removal and disposal of Tree and Planting Protection around existing trees which are designated to remain.

### PK-ESCR 764.3. MATERIALS

All timber shall be Douglas Fir Grade No. 1. Fasteners, such as nails, shall meet the standard industrial fastener specifications for the intended application, and be galvanized in conformance with ASTM Designation A 123.

Plastic Barricade Construction fencing fabric - Color Orange. Manufactured by Allied Products Group, 751 North Bolingbrook Drive, Bldg.16, Bolingbrook, Illinois 60440, or approved equal. Fabric is 5'-0" wide with nominal mesh openings of 1/4"-2" and shall conform to the following requirements:

1. Tensile strength range of 2000 - 2310 P.S.
2. Impact load of 4 to 4.5 foot pounds.
3. Service temperature range between -40 to +200 degrees F.
4. Elongation at break % to be 500%.
5. Weigh per 100' roll to be 30lbs.

### PK-ESCR 764.4. METHODS

The Contractor shall construct and install Tree and Planting Protection as shown on the Drawings. All work shall conform with National Design Specifications for Stress Grade Lumber and its fastenings.

All timber at the site of the work shall be stored in piles on supports at least twelve (12") inches above the ground surface, and so piled as to prevent warping and to shed water. When required by the Engineer, it shall be protected from the weather by suitable covering. The timber shall be close-stacked. The ground under and in the vicinity of all stacks shall be cleared of weeds and rubbish and shall be drained to prevent accumulation of water.

Workmanship shall be first class and only competent carpenters shall be employed. All timber shall be accurately cut and framed to a close fit in such manner that the joints will have even bearing over the entire contact surfaces. No blocking or shimming will be allowed in joints. Timber shall be cut off with a saw; no axe is to be used. Unless otherwise specified, heads of nails and spikes shall be driven with just sufficient force to set the heads flush with the surface of the wood. Deep hammer marks in wood surfaces shall be considered evidence of poor workmanship and sufficient cause for rejection of the pieces affected.

The timber shall be carefully handled, without sudden dropping, breaking of outer fibers, bruising, or penetrating the surface with tools. The timber may be handled with rope slings.

Protective Tree Barriers shall be maintained for the duration of the contract in a condition safe to the public and satisfactory to the Engineer. Upon completion of construction work around the area, all Protective Tree Barriers shall be disassembled, removed and disposed of away from the site.

**PK-ESCR 764.5. MEASUREMENT**

The quantity of Temporary Wooden Tree Guards to be measured for payment shall be the number of EACH Temporary Wooden Tree Guard actually constructed according to the Contract Drawings, around tree and planting which is to remain, and subsequently removed at each location as directed by the Engineer.

The quantity of Temporary Wooden Tree Guard for Groves to be measured for payment shall be the linear feet of Temporary Wooden Tree Guard for Groves actually constructed according to the Contract Drawings, around tree and planting which is to remain, and subsequently removed at each location as directed by the Engineer.

**PK-ESCR 764.6. PRICES TO COVER**

The contract price bid per each type of Temporary Wooden Tree Guard shall cover the cost of furnishing all labor, materials, plant, equipment, insurance, and incidentals required to construct, maintain and subsequent removal of the barrier in the locations as directed by the Engineer, in accordance with the Contract Drawings, the specifications, and the directions of the Engineer.

The contract price bid per linear foot of Temporary Wooden Tree Guard for Groves shall cover the cost of furnishing all labor, materials, plant, equipment, insurance, and incidentals required to construct, maintain and subsequent removal of the barrier in the locations as directed by the Engineer, in accordance with the Contract Drawings, the specifications, and the directions of the Engineer.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 764 A</b>	<b>TEMPORARY WOODEN TREE GUARD</b>	<b>EA</b>
<b>PK-ESCR 764 B</b>	<b>TEMPORARY WOODEN TREE GUARD FOR GROVES</b>	<b>L.F.</b>

**END OF SECTION**

**SECTION PK-ESCR 781 – ITS SINGLE MODE, FIBER OPTIC CABLE, 12 STRAND**  
**SECTION PK-ESCR 782 – ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND**  
**SECTION PK-ESCR 783 – ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND,**  
**REDUCED OD, HIGH FLEXIBLE TYPE**  
**SECTION PK-ESCR 784 – ITS SINGLE MODE, FIBER OPTIC CABLE, 216 STRAND**

**GENERAL:**

Under this item, the contractor shall furnish and install new, single mode (SM) fiber optic cable used for the NYC DOT ITS communications backbone, distribution network and equipment drops, include all passive components and miscellaneous equipment as necessary for a complete cable plant as shown in the plans and/or as directed by the Engineer.

Backbone, data distribution and equipment drop cables refer to the functional applications of the fiber optic cable, as defined below, and not the type/ratings of fiber cable.

The quantity and types of fibers contained in each cable shall be in accordance with the plans.

The fiber optic cables will be used in harsh overhead and underground environments within NYC for Traffic control, ITS and outdoor general structure to structure fiber communications. The cable shall be rated for outdoor (outside plant), in-conduit use, direct burial and for exposed environment wherever exposed to UV rays. The cables shall be rodent resistant.

**Materials:**

Single mode fiber optic cable shall incorporate a water swellable tape, loose buffer tube cable design.

Fiber optic cable shall be suitable for installation in conduit in an outside or underground urban cable plant environment.

The fiber optic cable shall be all dielectric type.

The fiber cable shall meet the requirements of the United States Department of Agriculture Rural Utility Service 133A.3.2.(RUS) 7 CFR1755.900, the requirements of ANSI/ICEA Standard for Fiber Optic Outside Plant Communications Cable, ANSI/ICEA S-87-640-1999, TIA/EIA FOTP Standards 455 and UL 1666 standard minimums.

Fiber Optic cables shall be new, unused and of current design and manufacturer.

The ITS Fiber Cable Manufacturer shall be the approved NYC DOT – Signals ITS fiber cable manufacturer:

Prysmian Group – General Cable US  
North American Headquarters  
4 Tesseneer Drive  
Highland Heights, KY 41076

ITS Fiber Cable series:

Express LT (Gel Filled, Dielectric, Rodent resistant)

Reduced diameter, Bend-Optimized, Gel filled, ITS Fiber Optic cable, where required, shall be:

Single mode, Compact, single jacket solution for Outside Plant use. Cable shall be multi-purpose, loose tube cable offering a 19% reduction in diameter and 30% reduction in weight

over standard loose tube designs while meeting or exceeding RUS/RDUP, GR20, G.652.D SSMF and G.657.A2. industry standards.

The reduced diameter fiber cable shall be of the type designed to reduce the cable bend radius for flexible use in tight spaces such as smaller pedestals, hand holes and for improved cold temperature performance. The reduced diameter fiber cable shall have dual rip cords for easy jacket removal.

**Optical Requirements:**

This specification contains minimal design and test values for all-important mechanical, optical, and environmental parameters and as such, is the basis for all incoming inspection and acceptances.

The optical fibers shall meet the requirements of EIA/TIA-492CAAB “Detail Specifications for Class IVa Dispersion-Unshifted Single Mode Optical Fiber Cable with Low Water Peak” and ITU recommendation G.652.D, “Characteristics of Single-Mode Optical Fiber Cable”.

Maximum attenuation at:

1310 nm	0.4 decibels/kilometer
1383 nm	0.4 dB/km
1550 nm	0.3 dB/km
1625 nm	0.3 dB/km

Fiber attenuation shall be uniform with no discontinuities greater than 0.05 dB at 1,310 nm and 1,550 nm.

The attenuation measurements shall be in accordance with the latest revisions of EIA/TIA 455 Standards FOTP-20, 59, 61 and 78. The average change in attenuation at extreme operational temperatures (-40° C to 70° C [-40° F to 158° F]) shall not exceed 0.05 dB/cm at 1,550 nm. The magnitude of the maximum attenuation change of each individual fiber shall not be greater than 0.15 dB/km at 1,550 nm. The change in attenuation measurements shall be in accordance with EIA/TIA Standard FOTP-3.

Fiber macro bending attenuation shall not exceed the following under the stated conditions:

<b>Condition</b>	<b>Wavelengt</b>	<b>Maximum</b>
1 turn, 32±2 mm OD mandrel	1550 nm	0.50 dB
100 turns, 50±2 mm OD	1310 nm	0.05 dB
100 turns, 50±2 mm OD	1550 nm	0.10 dB
100 turns, 60±2 mm OD	1550 nm	0.05 dB
100 turns, 60±2 mm OD	1625 nm	0.05 dB

Water immersion at 23° C ±2° C: ≤ 0.5 dB/km at 1,310; 1,550 and 1,625 nm

Cutoff Wavelength: ≤1260 nm.

Mode-Field Diameter: 9.2 ±0.4 nm at 1,310 nm. 10.4±0.5 nm at 1,550 nm.

Zero Dispersion Wavelength: 1,312±10 nm.

Zero Dispersion Slope: ≤0.092 ps/(nm\*km).

Total Dispersion: ≤3.5 ps/(nm\*km) at 1,285-1,330 nm.

≤18 ps/(nm\*km) at 1,550 nm.

≤22 ps/(nm\*km) at 1,625 nm.

Polarization Mode Dispersion: ≤0.2 ps/(nm\*km).

### **Mechanical Requirements:**

Optical Fiber strands:

All optical fiber strands shall be: Corning SMF-28, Draka-BendBright™ or Prysmian OneSpec™ brand, single mode type or Engineer and NYC DOT Signals approved equivalent manufacture.

All glass fiber strands within a given cable shall be from the same manufacturer and shall contain no factory splices.

Each fiber shall conform to the following minimum requirements:

- Typical Core Diameter: 8.3 nm
- Cladding Diameter: 125.0±1.0 nm
- Core-to-Cladding Concentricity: ±0.8 nm
- Cladding Non-Circularity: ±1.0%

### **Fiber Cables - Delivery Requirements:**

Fiber cables shall be delivered, curbside, shipped on new, un-damaged, wood or reusable steel reels, without any splices.

Three (3) meters of each end of the fiber cable shall be accessible for testing upon receipt at the Contractor's facility and again immediately prior to installation/placement.

Both ends of the fiber cable shall be sealed to prevent moisture ingress.

A durable weather resistant tag or label on each reel shall contain the following information:

- Manufacturer's name.
- Cable type.
- Length of cable contained on the reel in meters and feet.
- Cable reel serial number.

Attached to the reel, in a weather resistant envelope, shall be the detailed reel shipping record. The shipping record shall contain the following, in addition to the above information:

- Date of manufacture.
- Date cable tested.
- Cable characteristics (size, attenuation for each fiber).
- Cable reel serial identification number.

### **Fiber Optic-Connectors:**

Fiber Optic Connectors shall be furnished and installed incidental to the cost of installing fiber optic cables. The connectors shall be factory installed. Field installation of fiber connectors shall only be permitted with the express consent of the Engineer and field connectorization will be considered on a case by case basis.

Fiber Optic connectors shall meet the following requirements:

- Corning UniCam® Type ST, twist lock (bayonet). Blue Color-coded boot
- Ceramic ferrules
- Single Mode (OS/2)
- Fiber secured within the ferrule with epoxy, as specified by the connector or epoxy manufacturer.
- Operating Temperature: -20° C to +70° C
- Low Insertion loss: 0.5 dB maximum
- Return loss: 55 dB minimum
- Field installable, Pretium® Performance

- Factory Polished
- 9/125 µm Fiber

**Construction:**

**ITS Cable-General:**

All fibers in the fiber optic cables shall be spliced, terminated, or both within the field cabinets, splice cases, signal patch and splice points and pull boxes, as designated in these contract documents and/or as directed by the Engineer.

The Contractor shall furnish all equipment, specialty test instruments and qualified fiber optic splicing technicians, as required for the installation, termination, testing and commissioning of the fiber optic cables.

The Contractor shall provide all passive components required to form a complete cable plant including, but not limited to, connectors and breakout kits, supports and ancillary components required for the installation of the cable plants including terminators, attenuators, moisture and water sealants, fiber approved lubricant, identification tags, cable end caps and cable management devices such as devices for the support and racking of slack fiber cable.

The components supplied shall be commercially available, state-of-the-art components, suitable for this application.

The backbone, distribution and drop optical fiber cable designations used in the plans indicate the function and strand counts of the fibers contained in the cable and not necessarily the type of cable.

Backbone fiber carries critical NYC DOT ITS backbone data and video between end points, hubs, active hubs and the Joint Traffic Management Center (JTMC).

Distribution fiber carries video from CCTV installations and data from field end point devices to hubs.

Drop fiber connects field end point devices for aggregation up to the distribution/backbone optical fiber cable.

**Preinstallation Requirements:**

The Contractor shall be entirely responsible for the fiber optic cable security, quality and adherence to these specifications, from its manufacture to the time the network is accepted by the Engineer.

Prior to installation of the cable, the Contractor shall submit a written Fiber Cable Installation Plan. The Install Plan shall be submitted to the Engineer for approval, at least sixty (60) days prior to the date the fiber installation work is to begin. The plan shall include an itemized work Method of Procedure (MOP) and written proof of appropriate training for all personnel who will be installing, terminating and testing the fiber system.

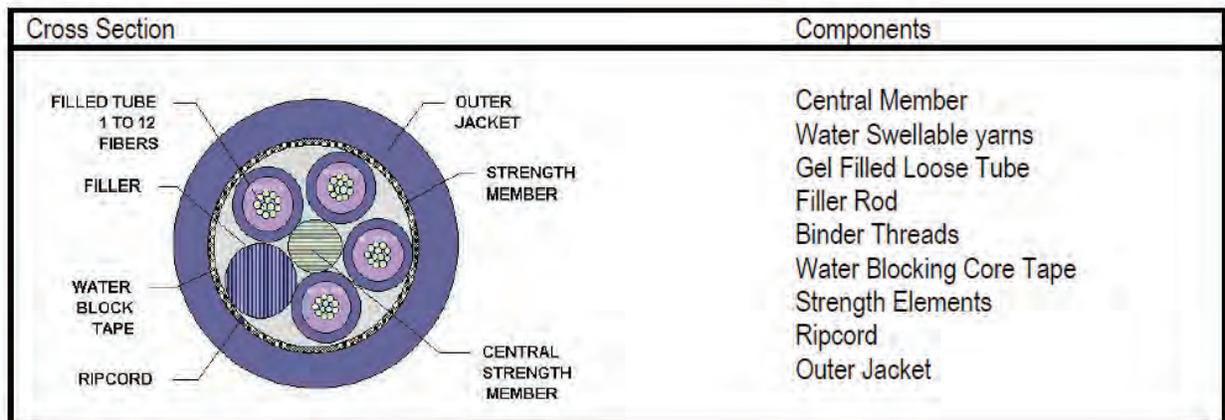

**Cable Plant - Design Submission:**

The Contractor shall also submit a detailed Fiber Cable Plant - Design Submission in working shop drawing format to the Engineer for approval. The Engineer shall have thirty (30) working days to review this submission. The design submission shall include the following:

- 1) Catalog cuts (TDS) and associated shop drawings for all cable, connectors, splice equipment, splice enclosures, splice trays, Patch panels, cable installation and test equipment in adequate detail to verify compliance with the specifications.

- 2) Manufacturer's recommended cable installation techniques such that the optical and mechanical characteristics of the cables are not degraded at the time of installation. The proposed installation methods shall be on site (field) reviewed by a qualified fiber technician of the cable manufacturer. The installation review recommendations shall include the following:
- a) Cable manufacturer's approved cable pulling lubricants for use on the cable and the intended method of lubricant application. Lubricants which are not factory approved will not be permitted.
  - b) Cable Placement Installation set-up and pull plans, including sizes, types and location of fiber rollers, feeder guides, tension gauge (make and model number), attachment of pulling jig to fiber jacket, direction and length of each pull.
  - c) Maximum cable pulling tensions, which shall specify both pulling effort from the cable conductors and for pulling solely from the outer jacket. Pulling tension worksheets shall be tabulated, reviewed and submitted by a qualified manufacturer's service technician or by a Professional Engineer who is experienced in outdoor fiber optic placement and who is licensed to practice in NY State.
  - d) Minimum bending radii, shall be specified in minimum bend radius for both the installation and for long term installation.
  - e) Method and equipment to pull multiple cables.
  - f) Method / materials to seal unterminated cables against water ingress.
  - g) Proposed splice locations and amount of slack proposed for each splicing location. This shall be shown by line diagrams using AutoCAD program file submissions.
  - h) The CAD layout and splice detail drawings shall be laid out on ANSI D size sheets and printed on 11"x17" B size sheets.
  - i) Splice material manufacturer's recommended procedures for installation of the splices and to test field configured enclosures.
  - j) Submit expected attenuation between end points of all fibers.
  - k) Including in the attenuation calculation submission shall be all expected losses resulting from cable, splices and connectors.
  - l) No fiber optic cable shall be installed until each of the items listed above have been submitted, reviewed and approved by the Engineer.

**Cable Cross Section (Representation of standard construction):**

**Overall Cable Construction:**

Buffer tube: High Modulus Polymeric material.

Dimension: 2.8 mm, nominal.

Tube and fiber color code per EIA/TIA-598

Filling Compound non-toxic and dermatological safe antioxidant hydrocarbon-based gel.

Dielectric Central strength member (CSM) with water swellable yarns.

An up-coat of polymer (if necessary, per construction)

Cable Core: The cable elements are stranded around the CSM, using reverse oscillation.

Moisture Resistance: A water blocking tape is applied over the cable core to prevent water ingress and migration with a nominal of 25% overlap.

Non-wicking binder yarns are applied over the core tape.

Cable Strength: Circumferential strength members are placed over the cable core and under the outer sheath.

Outer Sheath: UV Resistant, Black, Riser Rated PVC or HDPE.

A ripcord is applied under the outer sheath.

**ITS Fiber Cable Markings:**

Indent printed type - Manufacturer name, NYC DOT ITS FIBER OPTIC CABLE, # of fibers-fiber type, TELEPHONE HANDSET SYMBOL, MM/YY (Month & Year of manufacture), OFNR, NRTL LISTING, sequentially foot marked.

**Nominal Cable Dimensions & Weights:**

No. of Fibers	No. of Fibers per Tube	Cable OD (mm)	Cable OD (in.)	Weight KG/KM
6	6	11.3	.443	122
8	8	11.3	.443	122
12	6	11.3	.443	120
12	12	11.3	.443	122
16	8	11.3	.443	120
18	6	11.3	.443	118
24	6	11.3	.443	116
24	12	11.3	.443	120
30	6	11.3	.443	114
36	6	12.0	.473	133
36	12	11.3	.443	118
48	6	13.9	.548	173
48	12	11.3	.443	116
60	12	11.3	.443	114

216	12	18.6	.734	277
288	12	21.4	.844	364

**Fiber Characteristics:**

Maximum Attenuation @ 1310/1550nm	.35/.25 B/km
Core Diameter, nominal	8.3 μm
Cladding Diameter	125.0 ± 1.0 μm
Primary Coating Diameter	245 ± 10 μm
Maximum Dispersion Slope	0.092 ps/nm <sup>2</sup> -km
Fiber Cutoff Wavelength	1,150-1,350nm
Cabled Cutoff Wavelength	<1260nm
Mode Field Diameter @ 1,310nm	9.2 ± 0.4μm
Mode Field Diameter @ 1,550nm	10.5 ± 1.0μm
Cladding Non-circularity	<1%
Core/Clad Offset	□.80 μm
Zero Dispersion Wavelength	1,300-1,322nm
Numerical Aperture	0.13
Group Refractive Index @ 1,310/1,550nm	1.467/1.4675
Proof Test	100 kPSI

**TIA/EIA-598 Optical Fiber Cable Color Coding:**

The fiber optic cable color code is based on the 10 TIA colors that are used for plastic insulated conductor copper. Two more colors (Rose and Aqua) have been added to bring the optical fiber color code to 12.

The following fiber color code is for 12 fiber strands.

Fiber	Color Code	Color
1	blu	
2	orange	
3	gree	
4	brow	
5	slat	
6	whit	
7	red	
8	blac	
9	yello	
10	viole	
11	ros	
12	aqu	

For cables that consist of more than 12 strands, the color code repeats itself.

Each group of 12 strands is identified with some other means such as:

Multiple buffer tubes each with 12 or less strands either numbered or colored following the same color code, e.g., 1st tube is blue, 2nd is orange, etc.

24 strand groups with the color code repeating with some variation, e.g., the 1st group of 12 strands are solid colors and the 2nd group are solid colors with a stripe or some other identifying mark.

### **Preparation for Cable Delivery:**

The fiber optic cables shall be packaged to preclude the inducement of damage due to handling and transportation, and cable reel put ups shall be in accordance with the best commercial practices available.

Manufacturer's (source) Quality Assurance:

Each cable reel shall be tested immediately prior to shipment. The manufacturer's test shall be using a calibrated Optical Time Domain Reflectometer (OTDR).

The cable manufacturer shall certify that each reel of fiber cable that is furnished meets or exceeds the following test requirements as defined in EIA/TIA-455B "Standard Test Procedures for Fiber Optic Fibers, Cables, Transducers, Sensors, Connecting and Terminating Devices and Other Fiber Optic Components" Fiber Optic Test Procedures (FOTP):

Fluid Penetration: When tested in accordance with FOTP-82, a one (1) meter length of unaged cable shall withstand a one-meter static head or equivalent continuous pressure of water for one hour without leakage through the open cable end.

Filling Compound Flow: When tested in accordance with FOTP-81, the fiber cable shall exhibit no flow (drip or leak) of filling or flooding compound at 70° C.

Compressive Load: The cable shall withstand a minimum compressive load of 22 N/mm applied uniformly over the length of the sample. The cable shall be tested in accordance with FOTP-41, with the load applied at the rate of 2.5 mm/minute. The load shall be maintained for one minute and then decreased to 11 N/mm. The 11 N/mm load shall be maintained for 10 minutes. The magnitude of the attenuation change at 1,550 nm shall not exceed 0.4 dB prior to release of the 11 N/mm load. The repeatability of the measurement system is typically 0.05 dB or less. No fibers shall exhibit a measurable change in attenuation after load removal.

Tensile Loading and Bending: When tested in accordance with FOTP-33, using a maximum mandrel and sheath diameter of 560 mm the cable shall withstand a tensile load of 2,700 N. The change in attenuation shall not exceed 0.2 dB during loading and 0.1 dB after loading at 1,550 nm.

Low or High Temperature Bending: When tested in accordance with FOTP-37, the cable shall withstand four full turns around a mandrel of  $\leq 10$  times the cable diameter after conditioning for four hours at test temperatures of -30° C to 60° C. Neither the inner nor outer surfaces of the jacket shall exhibit visible cracks, splits, tears or other openings.

Optical continuity shall be maintained throughout the test.

Impact Resistance: When tested in accordance with FOTP-25, the cable shall withstand 25 impact cycles. The change in attenuation shall not exceed 0.2 dB at 1,550 nm. The cable jacket shall exhibit no cracking or splitting upon completion of the test.

Cable Flexibility: When tested in accordance with FOTP-104, the cable shall withstand 25 mechanical flexing cycles at a rate of 30" per cycles per minute with a sheath diameter not greater than 20 times the cable diameter. The fibers shall not experience an attenuation change greater than 0.1 dB at 1,550 nm. The cable jacket shall exhibit no cracking or splitting when observed under five times magnification.

Temperature cycling: When tested in accordance with FOTP-3, the change in attenuation at extreme operational temperatures (-40° C to 70° C) shall not exceed 0.2 dB/km at 1,550 nm.

Cable Twist: When tested in accordance with FOTP-85, a length of cable no longer than 4 meters shall withstand 10 cycles of mechanical twisting. The change in attenuation shall not exceed 0.1 dB at 1,550 nm.

The Manufacturer shall submit a plan for source QA/QC with the associated Technical Data Sheet (TDS) submission, for each cable type.

Reel by reel manufacturer's certificates of QA/QC shall include the actual end to end OTDR test results, test certificates shall be signed, dated and transmitted to the NYC DOT ITS project manager for use in site acceptances, as well as for the permanent optical cable performance record. Test certification documents shall be submitted prior to site inspection acceptance and cable placement activities. Manufacturer documents shall be provided within 10 days of the date of each manufacturer's shipment.

#### **Manufacturer's Shipping Certification:**

The following tests shall be performed, and the results documented for fiber cables meeting the requirements herein.

Prior to shipment from the factory: each fiber cable shall be OTDR attenuation tested, at both 1,310 nm and 1,550 nm with a calibrated test unit.

#### **Fiber Technicians - Experience Requirements:**

All Personnel involved in the installation, splicing, termination, and testing of the fiber optic cables shall submit proof of meeting the following experience requirements:

- 1) A minimum of five (5) years of experience in the installation of fiber optic cables, including fusion splicing, terminating and testing of single mode outside plant fibers.
- 2) Experience in installing at least five (5) systems where fiber optic cables are outdoors in conduit or underground in metropolitan duct banks. The systems submitted for reference shall have been in continuous satisfactory operation for at least two (2) years.
- 3) The Contractor shall submit individual resumes of all field personnel listing their names, fiber projects worked on and the names and telephone information for references who can be contacted regarding the individuals experience in installing large city wide fiber optic systems.

All Personnel shall also meet the following requirements:

- 1) Fiber Splicers and terminating technicians shall have been trained and certified in fiber optic splicing procedures by the manufacturer of the specific fiber splice and connector materials to be used on this project.
- 2) Fiber cable installers shall have been formally trained and certified in the correct fiber optic cable installation, pulling, placement and handling procedures by the manufacturer of the fiber optic cable to be used.

- 3) Personnel involved in fiber optic testing shall have been trained and certified by the manufacturer of the fiber optic cable test equipment (OTDR) to be used, and in fiber optic cable testing and reporting procedures.
- 4) Proof of the appropriate trainings shall be submitted, in writing to the Engineer for approval, a minimum of thirty (30) working days prior to start of cable installation.

**Fiber Installation Requirements:**

All fiber optic cable installed underground shall be placed in conduit or duct banks. No direct burial of cables will be permitted. The cables shall be installed as shown in the plans and in accordance with the approved cable plant installation plan.

Each existing conduit or duct bank to be occupied shall be rodded and roped with 1,200# rated mule tape to verify the intended new cable route, LOA distance and proven, obstruction free passage.

New 1.0" ID color coded innerducts shall be emplaced wherever fiber cable is to be run thru conduits or duct banks. Innerducts shall be run continuously thru existing manholes and pull boxes.

Show pullbox/manhole ID, slack loop and fiber cable length allowances for each manhole or pull box. Color coded innerducts are provided under a sperate payment item.

The Contractor shall furnish and install all incidental hangers, connections, equipment, and accessories as required to provide a complete and functional metropolitan ITS fiber-based communications plant. Include all related components as specified under this contract and coordination with any incidental equipment, as supplied by others.

All work shall be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

Fiber optic cable shall be installed in strict accordance with the approved manufacturer's recommendations and under the direct supervision of a qualified cable technician(s).

In addition, the following installation requirements shall also be met:

- 1) The identification, sizes, number of pullboxes and their final locations shall be as shown on the plans.
- 2) The Contractor may be required to install the cable in one pullbox at a time. The direction of each cable pull shall be documented, calculated and determined by the Contractor and shall require the approval of the Engineer.
- 3) The field cable installation shall be in strict accordance with the approved Cable Placement Installation set-up and pull plans.
- 4) A minimum of 30 m (100 Ft) of fiber cable slack, or less, as approved by the Engineer, shall be provided in pullboxes or manholes containing splices for the fiber cables to be spliced or as otherwise designated on the plans, and/or as directed by the Engineer. Additional fiber slack, as indicated on the approved Cable Placement installation plan, may be required for closure preparation and splicing.
- 5) Drip loops shall be provided for aerial fiber installations and shall be formed in accordance with the fiber manufacturer's written recommendation.
- 6) No fiber optic cable shall be pulled through the equivalent of more than one 90 degree bend unless so indicated on the approved Cable Placement plans or is specifically approved by the Engineer.

- 7) Fiber cables shall not be pulled over pullbox or manhole edges or corners, over or around obstructions, or through unnecessary curves or bends.
- 8) Fiber cables shall be looped in and out of cabinets, manholes and pull boxes to provide adequate slack, gradual bends and shall exert the least amount of stress on the fibers.
- 9) The Contractor shall ensure that the fiber cable is not damaged during storage, pulling or installation.
- 10) Fiber optic cable ends shall be kept sealed at all times during installation, using a method recommended by the cable manufacturer and approved by the Engineer. Close fitted removable caps that match the cable OD are preferred.
- 11) Fiber cable ends shall remain sealed until the Contractor terminates the fiber cables. Cables that are not immediately terminated shall have a minimum of two meters (7 feet) minimum of slack.
- 12) When using fiber pulling lubricants, the Contractor shall adhere to the cable manufacturer's requirements for the proper type, amount, application tools and methods. The contractor shall be responsible for the cleaning and removal of all lubricant from the exposed fiber jacket and enclosures.
- 13) Optical fiber cables shall be installed in continuous lengths without any intermediate splices throughout the project except where splices are specified and indicated on the approved Cable Placement submission and/or as approved by the Engineer.
- 14) Fiber Splices shall only be made in watertight, re-enterable splice enclosures. Splice enclosures shall match the splice type (butt type or butt run with tap) and shall be mounted in pullboxes, junction boxes, signal cabinets and where permitted in underground manholes or vaults.
- 15) Fiber optic drop cables shall be spliced to either the backbone or distribution cable at the locations indicated on the approved Cable Placement Installation plans and/or as directed by the Engineer.
- 16) The maximum fiber pulling tensions and minimum bending radii shall not be violated at any time during installation. The Contractor shall consult with the Engineer concerning the routing via any existing conduit, pullboxes, duct banks or risers, which could force the violation of the minimum bending radius for each size/OD of fiber optic cable. The Contractor shall document, submit and obtain approval from the Engineer if any modifications to the existing facilities are required. Violation of the pulling, minimum radius or installation parameters shall be cause for rejection of the installed cable.
- 17) Prior to any installation of cable, the Contractor shall rod, clean and rope (mule tape) each existing conduit in accordance with the requirements of the specification provisions.
- 18) Slack fiber and innerducts, where pulled through a pullbox, vault or manhole shall be racked to the enclosure wall.
- 19) All optical fibers shall be spliced where indicated to provide continuous runs. Where a fiber distribution/backbone fiber is spliced to a drop fiber, the distribution/backbone fiber beyond the splice point shall be a continuous fiber length to the end of the optical cable run.
- 20) Prior to any splicing or fiber termination the Contractor shall test each fiber of the installed optical cable for signal continuity, anomalies (events above 0.3 dB) and

individual fiber attenuation using a calibrated Optical Time Domain Reflectometer (OTDR), testing at wavelengths of 1,310 nm and 1,550 nm.

**Fiber Termination Requirements:**

The aggregate connector loss for complete connections to the terminal equipment shall not exceed a mean of 0.5 dB. No individual connector losses above 1.0 dB will be permitted. Connectors shall be qualified and accepted on the basis of connector-to-connector mating, using similar fibers. Unused (dark) optical fiber cables shall be properly terminated, tested and protected with sealed end caps.

**Fiber Testing Requirements (Fiber Optic Cable Installation-Site Acceptance Tests):**

All optical fiber links, including all dark/spare fibers, shall undergo the below acceptance tests after installation of fiber connectors and splices.

A fiber link is defined as: a continuous length of fiber including all splices and connectors and for fibers broken by an intermediate splice to a drop cable; the length of fiber from the break to each end.

The Contractor shall provide all connectors, calibrated fiber jumper cords, adapters and splices necessary to perform the required field validation of performance-based tests:

- 1) Using a calibrated OTDR test each link in both directions at 1,310 nm and 1,550 for fiber attenuation, continuity, length, and anomalies.
- 2) Each optical fiber shall meet the following acceptance criteria:
  - a) Attenuation: Average for both directions shall not exceed  $0.4 \text{ dB/km} + 0.1 \text{ dB/splice} + 0.5 \text{ dB/connector}$ . The number of splices and cable attenuation shall be based upon the approved Fiber Cable Installation plan.
  - b) Anomalies: No event shall exceed 0.3 dB. If any event is detected above that value, the Contractor shall repair or replace that entire section of fiber cable. A section of fiber is defined as the length of fiber cable between two adjacent splices, termination (patch) panels or a splice and a termination (patch) panel.
- 3) Using an optical source and a calibrated optical power meter measure the attenuation from both ends. The measured attenuation shall be meet the criteria defined for the attenuation using the OTDR.
- 4) Any fiber cable that fails to meet any of the testing requirements shall be replaced.
- 5) The Contractor shall submit to the Engineer a tabulated list of all fibers and the actual end-to-end measured values from the above tests. OTDR results shall obtained by a qualified technician with calibrated instruments and shall utilize the same instrument, calibration from test to test. The report of field acceptance testing shall be organized, by each link and each link shall be permanently identified by specified cable ID markers at each point. Link groupings, for each cable, shall include the To/From cable foot marks for validation of link lengths (LOA).
- 6) The field test reports shall include graphic depictions of all traces and loss length printouts.
- 7) Each fiber cable shall be listed according to the, cable ID, final strand ID, color code and link ID.
- 8) The Contractor's submission of accurate and validated field performance test data and its approval, by the Engineer, shall be the basis of acceptance for the fiber.

**Record Documentation Requirements:**

- 1) Five (5) complete sets of Installation, Operation and Maintenance (IOM) manuals shall be provided.
- 2) IOM Manuals shall be loose-leaf bound, in rugged, 3 ring binders, with insertable front and splines.
- 3) IOM Manuals shall have Machine Printed, Tabbed, reinforced section dividers and a Table of contents.
- 4) IOM Manuals shall also be provided in electronic format, as searchable PDF files, submitted on CD/DVD media. PDF files shall include a PDF Table of Contents with bookmark links matching the hard copy.
- 5) The IOM manuals shall, as a minimum, include the following sections:
  - a) Complete and accurate as-built diagrams showing the installed fiber optic cable plant, the lengths of each link segment, the cable identification schedules, the slack provided and the final locations and counts of all splices and terminations.
  - b) Complete performance data from the in-place Fiber Optic Cable Testing, for each link, including the OTDR trace graphic plots and attenuation measured, with the optical source and power meter. Dark fibers shall include in place connectors (end to end). Active fibers shall include End to End OTDR data with (1) patch loss at either end - identify the tested patch values used. OTDR Test report identification shall closely match the As Built Cable, breakout group and fiber strand identifications.
  - c) Factory QA/QC submissions including manufacturer's QC reports and on-reel OTDR Test reports, tested before shipping.
  - d) Contractor shall provide OTDR tests of new, on reel, FO Cables on arrival at the Contractor's storage warehouse facility (tested before installation)
  - e) Approved (stamped) copies of the Fiber Optic Material submissions (TDS)
  - f) Approved (stamped) copies of the Cable Installation Plans; including detailed splicing, terminating and testing procedures.
  - g) As built copies of the end-to-end ITS fiber pulling plans - including planned and actual pulling tension reports, site plans, including all changes, conduit and underground duct occupancies and corrected as built location/ survey data.
  - h) Complete Parts List / Bill of Materials including names of manufacturers, part numbers and local vendors.
  - i) Cable Identification and splice / patch elevation details. Include FOC circuit callouts, as patched for each endpoint, splice, tap and patch location.
  - j) Complete ITS Fiber Cable network maintenance and trouble-shooting procedures.

**Mechanical Requirements:**

Maximum Tensile Load for: Installation	2,700 N / 607 lbs.
Maximum Tensile Load for: Long Term	890 N / 200 lbs.
Minimum Bend Radius: Loaded	20 X OD
Minimum Bend Radius: Un-Loaded	10 X OD

Crush Resistance:	220N/cm (1.663 ft/lbs.)
Flexing, ±90°:	25 Cycles (min.)
Twist Test:	25 Cycles (min.)
Temperature Rating: Operation	-40° C to 70° C
Temperature Rating: Installation	0° C to 30° C
Temperature Rating: Storage	-40° C to 70° C

**Material:**

**Hardware-Fasteners:**

All external screws, nuts, bolts and locking washers shall be stainless steel; no self-tapping or Tek screws may be used, unless specifically approved by the Engineer. All screws, nuts, bolts and locking washers used shall be of corrosion resistant material, or Stainless Steel to resist corrosion.

Pole line hardware for aerial applications, shall be hot dipped galvanized type.

All material furnished shall be new, first commercial quality, and used in accordance with the highest industry practices.

**METHOD OF MEASUREMENT:**

Each linear foot of ITS Single Mode Fiber Optic Cable will be measured based on the furnished, installed and acceptance tested cable, in-place measurement, in accordance with the Contract Documents and/or as directed by the Engineer.

**BASIS OF PAYMENT:**

The price bid per linear foot of ITS Single Mode Fiber Optic Cable shall include the cost of furnishing all labor, materials, mounting, hardware, connectors, splices, related equipment and performance tests necessary to complete the work.

<b><u>Item No.</u></b>	<b><u>Item Description</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR 781	ITS SINGLE MODE, FIBER OPTIC CABLE, 12 STRAND	LINEAR FOOT
PK-ESCR 782	ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND	LINEAR FOOT
PK-ESCR 783	ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND, REDUCED OD, HIGH FLEXIBLE TYPE	LINEAR FOOT
PK-ESCR 784	ITS SINGLE MODE, FIBER OPTIC CABLE, 216 STRAND	LINEAR FOOT

**END OF SECTION**

## **SECTION PK-ESCR 785 – ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND, SELF-SUPPORTING, AERIAL DROP TYPE**

### **GENERAL:**

Under this item, the contractor shall furnish and install new, single mode (SM) fiber optic cable used for the NYC DOT ITS communications aerial and temporary use equipment drops, include all passive components and miscellaneous equipment as necessary for a complete cable plant as shown in the plans and/or as directed by the Engineer.

Equipment drop cables refer to the functional applications of the fiber optic cable, as defined below, and not the type/ratings of fiber cable.

The quantity and types of fibers contained in each cable shall be in accordance with the plans.

The fiber optic cables will be used in harsh overhead environments within NYC for Traffic measurement-control, ITS, CCTV and outdoor general structure fiber communications. The cable shall be rated for outdoor (outside plant) use, suitable for self-supporting installations, where in weather exposed environments and where subject to UV rays. The cables shall be Figure-8, steel messenger type design which allows easy, one-step aerial cable installation, using standard pole line hardware and cable supports.

### **Materials:**

Single mode fiber optic cable shall incorporate a gel free, fully water blocked design using craft friendly water swellable tape and loose buffer tube cable design.

Fiber optic cable shall be suitable for aerial installation in an outside urban cable plant environment.

The fiber optic cable shall be all dielectric type, except for the conductive, steel messenger supporting strand.

The fiber cable shall meet the requirements of: the United States Department of Agriculture Rural Utility Service 133A.3.2.(RUS) 7 CFR1755.900, the requirements of ANSI/ICEA Standard for Fiber Optic Outside Plant Communications Cable, ANSI/ICEA S-87-640-1999, TIA/EIA FOTP Standards 455 and UL 1666 standard minimums.

Fiber Optic cables shall be new, unused and of current design and of current product manufacture.

Fiber Cable Manufacturer shall be approved by NYC DOT – Signals. Approved manufacturers are:

Corning Optical Communications, 4200 Corning Place, Charlotte, NC 28216, or Prysmian Group North America – General Cable, 4 Tesseneer Drive, Highland Heights, KY 41076.

Fiber Cable series:

Corning - ALTOS® Figure-8, Loose Tube, Gel-Free, 48 strand, SM OS2, Prysmian – Telecom Single mode, Aerial, 48 strand, SMF-28 Ultra Fiber (OS2), or other manufacturers which are demonstrated to provide equivalent performance fiber optic cables, which shall be manufactured in USA, as approved by the Engineer.

### **Optical Requirements:**

This specification contains minimal design and test values for all-important mechanical, optical, and environmental parameters and as such, is the basis for all incoming inspection and material acceptances.

The optical fibers shall meet the requirements of EIA/TIA-492CAAB "Detail Specifications for Class IVa Dispersion-Unshifted Single Mode Optical Fiber Cable with Low Water Peak" and ITU recommendation G.652.D, "Characteristics of Single-Mode Optical Fiber Cable".

Maximum attenuation at:

Wavelength	Maximum Attenuation
1310 nm	0.4 decibels/kilometer (dB/km)
1383 nm	0.4 dB/km
1550 nm	0.3 dB/km

Fiber attenuation shall be uniform with no discontinuities greater than 0.05 dB at 1,310 nm and 1,550 nm.

The attenuation measurements shall be in accordance with the latest revisions of EIA/TIA 455 Standards FOTP-20, 59, 61 and 78. The average change in attenuation at extreme operational temperatures (-40° C to 70° C [-40° F to 158° F]) shall not exceed 0.05 dB/cm at 1,550 nm. The magnitude of the maximum attenuation change of each individual fiber shall not be greater than 0.15 dB/km at 1,550 nm. The change in attenuation measurements shall be in accordance with EIA/TIA Standard FOTP-3.

Bending Attenuation:

Fiber macro bending attenuation shall not exceed the following under the stated conditions:

<u>Bend Condition</u>	<u>Wavelength</u>	<u>Maximum</u>
1 turn, 32±2 mm OD mandrel	1550 nm	0.50 dB
100 turns, 50±2 mm OD mandrel	1310 nm	0.05 dB
100 turns, 50±2 mm OD mandrel	1550 nm	0.10 dB
100 turns, 60±2 mm OD mandrel	1550 nm	0.05 dB

Water immersion at 23° C ±2° C: ≤ 0.5 dB/km at 1,310; 1,550 and 1,625 nm

Cutoff Wavelength: ≤1260 nm.

Mode-Field Diameter: 9.2 ±0.4 nm at 1,310 nm. 10.4±0.5 nm at 1,550 nm.

Zero Dispersion Wavelength: 1,312±10 nm.

Zero Dispersion Slope: ≤0.092 ps/(nm\*km).

Total Dispersion: ≤3.5 ps/(nm\*km) at 1,285-1,330 nm.

≤18 ps/(nm\*km) at 1,550 nm.

≤22 ps/(nm\*km) at 1,625 nm.

Polarization Mode Dispersion: ≤0.2 ps/(nm\*km).

**Mechanical Requirements:**

**Fiber Cables:**

**Optical Fiber Strands:**

All optical fiber optical strands shall be: Corning SMF-28, Draka BendBright™ or Prysmian OneSpec™ G.657, single mode type or Engineer and NYC DOT Signals approved equivalent manufacture.

All glass fiber strands, within a given cable, shall be from the same manufacturer and fiber strands shall contain no factory splices.

Each fiber shall conform to the following minimum requirements:

Typical Core Diameter:	8.3 nm
Cladding Diameter:	125.0±1.0 nm
Core-to-Cladding Concentricity:	±0.8 nm
Cladding Non-Circularity:	±1.0%

**Fiber Cables - Delivery Requirements:**

Fiber cables shall be delivered, curbside, shipped on new, un-damaged, wood or reusable steel reels, without any splices.

Three (3) meters of each end of the fiber cable shall be accessible for testing upon receipt at the Contractor's facility and again immediately prior to installation/placement.

Both ends of the fiber cable shall be sealed to prevent moisture ingress.

A durable weather resistant tag or label on each reel shall contain the following information:

- 1.Manufacturer's name.
- 2.Cable type.
- 3.Length of cable contained on the reel in meters and feet.
- 4.Cable reel serial number

Attached to the reel, in a weather resistant envelope, shall be the detailed reel shipping record. The shipping record shall contain the following, in addition to the above information:

1. Date of manufacture.
2. Date cable tested.
3. Cable characteristics (size, attenuation for each fiber).
4. Cable reel serial identification number.

**ITS Fiber Optic - Connectors:**

Fiber Optic Connectors shall be furnished and installed – including the cost of connectorizing, testing and commissioning fiber optic cables. The fiber connectors shall be factory installed. Field installation of fiber connectors shall only be permitted with the express consent of the Engineer and field connectorization methods and exception will be considered on a case by case basis.

Fiber Optic connectors shall meet the following requirements:

- 1.Corning UniCam® Type ST, twist lock (bayonet). Blue Color-coded boot
2. Ceramic ferrules
3. Single Mode (OS/2)
4. Fiber secured within the ferrule with epoxy, as specified by the connector or epoxy manufacturer.
5. Operating Temperature: -20° C to +70° C
6. Low Insertion loss: 0.5 dB maximum / connector
7. Return loss: 55 dB minimum
8. Field installable, Pretium® Performance
9. Factory Polished

## 10. 9/125 µm Fiber

### **Construction:**

#### **ITS Fiber Cable - General:**

All fibers in the fiber optic cables shall be spliced, terminated, or both, within the field cabinets, splice cases, signal patch and splice points and pull boxes, as designated in these contract documents and/or as directed by the Engineer.

The Contractor shall furnish all equipment, specialty test instruments and qualified fiber optic splicing technicians, as required for the installation, termination, testing and commissioning of the fiber optic cables.

The Contractor shall provide all passive components required to form a complete cable plant including, but not limited to, connectors, fiber breakout kits, supports, pole hardware, attachments and ancillary components required for the installation of the ITS fiber cable plant. Include all incidental items such as: terminators, attenuators, conduit-duct moisture and water seals, fiber approved lubricant, identification tags, cable end caps, cable management devices including similar components necessary for the support attachment and racking of slack fiber cables.

The components supplied shall be commercially available, state-of-the-art components, suitable for this application.

The drop optical fiber cable designations used in the plans indicate the function and strand counts of the fibers contained in the cable and not necessarily the type of cable.

Drop fiber cable connects field end point devices for aggregation up to the distribution/backbone optical fiber cable. Aerial drop cables are used to provide temporary ITS fiber service to end point locations, while the Project work areas are being removed, excavated and awaiting the installation of ITS underground conduits and pathways to connect fiber to the permanent structures.

#### **Preinstallation Requirements:**

The Contractor shall be entirely responsible for the fiber optic cable security, quality and adherence to these specifications, from its manufacture to the time the network is accepted by the Engineer.

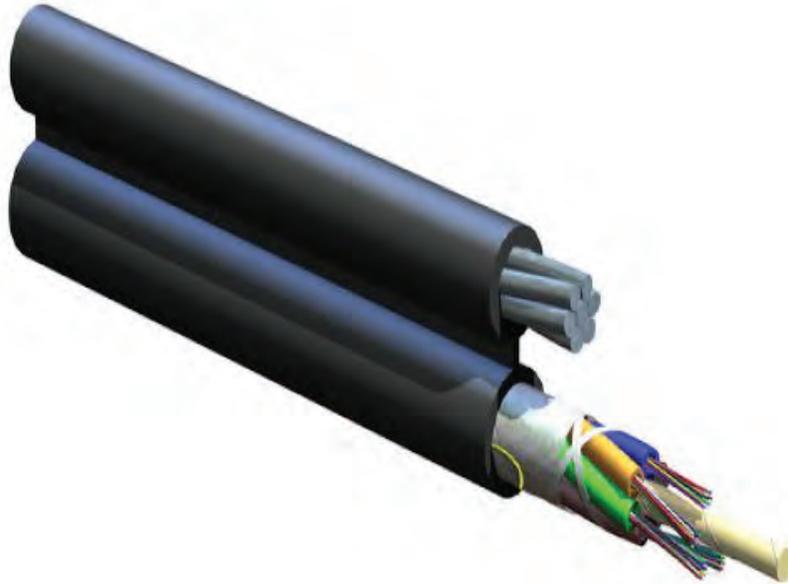

#### **Cable Plant - Design Submission:**

The Contractor shall submit a detailed Fiber Cable Plant - Design Submission, in working shop drawing format, to the Engineer for approval. The Engineer shall have thirty (30) working days to review this submission. The Fiber Cable Plant design submission shall include the following:

- 3) Catalog cuts (TDS) and associated shop drawings for all cable, connectors, splice equipment, splice enclosures, splice trays, Patch panels, cable installation, active and test equipment, in adequate detail to verify compliance with the specifications.
- 4) Manufacturer's recommended cable installation techniques such that the optical and mechanical characteristics of the cables are not degraded at the time of installation. The proposed installation methods shall be on site (field) reviewed by a qualified fiber technician of the cable manufacturer.
- 5) The installation review recommendations shall include the following:
  - a) Cable manufacturer's approved cable pulling lubricants for use on the cable and the intended method of lubricant application. Lubricants which are not factory approved will not be permitted.

- b) Cable Placement, Installation set-up and pull plans, including sizes, types and location of fiber rollers, feeder guides, tension gauge (make and model number), attachment of pulling jig to fiber jacket, direction and length of each pull.
- c) Maximum cable pulling tensions, which shall specify both pulling effort expected from the cable strand conductors and for pulling solely from the outer jacket. Pulling tension worksheets shall be tabulated, reviewed and submitted by a qualified manufacturer's service technician or by a Professional Engineer who is experienced in outdoor fiber optic placement (OSP) and who is licensed to practice in NY State.
- d) Minimum bending radii, shall be specified in minimum inches bend radius for both the installation and for long term installation.
- e) Method and equipment to pull multiple cables.
- f) Method / materials to seal unterminated cables against water ingress.
- g) Proposed splice locations and amount of slack proposed for each splicing location. This shall be shown by line diagrams using AutoCAD program file submissions.
- h) The CAD layout and splice detail drawings shall be laid out on ANSI D size sheets and printed on 11"x17" B size sheets.
- i) Splice material manufacturer's recommended procedures for installation of the splices and to test field configured enclosures.
- j) Submit expected attenuation between end points of all fiber segments.
- k) Including in the attenuation calculation submission shall be all expected losses resulting from cable, splices and connectors.
- l) No fiber optic cable shall be installed until each of the items listed above have been submitted, reviewed and approved by the Engineer.
- m) The locations of temporary ITS fiber drops, using Figure 8, self-supporting aerial cable shall be identified on the Contractors' work plan and once the permanent ITS fiber is installed, terminated, tested and commissioned, the aerial temporary fiber cables and supports shall be removed.

**Cable Cross Section (Representation of standard construction):**

**Overall Cable Construction:**

Buffer tube: High Modulus Polymeric material.

Dimension: 0.41 in (10.5 mm), nominal.

Total Buffer Tubes: 6

Active Buffer Tubes: 4

Fibers Per Tube: 12

Buffer Tube color code: Blue, Orange, Green, Brown

Dielectric Central strength member (CSM) with water swellable yarns. Cable Core: The cable elements are stranded around the CSM, using reverse oscillation.

Moisture Resistance: A water blocking tape is applied over the cable core to prevent water ingress and migration with a nominal of 25% overlap.

Cable Strength: Circumferential strength members are placed over the cable core and under the outer sheath.

Outer Sheath: UV Resistant, Black, Outdoor Rated MDPE.

**Nominal Fiber Cable Dimensions & Weights:**

Maximum Span, 1% Install Sag	550 ft (168 m)
Aerial Span Sag category, NESC	Heavy
Minimum Band Radius	4.13 in (105 mm)
Weight	2.15 lbs./ft. (297 kg/km)

**Fiber Characteristics:**

Maximum Attenuation @ 1310/1550nm	.35/.25 B/km
Core Diameter, nominal	8.3 μm
Cladding Diameter	125.0 ± 1.0 μm
Primary Coating Diameter	245 ± 10 μm
Maximum Dispersion Slope	0.092 ps/nm <sup>2</sup> -km
Fiber Cutoff Wavelength	1,150-1,350nm
Cabled Cutoff Wavelength	<1260nm
Mode Field Diameter @ 1,310nm	9.2 ± 0.4μm
Mode Field Diameter @ 1,550nm	10.5 ± 1.0μm
Cladding Non-circularity	<1%
Core/Clad Offset	□.80 μm
Zero Dispersion Wavelength	1,300-1,322nm
Numerical Aperture	0.13
Group Refractive Index @ 1,310/1,550nm	1.467/1.4675
Proof Test	100 kPSI

**TIA/EIA-598 Optical Fiber Cable Color Coding:**

The fiber optic cable color code is based on the 10 TIA colors that are used for plastic insulated conductor copper. Two more colors (Rose and Aqua) have been added to bring the optical fiber color code to 12.

The following fiber color code is for 12 fiber strands.

Fiber	Color Code	Color
1	blue	
2	orange	
3	green	
4	brown	
5	slate	
6	white	
7	red	
8	black	
9	yellow	
10	violet	
11	rose	
12	aqua	

For cables that consist of more than 12 strands, the color code repeats itself.

Each group of 12 strands is identified with some other means such as:

Multiple buffer tubes, each with 12 or less strands, either numbered or colored following the same color code, e.g., 1st tube is blue, 2nd is orange, etc.

24 strand groups with the color code repeating with some variation, e.g., the 1st group of 12 strands are solid colors and the 2nd group are solid colors with a stripe or some other identifying mark.

### **Preparation for Cable Delivery:**

The fiber optic cables shall be packaged to preclude the inducement of damage due to handling and transportation, and cable reel put ups shall be in accordance with the best commercial practices available.

Manufacturer's (source) Quality Assurance:

Each cable reel shall be tested immediately prior to shipment. The manufacturer's test shall be using a calibrated Optical Time Domain Reflectometer (OTDR).

The cable manufacturer shall certify that each reel of fiber cable that is furnished meets or exceeds the following test requirements as defined in EIA/TIA-455B "Standard Test Procedures for Fiber Optic Fibers, Cables, Transducers, Sensors, Connecting and Terminating Devices and Other Fiber Optic Components" Fiber Optic Test Procedures (FOTP):

Fluid Penetration: When tested in accordance with FOTP-82, a one (1) meter length of unaged cable shall withstand a one-meter static head or equivalent continuous pressure of water for one hour without leakage through the open cable end.

Filling Compound Flow: When tested in accordance with FOTP-81, the fiber cable shall exhibit no flow (drip or leak) of filling or flooding compound at 70° C.

Compressive Load: The cable shall withstand a minimum compressive load of 22 N/mm applied uniformly over the length of the sample. The cable shall be tested in accordance with FOTP-41, with the load applied at the rate of 2.5 mm/minute. The load shall be maintained for one minute and then decreased to 11 N/mm. The 11 N/mm load shall be maintained for 10 minutes. The magnitude of the attenuation change at 1,550 nm shall not exceed 0.4 dB prior to release of the 11 N/mm load. The repeatability of the measurement system is typically 0.05 dB or less. No fibers shall exhibit a measurable change in attenuation after load removal.

Tensile Loading and Bending: When tested in accordance with FOTP-33, using a maximum mandrel and sheath diameter of 560 mm the cable shall withstand a tensile load of 2,700 N. The change in attenuation shall not exceed 0.2 dB during loading and 0.1 dB after loading at 1,550 nm.

Low or High Temperature Bending: When tested in accordance with FOTP-37, the cable shall withstand four full turns around a mandrel of  $\leq 10$  times the cable diameter after conditioning for four hours at test temperatures of -30° C to 60° C. Neither the inner or outer surfaces of the jacket shall exhibit visible cracks, splits, tears or other openings.

Optical continuity shall be maintained throughout the test.

Impact Resistance: When tested in accordance with FOTP-25, the cable shall withstand 25 impact cycles. The change in attenuation shall not exceed 0.2 dB at 1,550 nm. The cable jacket shall exhibit no cracking or splitting upon completion of the test.

Cable Flexibility: When tested in accordance with FOTP-104, the cable shall withstand 25 mechanical flexing cycles at a rate of 30" per cycles per minute with a sheath diameter not greater than 20 times the cable diameter. The fibers shall not experience an attenuation change greater than 0.1 dB at 1,550 nm. The cable jacket shall exhibit no cracking or splitting when observed under five times magnification.

Temperature cycling: When tested in accordance with FOTP-3, the change in attenuation at extreme operational temperatures (-40° C to 70° C) shall not exceed 0.2 dB/km at 1,550 nm.

Cable Twist: When tested in accordance with FOTP-85, a length of cable no longer than 4 meters shall withstand 10 cycles of mechanical twisting. The change in attenuation shall not exceed 0.1 dB at 1,550 nm.

The Manufacturer shall submit a plan for source QA/QC with the associated Technical Data Sheet (TDS) submission, for each cable type.

Reel by reel manufacturer's certificates of QA/QC shall include the actual end to end OTDR test results. Fiber test certificates shall be signed, dated and transmitted to the NYC DOT ITS project manager for use in site acceptances, as well as for the permanent optical cable performance record. Test certification documents shall be submitted prior to site inspection acceptance and cable placement activities. Manufacturer documents shall be provided within ten (10) days of the date of each manufacturer's shipment.

#### **Manufacturer's Shipping Certification:**

The following tests shall be performed, and the results documented for fiber cables meeting the requirements herein.

Prior to shipment from the factory: each fiber cable shall be OTDR attenuation tested, at both 1,310 nm and 1,550 nm, with a calibrated test unit.

#### **Fiber Technicians - Experience Requirements:**

All Personnel involved in the installation, splicing, termination, and testing of the fiber optic cables shall submit proof of meeting the following experience requirements:

- 1) A minimum of five (5) years of experience in the installation of fiber optic cables, including fusion splicing, terminating and testing of single mode outside plant fibers.
- 2) Experience in installing at least five (5) systems where fiber optic cables are outdoors in conduit or underground in metropolitan duct banks. The systems submitted for reference shall have been in continuous satisfactory operation for at least two (2) years.
- 3) The Contractor shall submit individual resumes of all field personnel listing their names, fiber projects worked on and the names and telephone information for references who can be contacted regarding the individuals experience in installing large city-wide fiber optic systems.

All Personnel shall also meet the following requirements:

- 1) Fiber Splicers and terminating technicians shall have been trained and certified in fiber optic splicing procedures by the manufacturer of the specific fiber splice and connector materials to be used on this project.
- 2) Fiber cable installers shall have been formally trained and certified in the correct fiber optic cable installation, pulling, placement and handling procedures by the manufacturer of the fiber optic cable to be used.

- 3) Personnel involved in fiber optic testing shall have been trained and certified by the manufacturer of the fiber optic cable test equipment (OTDR) to be used, and in fiber optic cable testing and reporting procedures.
- 4) Proof of the appropriate trainings shall be submitted, in writing to the Engineer for approval, a minimum of thirty (30) working days prior to start of cable installation.

**Fiber Installation Requirements:**

The cables shall be installed as shown in the plans and in accordance with the Contractor's approved cable plant installation plan.

The Contractor shall furnish and install all incidental hangers, connections, equipment, and accessories as required to provide a complete and functional metropolitan ITS fiber-based communications plant. Include all related components as specified under this contract and coordination with any incidental equipment, as supplied by others.

All work shall be done in compliance with the latest published edition of NFPA 70 National Electrical Code (NEC) including the NYC Electric Code amendments to the NEC.

Fiber optic cable shall be installed in strict accordance with the approved manufacturer's recommendations and under the direct supervision of a qualified cable technician(s). In addition, the following installation requirements shall also be met:

- 1) The identification, sizes, number of pullboxes and their final locations shall be as shown on the plans.
- 2) The field cable installation shall be in strict accordance with the approved Cable Placement Installation set-up and pull plans.
- 3) Additional fiber slack, as indicated on the approved Cable Placement installation plan, may be required for closure preparation and splicing.
- 4) Drip loops shall be provided for aerial fiber installations and shall be formed in accordance with the fiber manufacturer's written recommendation.
- 5) No fiber optic cable shall be pulled through the equivalent of more than one 90 degree bend unless so indicated on the approved Cable Placement plans or is specifically approved by the Engineer.
- 6) Fiber cables shall not be pulled over pullbox or manhole edges or corners, over or around obstructions, or through unnecessary curves or bends.
- 7) Fiber cables shall be looped in and out of cabinets, manholes and pull boxes to provide adequate slack, gradual bends and shall exert the least amount of stress on the fibers.
- 8) The Contractor shall ensure that the fiber cable is not damaged during storage, pulling or installation.
- 9) Fiber optic cable ends shall be kept sealed at all times during installation, using a method recommended by the cable manufacturer and approved by the Engineer. Close fitted removable caps that match the cable OD are preferred.
- 10) Fiber cable ends shall remain sealed until the Contractor terminates the fiber cables. Cables that are not immediately terminated shall have a minimum of two meters (7 feet) minimum of slack.
- 11) When using fiber pulling lubricants, the Contractor shall adhere to the cable manufacturer's requirements for the proper type, amount, application tools and methods.

The contractor shall be responsible for the cleaning and removal of all lubricant from the exposed fiber jacket and enclosures.

- 12) Optical fiber cables shall be installed in continuous lengths without any intermediate splices throughout the project except where splices are specified and indicated on the approved Cable Placement submission and/or as approved by the Engineer.
- 13) Fiber optic drop cables shall be spliced to either the backbone or distribution cable at the locations indicated on the approved Cable Placement Installation plans and/or as directed by the Engineer.
- 14) The maximum fiber pulling tensions and minimum bending radii shall not be violated at any time during installation. The Contractor shall consult with the Engineer concerning the routing via any existing conduit, pullboxes, duct banks or risers, which could force the violation of the minimum bending radius for each size/OD of fiber optic cable.
- 15) All optical fibers shall be spliced where indicated to provide continuous runs. Where a fiber distribution/backbone fiber is spliced to a drop fiber, the distribution/backbone fiber beyond the splice point shall be a continuous fiber length to the end of the optical cable run.
- 16) At the completion of aerial drop fiber termination the Contractor shall test each fiber of the installed optical cable for signal continuity, anomalies (events above 0.3 dB) and individual fiber attenuation using a calibrated Optical Time Domain Reflectometer (OTDR), testing at wavelengths of 1,310 nm and 1,550 nm.

#### **Fiber Termination Requirements:**

The aggregate connector loss for complete connections to the terminal equipment shall not exceed a mean of 0.5 dB. No individual connector losses above 1.0 dB will be permitted. Connectors shall be qualified and accepted on the basis of connector-to-connector mating, using similar fibers. Unused (dark) optical fiber cables shall be properly terminated, tested and protected with sealed end caps.

#### **Fiber Testing Requirements:**

##### **(Fiber Optic Cable Installation-Site Acceptance Tests)**

All optical fiber links, including all dark/spare fibers, shall undergo the below acceptance tests after installation of fiber connectors and splices.

A fiber link is defined as:

a continuous length of fiber including all splices and connectors

and for fibers broken by an intermediate splice to a drop cable;

the length of fiber from the break to each end.

The Contractor shall provide all connectors, calibrated fiber jumper cords, adapters and splices necessary to perform the required field validation of performance-based tests:

- 1) Using a calibrated OTDR test each link in both directions at 1,310 nm and 1,550 for fiber attenuation, continuity, length, and anomalies.
- 2) Each optical fiber shall meet the following acceptance criteria:
  - a) Attenuation: Average for both directions shall not exceed 0.4 dB/km + 0.1 dB/splice + 0.5 dB/connector. The number of splices and cable attenuation shall be based upon the approved Fiber Cable Installation plan.

- b) Anomalies: No event shall exceed 0.3 dB. If any event is detected above that value, the Contractor shall repair or replace that entire section of fiber cable. A section of fiber is defined as the length of fiber cable between two adjacent splices, termination (patch) panels or a splice and a termination (patch) panel.
- 3) Using an optical source and a calibrated optical power meter measure the attenuation from both ends. The measured attenuation shall be meet the criteria defined for the attenuation using the OTDR.
- 4) Any fiber cable that fails to meet any of the testing requirements shall be replaced.
- 5) The Contractor shall submit to the Engineer a tabulated list of all fibers and the actual end-to-end measured values from the above tests. OTDR results shall obtained by a qualified technician with calibrated instruments and shall utilize the same instrument, calibration from test to test. The report of field acceptance testing shall be organized, by each link and each link shall be permanently identified by specified cable ID markers at each point. Link groupings, for each cable, shall include the To/From cable foot marks for validation of link lengths (LOA).
- 6) The field test reports shall include graphic depictions of all traces and loss length printouts.
- 7) Each fiber cable shall be listed according to the: cable ID, final strand ID, color code and link ID.
- 8) The Contractor's submission of accurate and validated field performance test data and its approval, by the Engineer, shall be the basis of acceptance for the fiber.

**Record Documentation Requirements:**

- 1) Five (5) complete sets of Installation, and As Built records are to be provided.
- 2) The aerial drop fiber cable records shall, as a minimum, include the following information:
  - a) Fiber Optic Cable Testing, for each link, including the OTDR trace graphic plots and attenuation measured, with the optical source and power meter. Dark fibers shall include in place connectors (end to end). Active fibers shall include End to End OTDR data with (1) patch loss at either end - identify the tested patch values used. OTDR Test report identification shall closely match the As Built Cable, breakout group and fiber strand identifications.
  - b) Factory QA/QC submissions including manufacturer's QC reports and on-reel OTDR Test reports, tested before shipping.
  - c) Cable Identification and splice / patch elevation details. Include FOC circuit callouts, as patched for each endpoint, splice, tap and patch location.
  - d) The contractor shall provide "as installed" information to the Engineer and the NYC DOT Signals office for each instance of self-supporting aerial drop fiber cables which are intended to provide temporary ITS end point network connections. Maintain accurate cable plant records during the duration of each set of temporary fiber used for bypass, demolition, excavation, underground construction and new facility installation staging, until the date of permanent fiber acceptance for each segment/reach.

**Mechanical Requirements:**

Maximum Tensile Load for: Installation	2,700 N (607 lbs.)
Maximum Tensile Load for: Long Term	890 N (200 lbs.)

Minimum Bend Radius: Loaded	20 X OD
Minimum Bend Radius: Un-Loaded	10 X OD
Crush Resistance:	220 N/cm (1.663 ft/lbs.)
Flexing, ±90°:	25 Cycles (min.)
Twist Test:	25 Cycles (min.)
Temperature Rating: Operation	-40° C to 70° C
Temperature Rating: Installation	0° C to 30° C
Temperature Rating: Storage	-40° C to 70° C

**Material:**

**Hardware-Fasteners:**

All external screws, nuts, bolts and locking washers shall be stainless steel; no self-tapping or Tek screws may be used, unless specifically approved by the Engineer. All screws, nuts, bolts and locking washers used shall be of corrosion resistant material, or Stainless Steel to resist corrosion.

Pole line hardware for aerial applications, shall be hot dipped galvanized type.

All material furnished shall be new, first commercial quality, and used in accordance with the highest industry practices.

**METHOD OF MEASUREMENT:**

ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND, SELF-SUPPORTING, AERIAL DROP TYPE will be measured based on the number of linear feet furnished, in place measurement, of installed and acceptance tested cable, in accordance with the Contract Documents and/or as directed by the Engineer.

**BASIS OF PAYMENT:**

The price bid per linear foot of ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND, SELF-SUPPORTING, AERIAL DROP TYPE shall include the cost of furnishing and installation along with all labor, materials, mounting, hardware, connectors, splices, related equipment and performance tests necessary to complete the work.

<b><u>Item No.</u></b>	<b><u>Item Description</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR 785	ITS SINGLE MODE, FIBER OPTIC CABLE, 48 STRAND, SELF-SUPPORTING, AERIAL DROP TYPE	LINEAR FOOT

**END OF SECTION**

## SECTION PK-ESCR 786 –ITS FIBER OPTIC INNERDUCT, 1 CHANNEL, 1.0 INCH

### **GENERAL:**

Under this item, the contractor shall furnish and install new, fiber optic innerduct used for the NYC DOT ITS communications used for optical cables placed in new and existing Rigid Metallic Conduit (RMC), and for pathway protection where ITS fibers are run thru underground conduits and utility duct banks. Work scope shall include providing on-site fiber pathway confirmations by use of the rod and rope method, installation of single, dual or triple runs of new innerduct, preparation, identification and installation of fiber reinforced, foot marked "mule" tape, within each innerduct pre-installed for related fiber cable pulling work under another section.

Innerducts shall be continuous and as shown on the contract plans, ready for of the placement of new ITS fiber.

Include all innerduct couplings, connectors, end caps, identification tags and support hardware as necessary, for a complete fiber cable plant, as shown in the plans and/or as directed by the Engineer.

The quantity and types of fiber innerduct contained in each conduit/duct pathway shall be in accordance with the plans.

### **Materials:**

All materials, fasteners and hardware furnished, assembled, fabricated or installed under this Specification shall be new, corrosion resistant and in strict accordance with the details shown on the plans and in the specifications.

Fiber optic innerduct shall be an individual HDPE conduit liner, as specified on the plans and in the Specifications.

Color:

The innerduct shall follow the NYC DOT ITS color code for trunk and backbone innerducts and as indicated on the plans.

The Contractor shall install the innerduct between equipment cabinets, manholes, pullboxes and utility (ECS) vaults, as shown on the plans. Innerduct shall have an inner diameter of 1.0-inch nominal. The outer diameter shall be sized to allow for the installation of four (4) innerduct channels within a 4.0" RMC conduit ID.

Product Standards:

The innerduct shall be fabricated out of high molecular weight, high density polyethylene (HDPE) which shall conform to the following material requirements:

Specification for Solid Wall High Density Polyethylene (HDPE) Conduit (ASTM F-2160)

Dimensions of PE/HDPE pipes, based on controlled outside diameter (ASTM D-3035)

Cell Classification: 335440A (ASTM D-3035).

Density: 0.946 g/cc (ASTM D-4883).

Melt Index: 0.25 g/cc (ASTM D-1238).

Tensile strength at yield: 22.6 MPa (ASTM D-638).

Elongation at break: 800 % minimum (ASTM D-638).

Flexural Modulus: 827 MPa (ASTM D-790).

Hardness (Shore D): 68.

Deflection temperature at 294 N: 69° C.

Environmental stress crack resistance - Condition B: 1000 hrs minimum (ASTM D-1693).

Brittleness Temp: -118° C (225° F) maximum (ASTM D-746).

UL 1990 Standard For Nonmetallic Underground Conduit (HDPE) With Conductors

**Materials:**

Drag Lines:

The Contractor shall provide non-conductive drag lines through the entire length of each of the individual channel of innerduct installed. The drag line shall be Bull-Line™ type, with longitudinal aramid strands (“warp”) tied together with 90° cross weave of polyester strands (“weft”). Drag lines shall have a minimum tensile strength of 1,250 lbs. Drag lines shall be factory installed by the innerduct manufacturer and shall be 3/8” width (10 mm), type: WK-12, as manufactured by: Arncorp. or Engineer approved equivalent quality. Drag lines shall be sequentially foot marked.

Fiber Optic Innerduct, 1 Channel; shall be further accepted upon the basis of the manufacturer’s written certification that it meets, or exceeds, each of the requirements of this specification.

Innerduct Manufacturer:

Fiber Optic Innerduct, 1 Channel; shall be new, unused and of current design and manufacture.

Fiber Optic Innerduct, 1 Channel; Manufacturer shall be an approved NYC DOT – Signals manufacturer:

Dura-Line division of Orbia Industries, 1400 Parkside Dr # 300, Knoxville TN 37922, [www.DuraLine.com](http://www.DuraLine.com)

Fiber Optic Innerduct Type: Smoothwall HDPE, UL Listed, Wall: SDR 13.5, 1.0 Inch ID

**Construction Details:**

Fiber optic innerduct shall be installed in conduits and duct banks where specified in the contract plans and / or as ordered by the Engineer.

Prior to the installation of the innerducts, the Contractor shall rope, rod and brush clean all existing conduit, duct banks and pullboxes as required. If existing manholes or pullboxes require resetting or other field modifications, the resetting / modification work shall be completed prior to the installation of new innerducts within the subject pullboxes or manholes and/or as directed by the Engineer.

Innerducts of the same color code identification, entering a pullbox or manhole from different sides, shall be aligned so that cables in a specific channel can be readily and directly pulled through the pull box or manhole, without crossing fiber cables installed in other pathways.

Innerducts shall run continuously through pullboxes or manholes, except at locations where slack fiber optic cable in excess of 10 liner feet will be stored. At slack storage pullboxes or manholes, the innerduct ends shall be extended at least six (6) inches past each (inner) box wall into the pullbox or manhole. Innerducts shall be installed in a neat and workmanlike manner and shall be secured or anchored using an approved work method to prevent innerduct movement during cable pulling operations.

All proposed fiber optic cable lubricants shall be compatible, and manufacturer approved for use with the innerduct material. Only approved lubricant products shall be ordered, used and comply

with the requirements of the fiber optic cable manufacturer. The Contractor shall submit written certification of the cable lubricant's compatibility to the Engineer for approval, prior to installation.

The Contractor shall apply only manufacturer approved pulling lubricants, in measured increments as necessary to ensure smooth, even cable pulls.

The Contractor shall pull in place the specified innerducts in accordance with manufacturer recommended installation procedures. The Contractor shall submit a written Method of Procedure (MOP) which details the intended Fiber Innerduct and Cable installation procedures. The plan of installation and procedure shall be delivered to the Engineer for approval a minimum of thirty (30) working days prior to the start of installation.

During installation of the fiber Innerduct, guide wheels, bending shoes or quadrant cable guides shall be used to achieve a smooth transition from road grade cable reels to the actual underground conduit depth centerlines.

Innerduct shall have a 24" bend radius, minimum.

Fiber Cable Pulls into Innerduct Pathways:

The Contractor shall insert removable filler inserts at the ends of the innerducts in order to avoid collapsing of the innerduct especially when using compression / pulling grips.

The maximum pulling in force shall not exceed 4.4 kN (1,000 lbs.) in any segment / pull reach.

The fiber cable manufacturer shall review and approve the Contractor's intended fiber innerduct and fiber cable installation plan, including pull and tension calculation details. The fiber manufacturer's installation instructions shall be submitted for approval along with the Contractor's fiber work method submission.

Pathway Penetration Sealing:

At all locations where innerducts terminate or transit, the Contractor shall install sealing and termination plugs for all innerduct pathways. Use only approved, removable, mechanical conduit or duct to innerduct OD seals in order to prevent water, gases and foreign matter ingress.

Removable innerduct plugs (end caps) shall be installed immediately after the innerduct is emplaced within each pullbox/manhole. Each innerduct shall be tested for clear bore and proper installation, using a closely sized, leather disc or aluminum "proof" mandrel". Each Innerduct's integrity shall be verified in place, by the Contractor, in the presence of the Engineer.

Components and Incidentals:

The Contractor shall provide all components required to form a complete innerduct and fiber cable plant including, but not limited to; bushings, couplings, connectors, duct transitions, fiber enclosure kits, supports and ancillary components required for the installation of the ITS fiber cable plant.

Include all incidental items such as: removable gas, moisture and water conduit/duct seals, fiber approved lubricant, identification tags, end caps and innerduct management devices including such devices necessary for the support racking and connections of slack fiber cable / innerducts within pullboxes and manholes.

The components supplied shall be commercially available, state-of-the-art components, suitable for this application.

**Pre-installation Requirements:**

The Contractor shall be entirely responsible for the fiber optic cable and innerduct security, quality and adherence to these specifications, from its manufacture to the time the network is accepted by the Engineer. **Optical Fiber Innerduct Color Code**

The EIA telecommunications cable color code is specified for innerduct color identification, colors are based on the pathway colors that are used for similar NYS/NYC DOT ITS systems.

<b>Color Code</b>	<b>Service</b>	<b>Color</b>
Blue	NYC DOT - Fiber	
Orange	Reserved for Verizon / CATV Fiber	
Green	** USE FOR ITS BACKBONE FIBER INNERDUCT NYC DOT – ITS Fiber	
White	NYC DOT - Future	
Red	Reserved for FDNY	
Black	Fiber Drop use only	
Yellow	Restricted color. Do not use (Gas Utility)	

All material furnished shall be new, first commercial quality, and used in accordance with the highest industry practices.

**METHOD OF MEASUREMENT:**

ITS FIBER OPTIC INNERDUCT, 1 CHANNEL, 1.0 INCH will be measured based on the number of linear feet furnished, in place measurement, of installed and tested innerduct, in accordance with the Contract Documents and/or as directed by the Engineer.

**BASIS OF PAYMENT:**

The price bid per linear foot of ITS FIBER OPTIC INNERDUCT, 1 CHANNEL, 1.0 INCH shall include the cost of furnishing and installation along with all labor, materials, incidentals, mounting, hardware, connectors, couplings, drag lines, identification, related equipment, integrity tests and record documentation necessary to complete the work.

<b><u>Item No.</u></b>	<b><u>Item Description</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR 786	ITS FIBER OPTIC INNERDUCT, 1 CHANNEL, 1.0 INCH	LINEAR FOOT

**END OF SECTION**

**SECTION PK-ESCR 787 – ADJUST TOP OF UTILITY STRUCTURE TO GRADE**

**GENERAL:** Under this item the Contractor shall remove existing frames and covers of utility structures (I.E. existing catch basins, manholes, drain inlets and electric covers) and reset them to grades shown on the plan or directed by the Engineer. Work under this item includes excavation.

**MATERIAL:** All changes shall be made with acceptable brick laid in Portland cement mortar of one (1) part cement and two (2) parts of fine aggregate as directed by the Engineer.

**METHOD:** All work shall be done in a workmanlike manner by competent masons, but if the frames or covers are broken through carelessness of the Contractor, the contractor shall replace them with new ones equal to those broken, at the contractors own expense.

**MEASUREMENT & PAYMENT:** The quantity of ADJUST TOP OF UTILITY STRUCTURE TO GRADE, to be paid for, shall be the number of structures adjusted in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price for EACH structure adjusted and shall include the cost of all labor, materials, equipment and incidental expenses in including excavation and backfill, necessary to complete the work in accordance with the plans and specifications to the satisfaction of the Engineer.

<b><u>Item No.</u></b>	<b><u>Item</u></b>	<b><u>Pay Unit</u></b>
PK-ESCR 787	Adjust top of Utility Structure to Grade	EACH

**END OF SECTION**

**SECTION PK-ESCR 788 – ALLOWANCE FOR UTILITY COMPANY FEES**

**GENERAL:** Under this item the Contractor shall pay Utility Company fees (such as ConEd “Accommodation Cost” or “Excess Distribution Facility (EDF) Cost” fees) that are related to the ITS work (PK-ESCR 450 through PK-ESCR 469 and PK-ESCR 781 through PK-ESCR 786) but not included in other specification items and/or not indicated on contract plans but deemed necessary to complete the work.

The Contractor shall submit to the Engineer legible, stamped paid receipts from the utility company(s) along with the description and the location of work clearly displayed.

**MEASUREMENT & PAYMENT:** For authorized work performed under this Contract, payment will be based upon submission of legible paid receipts with description and location of work approved in advance by the Engineer.

The Contractor will be reimbursed the invoice amount with no markup.

<u>Item No.</u>	<u>Item</u>	<u>Pay Unit</u>
PK-ESCR 788	Allowance for Utility Company Fees	Fixed Sum (FS)

**END OF SECTION**

## SECTION PK-ESCR 802 – STEEL FENCE WITH CLIMBING PROTECTION

**WORK:** Under these Items, the Contractor shall furnish and erect **STEEL FENCE WITH CLIMBING PROTECTION** and **GATES WITH CLIMBING PROTECTION** of the types and sizes shown on the plans, in accordance with the plans, specifications, and directions of the Engineer.

**MATERIALS:** Unless otherwise specified, the materials shall meet the requirements of the NYCDOT Standard Highway Specifications.

**FENCES AND GATES** shall be constructed of solid bars, posts, and rails of the sizes shown on the plans unless specifically noted as lightweight. All material shall conform to Specification ASTM A36.

**FABRICATION- LIGHTWEIGHT GATE** (where specified only): Shall be as manufactured by Shannon Gates and Railings, Deer Park, NY, or approved equal and shall be fabricated from 16G square tubing and 1/2" channels.

**FABRICATION-STEEL FENCES AND GATES:** Fences and Gates shall be fabricated in strict accordance with the plans and approved Shop Drawings. Posts and rails shall be formed into panels of the shapes on the plans and joints completely welded with welds of proper size and shape; all welds ground smooth to a neat finish. Connection shall be provided as indicated on the plans. Welding shall conform to the requirements given in the NYCDOT Standard Highway Specifications.

Posts and pickets shall, in all cases, be truly vertical. Rails and bars shall be parallel to grade as shown on the plans. Panels shall be curved as required by the work. Braces shall be required at two-thirds (2/3) of the way up each post when fence is ten feet (10') high or over.

**HINGES:** shall be Stanley #BB855, Heavy Duty Steel Ball Bearing Hinge, 5" x 6", as manufactured by Stanley Hardware, New Britain, CT, Shannon Gates and Railings, Deer Park NY or approved equal.

**LOCK BOLT- Double Gates:** Shall be a drop rod bar arranged to engage the gate stop. Locking device shall be constructed so that the drop rod cannot be raised when the gate is locked. The locking bolt and bolt catch hardware shall be constructed as shown on the standard detail drawings. The locking device shall have provisions for a padlock. All necessary fittings and gate holders to lock gates in both open and closed positions shall be furnished. The locking device shall be as manufactured by Shannon Gates and Railings, Deer Park NY, or an approved equal locking device.

**GATE LATCH – Single Gates:** Shall be a lockable stirrup type. Latch shall be constructed of steel bars and blocks with a stainless steel pin, as shown on the drawings. The ends of stirrups shall be treated with a heavy-duty flexible, rubberized coating such as Plastidip as manufactured by P.D.I. Inc., Circle Pines, MN, or approved equal.

**PADLOCK:** The Contractor shall furnish one padlock for each single gate and each leaf of double gates. The padlocks shall be American No. 5571 as manufactured by American Lock Co., Crete, IL., or approved equal. All padlocks for the same park facility shall be keyed alike, with two inch (2") wide by three-quarter inch (3/4") thick brass body, maximum security, five (5) pin tumblers with hardened alloy steel chrome plated shackle no less than three-eighth inch (3/8") diameter and two inch (2") clearance (elongated shackle). A galvanized steel chain, nine inches (9") long

shall be fastened to the gate and body of the lock. The chain shall be five-sixteenths inch (5/16") by one and three-eighths inch (1 3/8"). The Contractor shall furnish two (2) keys for each padlock.

**CAST IRON PARKS LEAF – Double Gates:** The Park Leaf casting shall be as manufactured by Wemco Castings, Bohemia, N.Y, or approved equal. The NYCDPR retains exclusive right to the use of the pattern. Leaf castings are to be fabricated from Ductile Iron 65-45-12. The small 9 1/2" leaf shall weigh approximately six pounds (6 lbs.) each. The back of the leaf casting is to be flat and the front face shall be contoured with the veins of the leaf shown in relief. See Contract Drawings for structural details.

Park leaves shall be welded to each leaf of the steel gate in the shop. Field welding will not be permitted.

**GROUT:** Grout for fence posts shall be non-shrink, cement based grout such as SonogROUT 10K as manufactured by BASF Building Systems, Shakopee, MN or SikaGrout 212, as manufactured by Sika Corporation, Lyndhurst, NJ, or approved equal.

**SEALANT:** Sealant around fence post shall be one part polyurethane, elastomeric adhesive such as MasterSeal CR 195, as manufactured by BASF Building Systems, Shakopee, MN or Sikaflex1a, as manufactured by Sika Corporation, Lyndhurst, NJ, or approved equal.

**PAINTING:** The fences and gates shall receive three (3) coats of paint. The first coat shall be shop applied; the second and third coat shall be field applied. Immediately prior to painting, all surfaces of fences and gates shall be thoroughly free of debris. All surfaces that are rust free shall be treated in accordance with SP-1, Solvent Cleaning. Treatment shall be performed with a solvent such as mineral spirits, xylol, or turpentine to remove all dirt, grease, and foreign matter. Surfaces that show evidence of scale and rust shall be cleaned in accordance with SP-2, Hand Tool Cleaning, a method generally confined to wire-brushing, sandpaper, hand scrapers, or hand impact tools or SP-3, Power Tool Cleaning, a method generally confined to power wire brushes, impact tools, power sanders, and grinders in order to achieve a sound substrate. After the fence and gates have been cleaned and prepared, they shall be painted as follows:

**First Coat (Shop Applied):** D.T.M.(Direct to Metal) Alkyd semi-gloss P24, as manufactured by Benjamin Moore & Co., Montvale, NJ, or Kem Bond® HS Metal Primer, B50NZ3, red oxide, as manufactured by Sherwin Williams Company, Woodside, NY, or approved equal. Primer shall be a fast drying, 53 to 61% weight solids, low VOC, rust inhibiting, modified alkyd metal primer with a dry film thickness of 1.7 - 5 mils. Paint requires up to two (2) to two and a half (2 ½) hours drying time before recoating (with alkyds).

**Second Coat and Third Coats (Field Applied):** D.T.M.( Direct to Metal) Alkyd semi-gloss P24, Safety Black, as manufactured by Benjamin Moore & Co., Montvale, NJ, or Steel Master 9500 Silicone Alkyd, as manufactured by Sherwin Williams Company, Woodside, NY, or approved equal. Color to be Black unless otherwise shown on the contract drawings. Topcoat shall be a silicon alkyd, semi or high gloss coating having a dry film thickness of 1.7 - 3 mils. Paint requires up to thirty (30) hours drying time @ 50° F; up to sixteen (16) to eighteen (18) hours drying time @ 77° F. Paint adhesion shall be 100% retention in accordance with ASTM D3359, classification 5B.

All paints shall be applied when ambient air temperature is 50 °F minimum and rising. No painting will be allowed below the minimum ambient air temperature. Surfaces to be painted shall be moisture free. In addition, no painting will be allowed below the temperature at which moisture will condense on surfaces.. The ambient temperature must be at least 5 degrees F above the dew point.

**INSTALLATION:** The fences shall be erected in holes that have been formed in the concrete or stone to receive them. After the posts have been set in place and properly supported to hold them in line and grade, the annular space shall be filled with the specified non-shrink, cementitious grout. The grout shall be flush with the concrete curb. After the grout has cured, the Contractor is to install polyurethane sealant around the fence post. Sealant shall be gunned in between the base of the fence post and the concrete curb. Sealant shall be applied in strict accordance with the manufacturer's instructions, and shall be tooled in as required. **Note: All gypsum (Calcium Sulfate, CaSO4) based grout will be rejected.**

Any fences and gates not set plumb and true to line and grade shall be removed and replaced at the Contractor's expense. The Contractor shall maintain the fences and gates during the life of the contract and shall repair replace all members that are disturbed, damaged, or destroyed.

**SUBMITTALS:** All submittals shall be in accordance with the requirements of the S-Pages.

**Shop Drawings:** shall be submitted prior to manufacture. **SAMPLES:** The Contractor shall submit for the approval finished samples of parts of the fences. The workmanship and finish of the final product shall be equal to the approved samples. Only if proposed manufacturer is other than as specified, a full size sample must be submitted for approval for the following: Gate latch for single gate, padlock, cast iron parks leaf.

**FOUNDRY CERTIFICATE:** A certificate verifying the quality of ductile iron for the Parks Leaf shall be submitted. Certificate shall be on Manufacturers' letterhead, dated and signed by the company President with Contract Number, Contract Title, Contractor Name, and Class of Ductile Iron provided.

**PAINT SUBSTITUTION:** A written request for paint substitution must be submitted to the Engineer. The Contractor shall submit this request, along with manufacturer's data sheets for approval, a minimum of two (2) weeks prior to the intended date of paint application. All paint substitutions must be approved in writing prior to use.

**MEASUREMENT AND PAYMENT:** The quantity of **STEEL FENCE** to be paid for shall be the number of **LINEAR FEET** of each type fence furnished and erected complete, in accordance with the plans, specifications, and directions of the Engineer.

The quantity of **GATES** to be paid for shall be the number of **EACH** size (including both leaves of double gates and gate posts) furnished and erected complete in accordance with the plans, specifications, and directions of the Engineer, including Park leaf castings where double gates are specified, locking devices, gate stops, and padlocks.

The prices bid shall be unit prices per **LINEAR FOOT** of Steel Fence of each type and a unit price for EACH gate and shall include the cost of all labor, materials, and equipment required to furnish and erect fences and gates, including painting, grout, sealant, and all incidental expenses necessary to complete the work in accordance with the plans and specifications, to the satisfaction of the Engineer.

Concrete and excavation shall be paid for separately under their respective Items.

Item No.	Item	Pay Unit

END OF SECTION

## **SECTION PK-ESCR 805 – CUSTOM SITE FURNISHINGS**

### **PK-ESCR 805.1 INTENT**

This section describes the products and installation of Site Furnishings in accordance with the plans, specifications and directions of the Engineer.

### **PK-ESCR 805.2. DESCRIPTION**

- A. Under this Section, the Contractor shall furnish and install the followings Site Furnishings, in accordance with the Contract Drawings, specifications and directions of the Engineer:
1. RPL Bar Top Table – Low Height
  2. RPL Bar Top Table – High Height
  3. RPL Bar Bench
  4. RPL Bar Bench Backed
  5. Amphitheater Bench

### **PK-ESCR 805.3. MATERIALS**

#### **PK-ESCR 805.3.1. REFERENCES**

- A. ASTM Testing Standards:
1. ASTM B 117 – Standard Practice for Operating Salt Spray (Fog) Apparatus.
  2. ASTM D 522 – Standard Test Methods for Mandrel Bend Test of Attached Organic Coatings.
  3. ASTM D 523 – Standard Test Method for Specular Gloss.
  4. ASTM D 2247 – Standard Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
  5. ASTM D 2794 – Standard Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
  6. ASTM D 3359 – Standard Test Methods for Measuring Adhesion by Tape Test.
  7. ASTM D 3363 – Standard Test Method for Film Hardness by Pencil Test.
  8. ASTM G 155 – Standard Practice for Operating Xenon Arc Light Apparatus for Exposure of Non-Metallic Materials.
- B. ISO Testing Standards:
1. ISO 1520 – Paints and Varnishes – Cupping Test.
  2. ISO 2815 – Paints and Varnishes – Buchholz Indentation Test.
- C. ANSI/BIFMA Testing Standards:
1. ANSI/BIFMA X5.4-2005 – Standard Test for Lounge Seating.

**PK-ESCR 805.3.2. SUBMITTALS**

- A. Product Data: Submit manufacturer's product data, storage and handling requirements and recommendations, installation methods and available colors, styles, patterns and textures.
- B. Shop Drawings: Submit manufacturer's shop drawings, including plans and elevations, indicating overall dimensions for approval by the Engineer.
- C. Samples: Submit manufacturer's samples of materials, finishes, and colors, including three (3) samples of specified color as applied to an 8 inch by 8 inch square of specified metal for approval by the Engineer.

**PK-ESCR 805.3.3. DELIVERY, STORAGE, AND HANDLING**

- A. Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.
- B. Storage: Store materials in clean, dry area in accordance with manufacturer's instructions. Keep materials in manufacturer's original, unopened containers and packaging until installation.
- C. Handling: Protect materials and finish during handling and installation to prevent damage.

**PK-ESCR 805.34. WARRANTY**

- A. Warranty Information:
  - 1. Products will be free from defects in material and/or workmanship for a period of three years from the date of substantial completion.
  - 2. The warranty may exclude damage resulting from accident, misuse, tampering, negligence, or abuse.
  - 3. Products shall be repaired or replaced to the satisfaction of the Engineer any items found defective upon inspection by an authorized manufacturer service representative and Engineer.

**PK-ESCR 805.4. METHODS**

The following methods of installation shall be used.

- A. Examination:
  - 1. Examine areas to receive the Site Furnishings.
  - 2. Notify Engineer of conditions that would adversely affect installation or subsequent use.
  - 3. Do not begin installation until unacceptable conditions are corrected and acceptance verified in writing by Engineer.
- B. Installation:
  - 1. Install Site Furnishings in accordance with manufacturer's instructions at locations indicated on the Drawings.
  - 2. Locate Site Furnishings as directed by Engineer.

3. Install Site Furnishings plumb and level.
- C. Adjusting:
1. Finish Damage: Repair minor damages to finish in accordance with manufacturer's instructions and as approved by Engineer.
  2. Component Damage: Remove and replace damaged components that cannot be successfully repaired as determined by Engineer.
- D. Cleaning: Clean Site Furnishings promptly after installation in accordance with manufacturer's instructions. Do not use harsh cleaning materials or methods that could damage finish.
- E. Protection: Protect installed Site Furnishings to ensure they will be without damage or deterioration at time of Substantial Completion.

**PK-ESCR 805.5. MEASUREMENT**

The quantities of **RPL BAR TOP TABLE - LOW HEIGHT, RPL BAR TOP TABLE - HIGH HEIGHT, RPL TOP SEAT, and RPL TOP SEAT BACKED** to be measured for payment shall be the square foot of each type Site Furnishing installed at the site to the satisfaction of the Engineer.

The quantities of **AMPITHEATRE BENCH** to be measured for payment shall be the quantity of each type Site Furnishing installed at the site to the satisfaction of the Engineer.

**PK-ESCR 805.6. PRICES TO COVER**

The prices bid shall be the unit price per EACH type site furnishing Item covered under this Section and shall include the cost of furnishing all labor, materials, equipment, insurance, and incidentals necessary to furnish, assemble and install the Site Furnishings including, but not limited to, chair arm rests and glides, and hardware, all in accordance with the Contract Drawings, the specifications and the directions of the Engineer.

*Payment will be made under:*

**END OF SECTION**

## SECTION PK-ESCR 809 – SOD NEW LAWN, SPORTS FIELDS

**WORK:** Under this Item, the Contractor shall furnish and install **SOD NEW LAWN** areas including preparation of sod bed and shall maintain new lawn areas in accordance with the plans, specifications, and directions of the Engineer.

**INTENT:** This specification is intended for rototilling and sodding new lawn of any size on either new or existing topsoil.

### **MATERIALS:**

**Sod sports field mix:** The Sod must be a superior sod grown from high quality seed of known origin. Seed is to be inspected by a Certification Agency to assure satisfactory genetic identity and purity, overall high quality, and freedom from noxious weeds at time of harvest.

A fescue mix on a sand based soil. The blend/mix of grass in sod shall meet the specifications set below and shall be harvested from one field to ensure a uniform color and texture.

- 25% JASPER CREEPING RED FESCUE
- 25% VICTORY CHEWINGS FESCUE
- 30% SPARTAN HARD FESCUE
- 10% AMERICA KENTUCKY BLUEGRASS
- 10% JEFFERSON KENTUCKY BLUEGRASS

NOTE: Sod shall be machine cut to a uniform soil thickness of one-quarter inch (1/4") at the time of cutting. Measurement for thickness shall exclude top growth and thatch.

Individual pieces of sod shall be cut forty-eight inches (48") wide by sixty-two and one-half feet (62.5') long (250 sq.ft.). Sod shall not be harvested or transplanted when moisture content may adversely affect its survival.

Sod shall be harvested, delivered, and transplanted within a period of thirty six (36) hours. Before cutting, Sod shall be mowed uniformly at a height of one and one-half inches (1 1/2"). The Engineer may inspect the Sod before it is harvested, but reserves the right to reject, on or after delivery, any Sod which, in their opinion, does not meet with the specifications.

When sod is delivered with monofilament (plastic or similar) backing, the backing shall be removed after rolling out the sod and discarded in an approved manner.

**Ground Limestone:** (Calcium Carbonate) shall have the following analysis: at least fifty percent (50%) shall pass a 200 mesh sieve; at least ninety percent (90%) shall pass a 100 mesh sieve; and one hundred percent (100%) shall pass a 10 mesh sieve. Total carbonates shall not be less than eighty (80) percent or 44.8% Calcium oxide equivalent. Pelleted limestone may be substituted at the discretion of the Engineer, when wind conditions exceed five (5) miles per hour.

The Contractor shall, at the direction and discretion of the Engineer, furnish a certified report of chemical analysis of representative samples of the Limestone which he proposes to use. All samples are to be taken by the Engineer and delivered to the laboratory: the price bid shall include inspection and laboratory charges. Limestone shall not be delivered until samples have been approved by the Engineer, but such approval does not constitute acceptance of the material. The Engineer reserves the right to reject on or after delivery any material which does not, in the Engineer's opinion, meet these specifications.

All limestone shall be delivered in standard size bags of the manufacturer showing weight, analysis, and name of the manufacturer. It shall be stored in such a manner that its effectiveness will not be impaired, as directed by the Engineer.

The rate of application of limestone per thousand (1,000) square feet shall be as follows, depending on the Hydrogen Ion concentration (pH) shown by a pH test (pH test to be provided by the Contractor at no additional cost to the City).

<u>pH</u>	<u>RATE (LBS.)</u>
Below 5.0	160
5.0 to 6.0	80
Over 6.0	0

Commercial Fertilizer Low Phosphorus (Slow Release): shall have the following composition by weight: Nitrogen (N) shall be min. 4% - max. 10%, of which min. of 50% is slow-release; available Phosphorus (P) shall be 0.67% or less (unless soil test indicates a need for additional phosphorus); and soluble Potash (K) shall be min. 4% - max. 12%.

Fertilizer shall be a pesticide free (no weed-and-feed) product such as Safer Ringer Lawn Restore II 10-0-6 as manufactured by Woodstream corp., Lifitz, PA; "Healthy Turf (8-1-9)" as manufactured by Plant Health Care, Inc., Pittsburgh, PA; Nutrients Plus (7-2-12) as manufactured by Nutrients Plus, Virginia Beach, VA; or approved equal.

All Commercial Fertilizer Low Phosphorus (Slow Release) shall be delivered in standard size bags of the manufacturer, showing weight, analysis, and name of manufacturer. It shall be stored as directed by the Engineer in such a manner that its effectiveness will not be impaired.

Application of any fertilizer on lawns or non-agricultural turf within 20 feet of a water body or on paved surfaces is restricted and may not be applied unless there is a buffer at least 10 feet wide of planted or naturally occurring vegetation, such as shrubs, trees and plants between the area receiving fertilizer and the water. Fertilizer shall not be applied between December 1 and April 1.

The rate of application: Two (2) applications of acceptable commercial fertilizer shall be applied by machine, each application at the rate of ten (10) pounds per 1,000 square feet or as recommended by the manufacturer. The first application shall be made at the time installation of Sod as specified.

The second application shall be made approximately six (6) months after the first application. This treatment shall take place during the next appropriate fertilizing season, the following Spring or Fall, and shall be subject to the direction of the Engineer.

The second application shall be applied to the surface only. Incorporation shall be achieved by thoroughly watering the entire area after application. The Contractor shall provide all labor and materials, including water, if not available from NYC sources.

**PREPARATION OF SOD BED:** Before any sod is placed, all areas to receive sod shall be thoroughly loosened with a rototiller to a depth of six inches (6"). All sticks, stones, roots, vegetation, or other objectionable material which might interfere with the formation of a finely pulverized sod bed shall be removed from the soil and a smooth uniform surface grade shall be established. Hollows, depressions, and gullies shall be filled by raking to level and topsoil added as necessary to provide a smooth surface prior to sodding. Topsoil shall be spread over the area to receive sod to the depth indicated on the drawings and as required to achieve the designated finished grade.

Compost (where required, paid separately): shall be thoroughly incorporated into the top five inches (5") of soil, where sod will be installed on existing topsoil and where soil testing indicates

low levels of organic matter. Where required, the compost shall be spread at the rate of one (1) cubic yard per one thousand (1,000) square feet unless otherwise directed by the Engineer. Where seed will be installed on new topsoil, compost shall not be added.

Amendments: After the compost has been incorporated into the existing soil, limestone (where required) and Commercial Fertilizer Low Phosphorous (Slow Release) shall be worked into the top three inches (3") of soil as directed by the Engineer.

All amendments must be submitted to the Engineer for approval, see SUBMITTALS: The Contractor shall notify the Engineer three (3) days prior to application of amendments.

**INSTALLATION:** All areas to receive sod shall then be compacted using a two hundred pound (200 lb.) roller. The area shall then be thoroughly watered prior to the placement of Sod. After drying out sufficiently, the area shall be considered ready to receive the sod.

Sod is not to be delivered or placed in a frozen condition. Sod shall be harvested, delivered, and installed within a period of thirty six (36) hours. No sod shall be harvested, delivered, or placed when, in the opinion of the Engineer, high temperatures may adversely affect the survival of the Sod.

The first row of sod shall be laid in a straight line with subsequent rows placed parallel to and tightly against each other. Lateral joints shall be staggered, each piece butted close together with no voids between the pieces. Care shall be exercised to ensure that the sod is not stretched or overlapped. Where mechanical equipment is used to lay sod, flotation tires are to be used. The sod shall be rolled immediately after placement and then thoroughly watered.

Sod shall be laid a minimum of four (4) weeks prior to the Substantial Completion date to allow the sod to thoroughly knit before being turned over to the Engineer. All dead sod shall be replaced prior to the Substantial Completion. All extra sod and/or plant debris remaining from the preparation procedure shall be removed from the site. The Contractor shall be liable for any damage to property caused by their sodding operations. All areas and construction disturbed shall be restored to their original condition, to the satisfaction of the Engineer.

**WATERING AND MAINTENANCE:** The Contractor shall maintain all sodded areas until Substantial Completion of the contract. The Contractor shall properly water as required to maintain optimum growing conditions for the new stand of grass until Substantial Completion. Where water is supplied from City hydrants, the Contractor shall obtain a hydrant permit from the Department of Environmental Protection. The Contractor is responsible for keeping the permits current. The permits are available from each borough office. To obtain a permit, the Contractor should bring a copy of their contract with a general description of the hydrant location(s) they propose to access. The addresses of borough offices are:

Manhattan: 1250 Broadway (8th floor)  
Brooklyn: 250 Livingston St. (8th floor)  
Bronx: 1932 Arthur Avenue (6th floor)  
Queens: 96-05 Horace Harding Ex., Corona  
Staten Island: 60 Bay St (6th floor)

If water is not available from NYC sources, the Contractor is responsible for supplying water from their own source.

In absence of adequate rainfall, watering shall be performed daily or as often as necessary and in sufficient quantities to maintain moist soil to a depth of at least four (4") inches. Watering shall be done during the heat of the day to prevent wilting.

The first mowing shall not be attempted until the Sod is firmly rooted and secure in place. Not more than forty percent (40%) of the grass leaf shall be removed by mowing. The grass height shall be maintained between one and one-half inches (1 1/2") and three inches (3"), as directed by the Engineer, until Substantial Completion. Any unsatisfactory Sod shall be removed and replaced at the Contractor's expense.

**SUBMITTALS:** Submittals shall be as per the S-Pages.

Sod Mix: The Contractor shall submit a document from the sod source for approval prior to delivery of sod to the site showing the seed composition and percentages of each grass type proposed.

Amendments: The Contractor shall submit proposed soil amendments for approval prior to delivery.

Invoices: The Engineer reserves the right to request Contractor's invoices for all products used in this item.

**MEASUREMENT AND PAYMENT:** The quantity of **SOD NEW LAWN** to be paid for under this Item shall be the number of **SQUARE FEET** of sod furnished, placed, and maintained in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be a unit price per **SQUARE FOOT** of Sod and shall include the cost of all labor, materials, and equipment necessary or required to prepare the sod bed, incorporating Limestone (where needed), Commercial Fertilizer Low Phosphorous (Slow Release), dispose of surplus materials, furnish, lay, maintain, and water Sod and all work incidental thereto, in accordance with the plans and specifications, to the satisfaction of the Engineer.

Topsoil shall be paid for separately. Compost (where required per test results for existing soil) shall be paid for under its respective contract item. The price of water, regardless of the source, shall be considered part of the bid price.

Payment for work performed under this item shall be made as follows:

40% - after preparation of sod bed

30% - after sodding and rolling

10% - after second application of fertilizer

20% - at Substantial Completion, having maintained and watered new lawn to the satisfaction of the Engineer.

**END OF SECTION**

## SECTION PK-ESCR 811 – CONCRETE PAVERS ON CONCRETE BASE

**WORK:** Under these Items, the Contractor shall furnish and install **CONCRETE PAVERS ON CONCRETE BASE** in accordance with the plans, specifications, and directions of the Engineer.

**PATTERN:** The layout of the pavers shall be subject to approval by the Engineer. Layout patterns and paver designs are as indicated on the plans. All edges, borders, and corners of the paved area shall be finished to true and neat lines. Special cutting, soldier courses, color patterns, various shapes, and variations in size and finish are all to be included in the square yard price bid.

### **MATERIALS:**

**Pavers:** The pavers shall be manufactured from high quality, steam cured, pre-cast concrete having a minimum compressive strength of 8,000 p.s.i. and maximum water absorption of 5 percent. Unless otherwise noted on the plans, all pavers shall be hexagonally shaped concrete blocks eight inches (8") across flats and three inches (3") in thickness, with a permissible plus or minus tolerance of one-sixteenth inch (1/16") in any dimension. All pavers shall have a 1/16" bevel and spacer lugs to provide joint consistency. All pavers to accommodate pedestrian and vehicular traffic and have an SRI value in the range of 22 to 42. All pavers shall be as indicated on the plans or approved equal. All pavers used shall be of the same manufacturer. Refer to drawings for paver colors. Design requires four paver colors to create a gradation across the esplanade using charcoal, limestone gray, natural charcoal blend, and a white gray with darker gray/green and white flecks. All pavers shall have Tudor finish.

**Aggregate Base Course:** The aggregate base course shall be as shown on the plans and details.

**Concrete Base:** The concrete base shall be as shown on the plans and details. Concrete mix per Section ESCR-4.06.

**Bituminous Setting Bed:** Asphalt cement to be used in the bituminous setting bed shall conform to PGA 64-22, ASTM D6373 for Performance Graded Asphalt.

The fine aggregate to be used in the bituminous setting bed shall be clean, hard sand with durable particles and free from adherent coatings, lumps of clay, alkali salts and organic matter. It shall be uniformly graded from "coarse" to "fine" and all passing the No. 4 sieve and meet the gradation requirements when tested in accordance with the standard method of test for sieve or screen analysis of fine and course aggregates ASTM C136.

The dried fine aggregate shall be combined with hot asphalt cement, and the mix shall be heated to approximately 3000 F. at an asphalt plant. The approximate proportion of materials shall be seven (7%) percent cement asphalt and ninety-three (93%) percent fine aggregate. Each ton shall be apportioned by weight in the approximate ratio of 145-lbs. asphalt to 1,855-lbs. sand. The Contractor shall determine the exact proportions to produce the best possible mixture for construction of the bituminous setting bed to meet construction requirements.

**Tack Coat:** Tack coat shall be # 237 2% Neo-Asphalt, Brush Grade as manufactured by Hanover Architectural Products, Hanover, PA, or approved equal. Tack coat shall be an asbestos free, cold applied, rubberized asphalt cement, and shall consist of two percent (2%) neoprene rubberized asphalt with 1500 softening point and 6.5 percent (6.5%) inorganic material.

**Sand:** Sharp, washed sand with 100 percent passing No. 16 (1.18-mm) sieve.

**Inspection:** Equipment, materials and preparation of the mixtures will be subject to inspection and approval at the refineries and plant as may be directed. In conjunction therewith, the Contractor shall employ the services of an approved inspection service for the purpose of

providing plant certification of the asphalt pavement mixture conformance to these specifications. The inspection services shall be under the jurisdiction of and shall report directly to the Engineer for approval

Tests: Unless otherwise specifically provided, tests of materials shall be made in accordance with the latest specifications of the ASTM.

Transportation: Shipments of material shall be made in tight vehicles previously cleaned of all foreign material, and delivered to the work, so that it will not become contaminated in any way.

Joint Filler: Upon the completion of the work of laying the blocks in each section to the satisfaction of the Engineer, the surface of the blocks shall be swept clean, and the joints filled with fine sand. All joints shall be filled the same day as the blocks are laid. Filler shall not be applied if the blocks are wet or if the air conditions are such that the fill does not readily enter the joints. Filler shall be well worked into the joints by means of squeegees or other approved devices operating slowly backward and forward. Squeegeeing shall continue until the joints are flush with top surface. Immediately after the joints are filled, the pavement shall be lightly sprayed and cleaned.

**INSTALLER QUALIFICATIONS:** A firm with a minimum of 10 years documented experience in the installation of concrete pavers, similar to the complexity of the design indicated for this project and with a record of successful performance. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

### **INSTALLATION:**

Placement: The pattern for placement of pavers shall be that indicated on plans or implied by shape of paver. All edges, borders and corners of paved areas shall be finished to true and neat lines. Pavers shall be clean of all adhering material when placed. Pavers which, in the opinion of the Engineer, are not satisfactorily clean shall be well washed before being placed.

Testing: After a sufficient area of pavement has been laid, as determined by the Engineer, the surface shall be tested with a ten foot straight edge laid parallel with the center line and any depression exceeding one-quarter (1/4) inch shall be corrected and brought to the proper grade. All stones disturbed in making replacements or correcting depressions shall be settled into place by carefully ramming or tamping to grade by the use of a hand tamper applied upon a two (2") inch board.

Subgrade Preparation: The subgrade shall be compacted with equipment that will yield the following density:

Cohesive Subgrade - Minimum of 95% of AASHTO T 180 Method D density

Cohesionless Subgrade - Minimum of 100% of AASHTO T 180 Method D density

The Contractor shall remove from the subgrade all debris, foreign and other undesirable material which interferes with satisfactory construction. The fine grade shall not be muddy or otherwise unsatisfactory when the base course material is placed upon it. If the fine grade becomes rutted or displaced, due to any cause whatsoever, the Contractor shall regrade same without additional payment.

Installation of Bituminous Setting Bed: To install the setting bed over the surface of the base, place three-quarter inch (3/4") deep control bars directly over the base course. If grades must be adjusted, set wood chocks under depth control bars to proper grade. Set two bars parallel to each other approximately 11 feet long (2" x 6" board). The depth of control bars must be set carefully to bring the paver, when laid, to the proper grade.

Place some bituminous material between the parallel depth control bars. Pull this bed with the striking board over these bars several times. After each passage, low porous spots must be

showered with fresh bituminous materials to produce smooth, firm and even setting bed. As soon as the initial panel is completed, advance the first bar to the next position in readiness for striking the next panel. Carefully fill any depressions that remain after removing the depth control bars and wood chocks.

Bed shall be spread in a continuous professional manner. Installation of base in spotted, different and isolated areas will not be accepted. Bed depth greater than one and one eighth inch (1-1/8") will not be acceptable. After setting bed has cooled, it shall be rolled by hand with a one hundred pound (100 lb.) roller to eliminate sponginess and to prepare the surface for the installation of the tack coat. Setting bed shall be protected against all pedestrian traffic and construction equipment to ensure a level surface for setting pavers.

**Tack Coat:** The neoprene-modified asphalt adhesive tack coat shall be applied by mopping, squeegeeing, or troweling over the top of the bituminous setting bed so as to provide a bond between the bituminous setting bed and the paver.

**Setting Pavers:** When modified, asphalt adhesive is dry to touch, carefully place the pavers by hand, in straight course, with hand tight joints and uniform top surfaces, keeping full alignment according to the patterns shown on the plans or implied by the shape of the paver. In no case shall the bituminous setting bed in front of the pavement be disturbed or walked on during the laying of the blocks.

**Joint Filler:** Upon the completion of the work of laying the blocks in each section to the satisfaction of the Engineer, the surface of the blocks shall be swept clean, and the joints filled with a mixture of one (1) part Portland Cement and ten (10) parts sand thoroughly dry mixed in an approved batch mixer for not less than one and one-half (1-1/2) minutes.

All joints shall be filled the same day as the blocks are laid. Filler shall not be applied if the blocks are wet or if the air conditions are such that the filler does not readily enter the joints. Filler shall be well worked into the joints by means of squeegees or other approved devices operating slowly backward and forward. Squeegeeing shall continue until the joints are full. Immediately after the joints are filled, the pavement shall be swept clean.

**DEFECTS:** Where defects in composition, compression or finished appear in the complete work, such finished areas shall be removed to the full depth of the course and the defective material replaced with the required thickness of pavement at the expense of the Contractor for such removing and replacing.

**COLD WEATHER:** Asphalt base course shall be mixed and placed in accordance with minimum placement temperature as specified in the following table. Unless notified by the Engineer in writing, no material shall be mixed or placed when the temperature is at, or lower than 50 °F.

**MINIMUM PLACEMENT TEMPERATURES**

MAT THICKNESS IN INCHES

SURFACE TEMP. (F)	<u>TEMPERATURE OF THE MIX</u>					
	<u>1/2"</u>	<u>3/4"</u>	<u>1"</u>	<u>1 1/2"</u>	<u>2"</u>	<u>3"</u>

+70-80	300	290	285	280	270	265
+80-90	290	280	275	270	265	260
+90	280	275	270	265	260	255

---

ROLLING TIME MINUTES	4	6	8	12	15	15
----------------------	---	---	---	----	----	----

**PRECIPITATION PROBABILITY:** Placement of bituminous paving materials shall not be scheduled when the Precipitation Probability, obtained by the Contractor from the U.S. Weather Bureau within three (3) hours prior to the start of such operations, equals or exceeds fifty percent (50%). The Contractor shall notify the Engineer of the exact time at which the above information was obtained.

**SAMPLES:** The Contractor shall furnish two (2) samples of each paver type before starting work for approval of the Engineer. Pavers used on site shall conform to the approved samples, in the opinion of the Engineer.

**PRODUCT DATA:** The Contractor to provide product data for each variety of each paver and paver accessories.

**SHOP DRAWINGS:** The Contractor to provide shop drawings to include layout plans, color gradation, patterning, color selection, sections, details, and interfaces with other Work. Drawings to include connection to waterfront structures, bulkhead, precast step downs, walls, stairs, buildings, and concrete curbs. The Contractor to provide shop drawings at eight (8) locations: north of Fields 1 & 2, Fire Boat House, Williamsburg Bridge BBQ, Houston stepdown, south of the track, north of the track, 10<sup>th</sup> Street BBQ, and 10<sup>th</sup> Street Comfort Station.

**MOCKUP:** Build mockups to set quality standard for fabrication and installation. The Contractor shall provide mockups at eight (8) locations of 30' by 10' areas. Build mockups to show the gradation of two (2) colors, three (3) colors and four (4) color changes, and interface with adjacent vertical surfaces. The Contractor shall provide mock-ups for the following esplanade areas: north of Fields 1 & 2, Fire Boat House, Williamsburg Bridge BBQ, Houston stepdown, south of the track, north of the track, 10<sup>th</sup> Street BBQ, and 10<sup>th</sup> Street Comfort Station. Approved mockups may become part of the completed work if undisturbed at time of substantial completion.

**MEASUREMENT AND PAYMENT:** The quantity of **CONCRETE PAVERS** to be paid for under these Items shall be the number of **SQUARE YARDS** of each type of pavement constructed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **SQUARE YARD** of Concrete Pavers and shall include the cost of all labor, materials, equipment and incidental expenses necessary to complete the work, including concrete pavers, setting bed and expansion joints, concrete base, all in accordance with

the plans and specifications to the satisfaction of the Engineer.

Aggregate base course (PK-ESCR 748) shall be paid for separately under its own contract item.

**END OF SECTION**

## SECTION PK-ESCR 907 – FISH CLEANING TABLE

### PK-ESCR 907.1. INTENT

This section describes the furnishing and installation of the Fish Cleaning Table in accordance with the plans, specifications and directions of the Engineer. □

### PK-ESCR 907.2. DESCRIPTION

- A. Under this section, the Contractor shall furnish and install the following items:
  - a. Fish Cleaning Table
  - b. Fish Cleaning Table Accessories
    - i. Plumbing Piping
    - ii. Pedal Valve & Accessories
    - iii. Stainless Steel Wire Mesh
    - iv. Stainless Steel Funnel
  - c. Coordination with adjacent work, utility connections, testing, adjusting as needed, and inspection.

### PK-ESCR 907.3.1. REFERENCES

- A. ASTM Material Standards:
  - a. ASTM A 36 – Standard Specification for Carbon Structural Steel
- B. ASTM Testing Standards:
  - a. ASTM B 117 – Standard Practice for Operating Salt Spray (Fog) Apparatus
  - b. ASTM D 522 – Standard Test Methods for Mandrel Bend Test of Attached Organic Coatings
  - c. ASTM D 523 – Standard test Method for Specular Gloss
  - d. ASTM D 2247 – Standard Practice for Testing Water Resistance of Coatings in 100% Relative Humidity
  - e. ASTM D 2794 – Standard Practice for Testing Water Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
  - f. ASTM D 3359 – Standard Test Methods for Measuring Adhesion by Tape Test
  - g. ASTM D 3363 – Standard Test Methods for Film Hardness by Pencil Test
  - h. ASTM G 155 – Standard Practice for Operating Xenon Arc Light Apparatus for Exposure of Non-Metallic Materials
- C. ISO Testing Standards:
  - a. ISO 1520 – Paints and Varnishes – Cupping Test
  - b. ISO 2815 – Paints and Varnishes – Buchholz Indentation Test

### PK-ESCR 907.3.2. SUBMITTALS

All submittals shall be as per the S-Pages.

- A. Product Data: Submit manufacturer's product data, storage and handling requirements and recommendations, installation methods and available colors, styles, patterns, and textures.
- B. Shop Drawings: Show fabrication and installation of Fish Cleaning Table. Include plans and elevations for the Fish Cleaning Table and control mechanisms. Include details, attachments, connectors, anchoring and connecting hardware, connections to water and sewer, and lightning grounding protection. Indicated field and shop welds.
  - a. Include Valve Schedule listing type of valve, manufacturer's model number and size, for each valve type required.
  - b. Indicate welded connections by AWS standard symbols. Detail loose and cast-in hardware, inserts, connections, and joints, including accessories.

- C. Samples: Submit manufacturer's samples of materials, finishes, and colors, including three (3) samples of specified color/finish as applied to an eight inch (8") by eight inch (8") square of specified metal for approval by the Engineer.
- D. Qualification Data: For firms and persons to demonstrate their capabilities and experience. Include qualifications below:
  - a. Work of this Section shall be fabricated by an experienced fabricator or manufacturer, who has been engaged in the production and installation of stainless steel furnishings and/or site amenities for at least five (5) years.
  - b. Qualifications of Welders: Qualify welders in accordance with AWS for each process, position, and joint configuration. Each operator shall have been qualified as prescribed by AWS. Welder qualification shall include passing the bend test. Require welders to retake the qualification test if, as determined by the Engineer, there is a reasonable doubt as to the proficiency of the welder. If the welder does not re-qualify, that welder shall not perform any welding for project work. Contractor shall pay all costs associated with welder qualification.
    - i. Requirements for welder qualifications shall include conditions specified for welding procedures specified in Article "Submittals" including testing standards and witness / approval by independent third party.
    - ii. Welding Certificates: Copies of certificates for welding procedures and personnel.
  - c. Qualification of Finishers: Firm experienced in successfully finishing steel fabrications similar to that indicated for this Project, with sufficient production capacity to produce required units without causing delay in the Work.
  - d. Qualifications of Installers: Installers to have no less than three (3) years of documented experiences who has completed installation of stainless steel element work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

**PK-ESCR 907.3.3. QUALITY CONTROL**

- A. Thermal Movements: Allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - a. Temperature (Range): 120 deg F, ambient; 180 deg F, material surfaces
- B. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.
- C. Qualify welding processes and welders in accordance with AWS D1.1 "Structural Welding Code – Steel", D1.3 "Structural Welding Code – Sheet Steel", and D1.2 "Structural Welding Code – Aluminum".
- D. Defective Work: Work that does not comply with the requirements, including strength, manufacturing tolerances, and finishes, are unacceptable. Replace with a Fish Cleaning Table and/or Fish Cleaning Table Accessories that comply with requirements.

**PK-ESCR 907.3.4. DELIVERY, STORAGE, AND HANDLING**

- A. Delivery:
  - a. Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.
  - b. Schedule delivery and installation of Fish Cleaning Table and accessories to coordinate with work adjacent to the Fish Cleaning Table.
- B. Storage: Store materials in a clean, dry area in accordance with the manufacturer's instructions. Keep materials in manufacturer's original, unopened containers and packaging until installation.

C. Handling: Protect materials and finish during handling and installation to prevent damage.

**PK-ESCR 907.3.5. WARRANTY**

A. Warranty Information:

- a. Products will be free from defects in material and/or workmanship for a period of three (3) years from the date of substantial completion.
- b. The warranty may exclude damage resulting from accident, misuse, tampering, negligence, or abuse.
- c. Products shall be repaired or replaced the satisfaction of the Engineer any items found defective upon inspection by an authorized manufacturer service representative and Engineer.
- d. Fabricator to provide a five-year (5) warranty against the effects of freeze-thaw.

**PK-ESCR 907.3.6. PRODUCTS**

- A. Fish Cleaning Table: as fabricated by Forms+Surfaces, 30 Pine Street, Pittsburgh, PA 15223; Contact: Jason Bajor, 914-589-6322, Jason.bajor@forms-surfaces.com; or approved equal.
- B. Fish Cleaning Table Accessories:
  - a. Stainless Steel Pipe and Fittings
    - i. Stainless Steel Pipe for Welding: Standard weight, Schedule 40, Stainless Steel Type 316L, maximum carbon content 0.03%.
    - ii. Specification: ASTM A-358/ASME SA-358.
    - iii. Range: ASTM A-312.
  - b. Pedal Valve & Accessories
    - i. Pedal valve to be single pedal valve floor mounted, one half inch (1/2") inlet and one half inch (1/2") outlet, as manufactured by "T&S Brass", #B-0507 or approved equal.
    - ii. Valve Box, Attachments, & Accessories
  - c. Stainless Steel Wire Mesh: two and three quarter inch (2 3/4") stainless steel mesh, 11 gal. (0.120" dia.)
  - d. Stainless Steel Funnel: 6" diameter stainless steel funnel for drain

**PK-ESCR 907.3.7. FINISHES**

A. Fish Cleaning Table: All visible surfaces to have dull #6 Satin Finish (RMS 32 max surface finish).

**PK-ESCR 907.4. METHODS**

The following methods of fabrication and installation shall be used.

A. Fabrication:

- a. General: Fabricate Fish Cleaning Table and accessories to comply with the requirements indicated for design, dimension, member sizes and spacing, details, finish, and anchorage.
- b. Assemble Fish Cleaning Table to the greatest extent possible to minimize field splicing, welding, and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- c. Welded Connections: Where shown on details and approved shop drawings, fabricate Fish Cleaning Table and accessories for connecting members by welding. Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following:
  - i. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base materials.
  - ii. Obtain fusion without undercut or overlap.
  - iii. Remove flux immediately.
  - iv. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.

- d. Non-welded Connections: Where shown on details and approved shop drawings, fabricate railings and gates by connecting members with concealed mechanical fasteners and fittings, unless otherwise indicated. Fabricate members and fittings to produce flush, smooth rigid, hairline joints.
  - e. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect Fish Cleaning Table to other work, unless otherwise indicated.
  - f. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during concrete casting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.
  - g. Provide inserts and other anchorage devices for connecting Fishing Cleaning Table and accessories to concrete. Fabricate anchorage devices capable of withstanding loads imposed by movement and due to other factors. Coordinate anchorage devices with supporting structure and lightening protection.
  - h. Shear and punch metals cleanly and accurately. Remove burrs from exposed cut edges.
  - i. Ease exposed edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.
  - j. Cut, reinforce, drill, and tap components, as indicated, to receive finish hardware, screws, and similar items.
  - k. Provide weep holes and other means to drain entrapped water in hollow sections of railings and gates that are exposed to exterior or to moisture from condensation or other sources.
  - l. Fabricate joints that will be exposed to weather in a watertight manner.
  - m. Close exposed ends with prefabricated end fittings as necessary.
- B. Examination:
- a. Examine areas to receive the Fish Cleaning Table. Examine substrates and conditions with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance.
  - b. Notify Engineer of conditions that would adversely affect installation or subsequent use. Proceed with installation only after unsatisfactory conditions have been corrected. Do not begin installation until acceptable conditions are corrected and acceptance verified in writing by Engineer
  - c. Do not install Fish cleaning Table and accessories until the supporting concrete has attained minimum design compressive strength.
- C. Installation:
- a. Connect to plumbing prior to installation of Fish Cleaning Table.
  - b. Install Fish Cleaning Table and accessories in accordance with manufacturer's instructions at locations indicated on the Drawings. Remove temporary shims, wedges, and spaces as soon as possible after anchoring and grouting are completed.
  - c. Fit exposed connections together to form tight, hairline joints.
  - d. Perform cutting, drilling, and fitting required to install Fish Cleaning Table and accessories. Set Fish Cleaning Table and accessories in location, alignment, and elevation; measured from established lines and levels and free from rack.
    - i. Do not weld, cut, or abrade surfaces of handrail, railings, and gates components that have been finished after fabrication and that are intended for field connection by mechanical or by other means without further cutting or fitting.
    - ii. Install Fish Cleaning Table and accessories plumb and level within a tolerance of one sixteenth inch (1/16") in three feet (3') [2 mm in 1m].
  - e. Tack-weld all exposed non-tamperproof nuts.
  - f. Anchoring
    - i. Grounding: Fish Table shall have provided at minimum one grounded connection.

- ii. Fasten Fish Cleaning Table and accessories to surfaces as shown on drawings.
  - iii. Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are filled. Place grout to finish smooth, level, and plumb with adjacent surfaces. Keep grout damp for a minim of 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.
  - g. Valves: Install valves of type and kind as indicated on the drawings, each complete with operator and accessory items as required by the actual location. Size valves the same size as the piping in which they are installed, unless otherwise indicated.
- D. Testing:
- a. The entire system shall be pretested and inspected. This shall include maintaining full pressure on the entire system for no less than one (1) hour. Following the pressure test, it is imperative that all components be flushed by running the water supply through the fixture for a period of time to ensure that all debris has been removed from the entire system and this is to be done in the presence of the Engineer.
  - b. Table shall be level with positive drainage to drain. If positive drainage is not achieved, the table must be re-set.
- E. Adjusting:
- a. Finish Damage: Repair minor damages to finish in accordance with manufacturer's instructions and as approved by Engineer.
  - b. Component Damage: Remove and replace damaged components that cannot be successfully repaired as determined by Engineer.
- F. Cleaning:
- a. Clean exposed Fish Cleaning Table and accessories after erection to remove weld marks, other markings, dirt, and stains.
    - i. Wash and rinse according to manufacturer's written recommendations. Protect other work from staining or damage due to cleaning operations.
  - b. Do not use harsh cleaning materials or methods that could damage or change the appearance of approved material finishes.
- G. Protection: Protect installed Site Furnishings to ensure they will be without damage or deterioration at time of Substantial Completion.

**PK-ESCR 907.5. MEASUREMENT**

The quantity of **FISH CLEANING TABLE** to be paid for shall be the **LUMP SUM** furnished an installed complete, in accordance with the plans, specifications, and directions of the Engineer.

**PK-ESCR 907.6. PRICES TO COVER**

The price bid shall be a **LUMP SUMP** for **FISH CLEANING TABLE** and all accessories and shall include the cost of all labor, materials, equipment, and incidentals required to complete the work, including unclassified excavation, concrete footings, instructional signage, handling, protection, fabrication, finishing, steel piping, connection to utilities, valve and valve box installation, testing, and all submittals, including delivery to site and all incidental expenses necessary to complete the work in accordance with the Contract Drawings, approved shop drawings, and specifications, to the satisfaction of the Engineer.

*Payment will be made under:*

**END OF SECTION**

## SECTION PK-ESCR 912 – NATURE EXPLORATION FABRICATION

### PK-ESCR 912.1. INTENT

This section describes the fabrication of the elements included in Nature Exploration, including, but not limited to, Log Scramble, Tree Round Border, Tree Round Maze, and Tree Round Seat, all in accordance with the plans, specifications and directions of the Engineer. □

### PK-ESCR 912.2. DESCRIPTION

Under this section, the Contractor must fabricate and deliver the Nature Exploration elements made from trees salvaged as specified in Section PK-ESCR 968 under Item No. PK-ESCR 916, all in accordance with the details indicated in the Contract Drawings, specified, or directed by the Engineer.

### PK-ESCR 912.3. MATERIALS

Unless otherwise specified herein, all materials shall conform to applicable portions of and shall meet the requirements of the NYCDOT Standard Highway Specifications.

1. Salvaged Wood: For tree salvage for Nature Exploration, see Specification Section PK-ESCR 968 Tree Salvage and Item No. PK-ESCR 916 Tree Selection, Storage and Preparation for Nature Exploration.
  - a. Species of salvaged wood to be used for fabrication of Nature Exploration elements to be of the genii *Quercus* and *Gleditsia*, see Specification PK-ESCR 968 Tree Salvage, Item No. PK-ESCR 916.
2. End Sealer (Mineral Wax): Exterior grade end grain sealing wax, water repellent to minimize water absorption, dirt repellent, odorless, dries to a clear finish. To be free of heavy metals, and be a non-toxic child safe preservative. May not contain arsenic, pentachlorophenol, creosote or similar toxic chemicals as their active ingredient shall not be used.
  - a. Provide “Anchorseal” clear wax sealer, an aqueous wax sealer, as supplied by U-C Coatings, Buffalo, NY, (888-363-2628); Waxwel Paraffin Blocks as supplied by Fabrication Enterprises Inc., White Plains, NY, (800-431-2830); Gulfwax Paraffin Wax as supplied by Royal Oak Enterprises, Roswell, GA (678-461-3200); or an approved high quality paraffin; to be applied to all shop and field cut ends of hardwood surfaces.
3. Penetrating Sealer: To be a transparent, water-repellent preservatives, penetrating wood sealer. Finish of wood to be clean, golden-tan color; treatment to reduce warping and cracking, and prevent water staining at edges. Sheen to be satin or matte. To be free of heavy metals, and be a non-toxic child safe preservative. May not contain arsenic, pentachlorophenol, creosote or similar toxic chemicals as their active ingredient shall not be used.

### PK-ESCR 912.3.1. REFERENCES

1. American Softwood Lumber Standard: Comply with DOC PS 20 and with grading rules of lumber-grading agencies certified by ALSC's Board of Review as applicable.
  - a. Timber Species and Grade: *Quercus* sp. (Mixed oak, Northern red oak, Red oak, White oak), to achieve standards set by NeLMA (Northeast Lumber Manufacturers Association) OR NHLA (National Hardware Lumber Association).
2. ASTM: American Society for Testing and Materials
3. ANSI: American National Standards Institute
4. AITC: American Institute of Timber Construction

### PK-ESCR 912.3.2. SUBMITTALS

1. Statement of Qualifications: to be submitted to identify and exhibit Nature Exploration Fabrication and wood fabrication qualifications as specified in Article “Qualifications” herein.

2. Product Data: for review and approval prior to fabrication of Nature Exploration elements. Provide product data for the following:
  - a. Fabricator facilities: Submit complete data on fabricator facilities for Nature Exploration elements specified. Include information of location, production capabilities, and the nature and character of wood fabrication that has been previously been made.
  - b. End Sealer (Mineral Wax): submit complete product data, manufacturer, manufacturer's test reports and certifications, and material safety data sheet (MSDS); manufacturer instructions, maintenance and operations instructions, and re-application instructions and timeframe if necessary.
  - c. Penetrating Sealer: submit complete product data, manufacturer, manufacturer's test reports and certifications, and material safety data sheet (MSDS); manufacturer instructions, maintenance and operations instructions, and re-application instructions and timeframe if necessary.
3. Maintenance & Warranty: Submit maintenance data and manufacturer's warranty in accordance with the requirements of the S-Pages.
4. Shop Drawings: Submit drawings showing sizes of each type of Nature Exploration element including, but not limited to, Log scramble, Tree Round Maze, Tree Round Border, and Tree Round Seat. Drawings to include plans, sections, showing all layout, dimensions, attachments and embedments. Drawings shall indicate salvaged tree species to be used for each Nature Exploration element, including full range of finishes and sealants.
5. Fabricated Element Submittal:
  - a. After the approval of the shop drawings by the Engineer, submit one sample fully finished for each:
    - i. Log Scramble
    - ii. Tree Round Border
    - iii. Tree Round Maze
    - iv. Tree Round Seat
6. Nature Exploration Log and Fabricated Elements Chain of Custody: Salvaged logs (and Nature Exploration elements) to remain in the Contractor's custody until fabrication and installation on site are completed as per specification Sections PK-ESCR 968 Tree Salvage and PK-ESCR 913 Nature Exploration Installation. The chain of custody must be included with the Nature Exploration delivery paperwork and submitted to the Engineer.

**PK-ESCR 912.3.3. QUALITY CONTROL**

1. Fabricator Qualifications: Nature Exploration Fabrication and wood fabricator shall be a firm or firms that have successfully supplied salvaged wood fabrications of material type and condition, similar to the quality specified, and in the quantity shown for a period of not less than 10 years. Nature Exploration elements shall be obtained from fabricator or fabricators capable of furnishing quantity, sizes, and quality of salvaged wood fabrications required.

**PK-ESCR 912.3.4. DELIVERY, STORAGE, AND HANDLING**

1. Delivery to Fabrication Facility: is covered under specification Section PK-ESCR 968, Item No. PK-ESCR 916.
2. Handling and Unloading: Handle salvaged wood and Nature Exploration elements to prevent breakage, soiling, or other damage. Do not use pinch or wrecking bars without protecting the edges of salvaged wood and Nature Exploration elements with appropriate materials. Lift with wide-belt type slings wherever possible. Do not use wire rope or ropes containing tar or other substances which may cause staining.

3. Storage and Protection:
  - a. Protect salvaged wood and Nature Exploration elements during storage and fabrication against moisture, soiling, staining, and physical damage.
  - b. Store materials under cover and protected from weather and contact with damp or wet surfaces. Stack salvaged trees flat with spacers between each bundle to provide air circulation. Stack Nature Exploration fabricated elements flat with spacers between each bundle to provide air circulation. Provide for air circulation around stacks and under coverings.
4. Delivery from Fabrication Facility to Site: Schedule delivery of fabricated Nature Exploration elements to avoid extended on-site storage and to avoid delaying the Work at the approval of the Engineer. If necessary on-site, store materials under cover and protected from weather and contact with damp or wet surfaces. Provide for air circulation within and around stacks and under temporary coverings.

**PK-ESCR 912.3.5. WARRANTY**

1. Products to be free from defects in material and/or workmanship for a period of three (3) years from the date of substantial completion. A three (3) year warranty shall be submitted, and in turn handed over to the Engineer.
2. The warranty may exclude damage resulting from accident, misuse, tampering, negligence, or abuse.
3. Products shall be repaired or replaced to the satisfaction of the Engineer, any items found defective upon inspection by an authorized fabricator service representative and Engineer.

**PK-ESCR 912.4. METHODS**

Work of this section includes all labor, materials, and services necessary to provide fabrication of Nature Exploration elements as shown in the Contract Drawings and/or specified herein, including by not limited to the following:

1. Field Measurements: Coordinate Nature Exploration Fabrication work and related layouts with trades and work preceding Nature Exploration installation and take additional field measurements as necessary to accommodate conditions.
2. Provisions for Examinations at the Shop: Nature Exploration elements will be made available for inspection by the Engineer prior to delivery to the site. Contractor will be responsible for arranging the schedule for the inspection trips to shop by Engineer.
3. Inspection On-Site, At Delivery: The Engineer will inspect Nature Exploration elements upon delivery to the site prior to installation. Allow a time duration on-site, as approved by the Engineer, for inspection and layout adjustment prior to installation.
4. Visual Criteria for Nature Exploration Elements: All examinations, selections, and approvals shall be for the purpose of achieving a final appearance, texture, and smoothness of Nature Exploration elements with greatest possible uniformity, and will be based on the following criteria:
  - a. All Nature Exploration elements shall be of sound stock and uniform texture, and shall be free from holes, seams, chips, gashes, stains, and other defects that are not natural to the salvaged wood specified and that would impair the strength, durability, and appearance of the work, as determined by the Engineer.
  - b. Inherent variations characteristic of the salvaged wood shall be brought to the attention of the Engineer at the time the samples are submitted for approval and shall be subject to the approval of the Engineer.
  - c. Salvaged wood shall be selected for species as specified in Section PK-ESCR 968.
5. Nature Exploration Fabrication:

- a. Provide Nature Exploration elements as indicated by Contract Drawings of solid wood units of sizes indicated with natural finish appearance. Provide Nature Exploration Elements in maximum lengths and sizes possible.
- b. Salvaged Wood Piece Selection:
  - i. All timbers shall be fine-grained with at least eighty (80) percent of the pieces possessing eight (8) annular rings to the inch, the remainder having at least six (6) rings to the inch.
  - ii. There shall be no loose knots, knotholes, shake, unsound wood, white specks or honeycomb allowed.
  - iii. Except as noted, other characteristics and limiting provisions are to be in accordance with Paragraph 131-A "Standard Grading Rules for West Coast Lumber".
  - iv. Provide Nature Exploration Elements in maximum lengths and sizes possible.
- c. Salvaged Wood Drying Procedure:
  - i. De-bark the lumber, mill, and shape to be one-half (1/2) inch larger than the actual size required. Provide dressed timber, unless otherwise indicated.
  - ii. Air dry in a controlled indoor environment for six (6) to nine (9) months. Kiln drying is not acceptable.
  - iii. Maximum moisture content: nineteen (19) percent after air drying.
  - iv. Mill a second time to final actual dimensions required by Contract Drawings. Finish exposed surfaces to remove planing or surfacing marks, and to provide a finish equivalent to that produced by machine sanding with No. six hundred (600) grit sandpaper.
  - v. Cull out unacceptable pieces.
- d. Nature Exploration Element Fabrication:
  - i. Surface shall be milled to size and surface shall be smooth, uniform and without imperfections as approved by the Engineer.
  - ii. Fabricate with provision for element to element interconnection as shown in Contract Documents.
  - iii. Salvage trees intended for Nature Exploration Elements Tree Round Border and Tree Round Maze shall be lathe-turned to a consistent diameter as shown in the Contract Drawings with exposed ends trimmed and eased to a minimum one-half (1/2) inch radius.
  - iv. Salvage trees intended for Nature Exploration Elements Log Scramble and Tree Round Seat shall have exposed surfaces finished to remove planing or surfacing marks, and to provide a finish equivalent to that produced by machine sanding with No. six hundred (600) grit sandpaper. All exposed edges to be eased to a minimum one-half (1/2) inch radius.
  - v. Provide pre-drilled holes, pre-cut and finished slot connections, for all connections or installations as shown in the Contract Drawings and/or approved Shop Drawings.
  - vi. All corners and exposed faces shall be rubbed or shaped to remove any sharp edges, splinters, in a manner approved by the Engineer and that will not show tool marks. All exposed edges of cut trunks shall be rounded with 1/2" radius, ground smooth, and free of splinters.
- e. Nature Exploration Element Finish:

- i. All Nature Exploration elements shall be treated with a non-toxic child safe preservative after all fabrication is completed. Preservatives containing arsenic, pentachlorophenol, creosote or similar toxic chemicals as their active ingredient shall not be used.
  - ii. End Grain Sealing: An end sealer (mineral wax) shall be applied to all shop and field cut ends of hardwood surfaces. Exterior grade end grain sealing wax, water repellent to minimize water absorption, dirt repellent, odorless, dries to a clear finish.
    - 1. Timber end grain shall be clean, dry, and free from surface contaminants that may form a barrier or seal against the end sealer.
    - 2. Apply a sealer to a small test area before beginning. Assess compatibility and end result. Follow manufacturer's instructions at all times.
    - 3. Apply Wood End Sealer with a soft brush. To be applied minimum two (2) coats of sealing wax to achieve minimum one (1) millimeter thick of sealer at all wood end grains. Wipe any excess wax from other areas with a clean, lint-free cloth. Buff to a consistent sheen.
  - iii. Penetrating Sealing: Use process that includes water-repellent treatment. Use process that does not include water repellents or other substances that might interfere with application of indicated finishes. After treatment, re-dry materials to 19 percent maximum moisture content.
    - 1. Application: Treat all non-end grain Nature Exploration element surfaces unless otherwise indicated.
6. Pre-installation Conference: Conduct conference at project site prior to installation by Nature Exploration Installer (if different), Nature Exploration Fabricator to be in attendance. See specification Section PK-ESCR 913 Nature Exploration Installation for additional information.

**PK-ESCR 912.5. MEASUREMENT**

The quantity of **NATURE EXPLORATION FABRICATION** for all Nature Exploration elements to be paid for shall be the **LUMP SUM**, fabricated, finished, sealed, and delivered to the site, in accordance with the plans, specifications, and directions of the Engineer.

**PK-ESCR 912.6. PRICES TO COVER**

The price bid shall be a unit price per **LUMP SUM** of **NATURE EXPLORATION FABRICATION** shall include the cost of all labor, materials, equipment, insurance, and incidentals required, including coordination with submittals, shop drawings, mock-ups, chain of custody, handling, protection, field measurements, fabrication, finishing, and delivery to the site, of all elements for Nature Exploration Fabrication in the sizes indicated, and all incidental expenses necessary to complete the work in accordance with the Contract Drawings and specifications, to the satisfaction of the Engineer.

Tree Salvage and Nature Exploration Installation shall be paid for under their respective item numbers.

*Payment will be made under:*

Item No.	Item	Pay Unit
PK-ESCR 912	Nature Exploration Fabrication	LS

END OF SECTION

## SECTION PK-ESCR 913 – NATURE EXPLORATION INSTALLATION

### PK-ESCR 913.1. INTENT

This section describes the installation of the elements included in Nature Exploration elements, including, but not limited to, Log Scramble, Tree Round Border, Tree Round Maze, and Tree Round Seat, all in accordance with the plans, specifications and directions of the Engineer. □

### PK-ESCR 913.2. DESCRIPTION

This Section includes installation of the salvaged, fabricated Nature Exploration elements including, but not limited to, the following:

1. Log Scramble
2. Tree Round Border
3. Tree Round Maze
4. Tree Round Seat

### PK-ESCR 913.3. MATERIALS

1. Fabricated Nature Exploration Elements: For fabricated Nature Exploration elements, see specification Section PK-ESCR 912. Fabricated Nature Exploration elements include Log Scramble, Tree Round Border, Tree Round Maze, and Tree Round Seat.
2. Steel Supports and Attachment: All steel supports and attachments shall comply with the requirements of Section ESCR-4.14. Steel support posts shall be of the size and length specified in the Contract Drawings.

### PK-ESCR 913.3.1. SUBMITTALS

1. Statement of Qualifications: to be submitted to identify and exhibit Nature Exploration Installer qualifications as specified in Article "Qualifications" herein.
2. Maintenance & Warranty: Submit maintenance data and manufacturer's warranty in accordance with the requirements of the S-Pages.
3. Samples: Samples for fabricated Nature Exploration elements included in specification Section PK-ESCR 912.
4. Work Plan Submittal: Submit plans indicating anticipated work schedule and detailed work plan approach for Nature Exploration area including, but not limited to, the Log Scramble, Tree Round Border, Tree Round Maze and Tree Round Seats. An approach to coordination with hardscape operations, stone layout and installation, soils and planting operations, irrigation, utilities and lighting to be included in the work plan.
5. Nature Exploration Log and Fabricated Elements Chain of Custody: Salvaged logs (and Nature Exploration elements) to remain in the Contractor's custody until fabrication and installation on site are completed as per specification Sections PK-ESCR 968 Tree Salvage and PK-ESCR 913 Nature Exploration Installation. The chain of custody must be included with the Nature Exploration delivery paperwork and submitted to the Engineer.

### PK-ESCR 913.3.3. QUALITY CONTROL

1. Installer Qualifications: Installer of salvaged wood exploration elements shall be by a firm that can exhibit proof of a minimum of seven (7) years prior successful experience with wood installations of similar material, design, and extent to that indicated for this Project.
  - a. Installer Foreman: Installation firm for wood exploration elements of this Project shall have on staff a supervising foreman assigned to this Project before initial installations, who shall have at least 10 years total wood exploration elements experience. Submit detailed resume

- of past experience with dates, duration and scope identification, project name and location, and work function of previous projects worked on.
- b. Use numbers of skilled workmen equal to work requirements or occasion. The skilled workmen shall be thoroughly trained and experienced in the necessary crafts and shall be completely familiar with the specific requirements and methods needed for performance of the work in this Section.
2. Full Mock-up:
    - a. One mock of for each of the following Nature Exploration elements to be mocked-up onsite, including marked out field measurements of adjacent work as necessary:
      - i. Log Scramble – one assembly
      - ii. Tree Round Border – 10' by full width of border mock-up required with adjacencies drawn out
      - iii. Tree Round Maze – one arc, 15 element minimum
      - iv. Tree Round Seat – minimum 5 seats required for mock-up
    - b. On-site mock-up to be coordinated with Nature Exploration fabricator (if different).
    - c. In person review and approval of mock-up by Engineer is required. Attendance is required of Nature Exploration fabricator at in-person review with Engineer and Nature Exploration installer.

#### **PK-ESCR 913.3.4. DELIVERY, STORAGE, AND HANDLING**

1. Delivery: from Nature Exploration fabricator facility to site included in specification Section PK-ESCR 912 Nature Exploration Fabrication.
2. Handling and Unloading: Handle Nature Exploration elements to prevent breakage, soiling, or other damage. Do not use pinch or wrecking bars without protecting the edges of Nature Exploration elements with appropriate materials. Lift with wide-belt type slings wherever possible. Do not use wire rope or ropes containing tar or other substances which may cause staining.
3. Storage and Protection: If necessary on-site:
  - a. Protect Nature Exploration elements during storage and construction against moisture, soiling, staining, and physical damage.
  - b. Store materials under cover and protected from weather and contact with damp or wet surfaces. Stack Nature Exploration fabricated elements flat with spacers between each bundle to provide air circulation. Provide for air circulation around stacks and under coverings.

#### **PK-ESCR 913.4.4. INSTALLER**

Requirements of Installer per section PK-ESCR 913.3.3.1 Installer Qualifications.

#### **PK-ESCR 913.5. METHODS**

Work of this section includes all labor, materials, and services necessary to provide fabrication of Nature Exploration elements as shown in the Contract Drawings and/or specified herein, including by not limited to the following:

1. Field Measurements: Coordinate Nature Exploration Fabrication work and related layouts with trades and work preceding Nature Exploration installation and take additional field measurements as necessary to accommodate conditions.
2. Pre-installation Conference: Conduct conference at project site prior to installation.
  - a. Contractor, together with the Engineer, shall schedule a meeting between the Contractor, Engineer, Nature Exploration Fabricator, and Nature Exploration Installer (if different) at a time sufficiently in advance of Nature Exploration elements installation to permit coordination. In addition, include in appropriate sequence, representatives of other related work.
  - b. At the meeting, review Nature Exploration elements transport to site, coordination with adjacent work and schedule, review quality control requirements including details of

construction, outstanding submittals, shop drawings, approved fabricated element mock-up, contract drawings and specifications, and on site conditions affecting or which may affect installations.

3. Installation: All Nature Exploration elements shall be installed by a qualified installer, experienced in erection of fabricated wood elements and meeting the qualifications specified above.
  - a. Erect Nature Exploration elements true and plumb. Provide temporary bracing to maintain lines and levels until permanent supporting members are in place.
  - b. Prepare subgrade by compacting points of contact and offset of six (6) inches to 95% compaction.
  - c. Handling: Handle and temporarily support heavy timber framing to prevent surface damage, compression, and other effects that might interfere with indicated finish.
  - d. Cutting: Avoid extra cutting after fabrication. Where field cutting is unavoidable, comply with requirements for shop fabrication in specification Section PK-ESCR 912 Nature Exploration Fabrication.
  - e. Installation: Install Nature Exploration elements as indicated in Contract Drawings.
    - i. Unless otherwise indicated, all steel supports and attachments to be hidden. Install steel supports and attachments with the same orientation with each connection.
  - f. Adjusting: Repair damaged surfaces and finishes after completing erection. Replaced damaged Nature Exploration Elements if repairs are not approved by Engineer.

#### **PK-ESCR 913.6. MEASUREMENT**

The quantity of **LOG SCRAMBLE**, **TREE ROUND BORDER**, **TREE ROUND MAZE**, and **TREE ROUND SEAT** to be paid for shall be on the **LUMP SUM** basis for work satisfactorily completed and installed all in accordance with the plans, specifications, and directions of the Engineer.

#### **PK-ESCR 913.7. PRICES TO COVER**

The price bid shall be a unit price per **LUMP SUM** of **LOG SCRAMBLE** for all element assemblies installed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, including site preparation, submittals, mock-ups, steel supports and attachments, chain of custody, handling, protection, field measurements, and installation, as inspected and approved by the Engineer; all in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LUMP SUM** of **TREE ROUND BORDER** for all element assemblies installed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, including site preparation, submittals, mock-ups, steel supports and attachments, chain of custody, handling, protection, field measurements, and installation, as inspected and approved by the Engineer; all in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LUMP SUM** of **TREE ROUND MAZE** for all element assemblies installed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, including site preparation, submittals, mock-ups, steel supports and attachments, chain of custody, handling, protection, field measurements, and installation, as inspected and approved by the Engineer; all in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be a unit price per **LUMP SUM** of **TREE ROUND SEAT** for all element assemblies installed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, including site preparation, submittals, mock-ups, steel supports and attachments, chain of custody, handling, protection, field measurements, and installation, as inspected and approved by the Engineer; all in accordance with the plans, specifications, and directions of the Engineer.

Tree Salvage, Nature Exploration Fabrication, Shredded Bark Mulch, Planting Soil, and Horticultural Subsoil to be paid for under their respective item numbers.

*Payment will be made under:*

**END OF SECTION**

**SECTION PK-ESCR 929 – REMOVE, SALVAGE, PROTECT AND REINSTALL –  
GOUVERNEUR GARDENS ARTIFACTS**

**PK-ESCR 929.1. INTENT**

This section describes work related to the removal, salvage, storage and relocation of items currently located in the Gouverneur Gardens garden at 605 Water Street in accordance with the plans, specifications and directions of the Engineer. □

**PK-ESCR 929.2. DESCRIPTION**

- A. Work in this section is related to the removal, salvage, storage and relocation of items currently located in the west garden next to the Gouverneur Gardens Building 4, at the corner of South Street and Montgomery Streets in Lower East Side, New York. The term item includes paving, pavers, cobblestones and other artifacts as shown and described on the drawings. Included are:
1. Compost Bins
  2. Cobblestones edges
  3. Cobblestone pavers
  4. Small boulders
  5. Brick edges and pavers
  6. Protect wall plaques and signage
- B. Documentation of existing items.
1. The Contractor shall engage an experienced photographer to provide photographic documentation of each item on three occasions - prior to start of work, at the storage facility, and upon delivery of the items to the site (after storage).
  2. Contractor shall prepare a written document (Gouverneur Gardens Item Relocation Report) describing in detail methods for dismantling, lifting, moving, and protecting all elements.
- C. Protect, dismantle, and number each element and item.
1. After photographic documentation and careful evaluation of current condition, Contractor shall dismantle item for removal and storage.
  2. The individual elements of each item are to be numbered. Contractor shall provide reproducible record drawings of each item documenting location of numbered elements.
  3. Following dismantling and numbering, Contractor shall provide protective covering for all item. Protective covering shall remain in place during transportation, storage and through return of items to the site.
- D. Transport and storage of items to storage facility.
1. Contractor shall transport all protected items to approved facility. Prior to moving the items, the Contractor shall inspect the facility with the Engineer to ensure that items are placed to the Owner's satisfaction.

E. Transport of Items from storage facility to Gouverneur Gardens garden site.

1. Contractor shall transport all protected items from their place of storage to specified locations in the Gouverneur Gardens garden, New York. Prior to transport, Contractor shall provide a schedule of delivery dates for approval by Engineer, in consultation with a Gouverneur Gardens representative.

**PK-ESCR 929.3. MATERIALS**

**A. PROTECTIVE COVERINGS**

1. The contractor is responsible for designing, customizing, and constructing protective coverings for each numbered element of a item. Materials may include, but are not limited to wooden crates and padded or insulated materials. Types of materials used shall not have any adverse impact on item materials (e.g., moisture damage).

**PK-ESCR 929.3.1. REFERENCES** Is this

- A. For granite, comply with recommendations of the National Building Granite Quarries Association Inc. (NBGQA).
- B. For unit masonry, comply with standards established by the American Society of Testing and Materials (ASTM).
- C. For bronze work, comply with standards established by the American National Standards Institute (ANSI).

**PK-ESCR 929.3.2. SUBMITTALS**

- A. Schedule of work: For the record, submit proposed schedule for on-site work and for transport of items to off-site facility. Prior to return of items to the site, provide schedule of delivery dates to the Engineer for approval.
- B. Item Relocation Report: Contractor shall prepare a written document describing, in detail, methods for dismantling, lifting, moving, and protecting all elements of each item. No work described in this report shall commence until this document has been reviewed and approved by the Engineer.
- C. Record photographs: The Contractor shall engage a photographer to provide photographic documentation of each item on three occasions - prior to start of work, at the storage facility, and upon delivery of the items to the site (after storage).
  1. All photographs shall be 7.2 megapixel minimum file size. Prints shall be labeled in sequence with a permanent identification number inscribed thereon.
  2. In addition to the proper identification numbers, prints shall be further identified (on the back of the print) by appropriate permanent markings, such as labels using archival quality adhesive, consisting of the following information:
    - a. Contractor name
    - b. Photographer name
    - c. Name of Engineer, c/o DDC PM/CM
    - d. Contract number

- e. Name of Gouverneur Gardens representative
  - f. Photo number
  - g. Date
  - h. Description of specific view indicating location (e.g., west face of item prior to relocation)
- D. The photographs taken shall be of good quality, clarity and be sufficient to accurately record the conditions and overall appearance of each item at each of the three phases of work described above. Each face or component of an item shall be photographed.
- E. Contractor shall deliver an electronic copy of images on a thumb drive along with all other materials to the Engineer.
- F. For the record, provide written documentation of any and all deficiencies or damage that may exist at items prior to start of work. If such conditions exist, they must be clearly represented in the record photographs.
- G. Record drawings: Prepare record drawing(s) which document numbered elements comprising each item. The purpose of these drawings is to enable reconstruction of items. Drawings(s) shall list and quantify all means and methods of construction observed at time of dismantling including but not limited to all means of connection (joints, dowels, etc.) and type and color of grout, sealant and other materials associated with items construction. Record drawings shall also indicate remaining existing features related to individual items (such as unit pavers, masonry units, benches, and plaques), their dimensional relationships to each other and to existing grades.

**PK-ESCR 929.3.3. QUALITY CONTROL**

- A. Contractor qualifications: Contractor shall present evidence of 5 years prior experience in the installation and removal of large scale artifacts. Contractor is required to have relevant experience in stone masonry work and/or conservation. Contractor shall provide a list of similar projects and references. Contractor's qualifications will be subject to review by the Engineer.

**PK-ESCR 929.3.4. DELIVERY, STORAGE, AND HANDLING**

- A. Items shall be delivered in undamaged condition.
- B. Store and handle items to prevent deterioration or damage due to moisture, temperature changes, contaminants, corrosion, breaking, chipping, or other causes. Engineer shall approve the use of any type of cleaner prior to use.

**PK-ESCR 929.3.5. WARRANTY**

- A. Contractor is fully responsible for condition of, and protection of items throughout project including, but not limited to, damage, vandalism and theft.
- B. Contractor shall have in place, at the time of work, an insurance policy which specifically identifies coverage for works of art against damage, theft and vandalism in the amount of \$ 25,000.00.

#### **PK-ESCR 929.4. METHODS**

##### **A. SITE CONDITIONS**

1. Contractor shall protect all site elements to remain as indicated on the drawings including, but not limited to, trees and soil areas.
2. Contractor is not required to protect foundations of items, unless such elements are indicated to remain as part of the item on the drawings.

##### **B. EXAMINATION**

1. Contractor shall examine site conditions with Engineer and Gouverneur Gardens representative present. For the record, provide photographic documentation and written description of any and all deficiencies or damage which may exist at items prior to start of work.
2. It shall be the Contractor's responsibility to document any condition which may affect the ability to reinstall items in their condition as documented at the start of work.

##### **C. DISMANTLING AND REMOVAL OF ITEMS**

1. Contractor shall dismantle all items specified in subsection 2.A above in accordance with highest industry standards. No element of the item may be cut or reduced in size. Separation of item from foundation shall be accomplished with great care and consideration of material(s). Saw cutting of foundations is permissible. Procedures for numbering dismantled units and lifting shall be as stated in the approved Item Relocation Report.
2. Each element of the item shall be numbered with non-permanent markings according to the approved procedures.

##### **D. PROTECTION OF ITEMS**

1. Contractor shall construct protective covering for each element of an item. Numbering system shall be shown on the outside of protective coverings as well as on individual pieces. Covering shall ensure that no damage occurs during transport, handling, storage and return transport to site.

##### **E. TRANSPORT AND STORAGE OF ITEMS**

1. Contractor shall transport items by means required to ensure safety of item giving consideration to weight, height, freeze-thaw resistance of materials, and temperature. Items shall be placed on elevated wood pallets in storage facility as directed by Engineer.

##### **F. RETURN TRANSPORT OF ITEMS**

1. Upon written approval of transport schedule, Contractor shall return items to site for re-installation under separate contract. Contractor shall remove and dispose of all protective coverings. Engineer will perform assessment of item condition prior to reinstallation.

#### **PK-ESCR 929.5. MEASUREMENT**

Measurement of REMOVE, SALVAGE, PROTECT AND REINSTALL – GOUVERNEUR GARDENS in accordance with the plans, relocation report, submitted documentation, PARKS-528

specifications, and directions of the engineer, the Contractor shall receive the LUMP SUM price bid.

**PK-ESCR 929.6. PRICES TO COVER**

The price bid shall be for a LUMP SUM for all removal, salvage, protection and reinstallation of Gouverneur Gardens Artifacts and shall include the cost of all labor, materials, equipment, and incidentals necessary to complete the work, including schedule of work, documentation of items, relocation report, record photography, record drawings, dismantling, transport, protection, storage, return and re-installation of items.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 929</b>	<b>REMOVE, SALVAGE, PROTECT AND REINSTALL GOUVERNEUR GARDENS</b>	<b>L.S.</b>

**END OF SECTION**

## **SECTION PK-ESCR 930 – REMOVE, SALVAGE, STORE AND REINSTALL – PARK ARTIFACTS EAST RIVER PARK**

### **PK-ESCR 930.1. INTENT**

This section describes work related to the removal, salvage, and storage of items currently located in the East River Park in accordance with the plans, specifications and directions of the Engineer.

### **PK-ESCR 930.2. DESCRIPTION**

- A. Work in this section is related to the removal, salvage, storage and relocation of sculpture currently located in the East River Park. Included are:

#### East River Park Sculptures

1. Seal sculptures at Lower Side Water Park
2. Bronze crabs and turtle sculptures at the Lower Side Water Park

- B. Documentation of existing conditions of artifact or sculptures.

1. The Contractor shall engage an experienced photographer to provide photographic documentation of each sculpture on three occasions - prior to start of work, at the storage facility, and upon delivery of the sculptures to the location approved by NYCDPR and the Engineer.

1. Contractor shall prepare a written document (Site Items Relocation Report) describing in detail methods for dismantling, lifting, moving, and protecting all elements. Report to include and categorize three sets of articles:

- i. Seals to be removed, salvaged, and protected and delivered to approved facility to be used for molds by the Pier 42 project. This includes full body, head, upper-half body, lower half-body, tail flipper, and pup sculptures.
- ii. Bronze crabs to be removed, salvaged, and protected and delivered to approved facility to be re-installed by the Pier 42 project.
- iii. Bronze turtles to be removed, salvaged, and protected and delivered to approved facility to be re-installed by the Pier 42 project.

- C. Protect, dismantle, and number sculptures.

1. After photographic documentation and careful evaluation of current condition, Contractor shall dismantle sculptures for removal and storage.
2. The individual elements of each sculpture are to be numbered. Contractor shall provide reproducible record drawings of each sculpture documenting location of numbered elements.
3. Following dismantling and numbering, Contractor shall provide protective covering for all sculptures. Protective covering shall remain in place during transportation, storage and through return of sculptures to the site.

D. Transport and storage of sculptures to storage facility.

1. Contractor shall transport all protected sculptures to approved facility or to a NYCDPR facility as directed by the Engineer. Prior to moving the sculptures, the Contractor shall inspect the facility with the Engineer to ensure that sculptures are placed to the Engineer's satisfaction.

**PK-ESCR 930.3. MATERIALS**

A. PROTECTIVE COVERINGS

1. The contractor is responsible for designing, customizing, and constructing protective coverings for each numbered element of a sculpture. Materials may include, but are not limited to wooden crates and padded or insulated materials. Types of materials used shall not have any adverse impact on sculpture materials (e.g., moisture damage).

**PK-ESCR 930.3.1. REFERENCES**

- A. For granite, comply with recommendations of the National Building Granite Quarries Association Inc. (NBGQA).
- B. For unit masonry, comply with standards established by the American Society of Testing and Materials (ASTM).
- C. For bronze work, comply with standards established by the American National Standards Institute (ANSI).

**PK-ESCR 930.3.2. SUBMITTALS**

- A. Schedule of work: For the record, submit proposed schedule for on-site work and for transport of sculptures to off-site facility. Prior to return of sculptures to the site, provide schedule of delivery dates to the Engineer for approval.
- B. SCULPTURE Relocation Report: Contractor shall prepare a written document describing, in detail, methods for dismantling, lifting, moving, and protecting all elements of each sculpture. No work described in this report shall commence until this document has been reviewed and approved by the Engineer.
- C. Record photographs: The Contractor shall engage an photographer to provide photographic documentation of each sculpture on three occasions - prior to start of work, at the storage facility, and upon delivery of the sculptures to the approved facility (after storage).
  1. All photographs must be 7.2 megapixel file size or greater and at least 2,400 pixels by 3,000 pixels. Prints shall be labeled in sequence with a permanent identification number inscribed thereon.
  2. In addition to the proper identification numbers, prints shall be further identified (on the back of the print) by appropriate permanent markings, such as labels using archival quality adhesive, consisting of the following information:

- i. Contractor name
  - ii. Photographer name
  - iii. Name of Engineer, c/o DDC PM/CM
  - iv. Name of NYCDPR Representative
  - v. Contract number
  - vi. Name of sculpture
  - vii. Photo number
  - viii. Date
  - ix. Description of specific view indicating location (e.g., west face of sculpture prior to relocation)
- D. The photographs taken shall be of good quality, clarity and be sufficient to accurately record the conditions and overall appearance of each sculpture at each of the three phases of work described above. Each face or component of a sculpture shall be photographed.
- E. Contractor shall deliver an electronic copy of images on a thumb drive along with all other materials to the Engineer.
- F. For the record, provide written documentation of any and all deficiencies or damage that may exist at sculptures prior to start of work. If such conditions exist, they must be clearly represented in the record photographs.
- G. Record drawings: Prepare record drawing(s) which document numbered elements comprising each sculpture. The purpose of these drawings is to enable reconstruction of sculptures under a separate contract. Drawings(s) shall list and quantify all means and methods of construction observed at time of dismantling including but not limited to all means of connection (joints, dowels, etc.) and type and color of grout, sealant and other materials associated with sculptures construction.

**PK-ESCR 930.3.3. QUALITY CONTROL**

- A. Contractor qualifications: Contractor shall present evidence of 5 years prior experience in the installation and removal of sculptures and/or large scale works of art. Contractor is required to have relevant experience in sculpture conservation. Contractor shall provide a list of similar projects and references. Contractor's qualifications will be subject to review by the Engineer.

**PK-ESCR 930.3.4. DELIVERY, STORAGE, AND HANDLING**

- A. Sculptures shall be delivered in undamaged condition.
- B. Store and handle sculptures to prevent deterioration or damage due to moisture, temperature changes, contaminants, corrosion, breaking, chipping, or other causes. Engineer shall approve the use of any type of cleaner prior to use.

**PK-ESCR 930.3.5. WARRANTY**

- A. Contractor is fully responsible for condition of, and protection of sculptures throughout project including, but not limited to, damage, vandalism and theft.

- B. Contractor shall have in place, at the time of work, an insurance policy which specifically identifies coverage for works of art against damage, theft and vandalism in the amount of \$ 250,000.00.

#### **PK-ESCR 930 .4. METHODS**

##### **A. SITE CONDITIONS**

- 1. Contractor shall protect all site elements to remain as indicated on the drawings including, but not limited to, trees and soil areas.
- 2. Contractor is not required to protect foundations of sculptures, unless such elements are indicated to remain as part of the sculpture on the drawings.

##### **B. EXAMINATION**

- 1. Contractor shall examine site conditions with Engineer and NYCDPR Representative present. For the record, provide photographic documentation and written description of any and all deficiencies or damage which may exist on sculptures prior to start of work.

NYCDPR Contact: Manhattan Forestry – 212-860-1845

- 2. It shall be the Contractor's responsibility to document any condition which may affect the ability to reinstall sculptures in their condition as documented at the start of work.

##### **C. DISMANTLING AND REMOVAL OF SCULPTURES**

- 1. Contractor shall dismantle sculptures in accordance with highest industry standards. No element of the SCULPTURE may be cut or reduced in size. Separation of sculpture from foundation shall be accomplished with great care and consideration of material(s). Saw cutting of foundations is permissible. Procedures for numbering dismantled units and lifting shall be as stated in the approved SCULPTURE Relocation Report.
- 2. Each element of the SCULPTURE shall be numbered with non-permanent markings according to the approved procedures.

##### **D. PROTECTION OF SCULPTURES**

- 1. Contractor shall construct protective covering for each element of a SCULPTURE. Numbering system shall be shown on the outside of protective coverings as well as on individual pieces. Covering shall ensure that no damage occurs during transport, handling, storage and return transport to site.

##### **E. TRANSPORT AND STORAGE OF SCULPTURES**

- 1. Contractor shall transport sculptures by means required to ensure safety of SCULPTURE giving consideration to weight, height, freeze-thaw resistance of materials, and temperature. sculptures shall be placed on elevated wood pallets in storage facility as directed by Engineer. Upon written approval of transport schedule, Contractor must turn over sculptures to NYCDPR as directed by the Engineer.

- i. NYCDPR Contact: Manhattan Forestry 212-860-1845.

**PK-ESCR 930 .5. MEASUREMENT**

Measurement of **REMOVE, SALVAGE, STORE AND REINSTALL – EAST RIVER PARK** in accordance with the plans, relocation report, submitted documentation, specifications, and directions of the engineer, the Contractor shall receive the **LUMP SUM** price bid.

**PK-ESCR 930 .6. PRICES TO COVER**

The price bid shall be for a **LUMP SUM** for all removal, salvage, protection and reinstallation of East River Park Artifacts and shall include the cost of all labor, materials, equipment, and incidentals necessary to complete the work, including schedule of work, documentation of Sculptures, relocation report, record photography, record drawings, dismantling, transport, protection, storage, return and delivery of Sculptures.

*Payment will be made under:*

**END OF SECTION**

## SECTION PK-ESCR 937 – HORTICULTURAL SOILS SOURCING AND SUPPLY

**PK-ESCR 937.1. DESCRIPTION.** This section describes the sourcing, mixing, testing, stockpiling, furnishing, and installation of HORTICULTURAL DRAINAGE LAYER, HORTICULTURAL SUBSOIL, PLANTING SOIL FOR BEDS & PITS, and **PLANTING SOIL FOR SEEDED & SODDED LAWN AREAS** in accordance with the plans, specifications and directions of the Engineer.

### **PK-ESCR 937.2. MATERIALS.**

- A. General: Horticultural Soils are made up of a mix of three soil component materials: Sand, loam, and Compost as specified herein. The quality of the horticultural soil mixes depends on the quality of the original soil component materials. Soil component specifications and component ratios are provided for bidding purposes only. They require confirmation and adjustment by the Contractors' Soil Testing Laboratory, depending on availability of component materials, and with the approval of the Engineer, in order to meet Specification requirements. The Contractor is responsible for the time and cost associated with locating, testing and obtaining approval by the Engineer of sand, loam and compost materials as well as the final component soil mixes that meet the Specification requirements, regardless of the time for, or number of tests required to meet the requirements of this Specification.
- B. Environmental Requirements: Prior to delivery to the site, soil component materials and soil mixes must be sampled and analyzed by a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) - certified laboratory in accordance with the New York State Department of Environmental Conservation (NYSDEC) DER-10 protocols for the full list of parameters in Title 6 of the Official Compilation of the New York Codes, Rules and Regulations (NYCRR) Part 375-6.8; see analytical methods in the "Appeal Process" **DELIVERY, STORAGE, AND HANDLING.**
  - a. Results of the analytical testing must meet 6 NYCRR Part 375 Restricted Use – Restricted Residential (RURR) Soil Cleanup Objectives (SCOs). The soil component materials and soil mixes must not have any physical evidence of contamination, including but not limited to petroleum or unnatural/toxic odors, visual signs of staining, or elevated photoionization detector (PID) readings.
- C. Soil Component Materials:
  - a. **SAND:** A USDA Texture of coarse sand, naturally occurring siliciclastic material, consisting of clean, inert, rounded to sub-angular grains of quartz or other durable rock free from loam or clay, surface coatings and deleterious materials. Limestone-based or carbonate-based sands are not acceptable for use on the project. Sand manufactured from crushed or processed rock is not acceptable for use on the project. Meet the following criteria as confirmed by laboratory testing:
    - i. pH: 6.5 - 7.3.
    - ii. Salinity: Electrical conductivity of a 1:2 soil to water extract,  $\leq 1.50$  mmhos/cm (dS/m).
    - iii. Saturated hydraulic conductivity of the sand:  $\geq 8$  inches per hour, according to ASTM D5856, when compacted to a minimum of 90% Standard Proctor, ASTM 698.
    - iv. Organic Matter:  $< 0.25\%$  with no visible organic material present in this material.

- v. Particle size distribution shall be:

Particle Size Class	Passing Sieve No.	Range in % Passing (ASTM F 1632)
Fine Gravel	10	95 - 100
Very Coarse Sand	18	90 - 95
Coarse Sand	35	60 - 80
Medium Sand	60	10 - 40
Fine Sand	140	8 - 15
Very Fine Sand	270	1 - 10
		Determined by hydrometer method (ASTM F 1632)
Silt		1 - 6
Clay		0 - 4

- b. LOAM: A USDA Texture of Sandy Loam, Sandy clay Loam or Loam, naturally occurring soil with a developed stable crumb structure formed from geologic soil forming processes without admixtures of sand or organic matter sources (composts). Loam shall be free of subsoil, stones over one inch in diameter, earth clods, sticks, stumps, clay lumps, roots or other objectionable, extraneous matter or debris. Loam shall also be free of quack-grass rhizomes, Agropyron repens, and the nut-like tubers of nutgrass, Cyperus esculentus, and all other primary noxious weeds. Meet the following criteria as confirmed by laboratory testing:

- i. Organic Content: between 3.0 and 8.0 percent on a dry weight basis.
- ii. pH:  $\leq 7.2$  and shall be conducive to achieving pH requirements for soil blends specified herein.
- iii. Salinity: Electrical conductivity of a one to two soil to water extract,  $\leq 1.50$  mmhos/cm (dS/m).
- iv. Allowable USDA Sandy Loam Texture
  1. Sand:  $>52\%$  sand
  2. Silt + 2x Clay Content  $\geq 30\%$
  3. Clay: 7-20%
- v. Allowable USDA Sandy Clay Loam Texture
  1. Sand:  $>45\%$
  2. Silt:  $<28\%$
  3. Clay: 20-35%
- vi. Allowable Loam Texture
  1. Sand:  $<52\%$  Sand
  2. Silt: 28-52%
  3. Clay: 7-28%

- D. Compost: A stable, humus-like material produced from the aerobic decomposition of organic residues which shall have been composted for a minimum of one year (12 months). The use of biosolids as feedstock for compost production is prohibited. Compost

shall be a dark brown to black color and be capable of supporting plant growth with appropriate management applicable, with no visible free water or dust, with no rank or unpleasant odor, and meeting the following criteria as confirmed by laboratory tests:

Criteria	Test Method	Acceptable Range
Feed stock		Brewer's waste, or leaf mulches are acceptable. Composted municipal waste (chipped, shredded and screened wood, leaves, bark, etc.) alone is not acceptable unless it meets all of the criteria noted
Carbon/Nitrogen Ratio		10:1 - 25:1
Degree of Maturity	Dewer Self Heating <u>or</u>	VI-V
	Solvita Maturity Index <u>or</u>	6-8
	CO <sup>2</sup> Evolution	1.2%C/day
Texture	Dry Sieve and Hydrometer	Screened to 1/2 inch maximum particle size, and not more that 3 percent material finer than 0.002mm as determined by hydrometer test on ashed material.
Foreign Material	Dry Weight	Debris such as metal, glass, plastic, wood (other than residual chips), asphalt or masonry shall not be visible and shall not exceed 1% dry weight.
Organic Matter %	Dry Weight	≥25 percent
pH	1:1 soil-distilled water suspension using a glass electrode pH meter American Society of Agronomy Methods of Soil Analysis, Part 2, 1986.	6.5 to 7.3
Ammonium	Extract	<200 PPM
Salinity	1:5 soil to water ratio extract	2.0 mmhos/cm (dS/m).
Nutrient Content	Extract	Total Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sulfur, Calcium, Magnesium, Sodium, Iron, Aluminum, Manganese, Copper, Zinc.
Pathogens/Metals/ Vector Attraction	Extract	Meet all Federal and State of New York requirements for applications to soils with human activity.
Biological Organisms	Soil FoodWeb Analysis	Organism Biomass Data: Dry weight: 0.20 to 0.80 Active Fungi: > 3.00 µg/g Total Fungi: >300.00 µg/g Hyphal Diameter: > 2.50 µg/m Active Bacteria: > 3.00 µg/g Total Bacteria: > 300.00 µg/g Organism Biomass Ratios: AF:TB 0.01 to 10 AF:TF < 0.10 AB:TB < 0.10 AF:AB 0.01 to 10 Protozoa (Protists): # Flagellates: >10,000/g Nematodes: # Nematodes: >10.00/g

E. Soil Mixes:

- a. General: Create soil mixes by blending sand, loam and compost component materials to achieve specification requirements. The Contractor is responsible for the time and cost associated with mixing the components, testing the mixes to meet the requirements of the final mix designs, and obtaining approval by the Engineer regardless of the time for, number of test mixes, or tests required to meet the requirements of this Specification. Approximate mixing ratios are provided for bidding purposes, will require adjustment by the Contractors' Soil Testing Laboratory, depending on the final component soil materials, and with the approval of the Engineer, in order to meet Specification requirements.
- b. Horticultural Drainage Layer: Comply with requirements for sand as specified herein.
- c. Horticultural Subsoil: Combine sand and Loam to create a uniform blend. Approximate mix ratios, based on the approved loam USDAS classification, are 3 : 1 Sand : Sandy Loam, 4 : 1 Sand : Loam or 5 : 1 Sand : Sandy Clay Loam. Adjust the blended soil mix to meet the following requirements:
  - i. Comply with environmental requirements of Environmental Remediation Programs, 6 NYCRR Part 375.
  - ii. pH: 6.5 - 7.3.
  - iii. Salinity: Electrical conductivity of a 1:2 soil to water extract,  $\leq 1.50$  mmos/cm (dS/m).
  - iv. Saturated hydraulic conductivity of the sand:  $\geq 4$  inches per hour, according to ASTM D5856, when compacted to a minimum of 90% Standard Proctor, ASTM 698.
  - v. Organic Matter (ASTM F 1647): 2-3%.
  - vi. Compaction (as measured by Penetrometer): Uniformly increasing with depth, penetration  $< 220$  PSI (lbs./in<sup>2</sup>) after installation.
  - vii. No stones or coarse fragments over 1" in size.
  - viii. Particle size distribution shall be:

Particle Size Class	Passing Sieve No.	Range in % Passing (ASTM F 1632)
Fine Gravel	10	95 - 100
Very Coarse Sand	18	80 - 95
Coarse Sand	35	65 - 85
Medium Sand	60	30 - 40
Fine Sand	140	15- 25
Very Fine Sand	270	9 - 18
		Determined by hydrometer method (ASTM F 1632)
Silt		6 - 12
Clay		3 - 6

- d. Planting Soil for Beds & Pits: Combine horticultural Subsoil and Compost to create a uniform blend. Approximate mix ratios which meets the following requirements are 3.5 : 1 Horticultural Subsoil : Compost. Adjust the blended soil mix to meet the following requirements:
- i. Comply with environmental requirements of Environmental Remediation Programs, 6 NYCRR Part 375.
  - ii. pH: 6.5 - 7.3.
  - iii. Salinity: Electrical conductivity of a 1:2 soil to water extract,  $\leq 1.50$  mmos/cm (dS/m).
  - iv. Saturated hydraulic conductivity of the sand:  $\geq 2$  inches per hour, according to ASTM D5856, when compacted to a minimum of 90% Standard Proctor, ASTM 698.
  - v. Organic Matter (ASTM F 1647): 6-8%.
  - vi. Compaction (as measured by Penetrometer): Uniformly increasing with depth, penetration  $< 140$  PSI (lbs./in<sup>2</sup>) after installation.
  - vii. No stones or coarse fragments over 1" in size.
  - viii. Particle size distribution shall be:

Particle Size Class	Passing Sieve No.	Range in % Passing (ASTM F 1632)
Fine Gravel	10	95 - 100
Very Coarse Sand	18	90 - 95
Coarse Sand	35	65 - 85
Medium Sand	60	30 - 40
Fine Sand	140	15- 25
Very Fine Sand	270	9 - 18
		Determined by hydrometer method (ASTM F 1632)
Silt		6 - 12
Clay		3 - 6
Phosphorous (P)	Extract	20-100 PPM
Potassium (K)	Extract	200-600 PPM
Cation Exchange (CEC)	Extract	$>8$ Meq/100g

- e. Planting Soil for Seeded and Sodded Lawns: Combine Horticultural Subsoil and Compost to create a uniform blend. Approximate mix ratios which meets the following requirements are 4 : 1 Horticultural Subsoil : Compost. Adjust the blended soil mix shall to meet the following requirements:
- i. Comply with environmental requirements of Environmental Remediation Programs, 6 NYCRR Part 375.
  - ii. pH: 6.5 - 7.3.
  - iii. Salinity: Electrical conductivity of a 1:2 soil to water extract,  $\leq 1.50$  mmos/cm (dS/m).

- iv. Saturated hydraulic conductivity of the sand:  $\geq 2$  inches per hour, according to ASTM D5856, when compacted to a minimum of 90% Standard Proctor, ASTM 698.
- v. Organic Matter (ASTM F 1647): 3-5%.
- vi. Compaction (as measured by Penetrometer): Uniformly increasing with depth, penetration  $< 140$  PSI (lbs./in<sup>2</sup>) after installation.
- vii. No stones or coarse fragments over 1" in size.
- viii. Particle size distribution shall be:

Particle Size Class	Passing Sieve No.	Range in % Passing (ASTM F 1632)
Fine Gravel	10	95 - 100
Very Coarse Sand	18	90 - 95
Coarse Sand	35	65 - 85
Medium Sand	60	30 - 40
Fine Sand	140	15- 25
Very Fine Sand	270	9 - 18
		Determined by hydrometer method (ASTM F 1632)
Silt		6 - 12
Clay		3 - 6
Phosphorous (P)	Extract	20-100 PPM
Potassium (K)	Extract	200-600 PPM
Cation Exchange (CEC)	Extract	>8 Meq/100g

F. Soil Amendment Materials:

- a. Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in amounts recommended to eliminate deficiencies of proposed planting soil mixes as indicated in test reports from the approved testing laboratory.
- b. Lime: ASTM C 602, agricultural limestone containing a minimum 80 percent calcium carbonate equivalent and as follows:
  - i. Class: Class O, with a minimum 95 percent passing through No. 8 (2.36-mm) sieve and a minimum 55 percent passing through No. 60 (0.25-mm) sieve.
- c. Sulfur: Granular, biodegradable, containing a minimum of 90 percent sulfur, with a minimum 99 percent passing through No. 6 (3.35-mm) sieve and a maximum 10 percent passing through No. 40 (0.425-mm) sieve.
- d. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.
- e. Aluminum Sulfate: Commercial grade, unadulterated.

G. Penetrometer:

- a. Complete penetrometer testing with a penetrometer that complies with American Society of Agricultural Engineers (ASAE), S313.3 1999 (R 2018) Soil Cone Penetrometer standard. Subject to meeting this requirement, the following are acceptable penetrometer manufacturers:
  - i. Dickey-John Soil Compaction Tester, Dickey-John, Auburn, IL 62615, (217) 438-3371.
  - ii. Agratronix Soil Compaction Tester, Model 08180, Agratronix, Streetsboro, Ohio 44241, (800) 821-9542
  - iii. Turf-Tec, Model PN-Compi-S. Turf-Tec International, Tallahassee, FL 32303, 850-580-4026
  - iv. Agriculture Solutions Penetrometer, Agriculture Solutions, LLC, Strong ME, 04983, (888) 683-8291

H. Chinking Stone: All stone shall consist of naturally occurring dense, sound material of uniform color and shall be of such character that it will resist disintegration and erosion by the action of air; water; wetting and drying; freezing and thawing; and any other natural or climatic factors.

- a. It shall be free from soil, peat or any other organic matter.
- b. It shall be capable of being handled and placed without fracture or damage, and shall conform to standards and gradation requirements detailed in the following sections.
- c. Chinking stone to meet the following sieve analysis:

SIEVE SIZE	PERCENT PASSING
1 IN	95 - 100
3/8 IN	20 - 85
No.10	0 - 10
No.200	0 - 3

I. Underdrain: Underdrain shall comply with the requirements of item no. PK-ESCR 189.

J. Geotextile - Separation: Geotextile shall comply with the requirements of item no. PK-ESCR 149 Geotextiles-Separation.

**PK-ESCR 937.2.2. SUBMITTALS.**

- A. Product Data: For each type of product indicated.

- a. Submit most recent printed information from manufacturer.
    - i. Sand: identify the source area and prior land use.
    - ii. Loam: identify the source area and prior land use.
    - iii. Compost: identify the material(s) from of which is it composed and identify the location where material was composted.
    - iv. Soil Amendments:
      - 1. Ground Limestone:
      - 2. Agricultural limestone:
      - 3. Agricultural Elemental Sulfur:
      - 4. Agricultural Aluminum Sulfate
  - b. Data for the sand, loam and compost shall be no older than 30 days from date of the submittal submission.
  - c. Data for the Penetrometer to be used for in-place soil compaction testing.
  - d. Horticultural Soil Installation Equipment Specification Data showing low-ground pressure compliance of installation equipment.
- B. Qualification Data:
- a. Soil material supplier, including:
    - i. Provide soil material supplier number of years of experience, list of previous projects including project name, a contact name, phone number, and the number of cubic yards per each installation and a brief description of the project.
    - ii. Location where the planting soil mixes and component materials will be mixed and stockpiled including available soil mixing and stockpiling area.
  - b. Submit qualifications of Soil Testing Laboratory to be utilized for soil testing, including the resume of the staff anticipated to perform the required work of the project.
  - c. Submit qualifications of Field Quality Control Testing Laboratory and laboratory staff to be utilized for in-place soil compaction testing, including the resume of the staff anticipated to perform the required work of the project.
- C. Material Test Reports:
- a. General: Submit written reports of each sample tested. Include with each test report the following as a minimum and such other information required specific to material tested:
    - i. Date issued.
    - ii. Project Title, names of Contractor and supplier.
    - iii. Testing laboratory name, address and telephone number, and name(s), as applicable, of each field and laboratory inspector.
    - iv. Date, place, and time of sampling or test, with record of temperature and weather conditions.

- v. Location of material source.
- vi. Name and protocol of test performed.
  - 1. Sand and Loam Test Reports: Results of tests including identification of deviations from specified ranges. Identify any toxic substance(s) harmful to plant growth or life. Recommendations for soil amendments, mix proportions, and methods of preparation, as applicable to specifications herein.
  - 2. Compost Test Reports: Results of tests including identification of deviations from specified ranges. Identify any toxic substance(s) harmful to plant growth or life.
- b. Provide resubmissions of material samples with a matching material test report.
- c. Missing information, failure to use the specified testing protocol, or failure to supply a material sample as specified with the test report shall be grounds for rejection.
- d. Complete lab test reports submitted for approval by the Engineer no more than four (4) weeks (28 days) from date of sample collection and submittal for approval.
- e. Contractor is responsible for all costs associated with laboratory testing.
- f. Component Material Test Reports: Submit test reports with each sample of sand, topsoil, and compost for approval. Resubmissions of test reports shall be accompanied by a matching material sample.
  - i. Provide the following testing for Sand:
    - 1. Sieve and Hydrometer Analysis and Evaluation
    - 2. pH
    - 3. Saturated hydraulic conductivity
    - 4. Salinity
    - 5. Environmental Testing Compliance
    - 6. Test Frequency: As required to receive approval from Engineer
  - ii. Provide the following testing for Loam:
    - 1. Sieve and Hydrometer Analysis and Evaluation
    - 2. pH
    - 3. Buffer pH
    - 4. Cation Exchange Capacity
    - 5. Soluble Salts
    - 6. Nutrient Content (Total Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sulfur, Calcium, Magnesium, Sodium, Iron, Aluminum, Manganese, Copper, Zinc)
    - 7. Organic Content
    - 8. Saturated hydraulic conductivity
    - 9. Salinity
    - 10. Nutrient Content
    - 11. Environmental Testing Compliance
    - 12. Test Frequency: As required to receive approval from Engineer
  - iii. Provide the following Testing for Compost:

1. Feedstock
  2. Carbon/Nitrogen Ration (C/N)
  3. Degree of Maturity
  4. Texture (Particle Size)
  5. Organic Content (%)
  6. pH
  7. Buffer pH
  8. Cation Exchange Capacity
  9. Soluble Salts
  10. Nutrient Content (Total Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sulfur, Calcium, Magnesium, Sodium, Iron, Aluminum, Manganese, Copper, Zinc)
  11. Moisture Content
  12. Pathogens/Metals/Vector Attraction
  13. Biological Organisms
  14. Test Frequency: As required to receive approval from Engineer
- g. Soil Mix Test Reports: Submit soil mix test reports with each sample of horticultural drainage material, horticultural subsoil, planting soil for bed & pits, and planting soil for seeded and sodded lawns for approval. Provide resubmissions of test reports with a matching material sample.
- i. Provide the following testing for each soil mix:
    1. Sieve and Hydrometer Analysis and Evaluation
    2. pH
    3. Organic Content
    4. Salinity
    5. Nutrient Content
    6. Environmental Testing Compliance
    7. Test Frequency: As required to receive approval from Engineer.
- h. Off-Site Stockpile Environmental Test Reports:
- i. Provide the following Off-Site Stockpile Environmental testing:
    1. Environmental chemical analysis of all proposed horticultural soil mixes shall include USEPA Standard Test Methods for determination of total contaminant concentrations for the complete list of 6 NYCRR Part 375-6.8b parameters for Restricted Use Soil Cleanup Objectives - Residential category. Perform analysis of the horticultural soil mixes in accordance with USEPA Methods SW846; 8260 for Volatile Organics, 8270 for Semi-Volatile Organics, 8081 for Pesticides, and 8082 for Polychlorinated Biphenyls (PCBs), and 6010 for Metals.
    2. Demonstrate materials meet NYSDEC Part 375 RURR SCOs and do not exceed hazardous waste characteristic criteria (40 CFR Part 261).
    3. Provide a PDF of the lab report and an excel table comparing the fill material to the NYSDEC Part 375 RURR SCOs. Should the horticultural mixes possess hazardous or contaminated

characteristics, refer to the APPEAL PROCESS section below.

4. Test Frequency:
  - a. Every 400 Cubic Yards for the first 5,000 yards of each soil mix produced.
  - b. Every 1,000 Cubic Yards of each soil mix produced thereafter.
- i. Off-Site Stockpile QA/QC Test Reports: Once the planting soil mixes are approved, the supplier may begin stockpiling soil mixes. Ensure consistency (QA/QC) of mixes in stock-piles by periodic testing. Provide stockpile tests as indicated or as additionally requested by the Engineer. Provide test reports with a matching soil mix sample. The Engineer reserves the right to reject, on or after delivery, any material which does not, in the Engineer's opinion, meet these specifications.
  - i. Provide the following testing for Off-Site Stockpile QA/QC Testing:
    1. Sieve and Hydrometer Analysis and Evaluation
    2. pH
    3. Organic Content
    4. Salinity
    5. Test Frequency: One test per 2,000 cubic yards of each mix produced for off-site stockpiling.
- j. In-Place Soil Compaction Test Reports: Scale plan showing test locations and results for each test at horticultural subsoil and planting soil installation. Indicate test results showing compliance at each testing location.

#### D. Samples:

- a. Verification of Soil Components: Submit to the Engineer for distribution with complete soil testing results showing compliance with requirements:
  - i. Sand: Three (3) 1 quart samples in sealed labeled bags.
  - ii. Topsoil: Three (3) 1 quart samples in sealed labeled bags.
  - iii. Compost: Three (3) 1 quart samples in sealed labeled bags.
  - iv. Resubmissions of soil component samples shall be accompanied by a matching material test report.
- b. Verification of Soil Mixes: Submit to the Engineer for distribution with complete soil testing results showing compliance with requirements:
  - i. Horticultural Drainage Material: Three (3) 1 quart samples in sealed labeled bags.
  - ii. Horticultural Subsoil: Three (3) 1 quart samples in sealed labeled bags.
  - iii. Planting Soil for Beds & Pits: Three (3) 1 quart samples in sealed labeled bags.
  - iv. Planting Soil for Seeded and Sodded Lawns: Three (3) 1 quart samples in sealed labeled bags.
  - v. Resubmissions of verification of soil mix samples shall be accompanied by a matching material test report.
- c. Stockpile QA/QC Samples: Submit to the Engineer with complete soil testing

results showing compliance with requirements. Demonstrate consistency of soil mixes with the corresponding approved mix soil test. If, in the opinion of the Engineer, off-site stock-pile testing is not consistent with the approved mix, Contractor shall abandon the stockpile and remix soils for a new stockpile, making adjustments as recommended by Contractor's testing lab and as approved by the Engineer.

- i. Horticultural Drainage Material: Three (3) 1 quart samples in sealed labeled bags submitted to the Engineer for distribution.
  - ii. Horticultural Subsoil: Three (3) 1 quart samples in sealed labeled bags submitted to the Engineer for distribution.
  - iii. Planting Soil for Beds & Pits: Three (3) 1 quart samples in sealed labeled bags submitted to the Engineer for distribution.
  - iv. Planting Soil for Seeded and Sodded Lawns: Three (3) 1 quart samples in sealed labeled bags.
  - v. The Contractor, as often as requested by the Engineer, shall submit three (3) quart bags of each planting soil mix material with the matching material test report for each stockpile sample taken.
  - vi. Resubmissions of stockpile samples shall be accompanied by a matching material test report.
- d. Site-Delivered QA/QC Samples: Submit as often as requested by the Engineer three (3) quart bags of each planting soil mix or material delivered to the site with the matching material test report for each stockpile sample taken. Provide resubmissions of samples with a matching material test report.
- E. Planting Soil Quality Assurance Plan: Prepare a Planting Soil Quality Assurance Plan demonstrating Contractor's approach to sourcing planting soil, mixing, stockpiling, testing, tracking and delivery. Submit to Engineer for Approval prior to the start of soil sourcing work.
- F. Material Delivery Tickets: Each barge or truck load of Horticultural Soil Material must be accompanied by a delivery ticket indicating the date of loading, volume of material, horticultural soil type and off-site stockpile source number it has been taken from. Provide a copy of each delivery ticket to the Engineer prior to unloading.

### **PK-ESCR 937.2.3. QUALITY ASSURANCE.**

- A. Horticultural Soil Supplier: A supplier with sufficient experience in the supply and custom blending of soil components and mixes of similar types and volumes specified and indicated on the Drawings including, the creation of custom sand-based manufactured soils for similar landscape applications or golf course applications whose work has resulted in successful establishment of plants.
- a. Subject to meeting the requirements, the following are acceptable horticultural soil suppliers:
    - i. Advanced Soil Technologies, Brick, NJ 08723, (732) 840-1700 [www.advancedsoiltechnologies.com](http://www.advancedsoiltechnologies.com)
    - ii. GreenPro Materials, Div. of Tri-State Materials LLC, Bound Brook, NJ 08805, (908) 647-0159 [www.greenpromaterials.com](http://www.greenpromaterials.com)

- iii. Braen Supply, Haledon, NJ 07508, (973) 556-2698 [www.braensupply.com](http://www.braensupply.com)
  - iv. Cedar Hill Landscaping, Somerset, NJ 08873, (732) 469-1400  
[www.cedarhilllandscaping.com](http://www.cedarhilllandscaping.com)
- B. Soil Testing Laboratories: An independent soil testing laboratory with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein, including the ability to make recommendations about soil blending ratios and methods, amendment recommendations, and issuing reports as specified herein.
- a. Verify Testing Laboratories have the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein.
  - b. Horticultural Testing Laboratories: Subject to meeting the requirements, the following are acceptable horticultural testing laboratories:
    - i. Physical and Chemical Testing of Soils:
      - (1) McNitt & SerenSoil Testing, LLC, State College, PA, (610) 360-5985.
      - (2) Turf & Soil Diagnostics – NY, Trumansburg, NY, (855) 769-4231.
      - (3) University of Massachusetts Soil and Plant Tissue Testing Lab, Amherst, MA, (413) 545-2311.
      - (4) Approved Equal.
    - ii. Compost Testing:
      - (1) Soil FoodWeb New York, Center Moriches, NY 11716, (631) 750-1553.
      - (2) Penn State Analytical Services Lab, University Park, PA, (814) 863-0841.
      - (3) Woods End Research Laboratory, Mt. Vernon, ME, (207) 293-2457.
      - (4) AgroLab Harrington, DE 19952, (302) 566-6094.
      - (5) A&L Great Lakes Lab, Fort Wayne, IN 46080, (260) 483-4759.
    - iii. Biological Testing:
      - (1) Soil Food Web New York, Center Moriches, NY 11716, (631) 750-1553.
      - (2) Harrington Organics, Bloomfield, CT 06021, (800) 675-8733.
      - (3) Foothill Biological Soil Health Services, Grass Valley, CA 95945, (530) 648-0694.
      - (4) Earthfort, Corvallis, OR 97333, (541) 257-2612.
  - c. Environmental Testing Laboratories: a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory
    - i. For a list of NYSDOH ELAP-certified laboratories see: <https://www.wadsworth.org/regulatory/elap/certified-labs>

C. Monthly Inspections of Off-Site Stock Piles:

- a. The Engineer will inspect off-site stock piles monthly for compliance with these specification. Provide and pay for transportation for the Engineer or the Engineer's representatives to and from off-site stock pile facility locations and access to stock piles as required.

D. Horticultural Soil Installation Equipment:

- a. Utilize light-weight, low-ground pressure equipment that makes us of wide tracks or low inflation tires that will not exert a ground pressure greater than four (4) PSI.

E. Horticultural Soil Profile Mock-Ups:

- a. Prior to the start of horticultural soil installation, complete an on-site mock-up of each planting soil profile with all required layers.
- b. Mock-up size: a minimum of 15' x 15' fully installed and tested, indicating compliance with requirements to the satisfaction of the Engineer.
- c. Install mock-ups with the actual crews intended for the installation using the actual equipment to be used for the installation, as approved by submittals.
- d. Successful mock-ups may remain in place as part of finished work as permitted by the Engineer.

F. In-place Soil Testing: Test in-place Horticultural Soils with a third party testing lab employed by and paid for by the Contractor. Complete penetrometer testing frequency in accordance with "Field Quality Control" herein.

- a. Comply with the following instructions when using a penetrometer:
  - i. Avoid taking measurements when soil is too wet or too dry. Soil moisture at or slightly drier than field capacity is best.
  - ii. The penetrometer should be inserted at a constant rate of 1.2 inches/sec (3 cm/sec). Small variations will not affect the reading. Starting and stopping also will not affect the reading.
  - iii. Insert the soil penetrometer smoothly without jerking motions. A jerking motion will result in erroneous measurements.
  - iv. Measure subsoil to the depth shown on the Drawings less 3 inches.
  - v. Measure planting soil to the full depth shown on the Drawings.
  - vi. Stop insertion if soil readings exceed specified resistance and record measurement.
  - vii. Continue penetration to depth required and record final penetration reading.

**PK-ESCR 937.2.4. DELIVERY, STORAGE, AND HANDLING.**

A. Offsite Stockpile Maintenance:

- a. Stockpile horticultural soil component materials and planting soil mixes without intermixing.
- b. Do not store off-site stockpiled materials in mounds greater than six (6) feet high. Turn stockpiles at a minimum every two (2) weeks to prevent anaerobic conditions.

- Place, grade, and shape stockpiles to drain surface water.
- c. Cover stockpiles with a breathable fabric to prevent windblown dust and protect from erosion. Do not cover stockpiles with plastic.
  - d. Protect stockpiles from contamination from other materials, from erosion and deposition of water and wind borne materials of any kind.
  - e. Prohibit vehicular and pedestrian traffic on stockpiled materials.

B. Accessory and Packaged Materials:

- a. Store and handle packaged materials in strict compliance with manufacturer's instructions and recommendations. Protect all materials from weather, damage, injury and theft.

C. Bulk Materials:

- a. Sequence deliveries to avoid delay. On-site storage space is permissible only with written notice from the Engineer. Coordinate material deliveries only after preparations for placement of planting soil have been completed.
- b. Stockpile on-site horticultural soil component materials and planting soil mixes without intermixing.
- c. Do not store on-site stockpiled materials in mounds greater than six (6) feet high. Turn stockpiles at a minimum every two (2) weeks to prevent anaerobic conditions. Place, grade, and shape stockpiles to drain surface water.
- d. Cover stockpiles with a breathable fabric to prevent windblown dust and protect from erosion. Do not cover stockpiles with plastic.
- e. Protect stockpiles from contamination from other materials, from erosion and deposition of water and wind borne materials of any kind.
- f. Prohibit vehicular and pedestrian traffic on stockpiled materials.

D. Environmental Requirements:

- a. Do not handle, mix, haul, or deliver Horticultural Soils or component materials when excessively dry, wet, or frozen, or during or immediately after a heavy rainfall. Handle soil materials and components only when the moisture content is less than or equal to the optimum water content as determined for the Standard Proctor test. If the soil glistens or free water is observed when the sample is patted in the palm of hand, the soil is too wet and shall not be worked. The Engineer shall determine if the soil is too wet to handle.
- b. Apply water to Horticultural soils, if necessary, or allow Horticultural Soils to dry to bring soil moisture between 60% of optimum moisture content on the dry side of optimum and optimum moisture content as determined by ASTM D698 for mixing. The Speedy Moisture Tester can be used to determine soil moisture on stockpiled soils. The Contractor shall coordinate procedures to allow for drying and mixing of planting soils that exceed maximum allowable moisture contents.

E. Delivery And Approval:

- a. Notify the Engineer a minimum of 48 hours prior to the intended horticultural soil delivery dates.
- b. Provide a delivery ticket for each truck or barge delivery of horticultural soils indicating the date of loading, volume of material, horticultural soil type and off-site

stockpile source number it has been taken from.

- c. Horticultural soil materials delivered by barge or in trucks will be subject to visual inspection and additional testing as deemed necessary by the Engineer. The Engineer reserves the right to reject on or after delivery any material that does not, in their opinion, meet the limitations of this specification and approved samples, test reports and off-site stock pile inspections. Do not install horticultural soil materials until the Engineers' inspection, sampling and/or testing is completed, unless otherwise directed by the Engineer.
- d. Where horticultural soil is rejected, immediately remove rejected materials from the site. Where it has been determined by the Engineer that soil amendments are allowable, the correction shall be made at the Contractor's expense. Additional testing after amending shall also be at the Contractor's expense.
- e. Perform on-site horticultural soil testing with the original testing laboratories used to achieve the initial component and soil mix approvals, unless otherwise noted by the Engineer.

F. Appeal Process:

- a. Horticultural Soil Testing: The Engineer shall visually check for discrepancies between the delivered soil and the approved submittal and sample. If the Engineer suspects that the topsoil delivered to the site has excessively high levels of organic matter, clay, etc. that would not be within the allowable levels listed in this specification, the soil will be rejected until additional testing proves otherwise. Should the Contractor contest the Engineer's determination, the Engineer will take samples so additional tests may be performed at Contractor's expense. These results shall be considered final.
- b. Environmental Testing: The Engineer shall check for discoloration and evidence of unacceptable contents or signs of potential contamination. If the Engineer suspects that the fill possesses hazardous or contaminated characteristics, it will be rejected. Should the Contractor contest the Engineer's determination, the Engineer will take samples so additional tests may be performed at Contractor's expense at a laboratory certified by the NYSDOH ELAP for the selected analytical method.
  - i. Environmental testing of all horticultural soil mixes shall include, but not be limited to, USEPA Standard Test Methods for determination of total contaminant concentrations for the complete list of 6 NYCRR Part 375-6.8 parameters. Analysis of the horticultural soil mixes shall be performed by USEPA Methods SW846; 8260 for Volatile Organics, 8270 for Semi-Volatile Organics, 8081 for Pesticides, and 8082 for Polychlorinated Biphenyls (PCBs), and 6010 for Metals. Other hazardous waste characteristic tests may include those for ignitability, corrosivity, and reactivity, as deemed required by the Engineer.
  - ii. As specified in MATERIALS above, clean fill shall meet NYSDEC Part 375 RRR SCOs and not exceed hazardous waste characteristic criteria (40 CFR Part 261). If the clean fill fails, then the Contractor shall be responsible for:
    - (1) Payment of fees for services of the NYSDOH ELAP certified lab;
    - (2) Removal and legal disposal of unacceptable fill;

- (3) Replacement with acceptable clean fill; and,
- (4) All other expenses, as well as potential fines that may be incurred.

**PK-ESCR 937.2.5. COORDINATION, SEQUENCING AND SCHEDULING.**

- A. General: Coordinate the production, stockpiling, and delivery of horticultural soils to the project site in accordance with the Project Schedule as provided and regularly updated by the Engineer.
- B. Coordinate horticultural soil installation with subsequent biochar and planting operations so as to not compact horticultural soils by planting operations.
- C. Project Schedule: Coordinate with the soil supplier in order for the delivery schedules to be in sync with phased and sequenced site construction and planting schedules. Coordination shall include but not be limited to:
  - a. Provide Engineer monthly access for inspection at the off-site soil mixing and stockpile locations.
  - b. Testing and approval of soil component and planting mix materials at the indicated frequency.
  - c. Availability of stockpiled horticultural soils in sufficient quantities to keep pace with installation schedules
  - d. Delivery times, including overtime and night time deliveries occurring outside the Soil Supplier's regularly scheduled work week.
  - e. Project site delivery methods by either barge or truck.
  - f. Installation and protection of Horticultural Planting Soils in a manner that prevents compaction during subsequent planting operations.
- D. Estimated Soil Sourcing and Mix Design Approvals: Plan for adequate time for the sourcing, testing and approval of planting soil component materials and mixes. **The sourcing, testing and approval of soil mix components as well as the design, approval and stockpiling of soil mixes can take six months or more depending upon seasonal conditions and quality of materials sourced.** Do not deliver Horticultural Soil materials and Mixes to the site without prior approval by the Engineer.
- E. Estimated Soil Testing Durations: The following soil testing durations are provided as a guide for the contractor to be able to bid the project based on a realistic schedule. Actual testing durations may vary depending upon the contractors' ability to send materials to their approved testing lab, the testing labs' ability to complete multiple testing protocols simultaneously, the testing lab's ability to manage high seasonal demands for soil testing, and the ability of the contractor to deliver test reports as required.
  - a. Soil component materials: Sand, Topsoil, and batch quantities of Planting Soil Mixes testing and reporting is estimated to take five (5) to ten (10) business days per sample including the following tests:
    - i. dry and wet sieving
    - ii. Hydrometer
    - iii. nutrient content
    - iv. Ph

- v. organic matter content
  - vi. soluble salts
  - vii. saturated hydraulic conductivity
- b. Final Planting Soil Mixes, in stockpile quantities after initial soil mix approvals, testing and reporting is estimated to take five (5) to ten (10) business days per sample including the following tests:
- i. dry and wet sieving
  - ii. Hydrometer
  - iii. nutrient content
  - iv. pH
  - v. organic matter content
  - vi. soluble salts
  - vii. saturated hydraulic conductivity
- c. Compost testing is estimated to take 21 to 28 business days per sample including the following tests:
- i. C:N ratio
  - ii. Maturation test
  - iii. pH
  - iv. Organic matter content
  - v. Salinity
  - vi. Pathogens/Metals/Vector Attraction
  - vii. Nutrient content
  - viii. Biological Organisms
- d. Biological testing of final approved Planting Soil Stockpiles is estimated to take 14-18 business days.
- e. Environmental testing is estimated to take 18-24 business days.

**PK-ESCR 937.3. METHODS**

A. Examination and Preparation:

- a. Notify the Engineer of soil placement operations at least seven calendar days prior to the beginning of work.
- b. Verify that the locations of utilities, structures and other underground items have been clearly marked.
- c. Verify that the plumbing for the irrigation system main lines have been installed and accepted by the Engineer.
- d. Verify that the underdrainage system has been installed and accepted by the Engineer.
- e. Verify that the subgrade elevations meet required elevations and have been accepted by the Engineer.

- f. Before proceeding with work, notify the Engineer in writing of unsuitable conditions and conflicts.
- B. Installation – General
- a. Do not move or work planting soils when it is a wet or frozen condition. In all cases, the soil being placed shall be in a dry to damp condition with a moisture content not greater than optimum as determined by the Standard Proctor test. No wet soils shall be placed.
  - b. Place Horticultural Drainage Material, Horticultural Subsoil, Planting Soil for Beds and Pits and Planting Soil for Seeded and Sodded Lawn Areas in lifts compacted to meet profiles indicated on the Drawings.
  - c. Form transition layers between soils soil types and lifts with a light scarification of the horticultural soil surface prior the installation of each subsequent lift is required to break up any compacted surface and eliminate a compaction interface.
  - d. Prevent over compacted soils by beginning the work against walls or pavement edges, or in the center of planting beds or lawn area, and progressing outwards towards the borders. Place barricades as required to prevent any unnecessary compaction of planting soil from vehicles, equipment, or pedestrian traffic. Remove or restore to compliant conditions placed planting soils exhibiting noncompliant compaction values.
- C. Planting Soil Mock-Up:
- a. Prior to the start of horticultural soil installation, comply with mock-up requirements for each indicated soil profile as described in Quality Assurance section of this specification.
- D. Subgrade Preparation:
- a. After subgrade levels have been inspected and tested, and immediately prior to placing Horticultural Soils, scarify subgrade that the planting soil is placed upon to a minimum depth of four inches utilizing a toothed bucket of a backhoe or equivalent equipment.
- E. Horticultural Drainage Layer Installation:
- a. Install Drainage layer over the scarified existing or prepared subgrade where indicated on the Drawings.
  - b. Install Horticultural Subsoil with approved low-ground pressure equipment.
  - c. Install Drainage layer in one six (6) inch lift. Compact the drainage layer with light tamping by installers foot traffic. Do not mechanically compact the drainage layer.
- F. Horticultural Subsoil Installation:
- a. Place and spread Horticultural Subsoil over the Drainage Layer or on the scarified subgrade as indicated on the Drawings.
  - b. Install Horticultural Subsoil with approved low-ground pressure equipment.
  - c. Do not back-blade Horticultural Subsoil as it will contribute to over compaction.
  - d. Light foot traffic and low-ground pressure equipment is allowable for placing subsequent lifts and is needed to seat the soil layers within the profile, reducing overall subsidence.
  - e. Lightly scarify of the surface of each lift with hand tools to break up any compacted surface and eliminate any compaction interface. Higher trafficked areas will require

greater amounts of scarification as determined by the Engineer.

- f. Reducing the amount of compaction to the soils can be accomplished by beginning the work in corners, against walls or at the center of isolated beds and progressing outwards. This approach limits the amount of traffic needed for installation on the placed soil.
- g. Penetration resistance of installed Horticultural Subsoil as measured by the Engineer shall not exceed 220 PSI. Horticultural subsoil shall be uniformly increasing in density with depth. There shall not be any compacted layers (readings exceeding 290 PSI) within the soil profile. If readings of over 220 PSI are discovered, the Engineer shall take additional readings as required to determine if the soil is overly compacted.
- h. Decompact Horticultural Subsoil tested at 2200 PSI or higher as directed by the Engineer to obtain an installation that does not exceed readings of 220 PSI.
- i. Place and spread Horticultural Planting Soil to a depth greater than required such that after settlement, finished grade conforming to the lines, grades and elevations shown on the Drawings. Ensure proper drainage in an uninterrupted pattern free of hollows and pockets.
- j. Remove stiff clods, lumps, brush, roots, stumps, litter and other foreign material and stones over one inch in diameter as discovered during operations and dispose of legally off site.

G. Seeded and Sodded Lawn Area Soil Mix Installation:

- a. Lightly scarify of the surface of the Horticultural Subsoil with hand tools to break up any compacted surface and eliminate any compaction interface. Higher trafficked areas will require greater amounts of scarification as determined by the Engineer.
- b. Install Planting Soil over the prepared Horticultural Subsoil to the depths indicated on the Drawings.
- c. Install Planting Soil with approved low-ground pressure equipment.
- d. Do not back-blade Horticultural Subsoil as it will contribute to over compaction.
- e. Light foot traffic and low-ground pressure equipment is allowable for placing subsequent lifts and is needed to seat the soil layers within the profile, reducing overall subsidence.
- f. Lightly scarify of the surface of each lift with hand tools to break up any compacted surface and eliminate any compaction interface. Higher trafficked areas will require greater amounts of scarification as determined by the Engineer.
- g. Penetration resistance of installed Horticultural Subsoil as measured by the Engineer shall not exceed 140 PSI. Horticultural subsoil shall be uniformly increasing in density with depth. There shall not be any compacted layers (readings exceeding 290 PSI) within the soil profile. If readings of over 140 PSI are discovered, the Engineer shall take additional readings as required to determine if the soil is overly compacted.
- h. Decompact Horticultural Subsoil as directed by the Engineer to obtain an installation that does not exceed readings of 140 PSI.
- i. Place and spread Horticultural Planting Soil to a depth greater than required such that after settlement, finished grade conforming to the lines, grades and elevations shown on the Drawings. Ensure proper drainage in an uninterrupted pattern free

of hollows and pockets.

- j. Remove stiff clods, lumps, brush, roots, stumps, litter and other foreign material and stones over one inch in diameter as discovered during operations and dispose of legally off site.
- H. Planting Bed Soil Mix Installation:
- a. Lightly scarify of the surface of the Horticultural Subsoil with hand tools to break up any compacted surface and eliminate any compaction interface. Higher trafficked areas will require greater amounts of scarification as determined by the Engineer.
  - b. Install Planting Soil over the prepared Horticultural Subsoil to the depths indicated on the Drawings.
  - c. Install Planting Soil with approved low-ground pressure equipment.
  - d. Do not back-blade Horticultural Subsoil as it will contribute to over compaction.
  - e. Light foot traffic and low-ground pressure equipment is allowable for placing subsequent lifts and is needed to seat the soil layers within the profile, reducing overall subsidence.
  - f. Lightly scarify of the surface of each lift with hand tools to break up any compacted surface and eliminate any compaction interface. Higher trafficked areas will require greater amounts of scarification as determined by the Engineer.
  - g. Penetration resistance of installed Horticultural Subsoil as measured by the Engineer shall not exceed 140 PSI. Horticultural subsoil shall be uniformly increasing in density with depth. There shall not be any compacted layers (readings exceeding 290 PSI) within the soil profile. If readings of over 140 PSI are discovered, the Engineer shall take additional readings as required to determine if the soil is overly compacted.
  - h. Decompact Horticultural Subsoil as directed by the Engineer to obtain an installation that does not exceed readings of 140 PSI.
  - i. Place and spread Horticultural Planting Soil to a depth greater than required such that after settlement, finished grade conforming to the lines, grades and elevations shown on the Drawings. Ensure proper drainage in an uninterrupted pattern free of hollows and pockets.
  - j. Remove stiff clods, lumps, brush, roots, stumps, litter and other foreign material and stones over one inch in diameter as discovered during operations and dispose of legally off site.
- I. Finished Grading: Grade to finished grades indicated within 0.10 foot. Grade areas to drain water away from buildings or walls or other vertical structures and to provide suitable surfaces for mowing machines. Existing grades which are to remain but are disturbed by the Contractor's operations shall be restored.
- J. Protection: Protect work of this section until Substantial Completion.
- a. Select equipment and otherwise phase the installation of the planting to ensure that wheeled equipment does not travel over prepared horticultural subsoil or planting soil. Movement of tracked equipment over said soils will be reviewed and considered for approval by the Engineer. If it is determined by the Engineer that wheeled equipment must travel over already installed planting soil, provide a

written description of sequencing of work that ensures that compacted soil is loosened and un-compacted as the work progresses or place 3/4" plywood over the length and width of any travel way to cover planting soil to protect it from compaction.

- b. Disturbed areas outside the limit of work shall be protected and as required, graded smooth and spread with planting soil to meet finished grades.
- c. Protect installed Horticultural Soils from wind and water erosion. Comply with soil and erosion control requirements specified under separate items.
- d. Repair soil profiles where wind or water erosion has occurred to the satisfaction of the Engineer.

K. Acceptance:

- a. Confirm that the final grades of the Soils are at the proper finish grade elevations. Adjust grade with approved materials as required to meet the contours and spot elevations noted on the Plans. Request the presence of the Engineer to inspect final grade. Do not proceed with the remaining work of this Contract until the Engineer has given written approval of the final grade.
- b. Protect areas of in-place soil from additional compaction, disturbance, and contamination. Prohibit the following practices within these areas except as required to perform planting operations:
  - i. Storage of construction materials, debris, or excavated material.
  - ii. Parking vehicles or equipment.
  - iii. Vehicle traffic.
  - iv. Foot traffic.
  - v. Erection of sheds or structures.
  - vi. Impoundment of water.
  - vii. Excavation or other digging unless otherwise indicated.
- c. If planting soil or subgrade is over compacted, disturbed, or contaminated by foreign or deleterious materials or liquids, remove the planting soil and contamination; restore the subgrade as directed by Engineer and replace contaminated planting soil with new planting soil.

L. Cleaning:

- a. Protect areas adjacent to planting-soil preparation and placement areas from contamination.
- b. Keep adjacent paving and construction clean and work area in an orderly condition.
- c. Remove surplus soil and waste material including excess subsoil, unsuitable materials, trash, and debris and legally dispose of them off Owner's property unless otherwise indicated.

M. Post-Installation Biochar amendment: In accordance with Bid Item PK-ESCR – 945 BIOCHAR.

N. Post-Installation Compost Tea Applications: In accordance with Bid Item PK-ESCR – 951 COMPOST TEA.

**PK-ESCR 937.4. FIELD QUALITY CONTROL**

**A. Field Quality Control:**

- a. Testing Agency: Engage a qualified testing agency to perform field quality control tests and inspections.
- b. Perform the following tests and inspections:
  - i. In-place Compaction Testing with Penetrometer: As indicated under “Quality Assurance” herein. Complete in-place soil testing using a hand held penetrometer at a rate of one point every 1,000 square feet for installed horticultural soil prior to covering with planting soil and one point every 1,000 square feet for installed planting soil for beds and pits or seeded & sodded lawn areas.
  - ii. Compaction Testing: In addition to penetrometer testing, test in-place density for horticultural soil materials shall be made according to ASTM D1556 or ASTM D6938-08a. Compaction tests shall be conducted each 20,000 square feet for each soil type layer after each soil type has been placed, as directed by the Engineer. The engineer may direct additional testing in locations subject to compaction or adverse Contractor operations.
  - iii. Percolation testing: Test percolation of all Planting Soils using Turf-Tec IN2-W Infiltrometer utilizing manufacturer’s operating instructions. Percolation tests shall be conducted each 20,000 square feet for each soil type after each soil type has been placed, as directed by the Engineer. The engineer may direct additional testing in locations subject to compaction or adverse Contractor operations. Remove or restore to compliant conditions placed planting soils exhibiting noncompliant percolation values.
- c. Prepare test and inspection reports.
- d. Label each test report with the date, location keyed to a site plan or other location system, visible conditions when and where sample was taken, and sampling depth.
- e. Soil installation will be considered defective if it does not pass tests and inspections.
- f. Make corrections as directed by the Engineer and re-test until compliance with the requirements is achieved.

**PK-ESCR 937.5. MEASUREMENT.**

**A. PER LUMP SUM**

Payment for SOURCING AND APPROVAL OF COMPONENT MATERIALS, APPROVAL OF PLANT SOIL MIXES, and FIRST PHASE STOCKPILING OF SOIL MATERIALS will be made on a Lump Sum basis for work satisfactorily completed. Monthly payments will be made in proportion to the amount of work done as determined by the Engineer.

**B. PER CUBIC YARD**

Payment for the quantity of HORTICULTURAL DRAINAGE LAYER, HORTICULTURAL SUBSOIL, PLANTING SOIL FOR BEDS & PITS, or PLANTING SOIL FOR SEEDED & SODDED LAWN AREAS to be paid for shall be the number of cubic yards delivered to the project site by barge or truck as verified by the Engineer prior to unloading. No payment will be made for HORTICULTURAL DRAINAGE LAYER, HORTICULTURAL SUBSOIL,

PLANTING SOIL FOR BEDS & PITS, or PLANTING SOIL FOR SEEDED & SODDED LAWN AREAS not delivered to the project site. The quantity of CHINKING STONE to be paid for under the Item shall be the number of CUBIC YARDS, furnished and placed in accordance with the plans, specifications, and directions of the Engineer.

C. PER LINEAR FOOT

Payment for the quantity of DRAINAGE FOR NATURAL TURF FIELDS to be paid for shall be the number of LINEAR FOOT constructed in accordance with the plans, specifications, and directions of the Engineer.

**PK-ESCR 937.6. PRICES TO COVER**

A. The Lump Sum (LS) contract price for

Item No. PK-ESCR 937 CM SOURCING AND APPROVAL OF COMPONENT MATERIALS

covers the cost of all labor, materials, equipment, insurance, and incidentals required for the sourcing horticultural soil component materials including Engineer approved submittal of qualified soil testing lab, and submittal of each component material showing compliance with the specifications, and a 50 CY stockpile of each soil component properly stored and stockpiled and inspected and approved by the Engineer.

B. The Lump Sum (LS) contract price for

Item No. PK-ESCR 937 PM APPROVAL OF PLANT SOIL MIXES

covers the cost of all labor, materials, equipment, insurance, and incidentals required for the sourcing, blending, testing, and stockpiling of Including a 500 CY stockpile of each soil material properly stored and stockpiled and approved by the Engineer including Engineer approved submittal documentation of mix design and batch testing showing compliance with the approved mix design at the first 250 CY and final 250 CY of each stockpiled soil material.

C. The Lump Sum (LS) contract price for

Item No. PK-ESCR 937 SP FIRST PHASE STOCKPILING OF SOIL MATERIALS

covers the cost of all labor, materials, equipment, insurance, and incidentals required for the sourcing, blending, testing, and off-site stockpiling of 1,000 CY each material properly piled and protected, and as inspected and approved by the Engineer, including Engineer approved submittal documentation showing batch testing showing compliance with each of the material requirements for each 1,000 CY of stockpiled material.

D. The contact prices per cubic yard (CY) for

Item No. PK-ESCR 937 A HORTICULTURAL DRAINAGE LAYER

Item No. PK-ESCR 937 B HORTICULTURAL SUBSOIL

Item No. PK-ESCR 937 C PLANTING SOIL FOR BEDS & PITS

Item No. PK-ESCR 937 D PLANTING SOIL FOR SEEDED & SODDED LAWN AREAS

covers the cost of all labor, materials, equipment, insurance, and incidentals required for

the component material sourcing, blending, testing, off-site stockpiling, coordination, sequencing and scheduling, delivery to the project site by truck or barge, on-site stockpiling and handling, mock-ups, installation, compaction, de-compaction, in-place testing and post-installation maintenance and protection. Installation of Biochar and Compost Tea shall be paid for under separate items.

E. The price bid shall be a unit price per CUBIC YARD of Chinking Stone furnished and placed and shall include the cost of all labor, materials, equipment, and incidental expenses necessary to complete the work, including laboratory testing (if necessary) and preparation of grades, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

F. The price bid shall be a unit price per linear foot (LF) of DRAINAGE FOR NATURAL TURF FIELDS in the work complete, and shall include furnishing of all labor, materials, equipment and expenses necessary to complete the work, including prepare the subgrade, geotextile - separation, horticultural drainage layer, and underdrain, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

## SECTION PK-ESCR 943 – PARK SECURITY MEASURES

**WORK:** Under this item, the Contractor shall furnish, erect, and powder coat **PARK SECURITY MEASURES**, in accordance with the plans, specifications, and directions of the Engineer.

### **QUALIFICATIONS:**

#### **Manufacturer:**

- For security gate, a company specializing in the manufacturer of Anti-Ram barriers of the type specified, with a minimum of five (5) years' experience manufacturing operators of this type and design.
- For security bollards, manufacturer to have a minimum of 5 years with documented field experience with similar vehicle barriers.

If parks security measures are based on engineering instead of testing, a Professional Engineer licensed in New York with a minimum of 5 years of experience in projects of similar scope and complexity is to provide a design based on methodologies and calculations to evaluate the performance of bollards in response to the vehicle impact. Proposed design methodologies shall be submitted to Engineer for approval prior to commencement of work.

**Installer:** Must have a minimum of three (3) years' experience installing similar equipment or obtain other significant manufacturer endorsement of technical aptitude, if required, during the submittal process.

### **MATERIALS:**

Unless otherwise herein specified, all materials of construction shall meet the requirements of the NYCDOT Standard Highway Specifications.

**Concrete:** Per Section ESCR-4.06.

**Reinforcement:** Per Section ESCR-4.14

### **PRODUCTS:**

Fixed Bollard Type 1: K8 Rated Fixed Bollard with shallow mounted footing (Truckstopper 7 by Tymetal or approved equal) Address: SafetyFlex Anti Terrorist Barriers and distributed by Tymetal Corp., 678 Wilbur Avenue, Greenwich, NY 12834 – (800) 328 – 4283.

Fixed Bollard Type 2: K4 Rated Fixed Bollard with shallow mounted footing (Truckstopper 6 by Tymetal or approved equal) Address: SafetyFlex Anti Terrorist Barriers and distributed by Tymetal Corp., 678 Wilbur Avenue, Greenwich, NY 12834 – (800) 328 – 4283.

Security Gate: K8 Rated Gate, Terra Ultimate 180 Swing Barrier by Frontier Pitts or approved Equal Address: Crompton House, Crompton Way, Manor Royal Industrial Estate, Crawley, West Sussex RH10 9QZ

Removable Bollard: K8 Rated Bollard with shallow mounted footing (Truckstopper 7 by Tymetal or approved equal) Address: SafetyFlex Anti Terrorist Barriers and distributed by Tymetal Corp., 678 Wilbur Avenue, Greenwich, NY 12834 – (800) 328 – 4283.

**Fixed Bollard Type 3:** Custom K4 Rated Fix Bollard with custom dimensioned shallow mounted footing and custom bollard extension arm per drawings (Custom Truckstopper 6 by Tymetal or approved equal) Address: SafetyFlex Anti Terrorist Barriers and distribution by Tymetal Corp., 678 Wilbur Avenue, Greenwich, NY 12834 – (800) 328 – 4283.

## **PERFORMANCE REQUIREMENTS:**

**Fixed Bollard Type 1:** Impact Condition Designation M40, Penetration Rating P2, with a capability of stopping at 15,000lb vehicle traveling at speeds up to forty (40) mph with a vehicle penetration not to exceed twenty-three feet (23' [7 m]). The fixed bollard system shall be certified by an independent testing laboratory in accordance with ASTM F2656-15 or verified with engineering approved by the Engineer for finite element methods and models by a Professional Engineer licensed in New York State. Crash Test or Engineer shall be based on vehicle impact to a single bollard. If engineered, contractor to provide design methodologies and engineer calculations for review via submittal prior to work.

**Fixed Bollard Type 2:** Impact Condition Designation M30, Penetration Rating P1, with a capability of stopping at 15,000lb vehicle traveling at speeds up to thirty (30) mph with a vehicle penetration not to exceed three feet (3' [1 m]). The fixed bollard system shall be certified by an independent testing laboratory in accordance with ASTM F2656-15 or verified with engineering approved by the Engineer for finite element methods and models by a Professional Engineer licensed in New York State. Crash Test or Engineer shall be based on vehicle impact to a single bollard. If engineered, contractor to provide design methodologies and engineer calculations for review via submittal prior to work.

**Security Gate:** The manually operated vehicle barrier system shall be certified by an interdependent testing laboratory to meet one of the following performance requirements:

1. **IWA 14-1:2013:** Classification Code 7200(N2A)/80/90:4.7 for a 7,200kg vehicle weight travelling at 80kph (50mph) with a vehicle penetration not to exceed 4.7m (15ft).
2. **PAS 68:2010:** Classification V/7500(N2)/80/90/5 for a 7,500kg vehicle weight travelling at 80kph (50mph) with a vehicle penetration not to exceed 4.7m (15ft).
3. **ASTM F2656-15:** Impact Condition Designation M40, Penetration Rating P2, with a capability of stopping a 15,000lb vehicle traveling at speeds up to 40mph with a vehicle penetration not to exceed 7m (23ft).

**Removable Bollard:** Impact Condition Designation M40, Penetration Rating P2, with a capability of stopping at 15,000lb vehicle traveling at speeds up to forty (40) mph with a vehicle penetration not to exceed twenty-three feet (23' [7 m]). The removable bollard system shall be certified by an independent testing laboratory in accordance with ASTM F2656-15 or verified with engineering approved by the Engineer for finite element methods and models by a Professional Engineer licensed in New York State. Crash Test or Engineer shall be based on vehicle impact to a single bollard. If engineered, contractor to provide design methodologies and engineer calculations for review via submittal prior to work.

**Fixed Bollard Type 3:** Impact Condition Designation M30, Penetration Rating P1, with a capability of stopping at 15,000lb vehicle traveling at speeds up to thirty (30) mph with a vehicle penetration not to exceed three feet (3' [1 m]). Fixed Bollard Type 3 to have custom footing dimensions per drawings and custom Bollard Extension Arm. The fixed bollard system shall be certified by an independent testing laboratory in accordance with ASTM F2656-15 or verified with engineering approved by the Engineer for finite element methods and models by a Professional Engineer licensed in New York State. Crash Test or engineering shall be based on vehicle impact to a single bollard. If engineered, contractor to provide design methodologies and engineer calculations for review via submittal prior to work.

**LOCKING MECHANISM:** For Removable Bollard and Security Gate, the system shall be secured by an anti-tamper locking mechanism encasing the locking pin complying with New York City Fire Code Chapter 5, Section FC 506 for "Keys and Key Access" and provide a minimum of five (5)

FDNY standard “1620” compliant keys. Lock must not be case hardened. Provide a minimum of two (2) extra locking pins. Means and methods for bollard lifting mechanism and removal procedures shall be submitted for approval by the Engineer prior to installation.

**ERECTION:** The posts for bollards and gate shall be set in concrete footings as shown on the plans or as directed by the Engineer. The sleeves for removable bollards shall be set in concrete footings, as shown on the plans or as directed by the Engineer.

All posts and sleeves shall be set plumb and true to line and grade. Any post and sleeve not set true to line and grade shall be removed and replaced at the Contractor's expense. Bending posts to make them plumb will not be permitted.

**Finish:** All bollard security measures must be stainless steel with a brushed finish.

All gate security measures items shall be hot-dipped galvanized and powder coated with TGIC Polyester. Galvanizing shall provide an acceptable substrate for applied powder coatings. No lacquer, urethane, or other coatings which would prevent proper adhesion of powder coating shall be applied to the steel. The powder coating shall be applied to the galvanized steel pipe in such a manner that the coating will not peel off per manufacturer's directions. Ensure surfaces to be coated are clean, dry, and free of grease, dust, rust, etc. Color shall be SAE International's AMS-STD-595 Paint Code: 17178 'Aluminum / Silver' (NYC DOT Standard 'George Washington Bridge Gray'). The TGIC-Polyester shall be applied without voids, teas, or cuts that reveal the substrate and shall thoroughly adhere to the metal as described in Laboratory Test requirements below.

**SUBMITTALS:** All submittals shall submitted and approved prior to manufacture and be in accordance with the requirements of the S-Pages. Submittals to include:

**Product Information and Testing Reports:** The manufacturer's literature for each product, including testing report with relevant information that clearly indicates testing conditions and how these apply to job conditions, along with all engineering for both standard testing conditions and deviations from standard testing conditions, shall be submitted.

**Engineering Calculations:** All engineering calculations, standard and deviations, must be submitted to the Engineer for approval.

**Shop Drawings:** Before the work is started, the Contractor shall submit shop drawings for approval for all security measure items. The Contractor shall submit shop drawings no later than four (4) months prior to the scheduled completion of the project. The Contractor shall submit the following information as required by the Engineer: materials, finishes, supports, hardware, fasteners, fittings, and accessories. Shop drawings to show relations to adjacent work, location of concrete footings, and reinforcement information. All drawings shall show English units. Metric units can be down in addition to English units.

**Installation instructions:** Submit two copies of manufacturer's installation instructions for this specific project. Submit manufacturer's completed warranty registration form to Engineer.

**Project List:** Submit list of product installations comparable to the subject job as reference. Include date of product installation, installer, and owner's name and location of the project.

**Design Mix report:** The Contractor shall submit a concrete design mix report per the requirements of the Concrete for Structures Section 4.06.

**Sample:** A color sample. A finish sample.

**Laboratory Test:** TGIC-Polyester Powder Coat. At the direction of the Engineer, a sample of TBID-Polyester powder coated security gate shall be tested for bonding of the powder coating to the metal. Test shall be the Cross Hatch test per ASTM D3359, Method B or ASTM D4551 with no failure in the coating. Failure to satisfactorily pass this test will be a basis for rejection.

**WARRANTY:** Provide a warranty against all defects in materials or workmanship for five (5) years after the date of installation. Defective materials shall be replaced at manufacturer's discretion with new or reconditioned materials furnished by the manufacturer, at no cost to the owner.

**MEASUREMENT AND PAYMENT:** The quantity of **FIXED BOLLARD TYPE 1, FIXED BOLLARD TYPE 2, SECURITY GATE REMOVABLE BOLLARD** and **FIXED BOLLARD TYPE 3** to be paid for under these items shall be the number furnished and installed in accordance with the plans, specifications, and directions of the Engineer.

The price bid shall be separate unit price for **EACH** Fixed Bollard Type 1, furnished and erected, and shall include the cost for all labor, material, equipment, and incidental expenses necessary to complete the work, including excavation, concrete for structure and footing, steel reinforcement, and powder coating, where required, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be separate unit price for **EACH** Fixed Bollard Type 2, furnished and erected, and shall include the cost for all labor, material, equipment, and incidental expenses necessary to complete the work, including excavation, concrete for structure and footing, steel reinforcement, and powder coating, where required, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be separate unit price for **EACH** Security Gate, furnished and erected, and shall include the cost for all labor, material, equipment, and incidental expenses necessary to complete the work, including excavation, concrete for structure and footing, steel reinforcement, and powder coating, where required, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be separate unit price for **EACH** Removable Bollard, furnished and erected, and shall include the cost for all labor, material, equipment, and incidental expenses necessary to complete the work, including excavation concrete for park structures, powder coating, and padlock, where required, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

The price bid shall be separate unit price for **EACH** Fixed Bollard Type 3, furnished and erected, and shall include the cost for all labor, materials, equipment, and incidental expenses necessary to complete the work, including excavation, concrete for structure and footing, steel reinforcement, and powder coating, where required, all in accordance with the plans and specifications, to the satisfaction of the Engineer.

## SECTION PK-ESCR 944 – COMPOST

### PK-ESCR 944.1. DESCRIPTION

- A. Under this Item, the Contractor shall furnish, spread, and incorporate COMPOST—in existing or new soil, in accordance with the plans and specifications, to the satisfaction of the Engineer.

### PK-ESCR 944.2. MATERIALS

- A. Compost: A stable, humus-like material produced from the aerobic decomposition of organic residues which shall have been composted for a minimum of one year (12 months). The use of biosolids as feedstock for compost production is prohibited. Compost shall be a dark brown to black color and be capable of supporting plant growth with appropriate management applicable, with no visible free water or dust, with no unpleasant odor, and meeting the following criteria as reported by laboratory tests:

Criteria	Test Method	Acceptable Range
Feed stock		Brewer's waste, or leaf mulches are acceptable. Composted municipal waste (chipped, shredded and screened wood, leaves, bark, etc.) alone is not acceptable unless it meets all of the criteria noted
Carbon/Nitrogen Ratio		10:1 - 25:1
Degree of Maturity	Dewer Self Heating <u>or</u>	VI-V
	Solvita Maturity Index <u>or</u>	6-8
	CO <sup>2</sup> Evolution	1.2%C/day
Texture	Dry Sieve and Hydrometer	Screened to 1/2 inch maximum particle size, and not more than 3 percent material finer than 0.002mm as determined by hydrometer test on ashed material.
Foreign Material	Dry Weight	Debris such as metal, glass, plastic, wood (other than residual chips), asphalt or masonry shall not be visible and shall not exceed 1% dry weight.
Organic Matter %	Dry Weight	≥20 percent
pH	1:1 soil-distilled water suspension using a glass electrode pH meter American Society of Agronomy Methods of Soil Analysis, Part 2, 1986.	6.5 to 7.3
Ammonium	Extract	<200 PPM

Salinity	1:5 soil to water ratio extract	2.0 mmhos/cm (dS/m).
Nutrient Content	Extract	Total Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sulfur, Calcium, Magnesium, Sodium, Iron, Aluminum, Manganese, Copper, Zinc.
Pathogens/Metals/Vector Attraction	Extract	Meet all Federal and State of New York requirements for applications to soils with human activity.

**PK-ESCR 944.2.1. REFERENCES.**

- A. U.S. Compost Council's Test Methods for the Examination of Composting and Composts.

**PK-ESCR 944.2.2. QUALITY ASSURANCE.**

- A. Compost Testing Laboratory: An independent soil testing laboratory with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein, including the ability to make recommendations about soil blending ratios and methods, amendment recommendations, and issuing reports as specified herein.
  - a. Verify Testing Laboratories have the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein.
  - b. Subject to meeting the requirements, the following are acceptable testing laboratories:
    - i. Compost Testing:
      1. Penn State Analytical Services Lab, University Park, PA, (814) 863-0841
      2. Woods End Research Laboratory, Mt. Vernon, ME, (207) 293-2457.
      3. Soil FoodWeb New York, Center Moriches, NY 11716, (631) 750-1553
      4. AgroLab Harrington, DE 19952, (302) 566-6094
      5. A&L Great Lakes Lab, Fort Wayne, IN 46080, (260) 483-4759

**PK-ESCR 944.2.3. SUBMITTALS**

- A. Certified third party test reports for Compost material showing compliance with requirements dated no earlier than 60 days from time of submittal.
- B. No Compost shall be delivered until the approval of test reports by the Engineer, but such approval does not constitute acceptance. The Engineer reserves the right to reject, on or after delivery, any material which does not, in their opinion, meet these specifications.

- C. Product Data: For each type of product indicated.
  - a. Submit most recent printed information from manufacturer.
    - i. Compost: identify the material(s) from of which is it composed and identify the location where material was composted.
  - b. Data for the compost shall be no older than 30 days from date of the submittal submission.
- D. Qualification Data:
  - a. Soil material supplier, including:
    - i. List of previous projects including project name, a contact name, phone number, and the number of cubic yards per each installation and a brief description of the project.
    - ii. Location where the planting soil mixes and component materials will be mixed and stockpiled including available soil mixing and stockpiling area.
  - b. Submit qualifications of Soil Testing Laboratory to be utilized for soil testing, including the resume of the staff anticipated to perform the required work of the project.
- E. Material Test Reports:
  - a. General: Submit written reports of each sample tested. Each report to include the following as a minimum and such other information required specific to material tested:
    - i. Date issued.
    - ii. Project Title names of Contractor and supplier.
    - iii. Testing laboratory name, address and telephone number, and name(s), as applicable, of each field and laboratory inspector.
    - iv. Date, place, and time of sampling or test, with record of temperature and weather conditions.
    - v. Location of material source.
    - vi. Name and protocol of test performed.
  - b. Resubmissions of material samples shall be accompanied by a matching material test report.
  - c. Missing information, failure to use the specified testing protocol, or failure to supply a material sample as specified with the test report shall be grounds for rejection.
  - d. Lab test reports submitted for approval by the Engineer shall be dated no more than thirty (30) days from date of sample collection.
  - e. Contractor to bear responsibility for all costs associated with laboratory testing.
  - f. Test Reports: The Contractor shall submit test reports with each sample of compost for approval. Resubmissions of test reports shall be accompanied by a matching material sample.
    - i. Provide the following Testing for Compost:
      - 1. Feedstock
      - 2. Carbon/Nitrogen Ration (C/N)
      - 3. Degree of Maturity

4. Texture (Particle Size)
5. Organic Content (%)
6. pH
7. Buffer pH
8. Cation Exchange Capacity
9. Soluble Salts
10. Nutrient Content (Total Nitrogen, Ammonium Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sulfur, Calcium, Magnesium, Sodium, Iron, Aluminum, Manganese, Copper, Zinc)
11. Moisture Content
12. Pathogens/Metals/Vector Attraction
13. Test Frequency: One for each 100 CY of compost supplied, unless otherwise directed by the Engineer.

**PK-ESCR 944.2.4. DELIVERY, STORAGE, AND HANDLING**

- A. Packaged Materials: Deliver packaged Compost materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and compliance with local, state and Federal laws if applicable.
  - a. Accompany each packaged delivery of Compost with delivery tickets.
- B. Bulk Materials:
  - a. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
  - b. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
  - c. Do not move or handle materials when they are wet or frozen.
  - d. Accompany each bulk delivery of biochar with delivery tickets.
  - e. When compost is stored on the job site, it shall be done as directed by the Engineer.
- C. Weather Limitations: Proceed with Compost installation only when existing and forecasted weather conditions permit application to the soil when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.
  - a. Do not apply Compost during windy or rainy conditions.

**PK-ESCR 944.2.5. COMPOST PRODUCERS**

- A. Subject to meeting the requirements, compost material is available from the following producers:
  - a. Long Island Compost, Islip, NY
  - b. "Nature's Choice Compost" by Nature's Choice Corp., Union, NJ,
  - c. Agresoil Compost by Agresource, Inc. Amesbury, MA,
  - d. Organic Recycling Inc. Orangeburg, NY
  - e. Approved Equal.

**PK-ESCR 944.3. METHODS**

- A. After all areas to be seeded, sodded or planted have been fine graded to their compacted depth as per the Drawings, compost shall be spread over the surface of the planting soil a rate of 1 cubic yard of Compost per 1,000 feet of planting soil surface, unless otherwise directed by the Engineer.
- B. Thoroughly incorporate the biochar into the top five (5) inches of the planting soil by hand with a rototiller.

**PK-ESCR 944.4. MEASUREMENT**

- A. The quantity of Compost to be paid for shall be the number of cubic yards furnished in accordance with the plans and specifications, to the satisfaction of the Engineer. The Compost shall be measured as delivered in bulk containers, bags or trucks at point of delivery and as documented by delivery tickets.

**PK-ESCR 944.5. PRICES TO COVER**

- A. The contact prices per cubic yard (CY) for Item No. PK-ESCR 944 COMPOST shall cover the cost of all labor, materials, equipment, insurance, testing and incidentals required furnish, spread, and incorporate COMPOST in planting soil to the satisfaction of the Engineer.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>
<b>PK-ESCR 944</b>	<b>COMPOST</b>	<b>CY</b>

**END OF SECTION**

## **SECTION PK-ESCR 945 – BIOCHAR**

### **PK-ESCR 945.1. DESCRIPTION**

- A. Under this Item, the Contractor shall furnish, spread, and incorporate BIOCHAR in existing soil, in accordance with the plans and specifications, to the satisfaction of the Engineer.

### **PK-ESCR 945.2. MATERIALS**

- A. Biochar: Class I Material, screened to  $\leq 1/4"$  (6.35 mm). Biochar shall meet the requirements of the International Biochar Initiative (IBI OSTD. 2.1) for Categories A and B. Biochar shall be a solid material obtained from thermochemical conversion of biomass in an oxygen-limited environment (pyrolysis) containing at least 60% carbon. Feedstocks may be composed of crop residue, wood or other forest waste. Biosolids, sewer sludge, animal wastes and other feedstocks may not be used in biochar material supplied. Biochar shall not include other soil conditioners, fertilizers or amendments.

### **PK-ESCR 945.3.1. REFERENCES**

- A. International Biochar Initiative (IBI OSTD. 2.1), Standardized Product Definition and Product Testing Guidelines for Biochar That Is Used in Soil, November 2015.

### **PK-ESCR 945.3.2. SUBMITTALS**

- A. Certified third party test reports for Biochar material showing compliance with requirements dated no earlier than 60 days from time of submittal.
- B. No Biochar shall be delivered until the approval of test reports by the Engineer, but such approval does not constitute acceptance. The Engineer reserves the right to reject, on or after delivery, any material which does not, in their opinion, meet these specifications.

### **PK-ESCR 945.3.3. DELIVERY, STORAGE, AND HANDLING**

- A. Packaged Materials: Deliver packaged biochar materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and compliance with state and Federal laws if applicable.
  - 1. Accompany each packaged delivery of biochar with delivery tickets.
- B. Bulk Materials:
  - 1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
  - 2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
  - 3. Do not move or handle materials when they are wet or frozen.
  - 4. Accompany each bulk delivery of biochar with delivery tickets.
  - 5. When compost is stored on the job site, it shall be done as directed by the Engineer.

C. Weather Limitations: Proceed with biochar installation only when existing and forecasted weather conditions permit application to the soil when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.

1. Do not apply biochar during windy or rainy conditions.

**PK-ESCR 945.3.4. MANUFACTURER**

A. Subject to meeting the requirements, the Biochar material is available from the following producers:

1. Biochar Solutions, Carbondale, CO
2. Char-Grow, Asheville, NC
3. Wakefield Biochar, Columbia, MO
4. Biochar Supreme, LLC, Everson, WA
5. Approved Equal.

**PK-ESCR 945.4. METHODS**

- A. After all areas to be sodded or planted have been fine graded to their compacted depth as per the Drawings, biochar shall be spread over the surface of the planting soil a rate of one half (1/2) inch depth of biochar material to the surface of planting soil. (1.5 cubic yards of biochar per 1,000 feet of planting soil surface.)
- B. Thoroughly incorporate the biochar into the top five (5) inches of the planting soil by hand with a rototiller.

**PK-ESCR 945.5. MEASUREMENT**

A. The quantity of BIOCHAR to be paid for shall be the number of cubic yards furnished in accordance with the plans and specifications, to the satisfaction of the Engineer. The biochar shall be measured as delivered in bulk containers, bags or trucks at point of delivery and as documented by delivery tickets.

**PK-ESCR 945.6. PRICES TO COVER**

A. The contact prices per cubic yard (CY) for Item No. PK-ESCR 945 BIOCHAR shall cover the cost of all labor, materials, equipment, insurance, testing and incidentals required furnish, spread, and incorporate BIOCHAR in planting soil to the satisfaction of the Engineer.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>

**END OF SECTION**

## SECTION PK-ESCR 946 – GEOCOMPOSITE DRAINAGE BOARD

### PK-ESCR 946.1. DESCRIPTION

- A. This section describes the furnishing and installation of GEOCOMPOSITE DRAINAGE BOARD in accordance with the plans, specifications and directions of the Engineer. □

### PK-ESCR 946.2. MATERIALS

- A. Geocomposite Drainage Board: An impermeable dimpled polypropylene sheet drainage core bonded to a layer of nonwoven filter fabric complying with the following properties:
  - 1. System Thickness (ASTM D-1777)  $\geq$  0.38 in
  - 2. Flow (Hydraulic gradient = 1) (ASTM D4716); 21 gal/min/ ft<sup>2</sup>
  - 3. Compressive strength (ASTM D-1621)  $\geq$  15,000 lb/ft<sup>2</sup>
  - 4. Fabric:
    - a. Flow (ASTM D-4491): 140 gal/min/ft<sup>2</sup>
    - b. Puncture (ASTM-D6241)  $\geq$  250 lbs.
    - c. Grab Tensile (ASTM D-4632)  $\geq$  90 lbs.
    - d. AOS: 70 U.S. Sieve (0.212 mm)

### PK-ESCR 946.2.1. REFERENCES

- A. American Society of Testing and Materials (ASTM):
  - 1. ASTM D 1777 Standard Test Method for Thickness of Textile Materials
  - 2. ASTM D 4491 Standard Test Methods for Water Permeability of Geotextiles by Permittivity
  - 3. ASTM D 4632 Standard Test Method for Grab Breaking Load and Elongation of Geotextiles
  - 4. ASTM D 4716 Standard Test Method for Determining the (In-plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head
  - 5. ASTM D 6241 Standard Test Method for Static Puncture Strength of Geotextiles and Geotextile-Related Products Using a 50-mm Probe

### PK-ESCR 946.2.2. SUBMITTALS

- A. Product data: Manufacturer's product data; indicate product supplied. Provide complete installation instructions proposed for use.
- B. No Geocomposite Drainage Board shall be delivered until the approval of test reports by the Engineer, but such approval does not constitute acceptance. The Engineer reserves the right to reject, on or after delivery, any material which does not, in their opinion, meet these specifications.

### **PK-ESCR 946.2.3. DELIVERY, STORAGE, AND HANDLING**

- A. Packing and shipping: Provide materials in original unopened containers with manufacturer's labels intact and legible.
- B. Acceptance at site:
  - 1. Unload materials: check for damage.
  - 2. Check the geocomposite drainage board upon delivery to ensure that the proper material has been received.
  - 3. Damaged materials determined by visual inspection will not be accepted.
  - 4. Remove rejected materials from site immediately.
- C. Storage and protection:
  - 1. Protect the geocomposite drainage board during shipment and storage at the construction site from temperatures greater than 160° F, mud, dirt, debris, and any other environmental condition that may damage the material's physical property values.
  - 2. Store materials in dry area in manufacturer's protective packaging in original containers with labels and installation instructions intact.
  - 3. Store materials under cover, off ground; protect from sunlight.
  - 4. Do not expose to aromatic hydrocarbons.
- D. The geocomposite drain board will be rejected at the time of installation if it has defects, tears, punctures, flaws, deterioration, or damage incurred during manufacture, shipment, or storage. Remove or repair torn or punctured sections as directed by the Engineer.
- E. Replace any geocomposite drain board damaged during manufacture, shipment, or storage at no additional cost to the Owner.

### **PK-ESCR 946.3. METHODS**

- A. Sequencing and Scheduling: Schedule installation just prior to installation of soil backfilling operations.
- B. Install the geocomposite drainage board in accordance with the plans and specifications.
- C. If at any time the Engineer determines that the method of installation does not produce a satisfactory wall drainage system, alter either the method and/or equipment as necessary to comply with the Engineer's direction.
- D. Vertical (Wall) Installation: Ensure that the surface that the geocomposite drainage board will be placed against is cleaned by removing all soil, debris, and irregularities that will prevent intimate contact between the surface and the geocomposite drain. Place the drainage core against the wall with the geotextile fabric side of the board facing the soil. Secure the geocomposite drainage board to the wall using metal stick clips, adhesives, or as recommended by the manufacturer. Install the geocomposite wall drain to allow weep holes, as shown in the plans, to drain water from the drainage core and to underdrain pipes.
- E. Horizontal (Deck) Installation: Ensure that the surface that the geocomposite drainage board will be placed against is cleaned by removing all soil, debris, and irregularities that will prevent intimate contact between the surface and the geocomposite drain. Place the

drainage core against the horizontal deck surface with the geotextile fabric side of the board facing the up. Secure the geocomposite drainage board to the deck using metal stick clips, adhesives, or as recommended by the manufacturer. Install the geocomposite to allow deck drains, as shown in the plans, to drain water from the drainage core.

- F. Form all joints by peeling or trimming the geotextile off the attached section to expose 3 inches of the drainage core. Overlap the drainage core of the second section over the first drainage core by 2 inches. Cover the joint by reattaching the geotextile flap and securely fastening it to the lower geotextile by means of a continuous strip of 3 inch wide waterproof plastic tape. Ensure that each overlapping course is shingled in the direction of water flow. If joints cannot be formed by interlocking the drainage grooves, then butt the drainage core together and cover with continuous, 6 inch wide geotextile. Center the geotextile fabric over the joint and securely fasten to the two geocomposite drainage board sheets with 3 inch wide waterproof plastic tape.
- G. Ensure that the nonwoven geotextile used to repair or replace damaged drainage core jacket material or used to cover joints in the geocomposite wall drain or to overlap the edges of the geocomposite wall drain shall meet the same criteria as the geotextile fabric specified for the geocomposite drainage board assembly.
- H. Cover all exposed edges of the geocomposite drainage board with geotextile by tucking and securing a minimum of 4 inches of geotextile behind the drainage core. This may be done by using the geotextile flaps at the edges or using a 12 inch wide continuous strip in the same manner, taping it to the exposed fabric 4 inches in from the edge with a continuous strip of 3 inch wide waterproof plastic tape, and folding the remaining geotextile and tucking it behind the drainage core edge.
- I. If the geotextile is torn, perforated, or ripped during installation, patch or replace as directed by the Engineer. Cut out the damaged section and replace it completely or repair it by placing a piece of geotextile over the damaged area and providing a minimum of 4 inches of overlap on all sides over the damaged area and secure the repair patch with 3 inch wide waterproof plastic tape. Discard and replace damaged drainage core sections. Replace or repair any geocomposite drainage board damaged during installation at no additional cost to the Owner.
- J. Place the underdrain pipes and free draining aggregate or drainage layer material as shown in the plans or as directed by the Engineer. Provide and maintain a positive outlet for the water in the geocomposite wall drain at all locations. Ensure that weep holes or deck drains are not sealed or made ineffective by the geocomposite drainage board material.
- K. Place backfill immediately over the geocomposite drainage board in a manner that does not crush or damage the geocomposite drainage board function. Take care to avoid excessive settlement of the backfill material. Do not expose the geocomposite drainage board for more than 7 days prior to backfilling. Replace and repair any geocomposite drainage board component that is damaged during the backfilling operation as directed by the Engineer.

#### **PK-ESCR 946.4. MEASUREMENT**

- A. The quantity of GEOCOMPOSITE DRAINAGE BOARD to be paid for shall be the square feet furnished in accordance with the plans and specifications, to the satisfaction of the Engineer.

**PK-ESCR 946.5. PRICES TO COVER**

A. The contract prices per square foot (SF) for

Item No. PK-ESCR 946 GEOCOMPOSITE DRAINAGE BOARD

shall cover the cost of all labor, materials, equipment, and incidentals required furnish and install the geocomposite drainage board to the satisfaction of the Engineer.

*Payment will be made under:*

<b>PK-ESCR 946</b>	<b>GEOCOMPOSITE DRAINAGE BOARD</b>	<b>SF</b>

**END OF SECTION**

## **SECTION PK-ESCR 949 – SITE PROTECTION FOR GOUVERNEUR GARDENS**

### **PK-ESCR 950.1. DESCRIPTION**

- A. Under this Item, the Contractor shall provide temporary SITE PROTECTION FOR GOUVERNEUR GARDENS property in accordance with the Drawings and specifications, to the satisfaction of the Engineer.

### **PK-ESCR 950.2. MATERIALS**

- A. Chain-Link Fencing: Minimum 2-inch, 0.148-inch thick, galvanized-steel, chain-link fabric fencing; minimum 4 feet high with galvanized-steel pipe posts; minimum 2-3/8-inch- OD line posts and 2-7/8-inch- OD corner and pull posts, with 1-5/8-inch- OD top rails with galvanized bottom tension wire.
- B. Portable Chain-Link Fencing: Minimum 2-inch 0.148-inch- thick, galvanized-steel, chain-link fabric fencing; minimum 4 feet high with galvanized-steel pipe posts; minimum 2-3/8-inch- OD line posts and 2-7/8-inch- OD corner and pull posts, with 1-5/8-inch- OD top and bottom rails. Provide concrete or galvanized-steel bases for supporting posts.
- C. Fencing Windscreen Privacy Screen: Polyester fabric scrim with grommets for attachment to chain-link fence, sized to height of fence, in color selected by Engineer from manufacturer's standard colors.
- D. Wood Enclosure Fence: Plywood, 4 feet high, framed with four 2-by-4-inch rails, with wood posts spaced not more than 8 feet apart.
- E. Polyethylene Sheet: Reinforced, fire-resistive sheet, 10-mil minimum thickness, with flame-spread rating of 15 or less in accordance with ASTM E84 and passing NFPA 701 Test Method 2.

### **PK-ESCR 950.2.1. COORDINATION, SEQUENCING AND SCHEDULING.**

- A. Install site protection prior to the start of demolition or removals work.

### **PK-ESCR 951.3. METHODS**

- A. General: Protection of Existing Facilities: Protect existing equipment, curbs, walls, structures, utilities, fencing, pavements, site furnishings, and other improvements at Project site and on adjacent properties, except those indicated to be removed or altered, as shown on the Drawings and to the satisfaction of the Engineer.
  - 1. Repair damage to existing facilities to remain.
  - 2. Where access to adjacent properties is required in order to affect protection of existing facilities, obtain written permission from adjacent property owner to access property for that purpose.
  - 3. Tree and Plant Protection: Comply with requirements specified in "Tree and Plant Protection," and bid items "Temporary Wood Tree Guard" and "Temporary Wood Tree Guard for Groves".
  - 4. Operation, Termination, and Removal:
    - a. Maintenance: Maintain facilities in good operating condition until removal.
    - b. Maintain site protection devices as required throughout construction

- period.
  - c. Relocate and reestablish site protection as required to maintain resident access to and from the building and other site areas and as directed by the Engineer.
  - d. Temporary Facility Changeover: Do not change over from using protection facilities to permanent facilities until Substantial Completion.
  - e. Termination and Removal: Remove each temporary facility when need for its service has ended or no later than Substantial Completion. Complete or, if necessary, restore permanent construction that may have been delayed because of interference with temporary facility. Repair damaged Work, clean exposed surfaces, and replace construction that cannot be satisfactorily repaired.
  - f. Materials and facilities that constitute site protection are property of Contractor.
  - g. At Substantial Completion, repair, renovate, and clean protected site features as directed by the Engineer.
- B. Gouverneur Gardens Property Area: Protect the Building, including building walls, windows, doors, lights, intake and exhaust vents and adjacent building utilities not designated to be removed, access ramps, railings, guard rails, signage, site walls, curbs, pavements and other site furnishings and features as indicated on the Drawings and to the satisfaction of the Engineer.

**PK-ESCR 951.4. MEASUREMENT**

A. PER LUMP SUM

Payment for Site Protection will be made on a Lump Sum basis for work satisfactorily completed. Monthly payments will be made in proportion to the amount of work done as determined by the Engineer.

**PK-ESCR 951.5. PRICES TO COVER**

A. The Lump Sum (LS) contract price for

Item No. PK-ESCR 949 SITE PROTECTION FOR GOUVERNEUR GARDENS

shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish, maintain, remove and complete the work, together with all other work in connection therewith and incidental thereto, in full compliance with the Contract Drawings, the specifications and the directions of the Engineer. Bid Items for "Temporary Wood Tree Guard" and "Temporary Wood Tree Guard for Groves" shall be paid for separately. Bid Item for Construction Fence shall be paid for separately.

*Payment will be made under:*

<b>Item No.</b>	<b>Item</b>	<b>Pay Unit</b>

END OF SECTION

## SECTION PK-ESCR 950 – SITE PROTECTION FOR PARK AREAS

### PK-ESCR 950.1. DESCRIPTION

- A. Under this Item, the Contractor shall provide temporary SITE PROTECTION FOR PARK AREAS at designated park areas in accordance with the Drawings and specifications, to the satisfaction of the Engineer.

### PK-ESCR 950.2. MATERIALS

- A. Chain-Link Fencing: Minimum 2-inch, 0.148-inch thick, galvanized-steel, chain-link fabric fencing; minimum 4 feet high with galvanized-steel pipe posts; minimum 2-3/8-inch- OD line posts and 2-7/8-inch- OD corner and pull posts, with 1-5/8-inch- OD top rails with galvanized bottom tension wire.
- B. Portable Chain-Link Fencing: Minimum 2-inch 0.148-inch- thick, galvanized-steel, chain-link fabric fencing; minimum 4 feet high with galvanized-steel pipe posts; minimum 2-3/8-inch- OD line posts and 2-7/8-inch- OD corner and pull posts, with 1-5/8-inch- OD top and bottom rails. Provide concrete or galvanized-steel bases for supporting posts.
- C. Fencing Windscreen Privacy Screen: Polyester fabric scrim with grommets for attachment to chain-link fence, sized to height of fence, in color selected by Engineer from manufacturer's standard colors.
- D. Wood Enclosure Fence: Plywood, 4 feet high, framed with four 2-by-4-inch rails, with wood posts spaced not more than 8 feet apart.
- E. Polyethylene Sheet: Reinforced, fire-resistive sheet, 10-mil minimum thickness, with flame-spread rating of 15 or less in accordance with ASTM E84 and passing NFPA 701 Test Method 2.

### PK-ESCR 950.2.1. COORDINATION, SEQUENCING AND SCHEDULING.

- A. Install site protection prior to the start of demolition or removals work.

### PK-ESCR 951.3. METHODS

- A. General: Protection of Existing Facilities: Protect existing equipment, curbs, walls, structures, utilities, fencing, pavements, site furnishings, and other improvements at Project site and on adjacent properties, except those indicated to be removed or altered, as shown on the Drawings and to the satisfaction of the Engineer.
  - 1. Repair damage to existing facilities to remain.
  - 2. Where access to adjacent properties is required in order to affect protection of existing facilities, obtain written permission from adjacent property owner to access property for that purpose.
  - 3. Tree and Plant Protection: Comply with requirements specified in "Tree and Plant Protection," and bid items "Temporary Wood Tree Guard" and "Temporary Wood Tree Guard for Groves".
  - 4. Operation, Termination, and Removal:
    - i. Maintenance: Maintain facilities in good operating condition until removal.
    - ii. Maintain site protection devices as required throughout construction period.
    - iii. Temporary Facility Changeover: Do not change over from using protection

facilities to permanent facilities until Substantial Completion.

- iv. Termination and Removal: Remove each temporary facility when need for its service has ended or no later than Substantial Completion. Complete or, if necessary, restore permanent construction that may have been delayed because of interference with temporary facility. Repair damaged Work, clean exposed surfaces, and replace construction that cannot be satisfactorily repaired.
  - v. Materials and facilities that constitute site protection are property of Contractor.
  - vi. At Substantial Completion, repair, renovate, and clean protected site features as directed by the Engineer.
- B. East River Park: Protect work of the Pier 42 project being completed under a separate contract, the Fire Boat House, the Williamsburg Bridge Piers, the 6<sup>th</sup> Street Bridge Structure, including pavements, fencing and supporting elements, the existing Jersey barrier and fence along the FDR Drive, and other site furnishings and features as indicated on the Drawings and to the satisfaction of the Engineer. Relocate and reestablish site protection as directed by the Engineer to maintain construction access to the Pier 42 project area for the Pier 42 project contractor.
- C. Corlears Hook Park: Protect existing soccer field and soccer field fencing, dog run and dog run fencing and other site furnishings and features as indicated on the Drawings and to the satisfaction of the Engineer.

**PK-ESCR 951.4. MEASUREMENT**

A. PER LUMP SUM

Payment for Site Protection will be made on a Lump Sum basis for work satisfactorily completed. Monthly payments will be made in proportion to the amount of work done as determined by the Engineer.

**PK-ESCR 951.5. PRICES TO COVER**

A. The Lump Sum (LS) contract price for

Item No. PK-ESCR 950 SITE PROTECTION EAST RIVER PARK

Item No. PK-ESCR 950 D SITE PROTECTION CORLEARS HOOK PARK

shall cover the cost of all labor, materials, equipment, insurance, and incidentals required to furnish, maintain, remove and complete the work, together with all other work in connection therewith and incidental thereto, in full compliance with the Contract Drawings, the specifications and the directions of the Engineer. Bid Items for "Temporary Wood Tree Guard" and "Temporary Wood Tree Guard for Groves" shall be paid for separately. Bid Item for Construction Fence shall be paid for separately.

*Payment will be made under:*

END OF SECTION  
PARKS-579

**SECTION PK-ESCR 951 – COMPOST TEA**

**PK-ESCR 951.1. DESCRIPTION**

- A. Under this Item, the Contractor shall complete soil and compost tea testing, furnish and apply COMPOST TEA in four (4) separate applications at lawn areas, planting beds and pits, in accordance with the plans and specifications, to the satisfaction of the Engineer.

**PK-ESCR 951.2. MATERIALS**

- A. Compost Tea: A concentrated organic liquid fertilizer that is made from steeping biologically active compost in aerated water. Compost Tea shall meet the following minimum standard as demonstrated by testing:

Criteria	Test Method	Minimum Levels per milliliter of compost Tea
Biological Organisms	Soil FoodWeb Analysis	10-150 µg active bacteria 150-300 µg total bacteria 2-0 µg active fungi 5-20 µg total fungi 1,000 flagellates 1,000 amoeba 20-50 ciliates 2-10 beneficial nematodes

- B. Adjust Compost Tea ingredients as recommended by the Testing Laboratory to achieve biological levels required as determined by Soil Biological Testing.

**PK-ESCR 951.2.2. SUBMITTALS**

- A. Qualification Data:

1. Compost Tea Producer/Applicator, including:
  - a. List of previous projects including project name, a contact name, phone number, and the number of square feet or acre per each application and a brief description of the project.
  - b. Location where the compost tea will be produced.
2. Soil Biological Testing Laboratory: Name and address of testing laboratory, including the resume of the staff anticipated to perform tests and make recommendations for the project.

- B. Material Test Reports:

1. General: Submit written reports of each soil sample tested. Each report shall include the following as a minimum and such other information required specific to material tested:
  - a. Date issued.
  - b. Project Title, name of Contractor.
  - c. Testing laboratory name, address and telephone number, and name(s), as

applicable, of each field and/or laboratory inspector.

- d. Date, place, and time of sampling or test, with record of temperature and weather conditions.
- e. Location of material source.
- f. Name and protocol of test performed.
  - (1) Soil Biological Test Reports: Results of tests including identification of deviations from specified ranges.
  - (2) Compost Tea Test Reports: Results of tests including identification of deviations from specified ranges.
- 2. Missing information, failure to use the specified testing protocol, or failure to supply a material sample as specified with the test report shall be grounds for rejection.
- 3. Lab test reports submitted for approval by the Engineer shall be dated no more than three weeks from date of sample collection.
- 4. Contractor to bear responsibility for all costs associated with laboratory testing.
- 5. Soil Biological Test Reports: Test for the following:

Criteria	Test Method	Acceptable Range
Biological Organisms	Soil FoodWeb Analysis	Organism Biomass Data: Dry weight: 0.45 to 0.85 Active Fungi: > 30.0 µg/g Total Fungi: >300.00 µg/g Hyphal Diameter: > 2.50 µg/m Active Bacteria: > 30.0 µg/g Total Bacteria: > 300.00 µg/g Organism Biomass Ratios: AF:TB 1.00 to 2.00 AF:TF > 0.10 AB:TB > 0.10 AF:AB 1.00 to 2.00 Protozoa (Protists): # Flagellates: >10,000/g # Amoebae: >10,000/g # Ciliates: < 470 Nematodes: # Nematodes: >10.00/g # Bacterial: > 4.0 # Fungal: > 4.0 # Fungal/Root: < 1.0 # Predatory: > 2.0 # Root: < 1.0 Mycorrhizal Fungi Endo % > 10 Ecto % > 10 Ericoid % > 10

- a. Include written recommendations from soil biological testing lab for compost tea brewing and applications to achieve recommended levels of biological organisms for lawn area, planting bed, and plant pit soils.

6. Compost Tea Test Reports: Test for the following:

Criteria	Test Method	Test results per milliliter of compost Tea
Biological Organisms	Soil FoodWeb Analysis	<ul style="list-style-type: none"> <li>µg active bacteria</li> <li>µg total bacteria</li> <li>µg active fungi</li> <li>µg total fungi</li> <li># flagellates</li> <li># amoeba</li> <li># ciliates</li> <li># beneficial nematodes</li> </ul>

**PK-ESCR 951.2.3. DELIVERY, STORAGE, AND HANDLING**

- A. Bulk Materials: Deliver compost materials in containers showing volume, name and address of manufacturer, and compliance with state and Federal laws if applicable.
  - 1. Accompany each delivery of compost tea with delivery tickets.
  - 2. When compost is stored on the job site, it shall be done as directed by the Engineer.
- B. Weather Limitations: Proceed with compost tea installation only when existing and forecasted weather conditions permit application to the soil when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.
  - 1. Do not apply compost tea during windy or rainy conditions.

**PK-ESCR 951.2.4. COMPOST TEA PRODUCERS/APPLICATORS**

- A. Subject to meeting the requirements, the Compost Tea applications can be performed with approved materials from the following producers/applicators:
  - 1. Kelco Construction, Hauppauge, NY (631) 462-2952
  - 2. Almstead Tree Company, New Rochelle, NY 10801, (914) 576-0193
  - 3. Alternative Earthcare, Bay Shore, NY 11706, (631) 862-5281
  - 4. Ecological Landscape Management, Smithtown, NY 11787, (631) 484-1979
  - 5. Organic Solutions Inc., Port Washington, NY (516) 883-6660

**PK-ESCR 951.2.5. QUALITY ASSURANCE.**

- A. Soil Biological and Compost Tea Testing Laboratory: An independent soil testing laboratory with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein, including the ability to make recommendations about soil blending ratios and methods, amendment recommendations, and issuing

reports as specified herein.

1. Verify Testing Laboratories have the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed and capable of making soil recommendations, and issuing reports as specified herein.
  2. Soil Biological Testing Laboratories: Subject to meeting the requirements, the following are acceptable horticultural testing laboratories:
    - a. Soil Food Web New York, Center Moriches, NY 11716, (631) 750-1553
    - b. Harrington Organics, Bloomfield, CT 06021, (800) 675-8733
    - c. Foothill Biological Soil Health Services, Grass Valley, CA 95945, (530) 648-0694
    - d. Earthfort, Corvallis, OR 97333, (541) 257,2612
- B. Soil Biological Testing: As indicated in “Methods” of this specification.
- C. Compost Testing Frequency: One (1) test per each 500 gallons of compost tea utilized.

**PK-ESCR 951.2.6. COORDINATION, SEQUENCING AND SCHEDULING.**

- A. General: Coordinate the collection of soil samples well in advance of compost tea production and applications so as to be able to make applications in accordance with the require seasons.
- B. Estimated Soil Biological and Compost Tea Testing Durations: The following soil testing durations are provided as a guide for the contractor to be able to bid the project based on a realistic schedule. Actual testing durations may vary depending upon the contractors’ ability to send materials to their approved testing lab, the testing labs’ ability to complete multiple testing protocols simultaneously, the testing lab’s ability to manage high seasonal demands for soil testing, and the ability of the contractor to deliver test reports as required.
1. Biological testing of soils and compost teas is estimated to take 10-14 business days.

**PK-ESCR 951.3. METHODS**

- A. Prior to application of compost tea, take soil samples in a manner directed by the testing lab from representative lawn, planting bed and tree pit areas for biological analysis.
1. Sample Lawn Areas at six (6) tests per ten (10) acres where compost tea will be applied.
  2. Sample planting beds at six (6) tests per ten (10) acres where compost tea will be applied.
  3. Sample six (6) tree planting pits where compost tea will be applied.
- B. Produce a compost tea in accordance with the recommendations of the biological testing laboratory based on soil biological testing.
- C. Make four (4) separate applications of compost tea by spray methods to lawn areas, planting beds and planting pits a minimum rate of 25 gallons of compost tea concentrate per acre of surface area 0.57 gallons per 1,000 square feet. Compost tea may be diluted with water in a 4:1 ratio of four (4) parts water to one (1) part compost tea concentrate to facilitate application.

1. Springtime Applications: Apply compost tea over planting beds, tree pits and lawn areas two (2) times no closer than three weeks between applications between May 1 and June 30
  2. Fall Applications: Apply compost tea over lawn areas, planting beds, and pits two (2) times no closer than three weeks between applications between September 1 and October 31.
- D. Lawn Areas: Apply Compost Tea by spraying on the surface of lawn areas. Spray applications shall make use of low-ground pressure tractor equipment equipped with boom sprayers. After compost tea application, immediately water the compost tea into the lawn using the automatic irrigation system.
- E. Planting Beds and Pits: Apply compost by ground injection method at a spacing of twenty four (24) inches on center at a depth of six (6) to eight (8) inches.

**PK-ESCR 951.3. MEASUREMENT**

- A. The quantity of COMPOST TEA to be paid for shall be paid by acre sprayed on lawns, shrubs or perennials in accordance with the plans and specifications, to the satisfaction of the Engineer. The Compost Tea shall be measured as delivered in bulk containers at point of delivery and as documented by delivery tickets.

**PK-ESCR 951.4. PRICES TO COVER**

- A. The contact prices per acre

Item No. PK-ESCR 951 A COMPOST TEA – SHRUBS AND PERENNIALS

covers the cost of all labor, materials, equipment, insurance, testing and incidentals required furnish and make multiple spray applications of COMPOST TEA at shrubs and perennials to the satisfaction of the Engineer. Payment for each of the four applications shall be made at a rate of 25% of the total unit price per acre.

- B. The contact prices per acre

Item No. PK-ESCR 951 B COMPOST TEA – LAWN

covers the cost of all labor, materials, equipment, insurance, testing and incidentals required furnish and make ground injection applications of COMPOST TEA at lawns to the satisfaction of the Engineer. Payment for each of the four applications shall be made at a rate of 25% of the total unit price per acre.

*Payment will be made under:*

## SECTION PK-ESCR 961 – BIKEWAY SYMBOLS IMPRINTED INTO CONCRETE

**PK-ESCR 961.1 WORK:** Under this Item, the Contractor shall install **BIKEWAY SYMBOLS IMPRINTED INTO CONCRETE**, using precast imprinted concrete, in accordance with the Contract Drawings and as directed by the Engineer.

**PK-ESCR 961.2 MATERIALS:**

All materials shall be as described under Section 4.13 of the New York City Department of Transportation Standard Highway Specifications with the following additions.

**Imprinted Concrete Block:** The imprinted concrete symbols must be fabricated in a 3' length x 2' width x 4" thick concrete block, with 4x4-W2.9xW2.9 welded wire fabric with 2" cover, installed to match the proposed adjacent sidewalk concrete paving. Use imprinting tools capable of imprinting the surface of the concrete with a uniform and aligned pattern and/or texture. Use a clear release agent as specified by the imprinting tool manufacturer. These materials must be approved by the Engineer prior to their use. Tinting to match the adjacent concrete sidewalk.

**Mortar Layer:** A 1" layer of cement mortar must be applied to the surface of the subbase before laying the Imprinted Concrete Block, for leveling.

**PK-ESCR 961.3 INSTALLATION:** Screed the top surface of the concrete block and apply release agent. Using methods as recommended by the manufacturer, apply pre-approved imprinting tools to the surface while the concrete is still plastic. The precast concrete may be cast upside down with a formliner as directed by the Engineer. The requirement for a lightly broomed surface is waived.

For ADA compliance, concrete stamps must not be more than ¼" deep.

**PK-ESCR 961.4 SUBMITTALS:**

The Contractor must provide a sample block to the Engineer for approval prior to installation. As many sample blocks must be constructed as are necessary to produce sample blocks that meet the approval of the Engineer. The permanent work must be consistent with the appearance of the approved sample block(s) as determined by the Engineer.

**PK-ESCR 961.5 MEASUREMENT AND PAYMENT:** For each Bikeway Symbols Imprinted into Concrete installed in accordance with the plans, specifications, and direction of the Engineer, the Contractor shall receive the unit price bid.

The price bid shall be a unit price for **EACH** Bikeway Symbols Imprinted into Concrete and shall include the cost of all labor, materials, and equipment and incidentals, in accordance with the plans and specifications, to the satisfaction of the Engineer.

## SECTION PK-ESCR 966 – POROUS GRASS PAVER

### PK-ESCR 966.1. INTENT

The work shall consist of furnishing and installing a grass paver system on structural topsoil material with a grass surface.

### PK-ESCR 966.3. MATERIALS

A. Contractor shall submit the following:

- a. Grass Paver Unit: Fifty (50) percent recycled materials of either polyethylene or high impact polypropylene.
  - i. Color: Ranges from dark shades of gray to black.
  - ii. Color Uniformity: Uniform color throughout all units in AL-82 pallet.
  - iii. Chemical Resistance: Superior
  - iv. Carbon Black for Ultraviolet Light Stabilization: 1.5 to 2.0 percent
  - v. Unit Minimum Crush Strength at 70 degrees F: 420 psi.
  - vi. Flexural Modulus at 73 degrees F: 35,000 psi.
- b. Base Course: Base course to conform to Section PK-ESCR 748 – Foundation Material for Concrete.
- c. Unit Fill Soil: Clean sharp sand (washed concrete sand). Choose one of the following:
  - i. Sharp, washed sand with 100 percent passing No. 16 (1.18-mm) sieve.
  - ii. Coarse, well-draining sand, such as washed concrete sand conforming to AASHTO M6 or ASTM C-33.
- d. Filter Fabric: Filter Fabric shall comply with the requirements of item number PK-ESCR 149.
- e. Topsoil: Topsoil shall comply with the requirements of item number PK-ESCR 937 C.
- f. Grass: Grass sod shall comply with the requirements of Specification Section PK-ESCR 109.

### PK-ESCR 966.3.2. SUBMITTALS

A. Contractor shall submit the following:

- a. Product Data: Submit manufacturer's product data.
- b. Certificates: Product certificates by the manufacturer certifying material compliance to make pavement system units.
- c. Samples: Contractor to provide samples for each material listed above.

B. Mockups:

- a. Build mockups to set quality standard for fabrication and installation. The Contractor shall provide mockups of 5' by 5' areas. Approved mockups may become part of the completed work if undisturbed at time of substantial completion.

**PK-ESCR 966.3.3. QUALITY CONTROL**

- A. The Contractor shall provide documentation for the following:
  - a. Installer Qualifications: A firm with a minimum of 5 years documented experience in the installation of porous grass pavers, similar to the complexity of the design indicated in this project and with a record of successful performance. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

**PK-ESCR 966.3.4. DELIVERY, STORAGE, AND HANDLING**

- A. Materials shall be delivered to the site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer. Materials shall be stored in accordance with manufacturer's instructions and protected during handling and installation to prevent damage.

**PK-ESCR 966.3.5. WARRANTY**

- A. Warranty Information:
  - a. Products will be free from defects in material and/or workmanship for a period of five (5) years from the date of substantial completion.
  - b. The warranty may exclude damage resulting from accident, misuse, tampering, negligence, or abuse.
  - c. Products shall be repaired or replaced to the satisfaction of the Engineer any items found defective upon inspection by an authorized manufacturer service representative and Engineer.

**PK-ESCR 966.3.6. MANUFACTURER AND PRODUCTS**

- B. Acceptable Manufacturer of porous pavement systems shall be as follows:
  - a. Alcoa Geosystems (Presto Products Co.), Model No. Geoblock 5150 Grass Pavers, 670 N. Perkins St. P. O. Box 2399; Appleton, WI 54912-2399, Toll Free Tel: 800-548-3424; Tel: 920-738-1328; Fax: 920-738-1222.
  - b. Invisible Structure Inc., Model No. Grasspave 2-2520, 1600-Jackson St Suite 310, Golden, Colorado 80401, Tel: 800-233-1510. Website: [www.invisiblestructures.com](http://www.invisiblestructures.com), Email: [sales@invisiblestructures.com](mailto:sales@invisiblestructures.com)
  - c. Site Fabric Inc, Tufftrack Pavers No. TT-24, Site Supply Inc., 713 Stimmel Rd, Columbus, Ohio 43223, Tel. 800-465-0900
  - d. Or approved equal

**PK-ESCR 966.4. METHODS**

- A. EXAMINATION: Installer shall examine surfaces to receive pavers and conditions. Notify the Engineer if site conditions are not acceptable. Do not begin preparation or installation until acceptable conditions have been corrected.

B. PREPARATION:

a. Subgrade:

- i. Excavate area allowing for unit thickness and the structural topsoil foundation material depth.
- ii. Provide adequate drainage from excavated area if area has potential to collect water, when working with in-place soils that have poor permeability.
- iii. Ensure in-place soil is relatively dry, non-frozen and free from standing water.
- iv. Uniformly grade subgrade.
- v. Level and clear subgrade of large objects, such as rocks and pieces of wood.

b. Base Preparation:

- i. Place six inch (6") thick Structural Topsoil material on geotextile fabric.
- ii. Compact structural topsoil to a 90% compaction.

c. Pavement System Installation:

- i. Install and infill units in accordance with manufacturer's instructions.
- ii. Cut units as directed by manufacturer to custom fit contours and around obstructions.
- iii. Ensure required traffic load transfer and support.
- iv. Prevent units from shifting during installation using permanent metal stakes through holes in units.
- v. Finish in accordance with manufacturer's instructions.
- vi. Grass: Install grass seed per section PK-ESCR 109 and as recommended by the pavement manufacturer.

**PK-ESCR 966.5. MEASUREMENT**

The quantity of Porous Grass Pavers to be measured for payment shall be the number of **SQUARE FEET** of pavers installed in accordance with the plans and specifications and to the satisfaction of the Engineer.

**PK-ESCR 966.6. PRICES TO COVER**

The unit price bid price per **SQUARE FEET** of **POROUS GRASS PAVERS** shall include the cost of all materials, labor, equipment, and incidentals including, but not limited to, grass paver unit, base course, unit fill soil, filter fabric, topsoil, grass and all excavation for sub-grade preparation. All in accordance with the plans, the specifications and the directions of the Engineer.

*Payment will be made under:*

END OF SECTION

PARKS-588

## SECTION PK-ESCR 968 – TREE SALVAGE

**DESCRIPTION OF WORK:** The work under this Section includes the removal and salvage of trees within the contract area for NYC Parks and for Nature Exploration elements.

Tree Salvage for Nature Exploration: The work under this Section includes the removal and salvage of trees within the contract area to be delivered to the Contractor's fabricator of Nature Exploration elements including Log Scramble, Tree Round Border, Tree Round Maze, and Tree Round Seat as shown in the contract documents. The trees salvaged for Nature Exploration must be 80-90% *Gleditsia* sp. and 10-20% *Quercus* sp. Salvage trees for Nature Exploration elements will be determined and tagged in the field by the Engineer prior to actual removal date.

Tree Salvage for NYCDPR: The work under this Section includes the removal and salvage of trees within the contract area for NYCDPR use. This will involve cutting trees to specific log lengths, itemizing and handling the logs as described below, and transporting the logs to a NYCDPR facility within the five Boroughs. The Contractor will be required to remove individual trees in a manner that will optimize reuse of each tree for millable lumber. It is the intent of this Section to enable the salvage of as many trees 12" DBH and above as possible for future reuse based on size, species, condition and stem shape. Salvage trees will be determined and tagged in the field by the Engineer prior to actual removal date.

All work shall be performed by skilled persons. All work shall be performed in a professional manner consistent with International Society of Arboriculture (ISA) and the American National Standards for Arboricultural Safety Z133-2012, approved by the American National Standards Institute (ANSI). ANSI Standards A300 and Z133, as well as all Federal OSHA laws and regulations, Federal Highway Administration (FHWA) Manual on Uniform Traffic Control Devices (MUTCD) Part 6 Temporary Traffic Control (TTC) standards are incorporated and are made part of this contract.

### **TREE CONTRACTOR'S QUALIFICATIONS / EQUIPMENT LIST:**

Certification and Experience. The Tree Contractor must provide the following:

- a. The Tree Contractor must have at least three (3) years of experience in pruning; removal and disposal of trees, hanging limbs, branches and stumps; and soil decompaction.
- b. The Tree Contractor must employ a minimum of one supervisory employee who is an ISA Certified Arborist, or a recognized approved equivalent certification such as New Jersey Certified Tree Expert.
- c. The Tree Contractor must prove to the Engineer by transcript or otherwise that they employ a minimum of one supervisory employee in the field at all times with no less than Two (2) years' experience in commercial logging. This supervisor must be capable of overseeing the felling of trees for salvage.
- d. At least one employee on each crew working within ten (10) feet of energized conductors must be a qualified line clearance tree trimmer as trained by TCIA Electrical Hazards Awareness Program (EHAP) as evidenced by certificate and/or by the live list of EHAP certificate holders on TCIA's website.

- e. The Tree Contractor must submit for approval the names of two (2) references with contact person's phone numbers where the Contractor has provided similar service and performed such work on contracts of comparable size.

### Equipment List

1. The Contractor shall possess and make available all tools, equipment and instruments necessary to make repairs and/or upgrades on all required parts and equipment covered under this contract. This shall include, but not be limited to, trucks, air lifts, climbing equipment, chainsaws of various sizes, chippers, stump grinders, portable wire detectors, hand tools, and all equipment and supplies necessary to complete the work as directed by the Engineer. In particular, the contractor shall provide the equipment and staff able to cut, move, stack at height of up to 14 feet, and load sawlogs of up to 8,000 pounds and up to 12 feet in length. Such equipment shall include but not be limited to:
  - a. Hand tools
    - PPE (personal protective equipment which includes chaps, hardhat, ear protection, eye protection, gloves, work boots);
    - Loggers tape or 30' tape measure for scaling and measuring logs;
    - Falling wedges, mallet/hammer;
    - Chainsaws with appropriate bar length to fell trees (such as 36" and 42"-length bar on Stihl 660 or Husky 395xp for bigger logs);
    - 3/8" or heavier chain or chokers to move logs as needed;
    - Paint marker such as Sakura Solid Paint Marker for marking cut logs on both ends.
  - b. Heavy equipment (one of the following):
    - Full sized skid steer with forks or grapple attachment (such as Bobcat T180 capable of moving full sized logs 5,000-8,000 pound range); OR
    - Excavator that can lift or move logs with minimal damage to bark; OR
    - Front loader with forks capable of moving 5,000-8,000 pound logs.

### **TREE SALVAGE PREPARATION**

In advance of the tree's salvage for Nature Exploration, the Engineer will perform a walkthrough with the Contractor's ISA Certified Arborist to select and tag those trees to be salvaged and delivered to the Contractor's Nature Exploration fabricator.

In advance of the trees' salvage for NYCDPR, The Engineer, in consultation with the NYCDPR Arborist, and the Contractors ISA Certified Arborist will perform a walkthrough to select and tag those trees to be salvaged and delivered to NYCDPR.

The tree removal walkthrough for Nature Exploration must occur in advance of the walkthrough for the NYCDPR salvage walkthrough. The Nature Exploration tree salvage walkthrough may not take place after the walkthrough for the NYC Parks Tree Salvage. At the discretion of the Engineer, these walkthroughs may be joined.

### **TREE REMOVAL AND SALVAGE METHOD**

Each tree shall be designated by the Engineer prior to removal for reuse ("remove and salvage"), and indicated as to log length (8-, 10-, or 12-feet), quantity (one or two) and any specific cutting notations. At each tree location, the Contractor will cut standing trees for sawlogs as specified on tree removal plan. Although salvaged logs will generally be 8-, 10- or 12-feet in length, alternative

lengths may be specified prior to removal. Length and quantity of all log sections depend on the shape and size of the tree and will be designated by the Engineer on a per tree basis.

Length and quality of all log selections for Nature Exploration depend on the shape and size of the tree and the appropriateness for its intended use as shown in the contract drawings and specification **Section PK-ESCR 912 Nature Exploration Fabrication** and **Section PK-ESCR 913 Nature Exploration Installation**.
